THE
ORACLE ENCYCLOPÆDIA.

Charles V. (*Le Sage*), born at Vincennes, 21st January, 1337, son of Jean II. and Bonne of Luxembourg, practically reigned as Dauphin after his father was taken prisoner at Poitiers. 'La Jacquerie' gave great strength in the States-General to the *Tiers État* led by Bishop Robert le Coq and Étienne Marcel, Provost of the Traders of Paris, but C. played off against them the nobility, clergy, and the provincial estates. After the devastating war of Charles the Bad of Navarre and Edward III. was closed by the peace of Brétigny, there was comparative quiet till the death of Jean (1364); after which the expedition of Du Guesclin against the Captal de Buch, Pedro the Cruel, the Black Prince, and his expulsion of the English, except from Calais, Bordeaux, and Bayonne, are the great features of C.'s reign. The 'Grand Companies' continued to harass the land, and the House of Burgundy rose into dangerous eminence. C. married Jeanne of Bourbon, and died 16th September, 1380, leaving two sons. One of his *ordonnances* fixed the royal majority at fourteen. C. got his surname for his habits of life. 'He passed through the courses of study then known—an apt and eager scholar. Religious he was and learned, yet not a monk on the throne. To read in Latin and French, to know something of mathematics as then studied, of astrology, alchemy, theology, to gather round him well-known learned clerks and philosophers seeking science, to collect books and lay the foundations of the great library of Paris, to listen to grave moralities or noble deeds of olden history, or "divers fair tales from Holy Writ"—these were the occupations of the sickly king.' Kitchin's *History of France*, pp. 454, 455.

Charles VI. (*Bien-Aimé*), the eldest son of Charles V., was born 3rd December, 1368, and succeeded his father in 1380. The Dukes of Berri, Bourbon, Burgundy, and Anjou shared supreme power during the minority of the boy-king. All these 'Princes of the Lilies' behaved badly. The last-named Duke abused the right of taxation to provide himself with means for his Sicilian expedition against Carlo Durazzo. The riots of *Maillotins* at Paris and Rouen, and of *Tuchins* in Languedoc, and the massacre of the Jews, showed the exasperation of the lower citizen class. In 1382, under the advice of the Duke of Burgundy, C. interfered in a struggle between Louis de Male, Count of Bruges, and feudal lord of Ghent, and the popular party under Philip van Arteveld, who was utterly defeated at Rosbecque and Courtrai. This success was made the occasion of great severities against the Parisians, the patriotic Desmarets being executed and the taxes increased. The following year C. expelled from W. Flanders the English crusade in favour of Pope Urban, which was commanded by the Bishop of Norwich. The marriage of the King to Isabella of Bavaria (1385), the expeditions against England (1386) of Admiral de Vienne and Constable Clisson, and the dismissal (1388) of the King's uncles by the 'Marmouset' party, mark the next few years. This introduced comparative quiet and economy until C.'s insanity, which occurred in 1392, and which brought his brother, Louis of Orleans, into prominence as the rival of the House of Burgundy. Louis, partly maintained by the exactions of his friend, the 'false' Pope Benedict XIII. at Avignon, stirred up the expedition of Glendower, which was crushed at Shrewsbury; and so neglected the helpless King, and oppressed the great towns, that his murder, in 1407, by Raoul d'Octonville, a follower of the Burgundian Duke Jean sans Peur ('the Fearless') was received with 'ecstasies of joy,' and publicly defended before the Dauphin and the nobles of France, assembled at the Hôtel St. Pol, in March, 1408. The Burgundian victory over the Liégois at Hasbain led to the 'paix fourrée' of Chartres, but the struggle between Burgundy and the Comte d'Armagnac, father-in-law of Orleans (in which the city of Paris took a leading part) was continued till the treaty of Pontoise (1414). The invasion by the English succeeding at Agincourt and elsewhere, the Armagnacs became unpopular, and in 1418 were massacred in Paris by the Burgundians. In revenge, Jean of Burgundy was murdered (1419) on the Bridge of Montereau by Tanneguy-Duchatel, one of the chiefs of the Orleanist party; and his son embracing the English cause, Paris was betrayed to Henry V., who by the treaty of Troyes (1420) obtained Catherine of France in marriage and the right of succession to the throne. Charles, however, survived Henry by two months, dying 21st October, 1422. 'He had reigned for forty-two years: long he had been but a name, a shadow. His voice, heard at rare intervals on some piteous occasion, was as if it came from the tomb: it usually had a plaintive gentleness, a touch of sad forgiveness in it. . . . The people called him "C. the Well-Beloved," clinging to him with a touching helplessness.' Kitchin's *History of France*, pp. 513-514.

Charles VII. (*Le Victorieux*, or *Le Bien-Servi*), born at Paris, 22nd February, 1403, was the fifth son of the preceding, whom he succeeded in 1422. In the same year he married Marie of Anjou, daughter of Louis, King of Sicily. He had previously, in 1418, assumed the title of Regent, and had acted with the Constable d'Armagnac against the Burgundian faction. While the latter occupied Paris, C. held a Parliament at Poitiers and Bourges. The treaty of Troyes (1420) had transferred the French crown to Henry V. of England. Accordingly C. had to fight with Bedford and other English commanders at Crevant (1423), Verneuil (1424), and on the fatal 'Day of Herrings' (1429) for his existence as a sovereign. The appearance of Joanne d'Arc at the siege of Orleans, and the dismissal of the favourite La Trémouille, changed the course of events. C. himself awakened up from the frivolous sloth in which he had been living, and detaching by the treaty of Arras (1435) the House of Burgundy from the English cause, he gained several important victories over his ancient foes, organised by his *ordonnances* the first standing army (cavalry and infantry) of France, and made an honourable truce in 1444. He also, by the Pragmatic of Bourges, resisted the Pope's fiscal claims on the national Church. When war broke out again, the English were speedily driven from Normandy, Guienne, and Gascony. In 1457 they had left the country. Suspicions of the Dauphin (afterwards Louis XI.) hastened C.'s end; he died 22nd July, 1461. He had twelve children, of whom one daughter, Catherine, was married to Charles of Burgundy; another, Madeleine, to Gaston de Foix. C. was much under the good influence of Agnes Sorel. In this reign Jacques Cœur founded French trade with the Levant, but was afterwards forced to flee from his country to escape the jealousy of the nobles. See Kitchin's *History of France*, b. iv. c. 6, 7; and Vallet de Viriville's *Histoire de C. VII.* (3 vols. Par. 1862-65).

Charles VIII. (*L'Affable*), born at Amboise 30th June, 1470, was the only son of Louis XI. and Charlotte of Savoy; his legitimacy has been questioned. He was declared king on his father's death in 1483. His sister, Anne of Beaujeu, became regent, and conducted a successful war against the Orleanists, among whom were the future King Louis XII. and De Comines, the Battle of St. Aubin (1488) deciding the final campaign in Brittany. In 1491 C., who had taken Dunois as his adviser, married Anne of Brittany, who had been already married by proxy to Maximilian. This led to a war with Germany, with whom Henry VII. sided. C., however, wished to prosecute the claim to Naples, which Charles of Anjou had bequeathed to his father; he also dreamed of conquering the Eastern Empire. He led an army of 30,000 men into Italy, drove the Médicis from Florence, obtained the Turkish Prince Zizim from Pope Alexander VI., and occupied Naples almost without striking a blow. The formation of the League of the Pope, Venice, Milan, Spain, and the Emperor caused C. to return home, winning on his way the victories of Fornovo and Novara. Gonsalvo de Cordoba immediately drove the French out of Naples. C. was arranging a new Italian campaign when he died, 7th April, 1498, predeceased by his son, Charles-Orland. C. was remarkable for courage and enterprise, but very sickly in body. See the *Mémoires* of Comines; Ségur's *Histoire de C. VIII.* (2 vols. 1835); and Varillas' *Histoire de C. VIII.*

Charles IX., born at St. Germain-en-Laye, 27th June, 1550, was the second son of Henri II. and Catharine de Médicis, and succeeded his brother François II. on his death in 1560, having previously borne the title of Duc d'Orleans. C. was quite passive in the earlier years of his reign, the Queen-mother pretending to favour the Huguenots. He was, however, brought over to the Catholic side by the interview which the French court had with the Duke of Alva (representing Philip II.) at Bayonne in 1567. The Huguenots then attacked Paris, and were defeated by Montmorency at St. Denis. After the short truce of Longjumeau, Condé, who had attempted to gain possession of the King's person at Meaux, was defeated at Jarnac, and in 1570 the peace of St. Germain-en-Laye was signed with Henri of Navarre, who had now become leader of the Huguenots. C. seems to have fallen under the influence of Coligny at this time: probably suspicion of the Guises and jealousy of his brother Henri contributed to this. He married Elizabeth, the daughter of Maximilian II., and betrothed his sister Marguerite to Henri of Navarre. To the assassination of Coligny, and the general massacre of 24th August, 1572, C. consented under considerable moral pressure. The Peace of Rochelle showed that the massacre was a great blunder. C. died 30th May, 1574, leaving no legitimate children. C. wrote a book, *La Chasse Royale*, printed in 1625, and wrote verses of high merit. Singular to say, the King who consented to the Massacre of Bartholomew also authorised the famous Calvinistic version of the Psalms by Marot to be printed. See Varillas' *Histoire de C. IX.*, and Sorlin de Sainte-Foy's *Histoire de la Vie, Mœurs, et Vertus du Roi C. IX.*

Charles X., the fourth son of the Dauphin Louis and Marie Josèphe of Saxony, and grandson of Louis XV., was born at Versailles, 9th October, 1757. In 1773 he married Maria Theresa of Savoy. He was then known as Charles Philippe, Comte d'Artois. His life was extremely vicious and stupid. C. supported the oppressive fiscal measures which precipitated the Revolution. Early in the struggle he emigrated with his sons, the Duc d'Angoulême and the Duc de Berri, and afterwards meeting his brother Louis, Comte de Provence, at the Conference of Pilnitz (1791), they issued the declaration which provoked from the National Assembly a decree placing their property under sequestration, and ordering them to return to France in three months. C. took part in the campaigns of the Dukes of Brunswick and York. He also accompanied Lord Moira's expedition of 1795, which was to assist the rising of Charette and Stofflet in the royalist provinces of the W. 'Monsieur,' as C. was then called, timidly withdrew without landing, went to Holyrood, and after the peace of Amiens (1802) to London, which he did not leave till 1814, when he entered Paris, and was enthusiastically received there and in the provinces. On the return of Napoleon, C. was sent to Lyon to organise assistance, but was obliged to retire with his brother to Ghent. On the second restoration, in spite of his vows to carry out the charter of the constitution, he became the head of the reactionary party against the moderate programme of the King and his ministers. After the assassination of his son, the Duc de Berri, C. succeeded in dissolving the Richelieu ministry, and bringing in that of Villèle and Peyronnet, which engaged in the inglorious war with Spain (1823). In 1824, in his sixty-seventh year, he succeeded Louis XVIII., and at once began a retrograde policy, encouraging Ultramontane pretensions, attacking the freedom of the press (the *Courrier* and the *Constitutionnel* were both prosecuted), and strengthening the Royalist Chamber of Peers by numerous creations. The elections of 1828 produced the more enlightened ministry of Portalis, Royer-Collard becoming President of the Chamber of Deputies. In spite of this and of the popular French intervention in Greece, a rupture took place on the question of Departmental administration; and the formation of the Polignac and Labourdonnaye ministry called forth the famous protest of the 221 deputies. Immediately after the successful expedition to Algiers, C. published the ordinances of 25th July, 1830, which threw Paris into the revolution known as the Three Days of Barricades. The King, in alarm, made ineffectual efforts to conciliate the popular party. It was too late. He then departed for England, where he assumed the title of Comte de Ponthieu. The rest of his life was spent quietly at Holyrood, &c. He died, 6th November, 1836, at Görz. C. was the last Bourbon King of France.

Charles the Rash (*Le Téméraire*), Duke of Burgundy, born at Dijon, 10th November, 1433, was the son of Philippe le Bon and Isabella of Portugal. His passionate, martial nature burst into action when Louis XI. attempted to take the Somme towns. C. formed a League of the Public Good, defeated the King at Montlhéry, and by the treaty of Conflans (1466) extended his father's hereditary possessions. When in 1467 he became Duke (he was previously known as Comte de Charolais), he suppressed with terrible severity the insurrection of the people of Dinant and Liége, and strengthened his position by marrying Margaret, the sister of Edward IV. of York. Afterwards, at the interview of Péronne, a sort of agreement was come to between the great vassal and his lord; but in 1471, C., taking some excuse from the Wars of the Roses, opened hostilities in Picardy, Normandy, &c., with an army composed partly of English and Italian mercenaries, but chiefly of the old feudal levy, which he opposed to the 'Compagnies d'Ordonnance' of Louis. In spite of his excellent artillery he was compelled to raise most of his sieges. He now thought of reviving the old kingdom of Burgundy by the addition of Lorraine, Provence, and Switzerland. These designs brought him into conflict with the Emperor Friedrich at Neuss, King René II. at Nancy, and with the Swiss Cantons, who defeated him utterly at Granson, and again, with the help of Lorraine cavalry, at Morat. With a third army C. made a final effort by laying siege to Nancy (1477), where he was killed (5th January), and his army dispersed. C. was unusually well educated for his age, attentive to religious fasts and ceremonies, fond of chivalry and ancient military custom, charitable to the poor, and energetic as a ruler, but rash in war and merciless in discipline. See De Comines' *Mémoires*; De Barante's *Histoire des Ducs de Bourgogne de la Maison de Valois*; Kirk's *History of Charles the Bold, Duke of Burgundy*; and Freeman's *Historical Essays*.

Charles'ton, the chief city of S. Carolina, U.S., is situated on a tongue of land, having the Cooper river on the E. and the Ashley on the S.W. Both of these rivers are wide and deep, affording good accommodation for shipping, and the bay or estuary which they form extends eastward for 7 miles. There is a troublesome sandbar at the entrance, broken, however, by a navigable channel of from 16 to 22 feet of water. Approaching from the ocean the effect is fine, with the bay, its islands, forts, and shores spread out, and the spires and shipping of the city in the distance. C. has some thirty churches and a large orphan asylum, negro-schools, schools and charities for white people who have suffered in the war, and the State Medical College. C. is the principal commercial city of the State, and has an extensive export trade in cotton, rice, and phosphates, &c., amounting to over $20,000,000 annually. Most of its bread-stuffs and manufactured goods are imported from the N. C. was founded in 1672, and in 1685 many French Huguenots settled in it. Before the civil war it was a charming city, with beautiful villas, gardens, and promenades; and was famed for the hospitality of its citizens and the gaiety of its society. On the 12th April, 1861, the civil war began by the firing of the first gun on Fort Sumter in C. harbour. In 1863 the Union forces bombarded the city, and on 18th February, 1865, they occupied it again. During the war a fire broke out, and it left for years a track of desolation across the city. Pop. 54,955.

Charlestown, a seaport of Massachusetts, U.S., is separated from Boston by the Charles river. It stands on an elevated peninsula, containing Breed's or Bunker Hill, crowned with a monument to commemorate the first battle of the Revolution, fought here 17th June, 1775. C. contains the Massachusetts state prison, and an extensive U.S. navy yard. It was annexed to the city of Boston in 1873.

Charles' Wain or **Waggon,** otherwise called the *Plough*, a popular name for the seven conspicuous stars in the constellation Ursa Major (q.v.).

Char'let, Nicolas Toussaint, a French painter, born in Paris, 20th October, 1792, was the son of a dragoon, and was familiar from childhood with barrack life. He was employed as a clerk in the Paris mayoralty till 1816, when his Bonapartism put an end to his official career, and the pressure of circumstances drove him into art, the special tendency of his mind leading him into the department of kindly and humorous caricature. His designs chiefly represent the phases of life in the barrack, the tavern, and the homes of the poor, but are always refined and genial. In his drawing, however broad the humour may be, there is always a basis of serious sentiment. By his *Épisode de la Campagne de Russie*, exhibited in 1836—a work remarkable at once for vigour of style and elevation of feeling—C. established his claim to high rank as a painter in oils. He died at Paris, 29th December, 1845. See Jules Janin, *Notice Nécrologique sur N. T. C.*

Charleville, a town in the department of Ardennes, France, on the Meuse, nearly opposite Mézières, with which it communicates by means of a stone bridge. It lies near the base of *Mont Olympe*, has fine promenades, a valuable library, large ironworks, and an active railway and river trade in wine, coal, iron, &c. C. was founded in 1606 by Charles, Duke of Nevers, hence its name. Pop. of commune 17,390; of canton 31,356.

Charl'ois, a town 2 miles S.S.W. of Rotterdam, on the Maas, notable as the scene of a terrible catastrophe in the year 1512, when some 8000 persons in a religious procession were drowned while crossing the frozen river. Pop. 9706.

Char'lotte Am'alie, the capital of St. Thomas, W. Indies. It has a spacious harbour, and is the W. Indian station for the English mail-packets. Pop. 13,027.

Charlott'enburg, a town of Prussia, province of Brandenburg, on the Spree, 4½ miles W. of Berlin, of which it may be regarded as a suburb. It has a royal palace, built in 1699, a beautiful park, in which there are a large orangery, a theatre, and a mausoleum of granite, under which rest the remains of Friedrich Wilhelm III. and Queen Luise. The principal industries are dyeing, printing, manufactures of machines, shot, porcelain, cement, wax, chocolate, soap, glass, &c. Pop. town district 76,859.

Char'lotte Town, the capital of Prince Edward Island, Dominion of Canada, on Hillsborough Bay, at the confluence of three rivers, each navigable for several miles. It possesses a very commodious natural harbour, vessels being able to ascend each of the rivers to a considerable distance. C. has also an ironfoundry, a woollen factory, and considerable shipbuilding. Pop. 11,373.

Charm (Fr. *charme*, Lat. *carmen*, a 'song'), a form of words in verse (hence the name), believed to possess a protective, hurtful, or healing power. For this purpose verse has always been held to be more potent than prose. Latin literature abounds with examples of the use of 'carmen' in the sense of a magic spell. The occult power dwelling in the C. exerted its mysterious influence during the 'incantation' or rhythmic recital of the words. But gradually this notion of a C. died out as the belief became confined to the more ignorant of the community, and now the word denotes any unintelligible jargon scribbled on paper by a quack and carried about by his dupes. See AMULET, INCANTATION, MAGIC.

Char'nel-House (Fr. *charnier* or *charnel*, Lat. *carnatis*, from *caro*, 'flesh'), a place in which the bones of the dead thrown up by gravediggers used to be deposited, at a time when overcrowded churchyards and other burying-grounds did not invite legislation against the nuisance they constituted. The C.-H. was sometimes a building complete in itself, having a chantry attached to it; but it was commonly a crypt under a chapel—not unfrequently, indeed, under the church itself.

Cha'ron first appears in later Greek mythology as a son of Erebus, appointed by the gods to ferry across the river of Hades the shades of such dead as had been buried. He exacted as toll from each an *obolus* or *danake*, and the coin was placed in the mouth of the dead previous to burial. C. is represented as a slovenly old man with squalid beard and clothes.

Charon.

Charr, a species of Teleostean fishes belonging to the salmon genus, and included in the family *Salmonidæ*. The C. is a freshwater fish, occurring in British and European lakes and rivers. The Lake of Geneva is celebrated for its C.—the *ombre chevalier* of that lake. The body of this fish is elongated, the tail forked, and the fins of small size. The back is coloured dark olive; the sides are of lighter colour, and spotted with red or white; the belly is light in colour, and may be pale or even deep orange. The colours vary with the season and reproductive periods of these fishes. Only the front part of the vomer is provided with teeth, as in the true salmon and bull-trouts. The C. feeds on crustacea, insects, &c.; and appears to live in deep water during summer, but to come to the surface and shallower waters in the autumn season. It spawns in autumn or winter, and ascends rivers for that purpose. The fish is more plentiful in the N. of England lakes than in Scotch waters; but its numbers have greatly decreased owing to the indiscriminate fishing permitted by the want of legislative measures.

Charte (Lat. *charta*, 'a paper'). Before 1789 France had properly speaking no great written guarantee of constitutional freedom. The successive constitutions of the Revolutionary period and the First Empire will be noticed elsewhere. The first French C. is properly that of 1814. The Senate, under Talleyrand, had already, on 6th April, prepared a draft constitution, which was 'to be submitted to the acceptance of the French people, and to which Louis Stanislas Xavier, freely called by the people, was to swear conformity.' But, in spite of the declaration of St. Ouen, Louis set this aside, and submitted to a meeting of the Senate and Corps Législatif the *C. Constitutionelle* of 4th June, 1814, which is couched entirely in the language of concession, and its preamble expressly affirms that the person of the King contains all authority. The document deals with public rights, such as equality before the law, equality of contribution to public burdens, freedom of civil and military offices, personal liberty, and liberty of conscience, freedom of discussion. The Catholic religion is declared to be the state religion, conscription is abolished, and the enjoyment of the nationalised property is guaranteed to its present owners. Then comes a chapter on the forms of government, defining the supreme executive vested in the King, the responsibility of ministers, the legislative power vested in King, Chamber of Peers, and Chamber of Deputies, the initiative of legislation, and the special initiative in taxation. The Chamber of Peers is next treated of: they sit in secret, have the sole jurisdiction in high treason, are free from arrest in matters criminal. The King has an unlimited power of creating peers, but the peer must be thirty years old before he has a deliberative voice. With regard to the Chamber of Deputies from the electoral colleges, the deputies are elected for five years; each one must be forty years old, and a ratepayer to the extent of 1000 frs. The suffrage is confined to ratepayers of 300 frs. The King may dissolve the Chamber, but must call another in three months. The persons of deputies are protected during session. The Chamber has the right of accusing ministers, who may be chosen from either House. The judges named by the King are not removable, except Juges de Paix. Juries are preserved. The whole military service is to remain in possession of its honours and pensions; the public debt is guaranteed; the ancient nobility resumes its titles. The C. is modified by the *Acte Additionnel*, drafted by Benjamin Constant, which, during the Hundred Days, Napoleon passed on 22nd April, 1815, and which received 1,300,000 votes. It reduces the minimum age of deputies to twenty-five, and removes the ratepaying qualification; an indemnity is given to representatives; offences of the press are appropriated to the jury; the duty is laid on ministers to give explanations when required; and the intervention of the legislature is made necessary in loans, alienations of territory, and in the levy of forces. On the second Restoration, which had proclaimed at Cambrai the dogma of legitimacy, Louis promised to reform fourteen articles of the C., but failed to do so. After the assassination of the Duc de Berri, a long series of retrograde measures were carried by the ministries of Villèle, Peyronnet, and Polignac; the National Guard was disbanded; new peers were indiscriminately created. Then came the address of the 221 members, 'that the policy of the Government was not consistent with the wishes of the people;' and the royal ordinances of St. Cloud (25th July, 1830), the object of which was the total destruction of the liberty of the press, and the restriction of electoral power to the wealthier classes. These ordinances, which dissolved the chamber, were unconstitutional. Associations were formed in Normandy, Burgundy, Lorraine, and Paris to resist payment of taxes not voted by the chamber; then came the Revolution, the new or revised C. of 6th August, 1830, and the ministry of Laffitte, Guizot, Dupont de l'Eure, Gérard, Bignon, Casimir Périer, Duc de Broglie, Baron Louis, Molé, Sébastiani, and Dupeir. One important point in this C. was that the regulation of the franchise, or, in the French constitutional language, the organisation of the electoral colleges, was not made part of the constitution, but left to the Legislature, so that universal suffrage might have been legally introduced before 1848. A direct initiative is given to both Chambers; the deputies and the electors nominate their presidents; the sittings of the Upper Chamber are made public; the Catholic religion ceases to be the state religion in this sense that all other Christian sects are admitted to receive state aid. All the peerages created by Charles X. were annulled, and speedy legislation was promised as regards the responsibility of the executive, the organisation of primary education, the re-election of deputies receiving official posts, the franchise, the use of a jury in the trial of political and press offences. In its main features the second repeats the first C. By a subsequent law of 29th December, 1831, the twenty-third article, which gave an unlimited right to create hereditary and life peerages with pensions, was limited to the nomination of life peers without pension from certain classes which are enumerated. There were three parties concerned in the preparation of this C.: the Progressists, of whom Constant was the type; the *Doctrinaires*, or 'quasi-Legitimists,' who did not wish to go beyond the principles of 1814; and the practical majority of the Chamber led by Dupin the Elder, whose anxiety was to point out that Louis Philippe succeeded, not as heir, but by choice. In 1831 the franchise was lowered from 300 to 200 frs. of direct taxes, and the eligibility qualification from 1000 to 500 frs. The only other constitutional law of importance prior to 1848, when the republican constitution was introduced, was the regency law of 1842.

Char'ter, in the law of England, is the instrument conveying a royal grant. It is generally written in Latin. The grant may be of lands, houses, or honours, not already possessed; or it may be confirmatory of a grant already made; in which case it is called a C. of Confirmation. It was also to forgive a felony, or other crime against the crown; in which case it is called a *C. of Pardon*. In Scotch law a C. is the written evidence of a grant of heritable (real) property, made under the condition that the grantee shall annually pay money or perform a service to the granter; and this must be in the form of a written deed. The granter is termed the superior; the grantee, the vassal. The vassal is said to *hold* the subject of the superior. The annual sum or service stipulated for is called the *Duty*. Charters are either *Blench* or *Feu*. A blench-duty is nominal, as a penny Scots or a red rose, *si petatur tantum*. A Feu-duty (q.v.) is a consideration of value.

Char'terhouse (a corruption of the Fr. *Chartreuse*, Latinised Carthusian), originally a Carthusian monastery, founded about 1370 by Sir Walter Manny outside the bar of W. Smithfield. It was surrendered to Henry VIII. 10th June, 1535, and after having been possessed by several eminent personages in turn, was sold for £13,000 by the Earl of Suffolk to Sir Thomas Sutton, who founded on it a magnificent hospital, and endowed it for a master, preacher, a head schoolmaster, a second master, forty-four boys, and eighty decayed gentlemen, known as *Poor Brethren*. The poor brethren must not be under fifty years of age, and must have been housekeepers; they must also be bachelors, or widowers, and members of the Church of England. The boys, or scholars, were admitted between the ages of ten and fourteen; and both they and the poor brethren gained admission less because of their poverty, than of the influence which they could command. The poor brethren have each an apartment, food, and about £26 a year for clothing, &c., and the scholars received free board and education. The masters, however, were allowed to receive others, either as boarders or as day-scholars, and as the C. was one of the best English schools, the number of these was always considerable. Among those C. boys who distinguished themselves in after-life are Barrow, Addison, Steele, Wesley, Thirlwall, Grote, Thackeray, Eastlake, and Havelock. The poor brethren remain where they were and under the same conditions, but in 1872 the school was removed to Godalming in Surrey, and since then the number of boys not on the foundation has greatly increased. The total attendance is estimated at 500. The school staff consists of a Head Master and 34 Assistant Masters. There are 60 scholarships which can be held by boys attending the school, and ten of these are vacant every year. There are also twenty-one exhibitions of £80 and tenable for four years, open to competition among the pupils who are to proceed to the Universities.

Charter-Party, this is a contract for letting a ship or part of one to a merchant, called the freighter or charterer, for the conveyance of goods for one or more voyages. It may be under seal or in writing only. A memorandum of agreement, or the heads of an agreement for the drawing up of a C.-P., are frequently all that passes between shipowner and freighter, and they are as binding as a formal instrument. By the C.-P. the owner or master usually undertakes that the ship shall be seaworthy, and otherwise in condition to carry the goods; that the ship will be ready on the day appointed; that after receiving her lading she shall sail on the first opportunity, and safely deliver her goods at the place of consignment. The charterer undertakes to pay the freight, and load and unload within the time agreed on. Each binds himself by a penalty to fulfil his undertaking. Of course the act of God or Queen's enemies relieves the shipowner of responsibility for delay or non-fulfilment of contract. The freighter may underlet, or put in the goods of another, unless contrary to the contract. The responsibility of the owner of the ship begins when the merchandise is put on board. The freighter generally insures. See BILL OF LADING.

Char'tism was the articulate expression of the misery and sense of wrong felt by the working classes (both artisan and agricultural) in the long period after the Napoleonic wars, when, without education or political rights or trade organisation, they expected to counteract high prices and low wages by a redistribution of political power. The same movement is seen in the 'Friends of the People' (1793), and in the 'Manchester Blanketeers' (1819). In 1830 Lancashire and Yorkshire operatives were receiving 4d. a day for twelve hours' work, and in some parishes the whole available property was insufficient for the relief of the poor, although the weekly allowance for a labouring man (including earnings) was sometimes only 3s. 1d. per week, when the quartern loaf was 1s. Rick-burning and machine-breaking were frequent in that year. The influence of a bad poor-law and of the vexatious corn-laws was in 1835 intensified by a bad harvest; and the excitement which the Reform Act of 1832 had partially allayed broke out in the Dorchester labourers' meeting in Copenhagen Fields (1834), the Lancashire torchlight meetings of 1838, and the Birmingham National Convention (elected by Chartists) of 1839. The 'Charter,' drawn up in 1838 by six radical M.P.'s, and six members of the 'Working Men's Association,' demanded universal suffrage, ballot, annual Parliaments, payment of members, abolition of the property qualification of members, and equal electoral districts. A monster petition was presented to the Commons on 14th June, 1839, but the motion to refer it to a committee was negatived by a majority of 189. This was followed by riots in Birmingham, Sheffield, Newcastle, &c., by forced contributions and the attempted suppression of religious services; but fortunately the threat of a 'sacred month,' or cessation of labour during August was not carried out. The best Chartists, such as Hetherington, Vincent, Lovett, and even Feargus O'Connor, were 'moral force' men, and supported their principles in the *Dispatch* (London), *True Scotsman* (Edinburgh), *Journal* (Birmingham), *Chartist Circular*, the *Northern Star*, and other papers. Prominent among 'physical force' Chartists was a Methodist minister named Stephens, who countenanced torchlight meetings (after they were by proclamation declared illegal), and was tried and sentenced to eighteen months' imprisonment at Chester in 1839. The popularity of Vincent, and the report that he had been cruelly treated in prison at Newport (Monmouth), occasioned the armed attack on that town under the leadership of Frost (a linendraper and magistrate), Williams (a publican), and Jones (a watchmaker). These men were tried for high treason, sentenced to death, and transported for life. In 1840-42, under O'Connor and O'Brien, C. was successfully revived, joint cause being made with the Irish Repealers. Duncombe presented in Parliament the petition of the 'National Chartist Association' (which possessed 400 affiliated societies and 40,000 members); and in the N. of England there was a systematic 'turn out' from the factories, although little violence was done to person or property. In spite of numerous prosecutions (on one of which Thomas Cooper was sent to prison for two years), the 'complete suffrage union' of Joseph Sturge and the abortive land scheme of O'Connor (who was now supported by Ernest Jones) continued to fan the excitement. O'Connor, who had weakened his position by opposing the Anti-Corn-Law League, was nevertheless returned to Parliament in 1846, on the downfall of Sir Robert Peel's administration, but nothing of importance occurred till after the French Revolution of 1848, when a monster meeting took place on Kennington Common. The petition presented by this meeting (against the proposed procession of which to Westminster great military preparations had been made) was found to be in great measure a dishonest fabrication. This fact, the prosperity of trade, and the increase of emigration, all tended to extinguish C. O'Connor became a lunatic. The resolutions in favour of household suffrage and ballot, moved by Hume in 1848, indicated that portions of Chartist principles were destined to survive. The Reform Bills of 1867 and 1885, and the Ballot Act of 1872, have substantially conceded the most important demands of the Charter, but the experience of America and France does not commend the principle of 'payment of members.'

Char'tres, the capital of the department Eure-et-Loir, France, lies in a hilly amphitheatre on the Eure, 47 miles S.W. of Paris by railway. It is in great part composed of picturesque old houses, and has many fine promenades. Its large cathedral of *Notre Dame*, rebuilt during the 11th, 12th, and 13th centuries, is one of the finest in France, and is almost unsurpassed for wealth of ornamental sculpture. The façade supports two elegant spires, the principal one being 400 feet high; and the windows are traced with 5000 figures, exhibiting fine artistic design and the rarest delicacy of colour. There are several other handsome churches, as those of St. Pierre and St. André, also an imposing episcopal palace, founded by Madame de Maintenon, a massive town-hall, a theatre, &c. C. has large manufactures of steel, woollens, leather, hosiery, &c., and an active trade in grain, wine, and cattle. Pop. 23,108. C. was the capital of the Gallic *Carnutes*, and became the *Autricum* of the Romans. In the Middle Ages it gave name to a country which fell to the crown of France in 1286, was raised to a duchy by François I., and became an appanage of the Orleans family, whence the eldest son of the Duc d'Orleans generally bore the title of Duc de C.

Chartres, Duc de, Robert Philippe Louis Eugène Ferdinand d'Orleans, brother of the late Duc d'Orleans, was born in Paris, 9th November, 1840, and at the Revolution of 1848 passed into exile with the rest of the family. He was educated at Eisenach, resided for some time at Richmond, and served along with his brother in the Federal army during the campaign of the Potomac (1862) in the American civil war. In 1863 he married his cousin, the eldest daughter of the Prince de Joinville, and in 1870 returned incognito to France, entering the army of General Chanzy under the name of Robert le Fort. After the German war, the National Assembly having revoked the law of banishment against the Orleans family, he was named commander of a squadron by Thiers, and served in Algeria in 1872. By the Expulsion Bill of 1886 he with others of his family was exiled from France.

Chartreuse', La Grande, a famous monastery in the department of Isère, France, 13 miles N. of Grenoble, picturesquely situated in the valley of the Guiers (nearly 4000 feet above the sea), enclosed by lofty mountains, and almost inaccessible. It was founded 1084 by St. Bruno, broken up at the Revolution of 1789, and reoccupied since 1816. The well-known liqueur of the same name is manufactured by the monks, and is held in much repute.

Charts are the maps, used in navigation, in which are specially noted the depth of soundings, the position of rocks and sandbanks, and the direction of currents and prevalent winds. The English Admiralty Office expends a large sum annually on the preparation of elaborate C. on a large scale, and these are sold at nominal prices, ranging from 3s. to 6d. each. At various places, as Gibraltar and Cape Town, there are depots for the supply of C., which are now in almost universal use.

Char'tulary (Late Lat. *chartularia*), a collection of charters belonging to a church or religious house, a civil corporation, or even private individuals. Where these were numerous, the necessity of such a collection, consisting of copies of the original charters, would soon suggest itself; and hence we find that chartularies were made in France as early as the 10th c. Many of them have been printed, and contain matters of great interest and value, historical and antiquarian.

La Grande Chartreuse.

Chase, Salmon Portland, a prominent American statesman, was born in Cornish, New Hampshire, 13th January, 1808, graduated at Dartmouth College, 1828, and, after studying law, settled in Cincinnati about 1830. C. was at first a Democrat, but in 1841 he assisted in organising the Liberty party, and sought to denationalise slavery. He was elected a senator in 1849, and in 1855 was made Governor of Ohio. In 1861 President Lincoln appointed him Secretary of the Treasury, and C. signalised himself by his bold financial policy during the crisis of the war. He was the originator of the far-famed *greenbacks*. On 12th October, 1864, C. was appointed Chief Justice of the United States, which office he held till his death, 7th May, 1873. C. stood very high in the esteem of his countrymen. He was unquestionably a man of noble character and great intellectual vigour, and his career must always form an important part of the history of his time.

Chas′idim (Heb. *ka-sē̆thēm*, 'the pious') were the Puritans among the post-Babylonian Jews. They were distinguished by their efforts after a Levitical and sacerdotal purity; for besides their leaders, who were properly the offerers of sacrifice, each individual obtained the standing of a priest by taking part in the purifications and sacrifices. They imposed upon themselves great acts of self-denial, and to a great extent had a community of goods. In process of time the association was split up, the ultra-Puritan party being the Essenes, while the moderate party, to which the Pharisees belonged, retained the name of C. A sect of C., which has survived to the present day, with doctrines drawn from the Bible, the Talmud, and especially the Cabala, was founded in Poland in the middle of the 18th c. by Rabbi Israel ben Eliezer Baal Shem.

Cha′sing, the art of chiselling or otherwise cutting out ornamental details on metallic surfaces, principally applied to the precious metals and bronze. C., indeed, in its widest signification, may be said to be the artistic sculpture of metal-work. The tools used by the chaser are 'gravers' and other cutting implements, 'rifflers,' and 'mats' for producing a soft superficial texture. Repoussé-work (q.v.), after being beaten up into form, is finished by C., as are also cast and 'struck' or stamped ornaments; and in relief is also applied to metal in the flat.

Chass′é, David Hendrik, Baron, a Dutch general and patriot, was born at Thiel, 18th March, 1765, entered the army of his country at the age of ten, and was made lieutenant in 1781, and captain in 1787, but subsequently joined the army of France. He rose to the rank of lieutenant-colonel in 1793, distinguished himself fighting against Prussia in 1796 and 1799, and was popularly called *Général Bayonette* during the Peninsular war. In 1811 Napoleon made him a baron of the Empire. After the first restoration of the Bourbons, he returned to Holland, and was lieutenant-general of the Dutch army, fought at Waterloo, was appointed Governor of Antwerp after the peace, and defended the town for about a month in 1832 with a garrison of 6000 men against a Belgian and French force 75,000 strong. C. died at Breda, 2nd May, 1849.

Chasseurs′ (Fr. 'huntsmen'), the name originally given to a French body of sharpshooters or skirmishers, formed in 1741, in imitation of the Tyrolese jägers (chamois-hunters) of the Austrian army. The French C. were at one time both infantry and cavalry, but the name came to be applied strictly to a celebrated foot corps organised in 1835 by the Duc d'Orleans, armed with improved rifles, and called *C. de Vincennes*, from having been quartered at Vincennes. In 1838 these troops were raised to a battalion, and they have since become known also as *Tirailleurs*. There are light troops corresponding to the C. in almost all European armies.

Chas′uble (*casula*, *casibula*, a diminutive of *casula*, used by Isidore of Seville for 'a mantle'), the principal garment of a Roman Catholic priest, and as such often called 'the vestment' in old English inventories. It is worn uppermost at the celebration of mass. Originally in the form of a circle, it was retrenched in the Western or Latin Church till it became oblong. In England it was generally adorned with Y-shaped crosses and orphreys, or with embroidered ornaments down the front and along the edges; and later with a Latin cross on the back, and an orphrey in front. The hooded C. seems to have existed in France as early as the 6th c.; it is the original of the *casula processoria*, 'processional C.,' which was formerly worn at processions, but not generally at mass. The modern-shaped Roman and French C. is the invention of the last two centuries.

Chat, the name applied to a genus of Insessorial birds, including several species, and belonging to the sub-family of *Erythacinæ* or robins, which in turn forms a group of the larger division *Sylviadæ* or warblers. The stone-C., whin-C., and wheatear are three familiar species included in this genus.

Châ′teau, or **Châtel** (Old Fr. *chastel*), a word of common occurrence in the names of French towns, and derived from the Latin *castellum*, 'a fort.'

CHÂTEAUDUN, a town of France, department of Eure-et Loir, on the Loire, 26 miles S.S.W. of Chartres. It has been almost entirely rebuilt since 1723, when it was destroyed by fire. Besides a castle, which dates from the 10th c., it has several fine churches, with the interesting ruins of Notre-Dame-de-la-Boissière. Its chief industries are tanning, and manufactures of blankets and hats; its commerce is for the most part in cattle, wine, wool, and hemp. Pop. of commune 7147; of arrond. 63,758. C. was stormed in 1870 by the Germans.

CHÂTEAU-GON′TIER, a town of France, department of Mayenne, on the right bank of the river of the same name, 17 miles S.E. of Laval. Its most interesting buildings are the Church de la Trinité, erected in the 17th c., the ancient Chapel des Ursulines, remarkable for its fine stained windows, and the Church of St. Jean. C. has cornmills, tanneries, potteries, and manufactures of linens, woollens, serge, &c., and in its vicinity are mineral springs. Pop. of commune 7281; of arrond. 73,229.

CHÂTEAU-MARGAUX, a beautiful castle near the village of Margaux, in the department of Gironde, E. of Castelnau de Medoc, on the left bank of the river Gironde, 14 miles below Bordeaux. It is famous for its vineyards, which yield one of the finest class of clarets.

CHÂTEAUNEUF (de Randon), a village of France, department of Lozère, 14 miles N.E. of Mende, pop. of commune 733. It is historically interesting for the touching incident connected with its surrender by the English governor in 1380 to the dead Du Guesclin, the former laying his sword and keys on the bier of the latter. Here also, on 18th November, 1870, the Germans defeated a superior force of French Mobiles.

CHÂTEAUROUX, a town of France, department of Indre, on the left bank of the river Indre, and a station on the Paris and Bordeaux Railway, 145 miles S.W. of the former city. The town hall occupies the site of the old castle, erected in the 10th c., and of which only a tower remains. C. manufactures and trades in woollens, cottons, hosiery, paper, hardware, leather, tobacco, &c., and has a considerable number of hands engaged in working lithographic stones. Pop. of commune 23,924; of arrond. 116,623.

CHÂTELLERAULT, a town of France, department of Vienne, 20 miles N.N.E. of Poitiers, on the right bank of the Vienne, and connected with a suburb on the opposite bank by a stone bridge having a castellated gateway, built by Sully, with four massive towers. Cutlery is extensively carried on, lace is manufactured, and there are bleaching-grounds for linen. The river-port gives rise to a large trade in the produce of the district. Pop. of commune 22,522; of arrond. 68,334. The Duke of Hamilton takes the title of Duke of C. from this place, the duchy having been granted to James Hamilton, Regent of Scotland, by Henri II. in 1548.

CHÂTILLON-SUR-SEINE, a town of France, department of Côte-d'Or, on the Seine, 45 miles N.N.W. of Dijon, with which it is connected by railway. It has a church of the 10th c., and large manufactures of cloth, iron, paper, &c., and a trade in timber and lithographic stones. The allied sovereigns held a congress here 5th February to 19th March, 1814, to negotiate terms of peace with Napoleon. Pop. of commune 5127; of arrond. 40,511.

Chateaubriand, François Auguste, Vicomte de, born at St. Malo, in Bretagne, 14th September, 1768, the youngest of ten children in an aristocratic family. He was first destined for the marine service, and educated at the Colleges of Dôle and Rennes; then for the Church, for which he studied at Dinan; but finally entered the army, from which, after being presented at court in 1787, he retired to his father's estate of Combourg. After witnessing the outbreak of the Revolution, C. set sail for America, with a view to discovering the N.W. passage. He saw the Canadas and some Indian tribes, when the news of the King's disaster at Varennes recalled him to France. After marrying Mademoiselle de Lavigne, to whom he did not profess to be attached, he joined the Prussian army before Thionville, where he was left for dead in the trenches. He then came in bad health and great poverty to London. While supporting himself by teaching and translations, he allowed one of his pupils, Miss Ives, to fall in love with him. In 1797 appeared his *Essai sur Révolutions Anciennes et Modernes*, a work written in a sceptical and pessimist spirit, and concluding against revolutions as useless, though made necessary by human passion. The deaths of his mother and sister made C. a Christian: he says, 'J'ai pleuré et j'ai cru.' In 1800 he returned to Paris under a false passport, which called him Lassaigne, and next year described his religious position in *Atala*, which had enormous success all over Europe. It was followed by *René*, the story of a youth who seeks for peace of mind among savage tribes, and the *Génie du Christianisme*, which is written to show that Christianity is the most beautiful, the most sublime, the most favourable to liberty, arts, and letters, of all religions; and that to it is due all modern civilisation, from agriculture and charity to abstract science and literary taste. This book, half melancholy, half enthusiastic, altogether mystical and almost irrational, found a ready audience at a time of so much sorrow and uncertainty. The love of nature, in which C. was preceded only by Rousseau and Bernardin de St. Pierre, contributed to its success. The book obtained for C. two diplomatic appointments, which, however, he resigned on hearing of the judicial murder of the Duc d'Enghien. In 1806-7 he made a pilgrimage through Greece, Palestine, and Spain, of which the fruits were his chief work, *Les Martyrs*, a prose epic of the time of the Diocletian persecutions, in which he wishes to set off the new faith against the corruptions of Paganism and the shortcomings of heathen wisdom; and *Le Dernier des Abencerages*, remarkable for its beautiful word-pictures of the Alhambra, &c. C. published in 1814 a passionate pamphlet, *De Bonaparte et des Bourbons*, which Louis XVIII. said was worth an army to the Restoration. C. enjoyed the title of Minister of State; but, as an ultra-royalist, he savagely attacked the constitutional Decazes in the *Conservateur*. After attending the congress of Verona, where the Spanish invasion question was discussed, and acting as Minister of Foreign Affairs under Villèle, C. became a Liberal writer in the *Journal des Débats*. At the Revolution of 1830, however, he showed Legitimist colours, refusing to take the oath to Louis Philippe, thus forfeiting a seat in the Chamber of Peers and a large pension. He was even prosecuted for sedition. Down to his death, 4th July, 1848, C. was half-republican, half-royalist, always a man of sentiment, not of intelligible principle. He left behind him a monument of sickly egotism in *Mémoires d'outre Tombe*. His old age, though brightened by the society of Mademoiselle Récamier and Béranger, was consumed by doubts about his own reputation. C. will always remain a proof of what literary genius without strong conviction can accomplish. Most of the great French critics and journalists have attempted to analyse and estimate C.

Châtelet-Lomont, Gabrielle Emilie, Marquise du, a celebrated French woman of letters, daughter of the Baron de Breteuil, was born at Paris, 17th December, 1706. Under her father she studied Latin, English, and Italian, and at fifteen undertook a translation of Virgil. At an early age she was married to the Marquis du Châtelet-Lomont, but in 1733 she left her husband and lived with Voltaire for fifteen years. They retired to Cirey, where they alternately studied, quarrelled, and were reconciled, till in 1747 the marchioness was captivated by the assiduities of M. de St. Lambert, a captain in the regiment of the Lorraine Guards, who was destined to be in turn the successful rival both of Voltaire and Rousseau. She died on 10th September, 1749. She was an eager and successful student of mathematics and the physical sciences. Among her works are *Dissertations sur la Nature et la Propagation du Feu* (Par. 1744); *Institutions de Physique* (Par. 1740); and her translation of Newton's *Principia*, not published till 1756, seven years after her death.

Chatham (Old Eng. *Ceteham* or *Cætham*, 'the village of cottages'), a strongly fortified town in the county of Kent, and one of the chief naval arsenals of Britain, on the right bank of the Medway, 30 miles E.S.E. of London by railway. It is a meanly-built town, but is defended by a series of detached forts, which also form a flank defence of the metropolis. Among the principal buildings are Fort Pitt (a combined fort and military hospital), an extensive arsenal, large barracks for the naval and military forces and engineers, and extensive depots and magazines. The Government shipbuilding establishment is situated at Brompton, on the estuary of the Medway, about half a mile below C., covers an area of some 100 acres, and includes building-slips, floating-docks, and sawmills on the largest scale. It is provided with Brunel blockmaking machinery, and also with a metal-mill for preparing copper plates, bolts, &c. An Admiral-Superintendent is in control of the dockyard, and has a salary of £1883; under him there are various officers and clerks, whose salaries range from £1000 to £80. The dockyard, in fact, costs the country, in salaries alone, £31,547. Pop. parl. bor. 59,210; mun. bor. 31,657; and civ. par. 31,901. C. sends one member to Parliament. The town is a place of considerable antiquity, and from remains found on the spot the Romans appear to have had a cemetery here. The dockyard was established in the reign of Elizabeth, and in 1667 a Dutch fleet of seventeen vessels, under Van Ghent, De Ruyter's vice-admiral, sailed up the Medway and set fire to the shipping. New buildings were erected between 1757 and 1805, and since the latter date great extensions of the marine resources of C. have been made.

Chatham Islands, or **Broughton Archipelago,** a group of islands in the S. Pacific, nearly 400 miles E. of the province of Canterbury in New Zealand, were discovered and named by Lieutenant Broughton in 1791. Their total area is 375 sq. miles. The largest is C. island or Warekauri; lesser islands are Pitt or Kangihaude, and Cornwallis or Rangiaura. The soil on the whole is fertile, and favourable to the cultivation of wheat; horses and oxen thrive, but there is no timber of any size. The natives, though a robust and vigorous race resembling the Maoris, are fast dying out. English and German missions are maintained here. Pop. 271.

Chatham, William Pitt, Earl of, one of Britain's greatest statesmen and orators, was born 15th November, 1708. His father, Robert Pitt, of Boconnoc, in Cornwall, was originally a country gentleman, and both father and grandfather (the latter had been Governor of Madras) sat in the House of Commons for Old Sarum. Pitt studied at Eton and Trinity College, Oxford, and after travelling on the Continent, obtained a cornetcy in the Blues. He did not, however, find his true vocation till, on his elder brother Thomas, being returned both for Oakhampton and Old Sarum, resigning the latter, he took the vacant place. In Parliament he espoused the side of Frederick, Prince of Wales, and by his eloquence and bitterness soon obtained the position of leader of the 'Boys,' as the younger Whigs, and opponents of Sir Robert Walpole, were then called. On the fall of Walpole, Pitt, although much disliked by the King, became a subordinate member of the Broad Bottom administration, and held the post of Paymaster-General. In 1756, Pitt, who had become the head of the Opposition to the Newcastle administration that had been formed on the death of Henry Pelham, and who was so popular that he was styled 'the Great Commoner,' was made Secretary of State in November, 1756, and in reality head of the Government. Driven for a time from power, he was recalled, in answer to the demand of the people, in June, 1757, and although the Duke of Newcastle was Premier, Pitt, who had the management of foreign affairs, was the real force of the administration. Under him, and mainly on account of the energy he infused into every department of the state, Britain rose to a position she had never, since the time of Cromwell, held among the nations. Everywhere British arms were victorious; in Canada and India, under Wolfe and Clive, great possessions were snatched from the French, and at Minden and Quiberon the power of France in Europe was shattered. 'We are forced,' said Horace Walpole, 'to ask every morning what victory there is, for fear of missing one.' Pitt, however, found himself compelled to resign office after the accession of George III., then under the advice of Lord Bute, and more immediately because the majority of the Cabinet refused to declare war against Spain. A pension of £3000 a year, however, was granted him, and his wife was created Baroness C. Till 1766 he remained out of office, when he was again called to form a ministry, which he did, going to the House of Lords as Earl of C. This second administration was, however, far from a success, and C., broken in health, and to appearance temporarily insane, resigned office in 1768. Although he never again was a minister, C. to the end of his life took a keen interest in the affairs of his country. He opposed the policy of the Government towards the American colonies, advocating conciliation; and yet it was after he had delivered a powerful address against a motion by the Duke of Richmond for making peace with America, then in alliance with France, that he fell back into the arms of his friends, and had to be carried dying from the House of Lords. His death took place 11th May, 1778. The country honoured him with a public funeral in Westminster Abbey; the sum of £20,000 was voted to pay his debts; and a pension of £4000 a year was settled on his descendants. C. was one of the greatest of British orators, patriots, and statesmen. Besides his actual achievements, which covered his country with glory, his foresight was shown in his proposals for parliamentary reform, for the direct government of India, and in his directing his foreign policy towards the preservation of Prussia, while it has been said of him with truth, that 'Time has approved almost all his greater struggles—his defence of the liberty of the subject against arbitrary imprisonment under "general warrants," of the liberty of the press against Lord Mansfield, of the rights of the constituencies against the House of Commons, of the constitutional rights of America against England itself.' In public life C. was purity itself. As an orator, his passionate eloquence and sarcasm, aided by a commanding presence, made him more feared than any of his contemporaries. His chief faults were intense pride, pomposity, and a tendency to theatrical airs even in private life, though he was a most affectionate husband. See the *C. Papers* (Lond. 1838-40); his Letters to his nephew, Lord Camelford (Lond. 1804); F. Thackeray's *Life of C.* (Lond. 1827); and Macaulay's *Essays*.

Chati, a cat resembling the leopard in appearance, occurs in S. America, feeds on birds and vermin, and is most destructive among poultry, for which it is always on the hunt after sunset. The coat is of a whitish-yellow, marked with black spots on the back, and with black bands round the tail. The C. is very shy, but when caught can be easily tamed.

Chati.

Chat Moss, a peat-bog in Lancashire between Liverpool and Manchester. It is composed entirely of decayed vegetable matter, is about 12 miles square, and varies in depth from 10 to 30 feet. A portion of it was reclaimed about the beginning of the present century by Roscoe of Liverpool; but it is most celebrated in connection with the Liverpool and Manchester Railway, which the engineering skill of George Stephenson successfully carried across the yielding surface in 1829.

Chats'worth, in Derbyshire, a country seat of the Duke of Devonshire, stands on the Derwent, 20 miles N. by W. of Derby. It is a splendid palace, of quadrangular design, having a façade 720 feet long, and being surrounded by grounds 9 miles in circuit, and only inferior to those of Versailles. Its conservatory is the finest in Europe, and the mansion itself contains famous art collections. The estate was originally a grant from William the Conqueror to his natural son William Peveril, and was held in Elizabeth's time by Sir W. Cavendish, who began (1570) the erection of the mansion, in which Mary Queen of Scots was imprisoned for some years. The old pile was included in the present edifice, which was designed by Wren and Talman, and built by the first Duke of Devonshire (1687-1706), and to which the N. wing was added since 1820.

Chatt'els, in English law, include all property, moveable or immoveable, which is not freehold, copyhold, or inheritable. They are either real or personal. Real C., or chattel interests, are interests or minor estates taken out of greater, as leases for terms of years. Personal C. are all property not connected with the freehold.

Chatt'erer the name of a large family of Insessorial birds belonging to the Dentirostral section of that order, and divided into a number of sub-families, including such birds as the Drongo-shrikes, caterpillar-eaters, fruit crows, true chatterers, manakins, &c. The Bohemian C., or common waxwing, is a familiar example of the typical genus. These birds possess short, broad bills, rounded wings, short tarsi, and curved claws.

Chatterer.

Chatt'erton, Thomas, the boy-poet, was born at Bristol, 20th November, 1752. His father, sexton at Redcliffe Church and master of a charity-school, died before C.'s birth. At school he was considered slow, but early manifested a taste for antiquities, which was first excited by a black-letter Bible belonging to his mother. Bound apprentice to an attorney at the age of fourteen, in this situation he endured much misery, solacing himself, however, by writing poetry and studying heraldry. In 1768, on the opening of Bristol New Bridge, he composed the *Description of the Fryars first passing over the Old Bridge, taken from an Antient Manuscript.* Before this, C. had written the celebrated *De Bergham Pedigree*, purporting to trace the descent of a tradesman called Burgham. These and other MSS., such as the *Romaunte of the Cnyghte*, and Thomas Rowley's *Sermon*, he declared were found in 'Canynge's Cofre,' an old chest taken from the muniment-room of Redcliffe Church. After this he sent to Walpole, for his *History of British Painters*, a manuscript entitled *The Ryse of Peyncteyne in England*, and also an account of noted 'carvellers and peyncters' of Bristol. Walpole, at first deceived, afterwards suspected forgery, and the correspondence was broken off. His three years of legal servitude over, C. proceeded to London, and was soon engaged in party-writing for the newspapers and magazines, taking the side of the Opposition. His industry was unceasing, and success at first made him look for a 'glorious prospect.' But this soon died away, for pasquinades, satires, burlesques, political letters, did not bring the means of life. Reduced at length to the extremity of despair and want, he sought the post of surgeon's mate in an African ship. Even this poor chance failed him. These reverses and the pangs of poverty acting on a natural predisposition, drove this lost genius to suicide, 25th August, 1770. His remains were laid in the burying-ground of Shoe Lane Workhouse. In the tragic sadness of his fate, and the precocity of his mental power, C. is without parallel in English literature. His short span of eighteen years was wondrously rich in results. Among his works are *Ella*, a tragedy; *Ode to Ella; Battle of Hastings; The Tournament;* and *Execution of Sir Charles Bawdin.* The 'forged' poems are undoubtedly superior to the others; but such a satire as *Kew Gardens*, compared with the *Ode to Liberty* and the *Bristow Tragedy*, shows strikingly his varied powers. It is a moot point whether his maturity would have fully realised the promise of youth; but that a longer life would have developed his genius can be clearly discerned from the works he has left. It may here be noted that C.'s knowledge of Old, or even Middle English, was of the very slightest; and it seems almost incredible that anybody should have ever supposed the forgeries to be genuine. Neither metres, nor rhymes, nor words, nor spelling, belong to the 15th c., or indeed to any other century. See *The Poetical Works of Thomas C., with an Essay on the Rowley Poems, by the Rev. Walter W. Skeat, M.A., and a Memoir by Edward Bell, M.A.* (Lond. 1875).

Chau'cer, Geoffrey, the first great English poet, was born probably about 1340. His father, John C., was a London vintner. It is not known where C. was educated. In 1359 he accompanied Edward III.'s army into France, was taken prisoner, and was ransomed in 1360. About 1366 he married a certain Philippa, a lady in attendance on the Queen, and shortly afterwards obtained an annual grant of 20 marks as a valet of the King's chamber. He was sent to Genoa, in 1372, to arrange a commercial treaty, and was made comptroller of the wool customs in London in 1374. About this time his income was also increased by the custody of a minor's estate. Between 1377 and 1384 he was employed on important missions in France, Flanders, and Lombardy. In 1382 he became comptroller of the petty customs, and was sent to Parliament as a Knight of Kent in 1386. But the same year saw the downfall of his patron, John of Gaunt, and the consequent dismissal of the poet from all his offices. His fortunes rose with the reviving influence of John of Gaunt in 1389. He was made clerk of the King's works; obtained, in 1394, an annuity of £20, and a pension of 40 marks on the accession of Henry IV. in 1399. He died, probably at his house in Westminster, in 1400.

Traveller, soldier, courtier, diplomatist, member of Parliament, he passed his life among the most various and splendid aspects of the society which he has so vividly and minutely portrayed.

His literary career has been divided by Furnivall into four periods—1. 1367-68, *Pity;* 1369, *Death of Blaunche*, more commonly known as *The Boke of the Duchesse.* 2. 1373, *Parliament of Fowles; Compleynte of Mars; Anelida and Arcite; Troylus; Adam Scrivener;* 1384, *Hous of Fame.* 3. 1386. *Legende of Good Women;* 1388, *Prologue to Canterbury Tales.* 4. 1391, *Astrolabe; Compleynte of Venus;* 1393-99, *Envoy to Skogan; Marriage; Gentleness; Lack of Steadfastness; Fortune; Purse.* The *Canterbury Tales* were begun in 1373 with the second *Nonnes Tale*, and were left unfinished in 1400. In this list we miss the *Court of Love*, the *Flower and the Leaf*, beautiful symbolical poems, and the *Romance of the Rose*, a vivid translation of about a third of the *Roman de la Rose* of Guillaume de Lorris and Jean de Meung. Some scholars have denied these works to be C.'s because they do not agree with a somewhat arbitrary rhyme-test. But there is no other author to whom these poems can be assigned, and it is certain that James I. of Scotland attributed the *Court of Love* to C. C. was at first greatly influenced by the French *trouvères*, but in his *Canterbury Tales* struck out an original form of poetry, substituting the delineation of character and contemporary life for the relation of monotonous and extravagant adventure. He recast and recoloured a number of chivalrous, humorous, and marvellous tales woven in France, Italy, and the East, and gave us in the persons of their imaginary narrators, the Canterbury pilgrims, a representative gallery of society in the 14th c. His characters are not extinct types but sharply defined, living men and women. His verse breathes of spring, and is bright with the splendours of chivalry. His narrative skill is consummate, his tales gliding on with captivating artistic fluency and unobtrusive felicities of phrase. He unites luxuriant invention and piercing satiric shrewdness with delicate pathos, sunny humour, grave love of truth, and refreshing delight in nature.

The English style of C. marks the beginning of the modern period in our literature. Contrasted with earlier English dialects, his language may be called uninflected, and comparatively few of his expressions have become entirely obsolete. See Minto's *English Poets*, and the publications of the *C. Society.*

Chaudes-Aigues ('hot springs') a town of France, department of Cantal, on the Remontalon, 28 miles E.S.E. of Aurillac. Its hot mineral springs (133° to 190° F.) are much used for medicinal purposes, and for discharging grease from the fleeces of sheep. C. has important fairs for the sale of pigs, and a considerable trade in tinwares. Pop. of commune 1674; of canton 6493.

Chaudfontaine ('hot spring'), a village of Belgium, province of Liége, a few miles from the city of Liége, on an island in the Vesdre, and much frequented by visitors in the summer season, on account of its baths and hot springs (104° F.). Pop. 1688.

Chau'dière, a river and lake of Canada. The river, after a course of 90 miles through the province of Quebec, joins the St. Lawrence 7 miles above the city of Quebec. About

2½ miles from its mouth are the Falls of the C.—**Lake C.** is merely an expansion of the river Ottawa. On its S. shore stands the capital of the Dominion of Canada.

Chaudière Falls.

Chaumette′, Pierre Gaspard, born at Nevers, 24th May, 1763, the son of a shoemaker, after a vagabond youth came to Paris in 1789, where he fell under the influence of Camille Desmoulins, and joined the Cordéliers. After haranguing and writing in the most violent journals for three years, he became in 1792 the Procureur of the Commune of Paris, and assumed the fanciful name of Anaxagoras. He established the Revolutionary Tribunal, and his rapid, sonorous eloquence made him influential in all the extreme measures of 1793. He founded the party of Hébertists, who desired to have religious honours paid to the goddess Reason, which was actually done at the *Fête de la Raison*, in which an actress named Maillard took the part of the goddess. With the assistance of Chabot, Clootz, and others, C. induced the Convention to adopt this absurdity. Danton and Robespierre now combined to crush the Hébertists, and C. was executed, 13th April, 1794.

Chau′mont, an ancient town in the department of Haute Marne, France, on the left bank of the Marne, 141 miles S.E. of Paris. The Church of St. John the Baptist is a fine building of the 13th c. C. has manufactures of hosiery, gloves, druggets, &c., wool and cotton spinning-mills, and tanneries. The treaty concluded here against Napoleon by the Allies, 1st March, 1814, formed the basis of the Holy Alliance. Pop. of commune 13,280; of arrond. 79,782.

Chaun′cey, Charles, the second President of Harvard College, was born in England in 1592, and educated at Westminster School and Trinity College, Cambridge. In 1627 he was made vicar of Ware, became a Puritan, and after being imprisoned and fined, emigrated to New England in 1636, and in 1654 was appointed President of Harvard. In 1659 he published twenty-six sermons on 'Justification.' He died 19th February, 1672. C. is the ancestor of all the American Chaunceys, who form a fairly numerous body.—**Chauncey, Charles, D.D.,** great-grandson of the above, was born 1st January, 1705. He was minister in Boston in one parish for sixty years, and is the author of various theological works which are still in repute in America. He died 10th February, 1787. See *C. Memorials*, by Professor Fowler.

Chau′ny, a town of France, department of Aisne, 19 miles N.W. of Laon. A portion of it is built on the right bank of the Oise, and the remainder on an island in the river. C. has manufactures of sacking, hosiery, and chemicals; bleaching-grounds and tanneries; and a trade in grain, timber, and cattle. Pop. of commune 9315; of canton 21,269.

Chausses (Fr. from the Lat. *calceus*, 'a shoe, or covering to the foot'), defence pieces of armour for the legs, worn in the Middle Ages. They were variously made of banded mail, riveted plates, chain-mail, or padded and quilted cloth, with metal studs. The C. were sometimes laced behind the leg.

Chaux de Fonds, La, a flourishing town in the canton of Neuchâtel, Switzerland, near the French frontier, in a valley 3271 feet above the sea. It is the chief seat of the watch-making industry in the Jura, employing 12,000 hands, and producing yearly some £400,000 worth of gold and silver watches. There are also important manufactures of mathematical and musical instruments, beer, bijouterie, and lace. The town has extended very rapidly, and is still increasing. Pop. 25,603.

Chav′ica, the dried unripe fruit of *C. Roxburghii*, one of the Pepper order, and known in commerce as *long pepper*. It contains an acrid resin, a volatile oil, and an alkaloid—*piperine*. C. is used in much the same way as black pepper, which in its properties it resembles. In India dried slices of it are in repute as a stomachic. C. found in the Malay Islands also yields a similar long pepper. C.-betel is betel-pepper. C. *Siraboa*, mixed with betel-nut and a little lime, is chewed. See BETEL.

Chay Root, Choy, or **Sayan,** a name applied to the root of *Oldenlandia umbellata* (one of the *Cinchonaceæ*), sometimes imported from India for the sake of the colouring matter in the bark, which is employed to dye red, purple, and orange-brown. The same name is also sometimes erroneously given to the roots of *Morinda*, *tinctoria*, and *citrifolia*, Indian plants of the same order. In C. R., known as Indian madder, some of the Ceylon tribes used at one time to pay their tribute.

Chead′le, a town and parish in Staffordshire, 14 miles N.N.E. of Stafford, in a hollow moorland region. The finest building is a Roman Catholic church, built in 1846 by the Earl of Shrewsbury, at a cost of £60,000. In the neighbourhood are iron-mines, collieries, copper and brass works, &c., which furnish employment to the inhabitants. The parish is mentioned in Domesday Book under the form *Cedla*. About 4 miles distant are the ruins of the Cistercian Abbey of Croxden, founded in 1176. Pop. reg. sub-dist. 7361; and civ. par. 4883.

Check (Fr. *échec*, 'chess'), a cloth variegated with rectangular spaces like a chessboard, which are variously coloured, but are most frequently alternate black and white.

Check′y, or **Chequée** (Fr. *échiquete*), in heraldry, describes a field divided into three or more continuous rows of small squares, tinctured alternately with a metal or fur, and a colour.

Chedd′ar, a village in Somersetshire, at the entrance of a most remarkable gorge in the Mendip Hills, overhung by walls of cavernous rock, in places rising perpendicularly to the height of several hundred feet, and honeycombed with caves hung with stalactites. The church has a square tower 100 feet high, and a sculptured stone pulpit. The neighbourhood was at one time famous for cheese, but now in any other part of the county C. cheese can be obtained of as good quality and in as great quantity as in C. itself. The C. process of cheese-making has now been widely introduced into the great dairy farms in the S.W. of Scotland. (See CHEESE.) Pop. civ. and ecc. par. 1941.

Chedu′ba, a richly productive island, included in the division of Aracan, British Burma, lies 20 miles from the coast. It yields large quantities of rice, sugar, tobacco, indigo, hemp, &c., and has mud volcanoes and petroleum springs.

Cheese is the compressed curd or casein of milk prepared for use as human food. In making C., the milk employed is gently heated to a temperature of about 112° F., and a sufficient quantity of rennet or of an acid substance is added to cause coagulation of the casein. Rennet, which is usually employed, is prepared from the lining membrane of the fourth stomach of the calf, which organ must be salted and dried for a year before it or its solution is used. The action of the rennet produces a complete coagulation of the casein, and the separation of the curd from a straw-coloured, clear, liquid, whey takes places on 'breaking the curd' by stirring with the hand or any implement. The greater part of the whey can be drained off, and the curd rendered rather dry and crumbly in the vessel, after which it is submitted to a further draining in a linen cloth, and pressed in the C.-press. The curd is then again broken up, and mixed with the proper amount of salt, placed in a clean cloth into the C.-vat or chessart, which has the shape the C. is intended to take, and submitted to a prolonged pressure in the C.-press to expel the last traces of whey. During this pressure the C. is turned occasionally. When perfectly pressed, the cheeses are put away on shelves in a cool apartment to harden and ripen, and in C. of good quality a gradual moulding should ensue. Four kinds of C. are found in commerce :—(1) cream C.; (2) C. made of sweet milk with a proportion of cream added; (3) sweet-milk C.; and (4) skimmed-milk C. The first variety, cream C., is made in Yorkshire and Neufchâtel, keeps only a short time, and, of course, is soft and very fat. The best ordinary C. belongs to the second class, and comprises Stilton, Double Gloucester, Roquefort, Gorgonzola, and Cheddar. Of the third class are Gloucester (single), Wiltshire, American, and Dunlop; and Parmesan and Dutch C. belong to the fourth class, which also includes most of the ordinary country C. made in Scotland. Gouda C. of Holland is made with curd formed by the action of hydrochloric acid on milk, and to this it owes its freedom from mites and its pungency. Parmesan C. owes its peculiar rich flavour to the sweet herbage on which the cows are fed along the banks of the Po. Swiss C. (Schapzieger and Gruyère) is flavoured with fragrant herbs, and made in cheeses of 40 to 60 lbs. It has been the custom in the cheese-producing districts of Switzerland for relations and friends to make a present to a bride and her groom of a large cheese, upon which the dates of the births, marriages, and deaths of the members of the new family are in due course registered. Many such registers are to be seen, and not a few are over 150 years old, having been retained as family heirlooms. The following table exhibits the composition of several varieties:—

	Chester.	Roquefort.	Dutch.	Gruyère.	Parmesan.
Water per 100 parts	30·39	26·53	41·41	32·05	30·31
Nitrogen ,,	5·56	5·07	4·10	5·40	5·48
Fat ,,	25·41	32·31	25·06	28·40	21·68
Ash ,,	4·78	4·45	6·21	4·79	7·09

C. is called on to discharge two functions in the economy of food. It is a most nutritive but somewhat indigestible article when the commoner qualities form an article of diet, as they frequently do among the labouring population. The richer varieties of C. are eaten in very small quantities after meals, and they, when ripe, are found to materially promote the process of digestion. Great improvement has taken place of late years in the manufacture of this article, especially in Scotland, where annual competitions take place among the makers. In 1894, 2,263,287 cwts. of C. were imported into the United Kingdom. This large amount cost the country £5,467,137; a heavy bill to pay, indeed, when the greater part of the money, if not the whole, should have passed into the pockets of the *home*-farmer. But as in the case of eggs and butter, so also in that of C., the farmer in the British Isles either cannot, or will not, drive the foreign products out of the market. His fowls will not lay sufficient eggs, his butter is deficient in flavour and *keeping* power, and his cheese is too costly, or too new. He throws the blame on 'high rent,' the consumers' craze for low prices, and 'nature,' and while he murmurs and grows faint-hearted, his customers apply elsewhere, vainly asking themselves why Holland should have so vast a surplus of eggs, why Danish and French butters are cheaper and better than British, and how the foreign cheese merchants manage to supply the market at the present prices.

Cheese-Hopper, the name given to the larva of a fly (belonging to the order *Diptera* and family *Muscidæ*), owing to its habit of bending the body into a loop, and of suddenly straightening it in order to spring. It exists in cheeses, the perfect fly being of minute size (1½ lines in length), of a black colour with red feelers and forehead. The bacon-beetle (see DERMESTES) and another fly (*Musca corvina*) also deposit their eggs in cheese, and thus cause much waste in dairies.

Cheese-Mite, a species of true mites, belonging to the class *Arachnida* (q.v.), and so named from its being mainly found in cheese and like substances. It possesses an oval-shaped body covered with prominent bristles, eight legs, and a mouth provided with mandibles or jaws. In decaying cheese the C.-M. is sometimes found in immense numbers. Reproduction is effected very quickly. No defined circulatory or respiratory organs exist in the animal, in which also the eyes are of simple character.

Chee'ta, or **Hunting Leopard** (*Shikari cheeta*), a species of carnivorous mammalia, generally regarded as allied to the panthers and leopards, and found in India, Persia, Sumatra, Senegal, the Cape, and other parts of Africa. This animal exceeds the ordinary leopard in size. The limbs are relatively longer than in the leopard, as are also the feet; the claws are blunt, and only partially retractile. The head is small in proportion to the animal's size and height, and a short mane of stiff hairs exists on the neck. The ears are short and rounded, the muzzle being truncated and short. The hair on the front part of the body and lower edges of the jaws is rough and elongated, as is also the fur of the hinder part of the abdomen. The colours are like those of the leopard, the general hue being, however, of a deeper fawn. The fur is marked on the body and limbs by round black spots. The face is striped, and a bold black streak runs from each eye to the angle of the mouth.

The C. is trained in India and Persia to hunt such game as antelopes, deer, &c. It is kept blindfolded until within sight of the quarry, when it is let slip, and stealthily approaches the prey. It then bounds in upon the antelopes, but if unsuccessful in its first onslaught, it makes no attempt to follow, but returns to the hunter. The name *Youze* is also given to the C., which under domestication may become tame and familiar.

Cheirol'epis, a genus of extinct Ganoid fishes, generally assigned to the division *Lepidosteidæ* of that order. The fossil remains of this genus occur in the Devonian or Old Red Sandstone formations. The head was of large size, and the body covered by small ganoid scales of lozenge shape. Each fin had its first ray existing as a strong spine, and the pectoral and ventral fins were well developed and scaly.

Cheir'omancy, or **Chir'omancy** (Gr. *cheir*, 'the hand,' and *manteia*, 'divination'), palmistry, a mode of forecasting the destiny of an individual from the lines of the hand. It was known to the ancients. Traces of it are visible in Aristotle. Artemidorus, however, in his *Dream Book*, was the first to give anything like a connected or systematic view of the subject. In the Middle Ages it was still more developed and associated with astronomy. Cardan, Paracelsus, Porta, and other dubious savans, sought to give it a scientific basis. But with the spread of knowledge it gradually lost its hold on the human mind, and is now professed only by gipsies.

Chei'ron, represented by Homer (Il. xi. 831) as the wisest and most humane of the Centaurs (q.v.); the instructor of Achilles, Jason, and Æsculapius; skilled in hunting, music, medicine, and prophecy, and throughout life and in his death a splendid example of self-sacrifice. The young Achilles, and sometimes the Erotes, or Loves, appear in existing representations riding on his back.

Cheironec'tes, a genus of Marsupial mammals represented by the Yapock or Yapock-opossum of Brazil, and allied to the opossums, from which, however, it is distinguished by its semi-aquatic habits. The hind-feet are webbed, the fore-feet being hand-like in conformation, and webbed only to the first joint of the digits. The fur is of a pale grey colour, banded with sooty-black. The C. possesses cheek-pouches, the food consisting chiefly of insects and crustaceans. The average length is 2 feet.

Cheiroste′mon, a genus of plants of the natural order *Sterculiaceæ*. *C. platanoides* is the hand-plant of Mexico, so named from the anthers and style of the flowers resembling in their arrangement a hand furnished with long claws. It was the *Macpalxochitlquahuitl* of the ancient Mexicans. It is found in forests near the city of Guatemala.

Cheirothe′rium ('hand-beast'), the name formerly given by Kaup to the ideal animal which was supposed to have made certain footprints seen in rocks of Triassic age in Britain and in Germany. The fossil remains of the actual animal were afterwards discovered, and the name *Labyrinthodon* (q.v.) substituted for that of C.

Cheke, Sir John, one of the ardent scholars who forwarded the revival of classical literature in England in the 16th c., was born at Cambridge, 16th June, 1514, and studied at St. John's College, Cambridge, where he became professor, and introduced a new method of pronouncing Greek, which, however, he was ordered to discard by Bishop Gardiner, the chancellor of the university. Among his pupils were William Cecil, afterwards Lord Burleigh, and Roger Ascham. In 1544 he became tutor to Prince Edward, and was made a canon of King's College (now Christ College), Cambridge. When his pupil ascended the throne, C. got various grants of lands and rents, was made Provost of King's College (1548), knighted (1551), and made a secretary of state (1553). Upon Mary's accession he was committed to the Tower on a charge of treason, but soon after obtained his liberty, went abroad, and taught Greek at Strasburg; but in 1556 was seized by the orders of Philip while travelling in Belgium, conveyed to England, and again imprisoned. In an evil moment C. abjured Protestantism to escape the stake, and grief at this apostasy seems to have hastened his death, 13th September, 1557. C. wrote a considerable number of works, partly scholastic, partly theological; but they have now no place in literature. For a list of these see Cooper's *Athenæ Cantabrigiensis*.

Chel′æ, Cheliceræ. The name *chelæ* is given to the largely developed 'nipping-claws' seen in such crustaceans as crabs, lobsters, &c., and also in the scorpions, in which latter forms the *chelæ* are formed by the *maxillary palpi* or appendages of the lower jaws. The *chelicerœ* of the scorpions are formed by the pincer-like extremities of the mandibles or larger jaws. The *chelicerœ* are, in short, the diminutives of the larger *chelæ*.

Chelms′ford (called in Domesday Book *Celmeresforde*), the capital of Essex, on the Chelmer, near its junction with the Cann, and about the heart of the county, 29 miles N.E. of London by railway. It has tanneries, cornmills, coachworks, &c., and a considerable river trade in agricultural produce. The river, which separates here into two branches, surrounding an island called Mesopotamia, is crossed by several bridges. C. possesses various handsome buildings, and a grammar school founded by Edward VI. Pop. parl. div. of county, 58,304; mun. bor. and civ. par. (each) 11,008; reg. sub-dist. 11,301.

Chelo′nia (Gr. *chelōne*, 'a tortoise'), the class of *Reptilia* or reptiles to which the tortoises and turtles belong. It is primarily distinguished by the fact that the true or endoskeleton combines with the outer or exoskeleton to form a bony case in which the body is enclosed. This case consists of a *back* or *carapace*, formed by the expanded spines of the dorsal vertebræ, and by the flattened and amalgamated ribs, generally eight in number on each side. Occasionally (as in the soft tortoises) the ribs may be imperfectly united towards their extremities, and gaps may thus be left in the otherwise solid structure. The sides of the structure are formed by *marginal plates*, which may either be bones developed by the skin (*dermal ossifications*), or be the ossified ends or cartilages of the ribs. The floor of the body or box is formed by nine pieces forming the *plastron*, which Owen thinks is a greatly developed breastbone, but other naturalists regard it as merely composed of dermal or skin ossifications; the C. in this latter view being destitute of a breastbone. The carapace and plastron are both covered by horny plates, which in the hawk's-bill turtle constitute the *tortoise-shell* of commerce. The dorsal vertebræ are thus immovably connected together, those of the neck and tail being alone mobile. The bones of the shoulder and pelvis, supporting the fore and hind limbs respectively, are contained *within* the ribs or carapace, instead of, as in all other vertebrata, existing *outside* the ribs. Clavicles or collar-bones are absent in Chelonians. Four limbs are developed. The bones of the skull are firmly ossified together, the halves or *rami* of the lower jaw being firmly united in front. No teeth exist, the jaws being sheathed in horn, like those of Birds (q.v.). In some (soft tortoises, &c.) fleshy lips may be present. The tongue is thick and fleshy; the heart is three-chambered, and the lungs are large and voluminous. These forms *swallow* air in breathing, like the frogs, the fixed nature of the chest rendering respiratory movements impossible of performance. These forms are cold-blooded and of slow movements; they hybernate in winter, may pass long periods without food, and will exhibit signs of vitality for a lengthened time after decapitation. They are divided into the *Cheloniidæ* or Turtles (q.v.), the *Trionycidæ* (soft tortoises and terrapins), and the *Testudinidæ* (Tortoises) (q.v.).

Fossil representatives of this group occur doubtfully first in the Permian rocks, where their footprints occur (*e.g.*, *Chelichnus Duncani* of Jardine); but in the Oolite rocks turtle remains are found, and the Eocene period is rich in Chelonian fossils. The Tertiary deposits of the Sewalik Hills of Hindustan afford the remains of a gigantic chelonian averaging from 18 to 20 feet long, and to which the appropriate name of *Colossochelys Atlas* has been given.

Chel′sea (originally *Ceoles-ige*, 'the island of ships'), Middlesex, now a suburb of London. In the 16th c. it was the residence of Queen Catharine Parr, Sir Thomas More, the Princess Elizabeth, Sir Hans Sloane, &c. Even in the 17th and 18th centuries it was still a village 2 miles from London, the residence of many of the nobility and gentry; and was famous for its Ranelagh Gardens, the favourite resort of pleasure-seekers from the capital. C. has numerous churches and chapels; that of St. Luke (1824) cost £40,000; another, a fine old brick structure near the river, is full of monuments and brasses to historic personages. It has also a training college for schoolmasters, and another for schoolmistresses; three fine suspension bridges; a Royal Military Asylum for the education of the sons of soldiers; and Botanic Gardens, the gift of Sir Hans Sloane, and one of the earliest botanic gardens in England. Pop. parl. bor., reg. dist., and civ. par. (each) 96,253.

Chelsea Hospital, for invalid and superannuated soldiers, has accommodation for 600 non-commissioned officers and privates. There are thousands of pensioners from the army, and very many of them are in bad health and poor circumstances, yet the above number only can be received into the Hospital, places becoming vacant owing to death being filled up at once from the ranks of those outside. The pension ceases on a man's admission, but a certain allowance for pocket-money (ranging from 6d. to 2s. a day) is made to each according to his rank in the service. Promotion is still continued among the pensioners admitted to the Hospital, who are divided into companies to which are attached retired officers, of all ranks except that of lieutenant. Quarters in the building are also allotted to these officers. An admitted pensioner has board, lodging, clothing, medical attendance, and all necessaries; but his wife, should he be a married man, receives no assistance from the Hospital. The staff consists of Governor, Lieut.-Governor and Secretary, Assistant Secretary, Chaplain, Physician and Surgeon, and Adjutant. The cost of the Hospital for the year 1894-95 was £26,633, and this was defrayed, according to custom, by a parliamentary grant. Gardens, a small park, and exercise grounds, covering altogether about 40 acres, are attached to the building, and a considerable portion is set apart and divided into small plots for the pensioners who are fond of gardening and are strong enough to attend to the work themselves. The building was begun in 1609 by Dr. Sutcliffe, Dean of Exeter, as a theological college, and was styled in its charter, 'King James's College at Chelsea.' Charles II. built on its site the present Royal Hospital, of which the architect was Sir Christopher Wren, and the cost £150,000. Yet in a wealthy and charitable state like England sufficient accommodation cannot be found for the men whose prime of manhood has been spent, and whose health has been tried and broken, in the service of their country. In the ranks the pay is small, and little or nothing can be saved; and, it must be confessed, the pension earned by the private is not sufficient to support him in after-life.

Chel'tenham, a parliamentary borough (comprised of the parish of C. and parts of the parishes of Leckhampton and Charlton Kings) and market-town, Gloucestershire, 8 miles N.E. of Gloucester, on the river Chelt, from which it derives its name. Its prosperity originated in its mineral springs, which were accidentally discovered in 1716. In 1788, George III. having derived much benefit from their use, C. at once became a fashionable resort. It has now magnificent promenades, and numerous handsome squares, crescents, and terraces; while two suburbs have been formed of well-built villas and first-class residences. To each of the spas a pump-room is attached. C. has an endowed grammar-school, a proprietary college, which holds a very high-class place among similar establishments, a ladies' college, and a training-college for male and female teachers. It returns one member to Parliament. Pop. parl. bor. 49,775; mun. bor., reg. sub-dist., and civ. par. (each) 42,914.

Cheltenham College.

Chemistry, which at present holds such an important and prominent position among the useful and exact sciences, and which has done so much for the good of mankind, and for the advancement of science generally, had for its origin the purely selfish desire for wealth.

History.—The alchemists, who were the fathers of the science, laboured to discover the philosopher's stone—a substance which, by contact with other bodies, should convert them into gold; and later they sought for the *elixir vitæ*, to give them perpetual youth, and by that means ensure an unlimited period during which to enjoy their riches. (See ALCHEMY). Such were the chief aims of alchemy—an art (for it cannot be called a science) which was first cultivated in the East, either by the Arabs or Greeks, and gradually extended to Spain and Africa, Germany, Italy, France, and England. To the alchemists we are indebted for the knowledge of a great many substances which their experiments elicited, and in many cases for the discovery of the chief properties of these substances, but it cannot be said that they left us any important theories. Theory began to dawn on chemists in the 17th c., and with its light C. rapidly assumed the proportion of a science, and developed with a rapidity unsurpassed by any other branch of knowledge. Johann Joachim Beccher and Georg Ernst Stahl were the first to introduce into C. a comprehensive and rational theory of the nature and properties of matter, and to refer them to a common principle. This theory originated with Beccher, but was extended and enlarged by Stahl, to whom most of the credit of its introduction was given; so much so, indeed, that it was styled the 'Stahlian' theory, though it is now better remembered as the 'Phlogiston' theory. Its principle was, that all combustible bodies were compounds containing a common constituent which was dissipated during combustion, leaving either a *calx* or an *acid* as residue, according to the nature of the combustible. This common constituent was believed to be a material substance, and to constitute the principle of combustion. It received from Stahl the name of *phlogiston.* Incombustible bodies were at first but little considered, but subsequently they were believed to be the calces or residues of substances which had undergone the process of combustion. Phlogiston, it was believed, could in many cases be made to combine with a calx or acid, and so produce the original substance. Chemists of the time had excessively vague ideas, if any, concerning the nature of phlogiston, but after the discovery of hydrogen they appear to have regarded that body as isolated phlogiston, an idea which must have appeared very plausible, considering the ease with which hydrogen burns, leaving no fixed residue, and the readiness with which many metals can be reformed from their calces when the latter are heated in a stream of it.

During the greater part of the 18th c. this theory reigned supreme, and was advocated and extended by some of the ablest men that have laboured in the cause of chemical science. Pre-eminent among them were Priestley, Cavendish, Black, Scheele, and Bergman,—philosophers to whom the world is largely indebted for their discoveries. It would take up too much space to enumerate all the substances brought to light by their researches; suffice it to say, that Priestley discovered oxygen, Cavendish first prepared hydrogen, and demonstrated the composition of water. Black discovered carbonic acid gas, and explained the difference between caustic and mild alkalies. Scheele first prepared chlorine, tartaric, citric, malic, oxalic, and gallic acids, and many important mineral acids; whilst to Bergman belongs the credit of having first introduced quantitative analysis into chemical science, and by that means prepared the way for the atomic theory.

Well as the phlogiston theory explained the leading properties of most substances known at the time of its introduction, and for nearly three-quarters of a century afterwards, it was doomed to a speedy destruction at the hands of Lavoisier, a man who effected a complete revolution in C., and laid the foundation for our present ideas.

Lavoisier proved that when a metal is calcined, the calx, or residue of combustion, weighs more than the metal originally taken; and that when this calx is heated with charcoal, at the same time that the metal is regenerated, a certain quantity of gas is produced, which possesses all the properties of 'fixed air,' or carbonic acid, discovered by Black, and is, in fact, the same substance. Moreover, he showed that during calcination in a closed vessel a certain quantity of air disappears, and that the weight of the air thus disappearing is exactly equal to the increase in the weight of the metal after calcination. He thus proved that a body in burning, far from losing anything, gains in weight, and that this gain in weight is attributable to the absorption of something from the air. Lavoisier made these observations before the discovery of oxygen, but the existence of that body furnished him with the means whereby to explain his experiments, and to overturn and completely dissipate the whole doctrine of phlogiston. He eventually proved that when combustible substances are burned, they combine with oxygen contained in the air, and yield new substances. When metals are reduced from their calces by heating the latter with charcoal, the oxygen contained in the calx combines with the charcoal to form carbonic acid gas, and thus leaves the metal at liberty. The reduction of a calx by hydrogen is owing to a similar cause, but in that case water, and not carbonic acid, results. The C. of Lavoisier's day was the C. of oxygen. Substances were examined for its presence, and new bodies were obtained by combining it with various known elements or compounds. Lavoisier determined the exact composition of the air, showed that oxygen was the active ingredient, and explained the part it took in the process of Respiration (q.v.). In the course of his researches he had proved that carbonic acid was a compound of carbon and oxygen, sulphuric acid of sulphur and oxygen, phosphoric acid of phosphorus and oxygen, and nitric acid of nitrogen and oxygen. These discoveries induced him to believe that oxygen was a necessary constituent of all acids, and on this account he gave it its present name. That oxygen is not a necessary constituent of acids has since been proved by the discovery of the hydracids, nevertheless it is present in by far the greater number of acids. It is impossible to overestimate the value of the reforms introduced into C. by Lavoisier. The science received an impetus never before experienced in its history, and discoveries and speculations multiplied in all directions. Quantitative analysis became an essential part of C., and numerous investigators laboured in its cause. Amongst the most celebrated of these may be mentioned Klaproth, Vauquelin, Stromeyer, and Berzelius. The researches of these chemists not only added to the knowledge of the composition and properties of known substances, but brought to light several new and interesting elements,—as, for instance, uranium, zirconium, titanium, tellurium, chromium, cadmium, selenium, &c.

At the time these discoveries were taking place, a most important controversy was being carried on by two French chemists, Proust and Berthollet. The latter maintained that the elements combined together in variable proportions, the former that the proportions were fixed and definite. The dispute ended in Berthollet's defeat, and in the establishment of one of the most important laws in chemistry, viz., that of definite proportions. This has brought us to the commencement of the 19th c.—a memorable period for chemists, for it was at this time that Dalton introduced the Atomic Theory (q.v.). Space does not permit us to trace the development of this theory, nor to show how the quantitative experiments of Bergman, Wenzel, Richter, Lavoisier, and others were instrumental in establishing the principles upon which it depends. The atomic theory being once firmly established upon a thorough basis of experimental evidence, chemists next turned their attention to the determination of the atomic weights of the elements, and for the results we are indebted to Dalton, Gay-Lussac, Dulong and Petit, Berzelius, Gerhardt, Staas, and others. At the time that Dalton was carrying on his experiments and enunciating his ideas, another eminent British chemist was startling the world by his striking and brilliant discoveries, and opening up a new field of research and speculation. In the year 1800, Volta had published a description of the Pile (q.v.), and shortly afterwards Nicholson and Carlisle had shown that by its agency water could be decomposed into its constituents, oxygen and hydrogen. Berzelius and Hisinger, following up the idea, had performed a series of experiments on the action of a current of electricity on various salts. It was Sir Humphry Davy, however, who enunciated the laws of voltaic chemistry, and threw an entirely new light on the composition of an important class of bodies. He found that potash, soda, lime, baryta, strontia, magnesia, and lithia were compounds of oxygen with metals. The latter he succeeded in isolating, and demonstrated their chief properties. These discoveries eventually enabled chemists to prove that the groups of compounds called *Alkalies*, *Alkaline earths*, and *Earths proper*, are simply the oxides of metals. Davy also established the fact that hydrochloric acid is a compound of chlorine and hydrogen, and that chlorine is an elementary substance, and not, as had been before believed, a compound of hydrochloric acid (or, as it was then called, *muriatic acid*) with oxygen. These facts quite upset Lavoisier's doctrines respecting the nature of acids, and led eventually to the discovery of the other hydracids, viz., hydriodic, hydrobromic, and hydrocyanic acids, and to the placing of hydrofluoric acid in the same group. Berzelius was another chemist to whom science lies under the greatest obligations. His whole life was devoted to investigation, and his labours have gone far to place C. on its present footing. To him we are indebted for much of the nomenclature of chemical substances at present in use; for his representation of atoms by symbols, and of reactions (or chemical changes) by means of equations. By his analyses he contributed largely to a knowledge of the atomic weights of the elements, and by his electro-chemical theory to a correct understanding of many important facts. His experiments with the blowpipe raised that instrument to an important place amongst chemical apparatus. He first isolated the elements silicon and selenium, showed that sulphur united with certain metals to form substances having a basic character, and with certain non-metals yielding bodies possessed of acid characters, and that these sulpho-bases and sulpho-acids combined, forming sulpho-salts. In fact, he clearly demonstrated the important analogies existing between the two elements sulphur and oxygen. His great merit lies in his having systematised C.

It was at the commencement of the present century that chemists began to direct their attention to the organic world, and to attempt to manufacture in the laboratory substances which previously had only been obtained from the products of animal and vegetable life. From that time to the present day organic C. has largely occupied the attention of chemists, and has led to the discovery of facts of the greatest practical importance. Of the services of this department of chemical science to the arts and manufactures too much could not be said. The brilliant discoveries of Perkin and Hoffman with aniline have supplied the dyer with the most beautiful colours ever produced, whilst not only aniline, but a host of other products, obtainable from Coal Tar (q.v.), are employed in numerous manufactures. Organic C. has supplied the physician and surgeon with medicines and remedies of the greatest value, with chloroform and chloral, carbolic acid, &c.

Among the chemists who have made organic C. their great study, none deserves more credit than Liebig, who first supplied a method for determining carbon and hydrogen in an organic body. In conjunction with Wöhler he discovered the compound carbon radicals, and added to our knowledge by isolating many new and important compounds. His experiments, too, into the physiological C. of plants and animals, have been of inestimable value to the farmer, and indeed have been the means of revolutionising agriculture, and of establishing it on a rational and scientific basis.

Before quitting the history of C., mention must be made of the services done for the science by the *Spectroscope* (q.v.). Fraunhofer was the first to observe in the sun's spectrum a number of black lines, which have since been found to be owing to the presence of certain metals in the state of vapour. This observation in the hands of Bunsen and Kirchoff led to the construction of the *spectroscope*, an instrument by means of which the smallest trace of many elements can be detected. By its aid, too, several new elements have been discovered —viz., cœsium, rubidium, thallium, and gallium. Not only has the spectroscope revealed the nature of the matter of which our earth is composed, but it has also demonstrated that the masses of the sun and of many planets are composed (in part at least) of the same elements.

Principles.—From the preceding sketch, it will have been seen that the object of C. is the investigation of matter with a view to the determination of its composition and properties. But to define C. in exact language is a matter of great difficulty, owing to the fact that the sister science of physics is engaged with almost the same problems: and indeed it is urged that C. is simply a branch of physical science. We must leave the reader to form his own definition from a statement of the leading facts and doctrines of the science.

Composition of Matter.—All investigations into the nature of matter have led to the conclusion that whereas certain substances can be decomposed or split into new bodies, others resist all efforts to decompose them. Substances of the first kind are called compounds, those of the second, elements. Up to the present time science has revealed the existence of sixty-six elementary bodies (if we include the metal gallium, and argon and helium, discovered quite recently). These elements differ from one another in appearance and properties. They are divided into two classes, which are called respectively *metals* and *non-metals*. Of the former, with the exception of quicksilver or mercury, all are solid at ordinary temperatures. Of the latter, six are gaseous (oxygen, hydrogen, chlorine, argon, helium, and nitrogen), one liquid (bromine), and the remainder solid at ordinary temperatures. Compounds are formed of the elements, united in various proportions; but the same compound always contains the same elements, and the same proportions of these. The majority of compounds contain but two, three, or four elements, but sometimes the number is greater.

Differences between Compounds and Mixtures.—A problem of repeated occurrence to the chemist is to decide whether he is dealing with a mixture of substances, or with a true chemical compound. This is not always an easy matter, but there are certain well-marked distinctions between the two, with which the reader should be made acquainted. Compounds, as we have said, are characterised by a definite composition: if solid, they very often crystallise, and the crystals have a definite and characteristic shape; if liquid, and volatile without decomposition, they boil at a definite temperature. Moreover, and most important of all, if we produce a compound from its elements, the union of the latter is attended with a disengagement of heat. A mixture, on the other hand, may contain substances in varying quantities. In a mixture, each of the ingredients retains its own properties, and the properties of the mixture are simply the mean of these. In making a mixture, no rise of temperature occurs; and finally, it is often possible, by purely mechanical means, to separate the ingredients of a mixture, and to obtain each in an isolated condition.

The investigation of compound substances constitutes by far the most important part of C., for it is with compounds that the chemist has chiefly to deal. There are two methods by which an insight can be gained into the composition and constitution of these bodies. The one consists in separating them into their elements or into compounds of a simpler nature than themselves: the other in building them up, it may be directly, it may be by several stages, from their elements, or from compounds the nature of which is already known. The first is the analytical, the second the synthetical method.

Affinity.—At the present time chemists and physicists are undecided in their opinions as to the nature of this force, but that it is intimately connected with heat and electricity cannot be doubted. Faraday, indeed, stated that 'the forces called electricity and chemical affinity are one and the same.' The degree of affinity existing between two bodies is measured by the amount of heat given out during their combination. A rough estimate of the affinity can also be formed by observing the stability of the compound when formed: unstable bodies—or such as are readily decomposed—containing elements with a weak affinity for one another. Chemical attraction or affinity is a force of enormous power, but is only exercised at minute and inappreciable distances. Affinity differs from gravity in its mode of action. The difference in the amount of affinity existing between different bodies is well illustrated by the replacement of metals from their solutions.

Laws of Chemical Combination.—These laws are of the greatest theoretical and practical importance. The first law is that of *definite proportions*, and may be thus stated:—*Two substances in combining, do so in definite proportions. The same compound, no matter what its source or origin may be, always contains the same constituents, and the same proportions of them.* The second law is that of *multiple proportions*, and is as follows:—*If two substances combine in more than one proportion, then, taking in the compounds so formed the same quantity of one of the substances, the quantities of the other vary in a simple manner.*

Atomic Theory.—The laws of combination and the facts of equivalence are beautifully explained by means of the Atomic Theory (q.v.), which asserts that all matter is composed of ultimate particles or atoms, which by no means in our power can be further subdivided. The atoms of which an element is composed are of the same kind, and possess the same weight and properties; but the atoms of different elements differ from one another in these respects. For information respecting the methods by which the atomic weights have been determined, the reader is referred to article Atomic Theory. A curious point in connection with the atoms is, that in the majority of cases a single atom cannot exist in the free state, but immediately combines with others of its own kind. Thus a single atom of hydrogen is only known in combination: as soon as it becomes free it seizes upon a neighbour, and forms a group of two atoms. To designate this group—or indeed the smallest particle of any body, whether simple or compound, capable of existing in the free state—the term *molecule* is employed. The molecule of hydrogen therefore contains two atoms. A drop of water is composed of myriads of particles or molecules, each of which contain one atom of the element oxygen and two atoms of the element hydrogen.

Molecular Weights.—By the molecular weight of a body, simple or compound, is understood the weight of its smallest particle capable of existence in the free state, compared with the weight of the atom of hydrogen. The determination of the molecular weights of compound substances is of great importance, because by simple analysis we cannot determine the actual number of the different atoms present, but only their ratio. The direct determination of molecular weights can only be accomplished in the case of volatile bodies. In other cases these weights can only be deduced either from the steps taken in the synthesis of the bodies, from a consideration of their reactions, or from the different products yielded by their decomposition.

Avogadro and Ampère enunciated the law that *in equal volumes of all gases and vapours, under the same conditions of temperature and pressure, the same number of molecules is contained.*

Chemical Notation.—Berzelius was the first to introduce the present system of symbols and formulæ as a means of briefly stating the composition of chemical substances. The most important points in connection with this subject are as follow:—An atom of an element is represented by means of the first letter or letters of its Latin name. Thus 'Hg' represents an atom of mercury (hydrargyrum), 'Na' an atom of sodium (natrium), 'K' an atom of potassium (kalium), &c. The composition of a molecule of an elementary substance is expressed by writing the symbol or symbols of the atoms of which it is composed side by side, and affixing small figures to the right hand, and a little below each symbol, to indicate how many atoms of the element in question are contained in the molecule. Thus P_4 represents a molecule of phosphorus, and shows that it consists of a group of 4 atoms of the element; $C_{12}H_{22}O_{11}$, a molecule of cane-sugar, containing 12 atoms of carbon, 22 of hydrogen, and 11 of oxygen. To represent several molecules a number is prefixed to the formula of the molecule, with or without a bracket. Thus $2P_4$ represents two molecules of phosphorus, $6(C_{12}H_{22}O_{11})$ six molecules of cane-sugar. A chemical equation represents by means of symbols or formulæ a chemical reaction. Thus—

$$2H_2 + O_2 = 2H_2O$$

represents the reaction which takes place when hydrogen combines with oxygen, and shows that two molecules of hydrogen (each containing two atoms) and one molecule of oxygen (also containing two atoms) give two molecules of water (each of which contains two atoms of hydrogen and one of oxygen). The sign + is equivalent to 'together with' or 'and;' the sign = to 'gives.' Such an expression is called an equation, because the quantity of matter represented on the left hand is equal to the quantity on the right. A chemical equation is *a qualitative and quantitative expression of a chemical reaction.* Qualitative, as it shows by means of symbols the composition of the different molecules, reacting and produced. Quantitative, for several reasons:—(1.) It represents the atomic composition of the different molecules. (2.) It also represents the relative *weights* of the different substances taking part in the reaction. For in the above equation $2H_2$ represents 4 atoms of hydrogen (the weight of each of which is taken as unity), and therefore 4 parts by weight; O_2, 2 atoms of oxygen (each of which weighs 16 times as much as the atom of hydrogen), and therefore 32 parts by weight; $2H_2O$, twice the combined weight of 2 atoms of hydrogen = 2 and 1 atom of oxygen = 16, and therefore 36 parts by weight. It follows that 4 parts by weight of hydrogen and 32 parts by weight of oxygen give 36 parts by weight of water; or, what is the same thing, 1 part by weight of hydrogen and 8 parts by weight of oxygen give 9 parts by weight of water. (3.) An equation also represents, in the case of gases or vapours, the relative volumes of them taking part in the reaction; for by Avogadro's law the same number of molecules is contained in equal volumes of all gases and vapours, providing they be at the same temperature and pressure, and therefore *the indices to the number of molecules are also the indices to the relative volumes.* Providing, therefore, that oxygen and hydrogen be at 100° C., and that the pressure is constant, 2 volumes of the latter and 1 volume of the former will give 2 volumes of steam.

In the following list are given the formulæ of some of the chemical compositions described in this work. The symbols of the elements appear in the article on Atomic Weights.

Acetate of Amyl. $C_5H_{11}C_2H_3O_2$
Aconitine. $C_{30}H_{47}NO_7$
Alcohol, Ethyl. $C_2H_5(OH)$
Alcohol, Methyl. $CH_3(OH)$
Alcohol, Ethene. $C_2H_4(OH)_2$
Aldehyde, Berozoic. $C_6H_5—COH$
Aldehyde, Cinnamic. $C_8H_7—COH$
Aldehyde, Cuminic. $C_9H_{11}—COH$
Alum. $Al_2(SO_4)_3,K_2SO_4, 24H_2O$
Alumina. Al_2O_3
Ammonia (gas). NH_3
Antimonious Acid. Sb_2O_3
Antimonious Chloride. $SbCl_3$
Arabine. $C_6H_{10}O_5$
Atropia. $C_{17}H_{23}NO_3$
Baryta. BaO
Benzoic Acid. $C_7H_6O_2$
Benzol (Benzine). C_6H_6
Boracic Acid. H_3BO_3
Brucine. $C_{23}H_{26}N_2O_4$
Butyric Ether. $C_4H_9O_2(C_2H_5)$
Cadmia. CdS
Caffeine. $C_8H_{10}N_4O_2$
Calamine. $ZnCO_3$
Calamine, Prismatic. $ZnOH_2OSiO_2$
Calcium, Carbonate of. $CaCo_3$
Camphor. $C_{10}H_{16}O$
Capric Acid. $C_{10}H_{19}O(OH)$
Caproic Acid. $C_6H_{11}O(OH)$
Carbolic Acid. $C_6H_5(OH)$
Carbonic Acid. CO_2
Carbonic Oxide. CO
Caustic Baryta. BaH_2O_2
Cellulose. $C_6H_{10}O_5$
Chameleon Mineral. K_2MnO_4
Chlorate of Potash. $KClO_3$
Chloroform. $CHCl_3$
Chrome Alum. $Cr_2(SO_4)_3K_2SO_4 24H_2O$
Chrysene. $C_{18}H_8$
Cinnamic Acid. $C_9H_7O(OH)$ or $C_8H_7(COOH)$
Cuprous Oxide. Cu_2O
Cyanic Acid. $CN(OH)$
Cyanide of Mercury. $Hg(CN)_2$
Cyanide of Potassium. $K(CN)$
Dulcite. $C_6H_{14}O_6$
Epsom Salts. $MgSO_4,7H_2O$
Ethyl Ether. $(C_2H_5)_2O$
Ferric Chloride. Fe_2Cl_6
Ferric Oxide. Fe_2O_3
Ferric Sulphite. FeS_2
Ferricyanogen. $Fe(CN)_6$
Ferrous Carbonate. $FeCO_3$
Ferrous Nitrate. $Fe(NO_3)_2$
Ferrous Sulphate. $FeSO_4,7H_2O$
Ferrous Sulphide. FeS
Free Chlorine. Cl_2
Free Cyanogen. $(CN)_2$
Gallic Acid. $C_7H_6O_5$
Garlic, Oil of. $(C_3H_5)_2S$
Glucosan. $C_6H_{10}O_5$
Glucose. $C_6H_{12}O_6$
Glyceric Acid. $C_3H_6O_4$
Glycerine. $C_3H_5(OH)_3$
Glycogen. $C_6H_{10}O_5$
Hæmatite, Brown. $F_2O_3,3H_2O$
Hæmatite, Red. Fe_2O_3
Hæmatoxyline. $C_{16}H_{14}O_6,3H_2O$
Hippuric Acid. $C_9N_9NO_3$
Hydrated Sulphuric Acid. H_2SO_4
Hydrate of Baryta. H_2BaO_2
Hydrate of Lime. H_2CaO_2
Hydriodic Acid. HI
Hydrobromic Acid. HBr
Hydrochloric Acid. HCl
Hydrocyanic Acid. $H(CN)$
Hydrosulphuric Acid. H_2S
Iodic Acid. HIO_3
Iodic Anhydride. I_2O_5
Iodoform. CHI_3
Isatin. $C_{16}H_{10}N_2O_2$
Lactic Acid. $C_3H_6O_3$
Leucine. $C_6H_{13}NO_2$
Lithia. L_2O or LHO
Magnesium, Chloride of. $MgCl_2$
Magnesium, Nitride of. N_2Mg_3
Manganic Acid. MnO_3
Mercuric Chloride. $HgCl_2$
Mercuric Oxide. HgO
Mercuric Sulphide. HgS
Mercurous Chloride. $HgCl$
Mercurous Oxide. Hg_2O
Methyl. CH_3
Methyl, Formiate of. CH_3,CHO_2
Methyl, Iodide of. CH_3I
Methyl, Oxide of. $(CH_3)_2O$
Methyl, Salicylate of. $CH_3C_7HO_3$
Molybdena. MoS_2
Morphia. $C_{17}H_{19}NO_3$
Naphthaline. $C_{10}H_8$
Natron. $C_3O_8Na_4 + 3H_2O$
Nickel, Arsenical. $NiAs_2$
Nickel-glance. $NiAs_2—NiS_2$
Nitrate of Soda. $NaNo_3$
Nitre. KNO_3
Nitric Acid. HNO_3
Nitric Oxide. NO
Nitrous Acid. N_2O_3
Nitrous Oxide. N_2O
Nitro-Glycerine. $C_3H_5(ONO_2)_3$
Olefiant Gas. C_2H_4
Oleic Acid. $C_{18}H_{34}O_2$
Olein. $C_{57}H_{104}O_6$
Orceine. $C_7H_7NO_3$
Orcin. $C_7H_8O_2$
Osmic Acid. OsO_4
Oxalic Acid. $C_2H_2O_4$
Oxide of Silver. Ag_2O
Palmitic Acid. $C_{16}H_{32}O_2$
Periodic Acid. HIO_4
Permanganate of Potash. $KMnO_4$
Permanganic Acid. Mn_2O_7
Picrotoxin. $C_5H_6O_2$
Piperine. $C_{17}H_{19}NO_3$
Platinum, Cyanide of. $Pt(CN)_4$
Platinic Chloride. $PtCl_4$
Platinous Chloride. $PtCl_2$
Potash, Caustic. KOH
Potassium Chlorate. $KClO_3$
Prussian Blue. $Fe_4 3FeCy_6$
Rubidia. Rb_2O
Sarcine. $C_5H_4N_4O$
Selenic Acid. SeO_3

Selenious Acid. SeO_2
Silica. SiO_2
Silico-fluoric Acid. $Si_2H_2F_6$
Soda, Chloride of. $NaCl$
Soda, Nitrate of. $NaNO_3$
Stannic Acid. H_2SnO_3
Stannic Chloride. $SnCl_4$
Stannic Sulphide. SnS_2
Stearic Acid. $C_{18}H_{36}O_2$
Strontia. SrO
Strontium, Carbonate of. $SrCO_3$
Strontium, Sulphate of. $SrSO_4$
Strychnia. $C_{21}H_{22}N_2O_2$
Styrol. C_8H_8
Succinic Acid. $C_4H_6O_4$
Sulphocyanic Acid. $CNHS$
Sulphovinic Acid. $C_2H_6SO_4$
Tannin. $C_{27}H_{22}O_{17}$
Tartaric Acid. $C_4H_6O_6$
Thorina. ThO
Trimethylamine. $N(CH_3)_3$
Turpentine, Oil of. $C_{10}H_{16}$
Xanthine. $C_5H_4N_4O_2$
Xylene. C_8H_{10}
Xyloidin. $C_6H_9(NO_2)O_5$
Yttria. YO
Zinc-blende. ZnS
Zinc-glance. $ZnSiO_4H_2O$

Constitution.—We have said that the nature of a compound depends upon the number and kind of atoms composing it, and also upon the manner in which the atoms are *arranged* or grouped. The last is an important point, for we very frequently find (more especially in the case of the compounds of carbon) that the molecules of two or more bodies contain the same number and kind of atoms, and yet possess very different properties. Thus acetic aldehyde and oxide of ethylene both have the formula C_2H_4O. The difference between such bodies can only be explained by assuming that the atoms composing their molecules are differently grouped; in other words, that they have a different *constitution.* The investigation of the constitution of compounds forms one of the principal aims of modern C., and has already advanced considerably. Substances which, like aldehyde and oxide of ethylene, have a similar atomic composition but a different constitution, are said to be *isomeric* (see ISOMERISM). Substances the molecular weights of which are multiples of one another, are said to be *polymeric.* Thus acetylene, C_2H_2, and benzol, C_6H_6, are polymers.

Chemists and Druggists, Laws relating to. The Pharmaceutical Society of Great Britain was incorporated by royal charter on 18th February, 1843. The charter provides that the society shall have the right to examine candidates for admission, and to confer on those qualified the title of 'Pharmaceutical Chemist.' To assume the title without licence is punishable by fine; but the practice of a chemist and druggist is open to those who pass successfully the preliminary and minor examinations. The Council of the Society is required to appoint examiners for Scotland, who have the same powers as the examiners in England. No member of the medical profession, or who is practising under the right of a degree of any university, or diploma or licence of a medical body, is entitled to be registered and if any one who is registered become a member of the medical profession, he is disqualified from remaining on the register. See APOTHECARY.

Chem'nitz, the first manufacturing and second trading town of Saxony, on a river of the same name, in a wide valley, at the foot of the Erzgebirge, 36 miles S.W. of Dresden by railway. It has cotton and spinning mills, machine-works, supplying locomotive and other engines to all parts of Europe, over 50 large dye-works, besides manufactures of silk, gloves, lace, musical instruments, embroideries, &c. There is a large export of woollen, cotton, and other manufactured goods. There are various technical schools, several good public buildings, an exchange, a large theatre, and fine promenades formed on the site of the old walls. Pop. 138,954. The first Christian church was built here in 938 by Otto I., and C. became an imperial city under Rudolf of Hapsburg in the 13th c. It was ruined by the Thirty Years' War, and only began to prosper again on the introduction of cotton-weaving in the end of the 17th c.

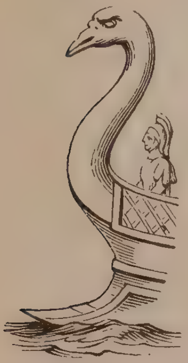
Chem'nitz, Martin, one of the most distinguished theologians of the Lutheran Church in the 16th c., was born at Treuenbrietzen, in Brandenburg, 9th November, 1522, and studied under Melancthon at Wittenberg. In 1547 he was appointed rector of the cathedral school at Königsberg, where he engaged in a controversy with Osiander in defence of the Lutheran doctrine of justification. Returning to Wittenberg in 1553, he lectured on Melancthon's *Loci Communes*—the origin of his own *Loci Theologici*, reckoned the best book of systematic theology produced in that age. In 1554 he settled in Brunswick, where he first became pastor, then superintendent, and died 8th April, 1586. He is most distinguished for his treatises against the Jesuits and the decrees of the Council of Trent; but probably the greatest ecclesiastico-political work of his life was inducing the Churches of Saxony, Franconia, and Swabia, to adopt the *Concordienformel* as their confession of faith.—**Martin C.,** son of the preceding (born 1561, died 1627), became privy councillor and chancellor to the Duke of Holstein-Gottorp.—**Philipp Bogislav von C.,** son of the younger Martin (born 1605, died 1678), entered the service of Sweden, was made royal historiographer, and raised to the order of nobility.

Chemnit'zia, a genus of Gasteropodous mollusca, the shell of which is of slender, elongated shape—the aperture being oval and the operculum horny. This genus is included in the family *Pyramidellidæ*, and its fossil representatives first appear in the Permian rocks, more than 150 fossil species being known.

Chenab' (Chináb), the largest of the rivers from which the Punjab ('five rivers') takes its name. Its source is in the Paralasa range of the Himalayas. After a course of about 600 miles it receives the Jhelam on its right; somewhat lower down, the Ravee on its left; and 110 miles still lower, on the same side, the united stream of the Beas and Sutlej. The entire body of waters before joining the Indus bears the name of the Punjnud. At Waizerabad the railway crosses C. by one of the longest iron bridges in the world, having a length of 1⅓ miles, and consisting of 64 spans of 1426 feet each. This bridge was opened by the Prince of Wales, 22nd January, 1876.

Chén'ier, André Marie de, a French poet and political writer, was born 29th October, 1763, at Constantinople, where his father was consul-general for France. He came to France at an early age, and studied at the Collége de Navarre, in Paris, there evincing poetic talent and acquiring a passion for ancient literature. In 1784 he travelled on account of his health in Switzerland, Italy, and Greece, and in 1787 he visited England as secretary to the embassy of M. Luzerne. Returning to Paris in 1790, while the Revolution was raging, he joined the brilliant 'Society of '89,' and volunteered to assist the infirm Malesherbes in the defence of Louis XVI. C. stood as far apart from despotism as from anarchy, and in prose and verse proclaimed at once his love of liberty and his detestation of violence. He was at last brought before the Revolutionary Tribunal, was condemned, along with forty-five others, and was guillotined, 25th July, 1794. When in prison C. burst forth in a beautiful ode, *La Jeune Captive*, of which the subject was his fellow-prisoner, the celebrated Comtesse de Coigny. His *Elégies* are exquisite in their mingling of classical spirit with an original boldness and vivacity. Only a tithe of his projected poems were finished, still the influence of C. is clearly visible in the early works of Chateaubriand, Barthelémy, Lamartine, and Victor Hugo.—**Marie Joseph de C.,** brother of the former, was born at Constantinople, 28th August, 1764, and became famous as the principal dramatist of the Revolution, and as a member of the Legislative Assembly from 1792 to 1802. He is also the author of the *Chant du Départ* and other songs. His dramas, of which the chief are *Charles IX.* (1790), *Jean Calas* (1792), *Henri VIII.* (1793), and *Timoléon* (1795), are full of republican declamation, and of the wild sentiments of the time. C. died 10th January, 1811.

Cheniscus, the ornamentation, either at the prow or at the stern of an ancient ship, representing the head of a goose. An illustration of the C. may be observed on Trajan's column. See *Art Dictionary.*



Cheniscus.

Chenopodia'ceæ, the Goosefoot or Spinach order, a natural order of Dicotyledonous plants, herbs, or small shrubs very generally distributed over the world, but chiefly found in temperate or ex-tropical countries. There are about 500 species, and among the best-known of the seventy-four genera are *Salicornia*, *Atriplex*, *Beta*, *Chenopodium*, and *Salsola*. From the ashes of several species — *Salsola*, *Salicornia*, &c.—which grow in salt marshes, *barilla*, used for obtaining carbonate of soda in former times, is obtained; but on account of soda being now much more easily obtained from other sources, the demand has of late fallen off. Among the other species are beet and mangold-wurzel (see BETA), spinach, &c. The seeds of several of them contain volatile oil or are nutritive—*e.g.*, Quinoa (q.v.). Some are anthelmintic, antispasmodic, aromatic, carminative, and stimulant. The fruit of the strawberry Blite of the S. of Europe has a sweetish, insipid taste.

Chenopod'ium, a genus of *Chenopodiaceæ* (q.v.), some of the British species of which are weeds, known under the name of *Goosefoot*. *C. ambrosioides*, the Mexican tea, is, owing to the essential oil which it contains, tonic and antispasmodic. *C. anthelminticum* yields 'wormwood oil,' so popular in the United States as a vermifuge. *C. Quinoa*, of the Pacific slopes of the Andes, is remarkable in so far that its seeds are extensively used as food by being ground and eaten as a gruel after the preparation has been seasoned with Chili pepper and other condiments, or by the seeds being roasted and boiled in water, which, after being seasoned, is supped. This last mixture, called *carapulque*, is a favourite Peruvian dish, and though unpalatable to those unaccustomed to it, is said to be very nutritious. The young leaves and shoots of the Good Henry, wild spinach, or Thesavy (*C. Bonus-Henricus*), a common British wayside weed, are, as well as those of *C. intermedium*, *C. Album*, used as substitutes for spinach.

Castle of Chepstow.

Chep'stow (Old Eng. *Ceapstow*, 'a place of trade'), a town of Monmouthshire, on the Wye, 17 miles E. by N. of Newport, has a river and coast trade in coal, iron, millstones, bark, cider, &c. It lies in a rocky gorge, where the river is crossed by a fine bridge, and is exposed to some danger from the tide, which frequently rises to the height of 50 feet, and even higher. About 5 miles off are the ruins of Tintern Abbey. Pop. reg. sub-dist. 11,311; civ. and ecc. par. 3378.

Cheque is a draft or order on a banker. It is subject to a stamp-duty of one penny, adhesive or impressed. A C. must be payable on demand to the bearer. A *crossed C.* has the name of a banker written across the face of it, to whom for security it is payable, or it may be crossed simply '—— & Co.' leaving the holder to insert the name of the banker. In this case it is only paid through that banker. If presented by any other person, it is not paid without inquiry. By statute the crossing is to be held a *material part of the C.* Any one obliterating or altering a C., with intent to defraud, is guilty of felony. A banker is personally liable if he pay a C. to which the signature of the drawer is forged; but if the signature of the payee only be forged, and that of the drawer genuine, the bank or banker is not liable to the drawer. In *Smith* v. *The Union Bank of London*, it was decided that a banker paying a C. to a party other than the bank whose name was written across, was entitled to do so. But this decision caused such dissatisfaction that it has since been settled that a crossed cheque is only payable to the banker whose name it bears.

Cher, one of the most central departments of France, in the basin of the Loire, has an area of 2780 sq. miles, and a population of 359,276. It is in great part an unbroken plain, bounded on the E. by the Loire, and intersected by the C. and Sauldre with their affluents, forming fertile valleys, in which are cultivated cereals, hemp, and vines. There are many fine forests, as those of Vierzon, Soudrain, Bornac, Chœurs, &c., and in the S.E., where rises a low range of hills, there occur extensive marshes. The climate is cold but healthy. Among the chief industries are cattle-rearing and iron-mining, while there are also extensive manufactures of cloth, porcelain, lace, glass, leather, &c., and a large export trade in agricultural produce, iron, and timber. C. is traversed by several canals, and by the Orleans and Lyon Railway. The capital is Bourges. The department was chiefly formed out of the provinces of Haute-Berri and the Bourbonnais.—The *river C.* rises in Creuse, near Crocq, flows N.W. through the department to which it gives name, and waters Loir-et-Cher and Indre-et-Loire, entering the Loire below Tours after a course of over 200 miles.

Cher'bourg, a strongly fortified seaport, and the most important town in the department of Manche, France, near the mouth of the Divette, 16 miles E.S.E. of Cap de la Hague, and 214 W.N.W. of Paris, with which it is connected by railway. It is one of the first arsenals of France, and the chief station of the marines. The town has a church of the 15th c., an hospital founded by Napoleon, a valuable fine-art collection, and a library of 61,000 volumes. The extensive fortifications of C. were begun by Vauban, and were only completed in 1858, at the enormous cost of £8,000,000. To the N. the roadstead is commanded by a detached breakwater, which is nearly parallel to the shore, is 2¾ miles long, encloses an area of 2000 acres, and supports six strong batteries. Round each end of this breakwater or *digue* vessels enter the harbour, and these channels are further protected by a series of island and mainland redoubts. The two main strongholds of C. are the extensive *Roches des Flamands* and *Roches du Homet*, and the town itself is overlooked by two forts, placed on the heights of Roule. The defences of C. make up a total of thirty forts of all kinds. The military port includes an outer harbour, having an area of 18 acres, and a floating dock of 15, and an inner floating dock of 21 acres, together admitting forty vessels of the first rank. There are also extensive shipbuilding slips and graving-docks. At the mouth of the Divette is the commercial harbour, connected with the sea by a channel 2270 feet in length, and protected by a granite mole. Besides the naval industries, there are manufactures of lace, hosiery, chemicals, leather, &c., and an export trade chiefly in cattle, salt, and wine. Pop. of commune 38,554; of arrond. 91,604. C., under the name *Carusburg*, is first authentically known in the 11th c., when a certain Comte Gerbert de C. appears in the ranks of the Normans at Hastings. In 1418 it was taken by the English, in 1450 retaken by Charles VII., and in 1758 again captured by the English, who destroyed its defences. A grand *fête* was given at C. on the opening of the inner floating dock by Napoleon III., at which the Queen of England and court were present by invitation, August, 1858.

Cher'ibon, or **Sheribon,** the capital of a Dutch residency of the same name, in Java, on the N. coast of the island, has a trade in teak-wood, coffee, and indigo. Pop. 13,840.

Cherimoy'er, a delicious Peruvian and Brazilian species of custard-apple, now naturalised in the E. Indies and other tropical countries, and reckoned inferior only to the mangosteen. It belongs to the order *Anonaceæ*.

Cherr'y, a genus of shrubs or trees belonging to the natural order *Rosaceæ*. It might be regarded as a sub-genus of Plum (q.v.). There are many species scattered all over the temperate portions of the world. The Gean and the common C. are both natives of Britain (though according to some the latter is a native of Syria and Western Asia generally, and only naturalised in Europe), and believed to be the progenitor of all the varieties of cultivated cherries. Their wood is highly valued by cabinetmakers and musical instrument makers. From the fruits of the former a spirit called *Kirschwasser* (also *Maraschino*) is distilled in Germany, and the fruits are also extensively used in France, Germany, and Scandinavia for making soups. Other species are found in the middle and S. of Europe, America, Mexico, and Natal. The wood of most of them is valued. Some have astringent bark, also esteemed as a febrifuge, while the leaves and kernels of nearly all contain hydrocyanic (Prussic) acid. There are very many cultivated varieties of C. esteemed for their fruit and the liqueurs prepared from it. In addition to Maraschino and Kirschwasser, the Ratafia of Grenoble is prepared from pounded cherries to which brandy, spices, and sugar are added. A gum not unlike gum-arabic exudes from the bark of many species of the genus.

Cherry Laurel, Common Laurel, Bay Laurel, Laurel Cherry, or **Laurel Bay,** a bush, having evergreen leaves. From the amount of hydrocyanic acid contained in it, nearly every part of the shrub is poisonous. The vapour of the bruised leaves will kill small insects. Hence, though custards, &c., are sometimes flavoured with C. L. water, great care should be exercised in its use.

Cherry Laurel.

Cher'so, an Austrian island in the Adriatic, government of Trieste, 12 miles S.S.W. of Fiume; area 105 sq. miles; pop. 8287. The surface is rugged, and towards the N. there are forests. There is a small town of the same name on the W. coast.

Chersone'sus, a Greek word denoting literally a land-island, *i.e.*, a peninsula. Pausanias applies it even to an island united to the mainland by a bridge. Several places were so named by the ancients:—the *Tauric C.* (the Crimea), the *Thracian C.* (the peninsula of Gallipoli), the *Cimbric C.* (Jutland), and the *Golden C.* (Farther India or Malacca).

Chert'sey (Old Eng. *Ceortes-ig*, 'Ceort's Island,' so called because situated on a spit of land between the Thames and a brook), a town in Surrey, 21 miles S.W. of London by railway, on the right bank of the Thames, which is here crossed by a handsome bridge. It has several almshouses, one founded by Cowley the poet, who died here, and a school founded in 1725 by Sir William Perkins for clothing and educating fifty children. The principal trade is in malt, flour, tiles, and bricks, and vegetables for the London market. C. is a very old place. Bede (*Hist. Eccl.* lib. iv. cap. 6) says that Earconwald, Bishop of the E. Saxons in London, built a monastery here (*circa* A.D. 666), but the town plays no part in history. Pop. parl. div. of county 61,970; reg. dist. 32,772; reg. sub-dist. 13,113; and civ. par. 11,298.

Cher'ub (pl. *Cherubs*, Heb. *Cherubim*), in the theology of the Hebrews was a creature of composite form, variously described in the sacred books. It is represented as having the human form (Ezek. i. 5), hands (Gen. iii. 24), two wings and one face (Exod. xxv. 20), four wings, four faces—of a man, a lion, an ox, and an eagle—four hands, the soles of the feet like a calf's, and the whole body full of eyes (Ezek. i.). The four beasts of the Apocalypse (iv. 6-8) had six wings, and each a different form—of a lion, a calf (the face of), a man, and an eagle. The attributes thus assigned to cherubs indicate the power of looking and moving swiftly in any direction without turning. As to the idea attached to the cherubs, everything points to this, that their proper task was to guard the unapproachable. The parallel to them is found in the winged bulls and lions of Nineveh (from which, it has been conjectured, they were borrowed, as recent discoveries show a strikingly close connection between Hebrew and Babylonian theology), the sphinx of Egypt, the chimæra, and griffin. Now the part ascribed to the griffin (Gr. *grups*, the same word as the Heb. C.) is that of guardian of treasure, and that this was just the office of the C. is manifest from Gen. iii. 24, and Ezek. xxviii. 13-16: hence their post on the top of the Ark (q.v.), and over it in Solomon's temple (1 Kings viii. 6-7), and their multitude of eyes (Ezek. i. and Rev. iv. 6). See Kuenen's *Religion of Israel*.

Cherubi'ni, Maria Luigi Carlo Zenobio Salvatore, the last of the great Italian composers, was born 8th September, 1760, at Florence. He was educated in Italy, but went to Paris as a young man, and remained there, where he was unboundedly popular, for the rest of his life. Of his very numerous compositions, which include twenty-eight operas, eighteen masses, and numerous smaller works, a few overtures are still heard, and at least two operas, 'Medea' and 'Les Deux Journées.' C. was Director of the Paris Conservatoire, where Auber and Boieldieu were his pupils. He died in Paris, 15th March, 1842. See an excellent work, called *Life of C.*, by Edward Bellasis (Lond. 1894).

Cherus'ci, a German tribe, separated from the Suevi by the Silva Bacenis, or Harz Forest, which formed the southern boundary. Under their chief Arminius (Hermann), they totally routed the Romans, commanded by Varus, in the Teutoburg forest, A.D. 9. Germanicus failed in his attempt to wipe out this stain on the Roman arms, but weakened by internal dissensions, the C. were subdued by the Chatti. About the beginning of the 4th c. they appear among the Frankish confederacy against Constantine, and, still later, Claudian alludes to them in his panegyric on the fourth consulship of Honorius.

Cher'vil, an umbelliferous plant, cultivated for the purpose of using it as an ingredient in soups. It is a native of the continent of Europe, but naturalised in Britain. The pleasantly aromatic odour of its leaves distinguish it from a poisonous weed, the leaves of which have a disagreeable odour. The great C., anise C., sweet C., sweet Cicely or myrrh, the needle C., Venus' comb or shepherd's needle, the parsnip C., and the wild C., are well-known species. All the species of *Chærophyllum* are also called C.

Ches'apeake Bay, a deep indentation on the Atlantic coast of the United States, nearly 200 miles in length, with a breadth of from 10 to 30 miles, and an average depth of 9 fathoms. At its mouth are the two capes Henry and Charles, facing each other. Its coast-line is very irregular, and forms numerous lesser bays. The eastern side has a flat and swampy shore; the western is a little higher. Besides a number of smaller streams, it receives the Potomac, Susquehannah, Rappahannock, York, and James rivers, all navigable; and by means of canals it is connected with other great water systems in the United States.

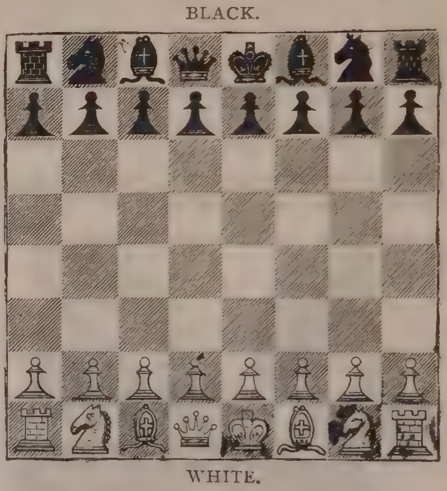
Ches'elden, William, surgeon and anatomist, was born 19th October, 1688, at Barrow-on-the-Hill, Leicestershire. He began to lecture on anatomy at twenty-two, and was elected a Fellow of the Royal Society in 1711, and a corresponding member of the Academy of Sciences at Paris in 1729, being the first foreigner honoured with that distinction. As surgeon to the St. Thomas's and St. George's Hospitals and to Westminster Infirmary, he acquired a brilliant reputation as an operator. He died 10th April, 1752. His chief works are *Anatomy of the Human Body* (1713); *Treatise on the High Operation for the Stone* (1723); and *Osteography, or Anatomy of the Bones* (1733).

Chesh'ire, a western and maritime county of England, lies between the rivers Mersey and Dee, and has an area of 655,036 acres. Pop. ancient county 730,058; adm. county 536,644; reg. county 707,978. It forms, towards the Irish Sea, a flat peninsula, the Wirral, between the estuaries of the great rivers, and inland a plain separating the mountains of Wales from those of Derbyshire. Near the centre it is intersected by an elevated ridge, running from the mouth of the Weaver in the N., to Beeston Castle rock (366 feet high) in the S.W., and in the W. also the county is slightly hilly, besides being bounded in great part by the Mersey on the E. and N., and by the Dee on the W. C. is watered by the Weaver and other navigable affluents of the Mersey. It has a moist climate and a soil fertile and loamy. There is excellent pasturage, and the agriculturists mainly devote their attention to dairy-farming, and especially to cheese-making. Of the 539,639 acres under cultivation in 1894, 83,065 were under corn crops; 38,044 under green crops; 61,390 under clover, grasses, etc.; 355,000 under permanent pasture; 1792 under small fruit; and 615 under nursery-grounds. Mountain and Heath covered 7121 acres, and Woods and Plantations 25,017. As much as 20,000 tons of cheese are produced yearly. C. is almost entirely formed of new red sandstone, containing an inexhaustible quantity of rock-salt, which is extensively mined near Northwich. When illumined by torchlight, the mines, some of them of vast extent, form a splendid spectacle. The other mineral products are coal, copper, lead, cobalt, and limestone. Chester is the capital, and among the other towns are Birkenhead, Stockport, Macclesfield, Staley Bridge, and Crewe. C. is connected with all parts of the kingdom by railway, and is traversed by the Grand Trunk and Bridgewater Canals. C. contains 8 parl. divisions, each of which returns one member: Altrincham, pop. 63,392; Crewe, pop. 64,434; Eddisbury, pop. 55,249; Hyde, pop. 57,468; Knutsford, pop. 55,073; Macclesfield, pop. 53,147; Northwich, pop. 69,893; and Wirral, pop. 73,119.

The original British inhabitants were the *Cornavii* or *Cornabii*. Under the Romans the district formed part of the province *Flavia Cæsariensis*. It first became permanently English in 828, when Ecgberht of Wessex compelled the submission of the N. Welsh, and then received the name *Ceastrescyre* ('shire of Chester'), of which the present form is a corruption. It was an earldom in the reign of Canute, was made a county palatine by William the Conqueror, having eight barons and a Parliament of its own. Henry VIII. abolished (1539) its separate Parliament, and compelled it to send representatives to the national assembly, but its independent jurisdiction did not finally cease till 1831.

Ches'nut, or **Chestnut,** a genus of Dicotyledonous trees or large shrubs, belonging to the order *Cupuliferæ*. The common sweet or Spanish C. is believed to have been originally introduced into Sardinia from Sardis in Asia Minor, and from thence to have spread all over the S. of Europe, where it forms in places large forests. In Britain the C. is widely distributed, and attains a good size, but there is evidence for believing that it was introduced by the Romans. It is now one of our trees most valued for its beauty, the excellence of its timber, and its fruit, which when roasted is very nutritive and not unpalatable. Among the species of C. may be mentioned the American C., the silvery C. of Java, the Tungurrut, the fruits of which are eaten boiled or roasted. (See also CHINQUAPIN.) The term C. is also given to various trees and shrubs which have no connection with the genus C.—*e.g.*, the horse-C., the Moreton Bay C., the Tahiti C., the water-C., the wild C. of the Cape of Good Hope, the yellow C. or C.-oak; the latter name is also sometimes applied to the timber of *Quercus sessiflora*, of which the woodwork of the roof of Westminster Abbey and various other old buildings is composed, and not, as long believed, of C.

Chess. The origin of this game is lost in antiquity. There seems to be little doubt that a game radically the same as the modern C. was played in the East some thousands of years ago. From Arabia it passed into Spain. In England it seems to have been known before the Norman conquest; but the game as now played may probably rather be said to have grown than to have been invented at any precise period. An elementary knowledge of C. is so generally diffused, and can be so much more effectually given *viva voce* than in a book, that, in the following observations, we will assume the reader to know the power of the various pieces and the object of the game. Any one who has not this knowledge, may acquire it in a few minutes from one who has. He may then enter on the study of this wonderful game, in which perfection lies beyond the reach of the human intellect; yet it is not the intellect alone which is concerned in C.-playing. Its results are largely affected by temperament, and by some of the moral qualities.



The names of the pieces are King, K.'s Bishop, K.'s Knight, K.'s Castle or Rook; Queen, Q.'s Bishop, Q.'s Knight, Q.'s Castle. Each piece has its respective Pawn.

Chess Board.

We give a few hints to beginners. The novice who may enter the lists with one a little more advanced than himself will probably find himself defeated in a few moves by what is called *scholar's mate*. Thus white and black move as follows:—White, king's pawn two; Black, king's pawn two; W. king's bishop to queen's bishop's fourth; B. king's bishop to queen's bishop's fourth; W. queen to king's rook's fifth; B. king's knight to king's bishop's third; W. queen takes king's bishop's pawn, and gives checkmate.

Now this mode of attack by queen and bishop is easily defeated, and, when defeated, it puts him who made it to great disadvantage by obliging his queen to retreat, and so causing loss of moves. Supposing W.'s two first moves to have been as before, let B. move his queen's pawn one square, so as to support the king. W. then, as formerly, plays his queen to the king's rook's fifth; B. king's knight's pawn one; thus giving check to the W. queen, who must retreat with very little choice of move. The novice should keep in view that it is not the force which he possesses on which his power for attack or defence depends, but that this depends on his *available* force. This being so, his first endeavour should be to play out his pieces early, to play them in support of one another, and to *castle* in good time. By the latter move, you probably place your king in a better position, and bring the powerful piece, the castle, into play. It is well to endeavour to have the attack; besides the strategical advantage of being the assailant, the position is more inspiriting than that of being on the defence. At the same time, a premature attack, that is, with a large part of your force at home, can hardly succeed. Play as much as you can with those who are more skilful than yourself. Never accept any indulgence when you have made a blunder, nor give any; otherwise, when the situation becomes critical, disputes are sure to arise; consequently, never take nor give back a move. In pursuing your own object, do not forget that your adversary is pursuing his at the same time; do not therefore play until you have, if possible, fathomed the motive of your adversary in making his last move.

The following are the leading laws of the game:—1. If you touch a piece you must play it; but, so long as you retain your hold, you can make any move consistent with its power. 2. If you touch a piece that cannot move, your adversary may compel you to move your king, if it be possible to do so. 3. If you make a false move, your adversary may make you retract it, and move your king, or he may oblige you to make any lawful move he chooses with the piece falsely moved. 4. On the king being checked, notice must be given, or the player whose king is attacked is not bound to notice the check. 5. When, towards the end of the game, one player has just sufficient force to win, he may be called on to win within fifty moves on each side. If he fail to do so, the game is held to be drawn. It sometimes happens that one player has the greater skill when there are many pieces on the board, and that the other again has more skill, when the board is nearly cleared, in manœuvring the pawns into queens, or otherwise. In this case the latter may, to the disgust of his adversary, choose to change queens and minor pieces early in the game. Now every player is entitled to play his own style of game, and to take every lawful advantage. Under many sorts of conditions have games been played; some of the great players have carried on so many as a dozen games at the same time and that without seeing any one of the tables. One game lasted over five years which was played between a resident in Australia and an inhabitant of Newark, U.S. The moves were made by letter, one competitor sending viâ Europe and the Suez Canal, while the other made use of the Pacific and San Francisco route. The most costly set of chessmen is in the possession of George Vanderbilt. They are made of silvered bronze and represent English and French historical characters of A.D. 1194; each figure appearing in the suitable costume of the period. The *white men* are English, the *black* French. The set belonged to Napoleon I. and was constantly used by him at St. Helena. The most ancient set is to be seen at the India Museum; it was discovered among the ruins of Brahmunadab, in Sindh, a city destroyed by earthquake in the 8th c.

Chest, the part of the trunk known as the thorax, composed of the dorsal vertebræ, the sternum, the ribs, and the costal cartilages. For anatomical description see SKELETON and THORAX.

Chest, Military, is the term used to denote the money and negotiable securities at the command of the commissariat department to meet the expenses of an army in motion.

Chest at Chatham, a fund established during the reign of Queen Elizabeth for the support of maimed and superannuated seamen. It dates from 1590, when all seafaring men in Her Majesty's service consented to a stoppage of from 2d. to 6d. a month out of their pay for this purpose, and as the money was kept in a chest, hence the name of the fund. When the managing office was removed to Greenwich in 1803, it retained the name, and became the *C. at Greenwich*. The monthly payment from the wages of the seamen was abolished in the reign of William IV. From the C. disabled sailors may receive a sum of money in hand, if they can still earn a living; if not, they may receive a pension for one year, for several years, or for life, as the case may be.

Ches'ter, an ancient city and bishop's see, a municipal and parliamentary borough, and the capital of Cheshire, on a rocky height on the right bank of the Dee (here crossed by a splendid stone bridge with a span of 200 feet), 16 miles S.E. of Liverpool. It is a great railway centre, and has one of the finest stations in the kingdom. By the Ellesmere Canal it is also connected with the Mersey. C. is surrounded by a wall 7 or 8 feet thick, now used as a promenade, and affording a wide prospect over a pleasant land. There were once seven towers in the walls, of which only two, Phœnix Tower and Water Tower, now remain. The two principal streets, which cross each other at right angles, are cut into the red sandstone rock to a depth of 10 feet, and the footways are within piazzas called the 'rows,' in front of the shops on the second stories, which are carried back about 16 feet. These 'rows' represent the original level. Flights of steps, at suitable distances, connect the rows with the street below, while beneath are ranges of shops of an inferior description on a level with the street. Numerous ancient houses with timber-framed gables, some of them curiously carved, give the city a peculiarly picturesque character. The cathedral, a massive Gothic structure of red sandstone, is of great antiquity. It grew out of the Abbey Church of St. Werburgh, founded early in the 10th c., but has recently been repaired in a style that has marred its former venerable appearance. The *diocese* of C., it may be noted, was not created till after the dissolution of monasteries by Henry VIII. Other churches are St. Bridget's, St. John the Baptist's, St. Michael's, and St. Peter's. C. has a grammar-school (King's School), founded by Henry VIII., and under the dean and chapter of the cathedral. St. John's Church is said to have been founded by Æthelred in 698. There is in the neighbourhood a fine public cemetery, and in 1867 a public park was opened, the gift of the late Marquess of Westminster.

On Friday, 31st May, 1895, the old Dee Mill, where the historic Miller of the Dee lived and worked, was almost entirely destroyed by fire. The mill stood on old Dee Bridge and occupied the site of a mill which was set up in the eleventh century by Hugh Lupus, Earl of Chester and nephew of the Conqueror. The mill, so says tradition, was doomed to be burned three times, and, curiously enough, the untoward fate has been more than fulfilled, seeing that the mill, which has just suffered, is the fourth on the site, each one of its predecessors having been burned down. The city has manufactures of paint, shot, and lead pipes; iron foundries, and a shipbuilding yard. The chief exports are cheese, lead, copper plates, cast-iron, and coal. C. returns one member to Parliament. The parl. bor. includes the old city and bor. of Chester, and parts of the townships of Hoole, Newton, Great Boughton, and Saltney. Pop. parl. bor. 42,297; county bor. and civ. par. (each) 37,105; and diocese 730,683.

C. was the *Devana Castra* of the Romans, so called from being half-encircled by the *Deva* or Dee,—the *Caerleon vawr*, 'City of the Great Legion,' of the Cymri. In 828-830 Egbert wrested it from the N. Welsh. The Danes captured it in 894, but it was recovered in 904. After the Norman Conquest the Earls of Chester held their courts there. Charles I., it is said, witnessed from the Phœnix Tower the defeat of his troops by the Parliamentary forces on Rowton Heath.

Ches'terfield, Philip Dormer Stanhope, Earl of, an English statesman, man of the world, and author, was born in London, 22nd September, 1694. In early life he travelled, was appointed gentleman of the bedchamber to the Prince of Wales (1715), and sat in the House of Commons as member for St. Germains, in Cornwall, for upwards of ten years. In 1726 his father died, and he entered the House of Lords, where he was noted for his eloquence, and the keenness of his opposition to Sir Robert Walpole, who was then in power. C. was a member of the Broad-Bottom Administration, formed in 1744, and was even made a chief secretary of state; but ill-health and deafness compelled him to retire from public life. C. wrote a good deal for some of the periodicals of the times, and was intimate with Bolingbroke, Swift, Pope, &c., and more celebrated for his wit and refined manners than for his statesmanship. His treatment of Johnson, however, provoked from the great lexicographer an outburst of honest, though surly and even exaggerated indignation, which is now chiefly interesting as marking the revolt of literature against the slavery of patronage. C. died 24th March, 1773. His most notable work is his *Letters to his Son* (1774), which may be considered even yet the best English compendium of the so-called 'ethics' of fashionable life.

Chesterfield, a town of Derbyshire, 21 miles N. of Derby, and 156½ from London by railway. It has a fine church (All Saints), and a grammar-school of the 16th c. There are manufactures of lace, merino, silk, cotton, earthenware, and hardware; and the neighbourhood is rich in coal, iron, lead, clay, &c. The trade of the place greatly increased after 1776, when Brindley constructed the *C. Canal*, joining the Trent near Stockwith. C. was the residence of the great engineers, the Stephensons, in their later days. In October, 1877, the Marquess of Hartington (now Duke of Devonshire) laid the foundation of a Stephenson Memorial Hall, which was designed to serve all the purposes of a scientific and literary institute, embracing a public hall, a free library, and lecture-rooms for science and art classes. Pop. parl. div. of county 61,294; mun. bor. 22,009; reg. sub-dist. 48,532; and civ. par. 13,242.

Chesterfield Inlet penetrates from the N.W. corner of Hudson's Bay 250 miles inwards. Its greatest breadth does not exceed 25 miles, and it is thickly studied with islets.

Chevalier' (Fr. 'horseman or knight'), in heraldry, signifies a horseman armed at all points. The term is used generally also in the sense of a knight.

Cheval'ier, Michel, one of the greatest of French political economists and free-traders, was born at Limoges, 13th January, 1806. After studying at the Polytechnic School and the School of Mines, he became an engineer in the department of the Nord. He was, however, soon attracted by the speculations first of St. Simon and subsequently of Enfantin, and for some writings in the *Globe* journal, which were considered an outrage against Christianity and morals, he was imprisoned for six months. Retracting what he had written, he was sent by Thiers on a special mission to the United States, to inquire into the systems of water and railway communication there. The brilliant letters which he wrote to the *Journal des Débats* when on the journey, and which were republished under the title *Lettres sur l'Amérique du Nord* (2 vols. 1836), dispelled many French delusions regarding America, and may be said to have made C.'s fortune. Various posts and dignities were bestowed upon him on his return to France, and in 1840 he was appointed Professor of Political Economy in the Collège de France. He was for a short time (1845-46) a member of the Chamber of Deputies. Writing vigorously against his former friends the Socialists, C. lost his various appointments on the Republic being proclaimed, but after the *coup d'état* they were restored to him, and he became known chiefly as one of the ablest French advocates of free trade. In 1860 he assisted Cobden in negotiating the important commercial treaty between England and France. In England, which he visited frequently, C. was much respected. His last visit was paid in 1875, when he received a warm reception in the commercial centres. He died 28th November, 1879. Among his works, his *Cours d'Économie Politique* (1842-50), *De la Baisse Probable de l'Or* (1859), translated into English by Cobden, and *Le Mexique Ancien et Moderne* (1863), are especially admired.

Chevaux'-de-Frise (Fr. *cheval*, 'a horse;' *de Frise*, 'of Friesland'), in defensive fortifications, large and strong pieces—centres or barrels—of timber, traversed with wooden spikes, pointed at each end, and shod with iron, which are used as an obstacle to impede the progress of an advancing enemy.

Che'viot Hills, a range of hills partly in Northumberland and partly in Roxburgh, and thus on the confines of England and Scotland. The highest points are Cheviot Hill in Northumberland, 2684 feet high, and Carter Fell, 2020 feet. The C. H. are in general smooth, and covered with a close sward. Numerous small streams, the Kale, Liddel, Tyne, Till, and Coquet, rise in the green recesses of this pastoral region, which Border ballads and tales have invested with an imperishable romance.

Cheviot Sheep.—A breed which occupies chiefly the Cheviot Mountains, but which has extended itself to the Lothians and to the Ochils. It is easily fed, and yields a large carcass of mutton. Cheviots are well woolled all over the body and the legs. They have white faces, open countenances, and bright, full, sparkling eyes; the lenses are large and very contractile, and the head is stylishly set upon the shoulders, which are rather light; the back is long and straight, and the quarters full. See SHEEP.

Chevreul', Michel Eugène, a distinguished French chemist, was born 31st August, 1786, at Angers (Maine-et-Loire). He was appointed in succession Professor of the Sciences at the Charlemagne College (1813), Director of the dyeing department in the Gobelins manufactory (1824), Professor of Applied Chemistry in the Museum of Natural History (1830), and Director of the Museum for the two quinquennial periods 1864 and 1869. Besides several works on chemistry, &c., numerous memoirs on colours and various chemical subjects are to be found in the *Annales de Chimie* and the *Mémoires* of the Academy of Sciences.

Chev'ron (Fr. 'a rafter'), in heraldry, one of the nine honourable ordinaries, which resembles the supports of a roof formed by two rafters leaning against one another. It is otherwise defined as the lower half of a Saltire (q.v.) brought to a point on the upper side. The C. is supposed to betoken the accomplishment by the bearer of something important, such as the founding of a family. A shield divided by a line in the form of a C. is said to be *per C.*, or *party per C.* The diminutive of the C.—half its size, or sometimes rather less—is called a *chevronel*.

In *architecture*, the term *C.* is used to denote the zigzag moulding characteristic of Norman architecture, and also found in the pointed arch of the transition period between the Norman and the Early English styles.

Chevrons, stripes worn on the arm by non-commissioned officers in the army. A lance-corporal or bombardier wears one, a corporal two, a sergeant three, and a staff-sergeant four.

Chev'y Chase, a celebrated ballad in English folklore. It appears in two forms, an ancient and more modern, both of which are given by Bishop Percy in his *Reliques*. The earlier and more rudely constructed, whose original title was *The Hunting a' the Cheviat*, may have been written in the reign of Henry VI. (1422-1461); the latter probably dates from the time of Elizabeth. The combat described in the ballad of C. C. is really imaginary, but was probably suggested by the historic battle of Otterbourne, fought between the rival Border nobles Percy (Hotspur) and Douglas in 1388, which is also the subject of a fine ballad. Both forms of C. C. are of English origin, but there is such knightly magnanimity in the narrative, that it became equally popular N. and S. of the Border. High and low alike rejoiced in the valiant strain. ‘I never heard,’ says Sir Philip Sydney, ‘the old song of Percy and Douglas, that I found not my heart moved more than with a trumpet; and yet is sung but by some blind crowder, with no rougher voice than rude style.’ The later and more familiar version has been extravagantly criticised by Addison in papers 70 and 74 of the *Spectator*.

Cheyne, George, a Scotch physician and mathematician, born of good family in Aberdeenshire in 1671. He practised at London from 1700 almost till his death, which took place at Bath, 12th April, 1743. C. strongly recommended milk and vegetable diet, having found such very beneficial in reducing his own corpulency. His work on *Fluxions* (1703) procured him admission to the Royal Society. Some of his other works are *A New Theory of Fevers* (1702), *Observations on Gout* (1722), *An Essay on Health and Long Life* (1725), and an *Essay on Regimen* (1739).

Chiabre′ra, Gabriell′o, born at Savona, 8th June, 1552, was the first Italian lyric poet of his time. Educated at Rome by an uncle, he afterwards took service with Cardinal Cornaro, but owing to an affray in which he avenged his quarrel with his own hand, he was obliged to leave the capital and retire into privacy. Honours were heaped upon him by Pope Urban VIII., by the Dukes of Savoy, Mantua, &c. C. died at Savona, 14th October, 1637. His lyrics are considered the best in the style of Pindar and Anacreon that have been produced in Italy in modern times. He also wrote several epic, dramatic, bucolic, and epistolary poems. His *Rime* (1731) and *Pœsie Liriche* (1781), together with his epics, *Delle Guerre de' Goti* (Ven. 1582) and *Amadeida* (Gen. 1620), are contained in the collection of his *Opere* (Ven. 1768).

Chia′na, the name of two small rivers of Tuscany,—one (the anc. *Clanis*) a tributary of the Arno, the other an affluent of the Paglia,—which water the wide expanse of the Val di Chiana, and have been the means of converting it into one of the most fertile districts of Italy, although prior to the time of Ferdinand III. their unrestricted inundations had rendered it a malarious and marshy wilderness.

Chiaramonté (Gulfi), a town in the province of Siracusa, Sicily, 33 miles W.S.W. of Syracuse, has a trade in corn and wine. Pop. 10,014.

Chia′ri, a town of N. Italy, province of Brescia, on the river Oglio, 14 miles W. of Brescia by railway. It was a walled town till the beginning of the present c., and has a church dating from 1431—80, and important silk manufactures. Here, on 1st September, 1701, Prince Eugene defeated the Franco-Spanish army commanded by Marshal Villeroi. Pop. 10,507.

Chiaroscu′ro (Ital. *chiaro*, Lat. *clarus*, ‘bright, clear;’ Ital. *oscuro*, Lat. *obscurus*, ‘obscure, dark’) is the Italian term for what is generally spoken of as ‘light and shade’ in painting. It may be described as the art of disposing the lights and shadows of a picture so as to realise the highest picturesque effect. The simplest and crudest form of C. is the violent contrast of light and shade; but the refinements of this quality of painting embrace the light in light, the dark in dark, and all those variations in the use of colours which produce the effects of reflected light, or light tempered by shadow. The first painter who reduced C. to a system was Leonardo da Vinci, and, though the quality is a main constituent of every successful work of art, it has been most effectively used, and may be most profitably studied, in the works of Correggio, Rembrandt, Titian, and Rubens.

Chiava′ri, a seaport of N. Italy, province of Genova, at the mouth of the Sturla, 21 miles E.S.E. of Genoa. Of its churches, the finest is the *Madonna del' Orto*. C. has manufactures of lace and silk, and important anchovy fisheries; in the neighbourhood are extensive slate quarries. Pop. 12,066.

Chiavenn′a (Ger. *Kläfen*), a town of N. Italy, province of Sondrio, 38 miles N.N.W. of Bergamo. It is situated on the Splügen road, and is the point of junction for the roads to Milan by Lake Como, to the Engadine, and the Swiss canton of the Grisons. C. has manufactures of silk and cotton. Pop. 4394.

Chica, a red substance obtained by boiling the leaves of *Bignonia Chica*, a native of the banks of the Orinoco and other parts of S. America. It is used by the Indians for painting their bodies, and in the arts for giving an orange-red colour to cotton fabrics. The name *C.* is also applied to *Sterculia Chicha*, the seeds of which are eaten by the Brazilians. C. is also another name for Pito, Poso, or maize-beer—a fermented liquor made from Indian corn by many tribes of the S. American Indians by fermenting the *chewed* maize. A very superior quality is made by pouring the liquor into an earthen jar containing several pounds of beef, and burying the whole underground for several years. When a child is born such a jar is buried, and only disinterred for the contents to be drunk at the same child's marriage. Vinegar and a spirituous liquor can be also made from it.

Chicacole′ (Sríkákulam), the chief town of Ganjam district, in the province of Madras, British India, 415 miles S.W. of Calcutta, and not far from the coast. It is noted for its beautiful muslins. In 1791 a terrible famine raged here and killed off the inhabitants, and in 1876 the place was visited by a great flood, which partly destroyed the bridge. The name of ‘happy rose-garden’ was at one time given to the place. Pop. 18,241.

Chica′go (pron. *Shekawgo*), in Illinois, one of the chief cities of the Union, is situated on the S.W. shore of Lake Michigan at the mouth of a river of the same name. The name is Indian, meaning ‘wild onion.’ C. stands on the great E. and W. route, and is the centre of an immense traffic. It is perhaps the most wonderful city in the world for its rapid growth and great energy. Living men remember when its site was a swamp, and could have been bought for a trifle. Fort Dearborn was erected in 1803 at the mouth of the river, and the place was a mere frontier post till 1831, when a settlement was made. The town was organised in 1833, and received a charter 4th March, 1837. The population in 1835 was 1000; 1837, 4470; 1845, 12,080; 1860, 110,973; 1880, 503,185; and in 1890, 1,099,850. The C. river, having two branches, separates the city into three parts, the business portion being on the S. side. The Illinois and Michigan Canal connects the C. river with the Illinois, which enters the Mississippi, thus uniting the navigation of the great lakes with the Gulf of Mexico. The river is bridged and tunnelled, and has some 28 miles of wharfage, and there is a tunnel for 2 miles under the lake, by which the city is supplied with 57,000,000 gallons of water daily. A terrible fire broke out 7th October, 1871, and lasted three days, destroying 17,450 houses, and consuming $196,000,000 of property. A fund amounting to $3,500,000 was subscribed in aid of the sufferers from all parts of the world, and the city was completely rebuilt in about two years. Total debt of city, less sinking fund, is over $13,000,000. The finest buildings are the court-house, observatory, the colleges, the Douglas monument, and some of the largest hotels in America. C. is the greatest depot for grain in the world. The business of pork-packing is the largest in the world. There are besides extensive manufactures of machinery, carriages, &c. C. is also the greatest railway centre in the Union, about thirty lines meeting there. In the public schools there are 2842 teachers and an enrolment of 134,327 white pupils and 1224 coloured. There are thirty daily papers and about two hundred magazines and periodicals. On 1st May, 1893, President Cleveland inaugurated there ‘The World's Fair,’ an international exhibition on a colossal scale, to which exhibits were contributed from almost every part of the world. About 360 millions of dollars are invested in the manufacturing establishments of the place, where 210,366 is the average number of employés, earning about 124 millions of dollars, and turning out 12 millions of dollars' worth of agricultural implements, nearly 3 millions worth of baking and yeast powders, 7¼ millions worth of shoes, 32½ millions of men's clothing, 30¼ of men's furnishing goods, 24½ of iron and steel goods, 17¾ of lumber, 194¼ of meat slaughtered and packed, 8 of distilled liquors, &c.

Chichen′, a town in Yucatan, Central America, about 30 miles W. by S. of Valladolid, and chiefly interesting for the ruins of an ancient city, attesting in its builders a considerable degree of civilisation. It is impossible to conjecture the purpose for which many of the structures were erected. There is a spacious parallelogram formed by rows of small pillars, and a truncated pyramidal mound, 75 feet high, each side of the base measuring about 200 feet, and crowned with a ruined building, of which the sides measure 43 feet by 49.

Chichen.

Chi′chester, a municipal borough, and bishop's see, in Sussex, 62 miles S.W. of London by road, and 79 by railway. It consists of two principal streets, with smaller streets at right angles to them, having an elaborately carved octagonal cross at their intersection. The city is surrounded by an ancient wall, a mile and a half in circuit, now lined with elms, and forming a pleasant promenade. The cathedral, an imposing structure, exhibiting almost every variety of Gothic, was built in the 12th and 13th centuries, and has undergone 'restoration' since 1830. It is rich in 'portraits' of English kings and bishops, and contains many interesting monuments; among others, one to Collins the poet, who was a native of the place, and another to Chillingworth. C. has extensive corn and cattle markets, but almost no manufactures. The harbour, 2 miles to the S.W., is connected with the city by a canal. Pop. parl. div. of county 54,360; mun. bor. 7830; reg. sub-dist. 7887; and diocese 549,472. C. is considered the *Regnum* of the Romans—the headquarters of Vespasian, who built the walls; and the coins and temple fragments found here favour the conjecture. But it derives its name from Cissa, a king of the S. Saxons, and appears in the *Chronicle* as *Cissa-ceaster*. Its oldest charter dates from the reign of Stephen.

Chicken-Pox, an infectious disease almost always confined to children. It seldom lasts more than a week, and is never fatal. There is first an eruption of pimples, which become vesicles on the second day (hence called crystal-pox). On the fourth day these vesicles become scabs, and fall off about the end of a week from the commencement of the disease. A slight aperient medicine is really all the treatment required. C.-P. generally occurs only once in a lifetime, and is essentially a disease distinct from *Small-Pox* (q.v.).

Chicken Snake, a harmless colubrine, occurring in N. America above 37° N. lat. It grows to 5 feet in length, is frequently discovered in houses and dairies, and receives the name of house, or milk, snake in consequence. White tinged with red is the colour of its body; the belly is of silver grey; dingy black spots appear here and there along the vertebral line. It feeds on frogs, birds, and the smaller vermin.

Chick-Pea, a genus of plants of the natural order *Leguminosæ* (sub-order *Papilionaceæ*). About twelve or fifteen species are known, natives of Southern or Eastern Europe, W. Africa, and Abyssinia. The C.-P., or Egyptian pea (*Cece* of the Italians, *Garbanzos* of the Spaniards, the *Gram* of India), is a native of the S. of Europe and of India. The leaves are covered with glandular hairs excreting oxalic acid —or, according to some, a mixture of oxalic, malic, and acetic acids—which hangs in drops which afterwards crystallise. The seeds are ground into meal and made into cakes, which form a large portion of the food of the people of the countries in which the C.-P. is a native, and are also parched and boiled. In Paris they are greatly used in soups. The acid crystals are collected by the natives in India, and considered an infallible cure in cases of indigestion. The herbage is well adapted for feeding cattle.

Chicken Snake.

Chickweed, or **Chickenweed**, a genus of plants of the natural order *Caryophyllaceæ*, but generally applied to *S. media*, one of the Stitchworts (q.v.). It is a troublesome weed, gathered to make poultices or to feed birds. The term *C.* is also sometimes given to *Roccella tinctoria*.

Chicla′na de la Frontera, a town of Spain, province of Cadiz, about 12 miles S.E. of Cadiz. It is built on a hill, and has a fine appearance. C. has a good hospital, manufactures of linen, earthenware, &c., and mineral baths of great repute in the W. of Andalusia. Pop. 12,348.

Chic′opee, a town of Massachusetts, U.S., at the confluence of the rivers C. and Connecticut, 85 miles W.S.W. of Boston by railway. It has several churches and newspapers, and large manufactures of cotton, woollens, paper, arms, &c. Pop. 14,050. C. was formerly called Cabotville.

Chi′cory, or **Succ′ory**, a genus of plants belonging to the order *Compositæ*, sub-order *Cichoraceæ*, comprising few species. The common C. is a plant with bright blue flowers, common on waysides and similar localities in some parts of England and most parts of Europe. The leaves are used for feeding cattle, and the blanched leaves as a salad. The roots when roasted form a substitute for coffee, and, indeed, in the opinion of many, if mixed with the latter improve its flavour. They also deepen the colour of the coffee. This adulteration is itself adulterated with roasted beans, parsnips, carrots, acorns, logwood, and mahogany dust, &c., and even, it is said, with the dried and ground bones of horses and bulls, &c. The Endive (q.v.) also belongs to this genus.

Chicory.

Chief (Fr. *chef*, 'head'), in heraldry, one of the nine honourable ordinaries, is the uppermost third, or less than a third, of the field of a shield, bounded by a horizontal line.

The C. may be borne with any other of the nine ordinaries except the Fesse (q.v.); it may also be charged with other heraldic figures or devices, which are then said to be *on a C. In C.* means borne on the uppermost part of the shield, even though the horizontal bounding-line is not drawn.

Chiem-See, the largest lake in upper Bavaria, 42 miles S.E. of Munich, is 10 miles long, 7 broad, and lies 1500 feet above the sea. It receives the Achen and Prien, and is drained by the Alz, an affluent of the Inn. It is rich in trout, salmon, pike, and carp, and is adorned with three fine islands. Herrenwörth, Frauenwörth, and Krautinsel. The Bairisch-Salzburg Railway runs along its southern shore. There are steamers on the lake.

Chie'ri (the *Carea* of the Romans), an old town in the province of Torino, N. Italy, 9 miles S.E. of Turin, has manufactures of fustians, cottons, linens, silks, &c. It is rich in churches, cloisters, educational and benevolent institutions. Its finest buildings are the Church of St. Dominico (1260), and that of Santa Maria della Scala (1405), a large Gothic edifice. Pop. 13,260. C. is frequently mentioned in Italian history.

Chie'ti, the capital of a province of the same name, Central Italy, 78 miles E.N.E. of Rome. It is the seat of an archbishop, and has a cathedral, several churches and convents, a college, a theatre, and remains of antiquity. Its industries in woollen and silk fabrics are unimportant, but its vicinity is extremely productive, and gives rise to a considerable trade. Pop. 22,432. C. partly occupies the site of the *Teate Marrucinorum*, of which traces are still seen. In 1524 St. Gaetano established the Theatine order here. The province of C. has an area of 1138 sq. miles, and a pop. estimated at 349,777.

Chignec'to Bay, the westerly of the two terminal branches of Fundy Bay, N. America, separated from Northumberland Strait, in the Gulf of St. Lawrence, by an isthmus, bearing the same name, 14 miles in breadth.

Chig'oe, or **Jigg'er,** a species of flea, found in the W. Indies and S. America, and noted for its habit of selecting the skin of the foot or under the toe-nails as a residence. If the eggs are allowed to be developed in the skin, the irritation produces a troublesome ulcer, amidst which the young larvæ appear. The remedy consists in extracting the C., and in applying tobacco-juice lotion to the affected part,—an operation in performing which the W. Indian negroes are said to be very expert.

Chihua'hua, capital of the Mexican state of the same name, lies on a tableland 4500 feet above the sea, and close to the river Chubiscar. It is a well-built town, with regular streets, a large cathedral, several convents, and an aqueduct 3 miles in length. It was founded in 1700, but has been falling into decay since the overthrow of Spanish authority. Pop. 13,128. S. of the town lie the famous silver mines of St. Eulalia.—The *State of C.*, separated from Texas, U.S., by the Rio Grande del Norte, has numerous mines, but the soil being dry, only the river-bottoms are cultivated, and a strip along the slope of the Sierra Madre. Near the base of this are extensive ruins, known as Casas Grandes. Area 87,802 sq. miles; population estimated at 298,073, mostly Indians.

Chil'blains, blains or boils caused by a chill or cold. The proper treatment consists in keeping the affected parts warm and dry, and applying iodine ointment to them. In strumous children, cod-liver oil and iron should be given.

Chil'dermas, or **Holy Innocents' Day** (28th December), is held as a festival by the Church of Rome, to commemorate the massacre of the Innocents by Herod. It is said to have been customary to whip the children upon this day, to enforce Herod's crime on their memory. It was thought unlucky to marry or commence any work on this day.

Chi-li, or **Pe-chi-li,** a province of the Chinese empire, bounded on the N. by the Great Wall, has an area of 59,000 sq. miles, and a pop. estimated at 17,900,000. It is watered throughout its length by the Pei-ho and its numerous affluents. The Hoang-ho also passes through its southern border. Pekin, the capital of the empire, lies near the Pei-ho in the northern part of the province.

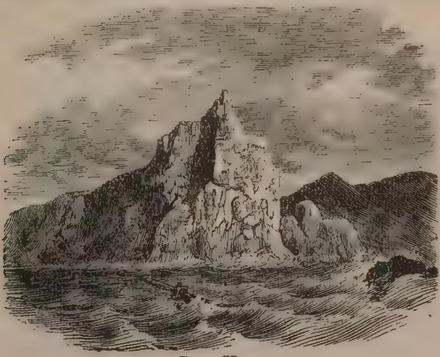
Chil'i, or **Chile,** a republic on the W. coast of S. America, bounded W. and S. by the Pacific Ocean, E. by the Andes, and N. by Bolivia: lat. 17° 28'-56° 20' S.; long. 66° 30'-75° 40' W. It has a coast-line of 2780 miles, and includes several islands, of which the largest is Chilöe (q.v.), although Queen Adelaide Island, Great Wellington Island, and Desolation Land are very nearly as extensive. The divisions, areas, and populations, according to the latest returns, are as follow:—

Provinces.	Area in Sq.Miles.	Population.	Capital.
Chilöe . . .	3,995	81,506	Ancud.
Llanquihue . .	7,823	78,640	Puerto-Montt.
Valdivia . . .	8,315	63,728	Valdivia.
Arauco . .	4,248	90,428	Lebu.
Magallanes . .	75,292	3,230	Punta Arenas.
Concepcion .	3,535	237,844	Concepcion.
Nuble . . .	3,556	164,779	Chillan.
Linares . .	3,488	117,920	Linares.
Maule . . .	2,930	129,081	Cauquenes.
Colchagna . .	3,795	162,448	San Fernando.
Santiago . .	5,223	400,047	Santiago.
Valparaiso . .	1,637	227,846	Valparaiso.
Aconcagua . .	5,840	159,872	San Felipe.
Antofagasta .	60,968	37,220	Antofagasta.
Tacna . . .	8,685	30,917	Tacna.
Tarapaca . .	19,300	47,730	Iquique.
Atacama . .	43,180	70,421	Copiapo.
Coquimbo . .	12,905	198,432	Serena.
O'Higgins . .	2,524	93,537	Rancagua.
Bio-Bio . .	4,158	130,702	Angeles.
Malleco . .	2,856	74,429	Angol.
Curicó . .	2,913	106,553	Curicó.
Talca . . .	3,678	162,406	Talca.
Cantin . . .	3,126	45,618	Temuco.
Grand Total .	293,970	2,915,332	—

Antofagasta was ceded by Bolivia to Chili in 1884, and Tacna (for ten years) and Tarapaca (altogether) were handed over by Peru. Tacna is still retained in consequence of the disturbances in Peru.

Physical Aspect, &c.—The country, stretching N. and S. in a long narrow strip, is cut off from the rest of the continent by the Andes, which here form a single magnificent ridge. S. of 41° the breadth is something under 30 miles, but to the N. of that latitude an average of 100 is maintained up to 27°, where for about 5° the country extends from the coast to a distance of at least 240 miles. After this, the breadth abruptly decreases to 160 miles, and then gradually to 70 miles. The ridge of the Andes consists of numerous offsets of the great range, and of intervening valleys of great fertility and beauty, which open upon the sea. In the N. is the barren and rainless waste of Atacama, while over the rich central region the snow-covered peak of Aconcagua (q.v.), the giant of the Chilian Andes, towers to a height of 22,422 feet. There are sixteen active volcanoes, such as Chillan and Villarica, both of which are 16,000 feet high; and the coast-line has been greatly extended of late years by the gradual upheaval which the country is undergoing. Among the rivers are the Loa, Copiapo, Guasco, Choapa, Rapel, Maule, Cauten, Biobio (q.v.), and innumerable smaller streams. A country like C., which extends through 40° of latitude, must necessarily present a great variety of climate, which in the N. is hot and dry, but in the central part of the country is delightfully tempered by prevailing sea-breezes; while at the S. there are storms of wind and rain nearly all the year round. On the whole, C. is singularly healthy, although the temperature often rises to 95° in the shade. January and February are the hottest months, and the rainy season, by which Atacama is almost unaffected, lasts from April till August intermittently.

Natural Products, &c.—The base and slopes of the Andes are clad with forests of fine timber trees, and wild apple and pear trees grow in abundance. Agriculture is rapidly improving, the principal crops under cultivation being maize, wheat, barley, and other European grains. The only hemp grown on the W. side of S. America is in C., which is also the original home of the potato. In the dry region of the N. there is a luxuriant yield of grapes, olives, figs, pomegranates, oranges, peaches, melons, &c. C. is plentifully stocked with cattle and goats, while its principal animals of prey are the puma or American lion, and the condor, a splendid Andian species of the vulture.



Cape Horn.

Geology and Mineralogy.—The upper portion of the Chilian mountains consists mainly of schistose rocks, the lower offsets of granitic, covered with tuff and lava in the vicinity of the volcanoes. Everywhere are seen hornblende, mica-schists, clay slates, and basaltic and felspathic porphyrites of deep red and brown tints, while limestone rocks occur in numerous places. Quartz is usually found in conjunction with veins of the metals, which exist in great abundance, and constitute the chief wealth of the country. The principal minerals are gold, silver, copper, lead, iron, tin, coal, and precious stones, such as agate, jasper, rock-crystal, &c. Atacama with its vast mineral resources has been brought within the reach of mining enterprise since the recent introduction of railways.

Means of Traffic, Commerce, &c.—C. is now placed in direct communication with Europe by means of a telegraph line from Buenos Ayres, which crosses the Andes by the Paso de la Cumbre, 12,178 feet high. The various railway lines throughout the country have a total length of 1735 miles. The railway across the Andes from Santa Rosa to Mendoza in the Argentine Republic approaches completion, over 100 miles of the road being now open; one-sixth of the distance, however, still separates the Chilian section from the Argentine. The cost of construction has already reached £9,500,000. There are about 7,000 miles of State telegraph lines. C. has considerable foreign commerce, chiefly with Britain, and the principal articles of export are copper and silver ore, wheat, nitre (nearly half the value of all the others), manganese ore, barley, wool, gold and silver bar, beans, guano, tallow, and hides. In 1893 the exports by land and sea amounted to £11,450,000, and the imports to £10,800,000. In 1892 the number of vessels that entered and cleared the ports of the republic was 16,740, representing 17,924,591 tons. C. has manufactures of linens, brandy, earthen and copper wares, &c. A great international exhibition was held at Santiago in the end of 1875.

People, Government, &c.—In the N. and central provinces the inhabitants are mostly whites or Chileños, of Spanish origin, distinguished by their enterprise and industry. The S. is almost wholly occupied by Indians. According to the constitution of 1833 the government is a republic, and the legislature consists of two houses: the Senate (elected for six years) and Chamber of Deputies (elected for three years). The public debt, which is chiefly contracted on account of railways, amounted in 1894 to £18,309,534. The estimated revenue for the same year is placed at £1,647,302, and the expenditure at rather more than two-thirds of that amount. The army cannot (by law) exceed 6000 men of all ranks and branches; but there is a National Guard in addition to the regular forces, and the body in 1894 consisted of 51,090 men. The fleet includes three armour-clads, 4 half-protected cruisers, several gunboats, and one torpedo flotilla. The prevailing religion is the Roman Catholic, but other churches are protected by a law of 1865. The law recognises civil marriage only.

History.—The country was overrun by Diego Almagro after the conquest of Peru in 1535, and later was made a general-captaincy, with an extended dominion stretching to Cape Horn. In 1810 began the revolt against Spain, which continued till 1818, when the decisive battle of Maypo gave C. her independence. The republic has since, in spite of repeated internal dissensions, firmly established its position as the most stable and enlightened of the S. American governments. In the spring of 1879 a war broke out on the boundary question between C. and the allied republics of Peru and Bolivia; and two years' bitter hostilities resulted in the triumph of C. and the almost total destruction of the land and sea forces of her antagonists.

Chillianwall'a (Chiliánwála), a village of the Punjab, 5 miles from the left bank of the Jhelam, and 85 miles N.W. of Lahor. Here, on 13th January, 1849, Lord Gough defeated the Sikhs, after an obstinate engagement. An obelisk has also been erected at C. to the memory of those who were slain in the two wars with the Sikhs. It is said that C. is the spot where the battle of Alexander and Porus took place after the passage of the river Jhelam.

Chill'icothe, the capital of Ross county, Ohio, U.S., on the Scioto river, 96 miles N.E. of Cincinnati by railway. It has large manufactures of machinery, and is the trading centre for the rich farming country bordering on the river. Formerly capital of the State, C. is finely built and wealthy. Pop. 11,288.

Chill'ingworth, William, a famous divine, called 'the immortal C.,' born in October, 1602, at Oxford, and had Laud for his godfather. While studying at the university of his native city he became a Roman Catholic, and went to Douay, but afterwards returned to the English Church, mainly through the persuasions of Laud, and in 1637 published his chief work, *The Religion of Protestants a Safe Way to Salvation,* in reply to the treatise of a Jesuit called Knott. He accompanied the King's troops during the civil war, was taken prisoner at the siege of Arundel, and died 30th January, 1644. C. was an able controversialist, but his clear, close reasoning is weakened by an immoderate dread of fallacy. He denounced persecution, and maintained that Scripture, and not Church authority, was the basis of Protestant faith. *The Religion of Protestants* is remarkably bold and tolerant, the first clear-ringing defence in the English tongue of the liberty of private judgment. In later times C. was a favourite with latitudinarians like Locke and Tillotson. See *Masters in English Theology* (Lond. 1877).

Chillon, a famous fortress, in the Canton of Vaud, Switzerland, at the E. end of the lake of Geneva, 6½ miles S.E. of Vevay. It stands on an isolated rock, at a distance of 62 feet from the shore, with which it is connected by a drawbridge. It is mentioned in documents of the 12th c., but the date of its foundation is not exactly known. Pietro of Savoy (Charlemagne the Little) converted it into a fortress in 1248. Bonnivard, prior of St. Victor, Geneva, was imprisoned here from 1530 to 1536. Byron's *Prisoner of C.* has invested the castle with an undying interest. It is now an arsenal.

Chilöe, an island forming a province of Chili, is situated in the Gulf of Ancud, is 120 miles long from N. to S., about 60 broad, and has an area of 3995 sq. miles, and a pop. of 81,506. It is a huge mass of volcanic rock, rising in no part higher than 2600 feet, and possesses a rich soil, which is almost entirely clad with forests, chiefly of a bastard cedar. The coast-land is cultivated, and yields wheat, barley, potatoes, and fruits. There is a considerable export of grain and timber. Ancud and Castro are the principal towns, the former being the capital, and having an excellent harbour.—The *Archipelago of C.* includes sixty other small islands, only half of which have inhabitants. The principal of these islets are Lemuy, Calbuco, Llaicha and Quinchao.

Chil'tern Hills, a chalky ridge across England, from Wilts, through Berks, Oxford, and Bucks, to the borders of Suffolk. The range is in great part from 15 to 20 miles in breadth, and its greatest height is Wendover, with 905 feet of an altitude.

Chiltern Hundreds.—The office of 'Steward of the C. H.' was established under the crown for the purpose originally of suppressing the bands of depredators who infested the forests of the Chiltern Hills. It began, however, to serve its singular modern political purpose about 1750. Besides this, there are also the stewardship of the Manor of Poynings, East Hendred, and Northstead, and the Escheatorship of Munster. A member of the House of Commons is unable to resign his seat unless through his acceptance of a place under the crown, but the now nominal appointment to any one of the above continues to be regarded as such an office, and thus affords a means of resigning. The office is almost invariably granted when applied for; no salary attaches to it; and it is usually resigned immediately after acceptance. As three such offices exist, there is no fear of the retirement of a member from the House being unnecessarily delayed.

Chimæ'ra, a fire-breathing monster of Greek mythology. Homer represents it as of divine origin, and as having the front of a lion, the tail of a dragon, and the body of a goat. It was killed by Bellerophon. In works of art it is represented as a lion with a goat's head springing from its back. The myth of its breathing fire is sought to be explained by a reference to the volcano of C. in Lycia, mentioned by Pliny and Mela. The name has since been given to any irrational product of a disordered fancy.

Chimæra, a genus of Elasmobranchiate fishes, forming the type of the sub-order *Holocephali*. These forms, represented by the *C. monstrosa* or 'King of the Herrings,' and by the *Callorhynchus Australis* of the S. Seas, possess a persistent notochord in place of the spine. The jaws are bony, and the scales are of the placoid kind. The mouth exists at the extremity of the head, and a single gill aperture only exists. The ventral fins are situated posteriorly, and the tail is heterocercal. Fossil species allied to the C. (genera *Elasmodus*, *Ischiodus*, &c.), occur in Mesozoic and Tertiary rocks.

Chiman'go, a species of Raptorial birds, belonging to the *Polyborinæ* or *Caracaras* (q.v.), found in S. America, and, according to Darwin, commonly associated in its habits of feeding on garbage with the Carrancha of Brazil. It possesses all the distinctive characters of the *Polyborinæ*, and by Darwin is said to be 'generally the last bird that leaves the skeleton' of its prey. He adds that it 'may often be seen within the ribs of a (skeleton) cow or horse like a bird in a cage.'

Chimbora'zo, the loftiest summit in the Andes of Quito, is 20,608 feet above the sea, and was once believed to be the highest mountain in the world. It is an extinct volcano, and has a trachyte peak, covered with perpetual snow. Humboldt (23rd June, 1802), ascended C. to within 2138 feet of its top, and Boussingalt and Hall (15th and 16th December, 1831) to within 1729 feet. The assertion of the French traveller Remy that he reached the summit (3rd November, 1856) in a mist 'without knowing it' is not generally credited.

On the 26th December, 1879, Edward Whymper commenced the ascent of C., and in his book, *Travels amongst the Great Andes*, he narrates how he reached the top on 4th January following, when he discovered that the true height of the mountain is 20,608, and not 21,425, as stated by Humboldt.

Chimere', the black satin robe worn by a bishop, on which the lawn sleeves, or the sleeves of a rochet, are sewn. In the time of Henry VIII. and Edward VI. it was scarlet, and was probably the sleeveless habit of a D.D. Objections were taken to this colour by Dr. Hooker, and the colour was changed to black.

Chimes, a set of bells in a church (or other) tower, also music performed upon such bells. See BELLS.

Chim'ney (Fr. *cheminée*, Ital. *camminata*, from Lat. *caminata*, der. of *caminus*, used by Vitruvius for a chimney). In the dwelling-houses of the ancients, the smoke and heated gases from the fireplace were, in general, left to find their way out of a room by openings in the roof or walls, and it is very doubtful whether either the Greeks or the Romans used any more satisfactory method than this. Modern chimneys were not known in this country until about the 12th c., and it is not until nearly four hundred years later that they appear to have been thought essential to every fireplace in a house.

The business of a C. is twofold—first, to carry off the smoke, and prevent its disagreeable presence in the room; and, second, to create a draught through the fuel, so as to consume it the more quickly and effectually. This latter function of the C. depends on the fact that hot air is bulk for bulk lighter than cold, so that when any column of heated air is allowed to communicate freely with the atmosphere at top and bottom, the cooler air continually pushes the hot air upwards, and thus keeps up a circulation.

If a C. be well designed in the first place, by having an opening as nearly as possible over the fire, a somewhat contracted neck, and a tolerably straight flue, it should never give any trouble by smoking. But if these points have been neglected, it is often very difficult so to alter the defectively formed C. as to prevent smoking. This nuisance is caused by down draughts, which most frequently result from the position of the top of the C. being such as to expose it to side currents and eddies of air. The most simple means of neutralising the effect of these is the fitting of revolving cowls upon the C.-pot, these cowls being so arranged that their openings always point away from the direction from which the wind is blowing. It is only in some few cases that the alteration of the flue or fireplace becomes absolutely necessary.

Chimborazo.

The chimneys of large factories are sometimes of extraordinary height, and their construction presents difficulties of no mean order.

The chimneys of steamers are commonly made, for convenience and lightness, of wrought iron, as also are those of locomotives. For factory chimneys, however, this material is not nearly so well adapted as the brick or masonry almost invariably used in their construction.

Chim'panzee, one of the highest or Anthropoid apes, included in the *Catarhine* section of the order Quadrumana (q.v.). The C. is the *Troglodytes niger* of naturalists; the Gorilla (q.v.) being the *Troglodytes gorilla*. This ape occurs chiefly in Western Africa, and inhabits much the same territory as the last-mentioned animal. The hair is nearly black in colour—hence the specific name *Niger;* but age is said to tint it with grey. The hair of the chest and abdomen is thinner than that of the limbs; and the hairs of the arm and forearm meet in opposition at the elbow to form a tuft, as in the gorilla. The nostrils are flat and oblique, and the muzzle projects. The C. approaches the human type of structure most nearly in the character of the skull, in its dentition, and in the relative size of the arms. It attains a height somewhat greater than that of the orang, which rarely exceeds 4½ feet in height. The arms in this species measure half as much again as the height of the body. The hand is equal to, or may be a little larger, than the foot; and as the sole of the latter can be placed flat on the ground, the C. can stand erect and run. Like the gorilla and orang, it often rests itself by leaning forward on the knuckles of the hand. It appears to be gregarious in habits, and its food consists chiefly of vegetable matter.

1, Hand; 2, Foot; 3, Skull.
Chimpanzee.

China Bark, a common name for Cinchona Bark (q.v.), especially in Germany.

China Grass. See BŒHMERIA, CORCHORUS, and SIDA. C. G. cloth is now used to some extent in Europe, being valued for its transparency and glossy appearance.

Chinande'ga, a town of Nicaragua, Central America, on a small river of the same name, 10 miles inland from the Pacific, is scattered over a wide area, and has a trade in cotton, sugar, maize, hides, &c.

China Root, the tuber of *Smilax China*, a kind of Sarsaparilla (q.v.), a native of China, Japan, and E. Indies. C. R. is possessed of diaphoretic properties.

Chin'cha Islands, three in number, belonging to Peru, and situated about 12 miles from the coast, in Pisco Bay, lat. 13° to 14° S. They have since 1840 been famous in Europe for their great guano deposits, which, since 1836, have formed the principal source of Peruvian wealth; but which are now becoming rapidly exhausted. They are named respectively N., Middle, and S. Islands, have an aggregate area of about 400 acres, are rocky and precipitous on the landward side, destitute of water, and without a trace of vegetation. From time immemorial they have been the resort of large flocks of penguins and other sea-fowl, the droppings from which, covering the surfaces and filling the crevices of the rocks, have formed immensely valuable stores of guano. The first cargo of guano was shipped to England in 1840.

Chinchill'a, a genus of Rodent (q.v.) quadrupeds, usually included in the family of the *Cavidæ* (Guinea-pigs, &c.), and found in mountainous districts of Peru and Chili. The average length of the C. is 14 or 15 inches including the tail, which makes up one-third of the measurement. The hind limbs are much larger than the fore, and the tail is clothed towards its tip with long hairs. The fur is of a light-grey on the upper, and whitish-grey on the under parts, and is of very fine texture. The food consists of roots, which it digs out by means of its powerful paws. When feeding, it sits on its hind limbs, and conveys the food to its mouth with the fore paws. There are five toes on the front, and four on the hind feet. The ears are large and prominent. The fur is manufactured into muffs, mantles, cloak-trimmings, and other articles.

Chinchilla.

Chinchilla, a walled town in the province of Albacete, Spain, 10 miles S.E. of Albacete; has manufactures of woollens, linens, leather, glass, &c., and an old church in which there are several fine pictures. Pop. 3368.

Chin-Chin, a gummy varnish used in China and Japan, and believed to be derived from *Plocaria tenax*.

Chinchon', a town in the province of Madrid, Spain, 25 miles E.S.E. of the metropolis, overlooks the Tagus, and has slight industries of linen, leather, and earthenware. Pop. 4961.

Chindwar'a (Chhindwará), chief town of an executive district of the same name, Nerbudda division, Central Province, British India, is situated at an elevation of 2100 feet, has a clear, healthy climate, and attracts many invalids. Pop. town 8973, dist. 407,494. The area of the district is 3915 sq. miles, and the chief crops are wheat, oil-seeds, sugar-cane, cotton, fibres, tobacco, and vegetables. The chief manufacture is cotton-weaving.

Chinese Empire, the oldest, most populous, and, after the Russian and British empires, the greatest in territorial extent in the world, may be said to occupy the whole of the eastern division of the Asiatic continent S. of Asiatic Russia and E. of British Burma. Besides *China Proper*, it includes Manchuria, Mongolia, Eastern Turkestan, Jungaria, and Tibet (q.v.). The suzerainty of the Chinese emperor was until recently acknowledged by the tributary kingdoms of Corea, Burma—which in 1875 resorted to its former custom of paying tribute to the imperial treasury, and thus reassumed the duties and obligations of a Chinese feudatory—Siam, and the minor states of the Indo-Chinese peninsula. Now, however, the whole of Burma Proper has been taken over by Great Britain, Siam has become more or less dependent upon France and altogether independent of China; Cambodia, Cochin-China, and the other smaller states in the peninsula, have fallen under the protection of France, and in 1895 the independence of Corea has been secured by the Japanese conquerors. Tibet and the *extra-mural* states of the empire—that is, those lying to the N. of the Great Wall of China, viz., Manchuria and Mongolia, as well as the states which pay tribute, but over which China exercises no direct administrative control—are each treated separately, and attention is here directed to the central and sovereign state of the empire, China Proper.

China, *Tsin*, or *Shih-pā-sang*, 'the eighteen provinces,' was called *Chin* by the inhabitants of India, from whom the Spanish and Portuguese adventurers of the 16th c. (the first Europeans to open up the Indian seas to commerce) obtained some knowledge of the country, the Indian name of which they altered into the Latinised form of *China*. The Tartar tribes in the N. gave to the country the name of Katai or Cathay, by which it was vaguely known in Europe during the Middle Ages. It is also called the 'Middle Kingdom,' a name which is appropriately applied to the central and principal state of an extensive empire. China Proper is divided into eighteen provinces, exclusive of the frontier province of Shing-king (q.v.) between the province of Chi-li and the Corea, and of the islands of Hainan and Formosa. In configuration it is singularly compact; it is of nearly uniform length and breadth; its coast-line is regular, with no deep indentations, and with only two notable peninsulas, Quang-tung or Lien-chow peninsula between the Gulf of Tonquin and the China Sea, and the Shan-tung peninsula between the Gulf of Pe-chi-li and the Yellow Sea. But though there are few deep indentations, there are numerous inlets, and the excellent harbours on these and on the mouths of the rivers are almost countless. The almost numberless islets that stud the E. coast lie as a rule close to the shore, while of the two great islands, Hainan, in the extreme S., is separated only by a narrow strait from Quang-tung peninsula, of which it doubtless at one time formed a part, while Formosa, in the E. Sea, is separated from the mainland by Fu-kien Channel, about 100 miles broad.

Boundaries, Area, Population.—China Proper is bounded on the N. by Manchuria, tapering off into the peninsula of Corea, Mongolia, and the dependent parts of Chinese Tartary; on the W. by Tibet and Burma; on the S. by Cochin-China or Anam and the China Sea; and on the E. by the Gulf of Pe-chi-li and Yellow and Eastern Seas—arms of the N. Pacific Ocean.

The following is a list of the provinces, with their areas and populations, given approximately; nothing can be definitely known by Europeans, for even if the authorities had the power to carry out a correct census, they would, as anyone acquainted with the Chinese character can well understand, most certainly decline to give Europeans accurate information on the subject.

Provinces.	Area in Sq. Miles.	Population.
Chikiang or Chehkiang	38,000	11,500,000
Fukien	39,000	23,000,000
Honan	66,900	22,200,000
Hunan	74,300	21,000,000
Hupeh or Hupe	70,500	33,400,000
Kansu	125,500	9,300,000
Kiangsi	72,200	24,500,000
Kiangsu	44,500	21,000,000
Nganhoi or Nganhwei	48,500	20,500,000
Pechili	59,000	17,900,000
Quangtung or Kwantung	74,500	27,000,000
Quangsi or Kwangsi	78,000	5,200,000
Queichu or Kweichow	64,600	7,700,000
Shansi	56,200	12,300,000
Shantung	53,800	36,300,000
Shensi	67,400	8,500,000
Szechuen	166,800	68,000,000
Yunnan	108,000	12,000,000
Island of Hainan	14,000	3,000,000
*Island of Formosa	15,000	3,500,000
Total	1,336,700	387,800,000
Dependent States—		
Jungaria	148,000	600.000
Manchuria	362,300	7,000,000
Mongolia	1,288,000	2,200,000
Tibet	651,500	6,250,000
Turkestan (Eastern)	432,000	600,000
Total	2,881,800	16,650,000
Grand Total	4,218,500	404,450,000

* Ceded to Japan in 1895.

Mountains, Rivers, Surface.—The physical geography of no country of equal extent is less complex than that of China. The gradually lowering spurs of the vast mountain system of the Himalaya enter the country from Tibet on the W., and traverse it in two main ridges, the general trend of which is from W. to E., but which throws out a number of lateral branches. Of these two main ridges, the *Nan-ling* ('Southern Range') extends in broken chains over the provinces of Yunnan and Quei-chu, exhibiting rugged mountains and fertile and abundantly watered valleys. From the eastern border of Quei-chu the Nan-ling extends E. and N.E., forming the frontier line between the provinces of Quang-tung and Kiang-si on the S. and those of Hu-nan and Hu-pe on the N., and finally bending E. and forming the southern boundary of the basin of the lower Yang-tse. Another branch of the Nan-ling stretches E.S.E. from the southern border of the province of Hu-nan, forming the northern limit of the wide valley of the Si-kiang river, which ultimately becomes the Chu-kiang or Canton river. The *Pe-ling* ('Northern Range') enters the province of Sze-chuen from the W. In this province the mountains are irregular, and numerous peaks, especially in the sub-range known as the Snowy Mountains, rise above the line of perpetual snow. From Sze-chuen the main chain traverses the province of Kan-su, where there are several subsidiary ranges, and where the valleys are numerous but small in extent. The chain crosses Shen-si into Shan-si, through the S. part of which it is continued into Hu-nan. The range seems again to cross upon the eastern bank of the Hoang-ho, and occupies the greater part of the province of Shan-si. The generally eastward trend of these mountain ranges determines the courses of the great rivers. The principal are the Si-kiang or Chu-kiang, flowing eastward S. of the Nan-ling range, through the southern provinces to Canton; the Yang-tse, flowing E. through the great central valley of the country between the Nan-ling and the Pe-ling mountains; and the Hoang-ho, flowing, in its lower course, through the valley to the N. of the main branch of the Pe-ling range. The other important streams of the country are either tributaries of these great rivers, or, like them, they flow eastward into the China, Eastern, or Yellow Sea, or into the Gulf of Pe-chi-li. The surface of the country presents every variety, from Alpine regions, where loftier peaks than those of Switzerland tower higher above the line of perpetual snow, to far-extending tracts, flat, alluvial, and fertile as the Netherlands, but infinitely more extensive. From the western frontier of China (about 100° E. long.) eastward to the middle of the country, or to about the meridian of 112° E., the surface is mountainous. In the N., especially in the province of Shan-si, the mountainous region extends 100 miles farther E., or to about the meridian of 114° E. In this western half of the entire area, immemorial forests clothe the mountains, and immense beds of coal occur. E. of this mountain region, the middle of the country is occupied by the great alluvial plain of the Yang-tse and Hoang-ho, extending northward from lat. 30° to 40° N. The Great Plain of the basin of the lower Yang-tse is about 700 miles in length, and varies in breadth from 150 to 500 miles. Its area (210,000 sq. miles), though greater than that of France, forms only a sixth part of China, yet it contains nearly one-half of the entire population, and is the most densely inhabited portion of the earth's surface. In the six fertile provinces that lie either wholly or in great part within it, 180,000,000 persons are supported. The remainder of the country is hilly or undulating. The lakes of China are numerous, the chief being the Tong-ting Lake in the N. of Hu-nan, about 250 miles in circumference, Lake Po-yang in Kiang-si, 180 miles in circumference, and the Tai-hu, or Great Lake, near Shanghai, 150 miles in circumference, and from 10 to 15 feet deep. All the lakes and rivers are abundantly stored with fish, and multitudes of families living on their banks, or in junks or floating houses on their waters, are maintained by the fisheries.

Geology and Mineralogy.—The mountain system of China, the outline of which has already been given, consists for the most part of granitic and metamorphic rocks, and to this bold and broken formation the rugged and picturesque character of so much of the scenery of China is due. In the valley of the Yang-tse cretaceous rocks and Tertiary beds occur. All classes of rocks containing metalliferous veins are largely present in this country. The whole of Northern China, embracing the greater portions of the provinces of Shan-tung and Pe-chi-li, and the whole of the provinces of Shan-si, Shen-si, and Kan-su, may be described as one vast and inexhaustible coal-field, while smaller fields occur in almost every other province. These strata are associated with varieties of iron ore, among which there are great fields of black oxide, the finest ore in the world. Fine limestone occurs in all directions, and gold—especially abundant in Yun-nan, in the S.W.—silver, tin, and copper are found in all the 'hill' provinces. In the province of Shan-tung there are four great coal-fields; and coke, which is manufactured in immense quantities, is used for smelting silver, and for other processes requiring great heat: iron, gold, and galena abound in numerous localities. Tertiary deposits cover the plain of Pe-chi-li, and among the hills limestone, granite, and metamorphic rocks prevail. There are numerous coal-mines, very inefficiently worked, and gold, silver, iron, and tin exist in many localities. In Shan-si, in which the mineral resources are great and varied, coal—bituminous, anthracite, and lignite—and silver, copper, and iron are plentiful. In Shen-si, Kan-su, and Ho-nan, all the minerals and metals named, together with quicksilver, exist in large quantities. Gold is common in the majority of the streams, and jade, agates, amber, iron pyrites, sulphur, and petroleum are obtained in many places. Gold and the other valuable metals are also pretty generally distributed on the alluvial flats and slopes of the western mountains trending N. and S., as well as in the southern province of Quang-tung. As a mineral product of China, porcelain is of the first importance in beauty and utility. The porcelain manufactories of the country are few in number, but are upon a large scale. The largest is named King-tu-ching, in Kiang-si, near Lake Po-yang, where there is an inexhaustible supply of the peculiar clay and silica from which the best porcelain is made, together with extensive coal-mines, whence fuel is obtained for the furnaces. The curious loam-terraces in the northern provinces, everywhere excavated into houses and villages, mark, according to Pumpelly and Williamson, the sites of former lakes and the channels of streams, and especially of the great river-system of the Hoang-ho or Yellow River, the course of which has suffered deflection from natural causes within our own time, and which appears to have been subject to similar vicissitudes prior to as well as during the historic period.

Canton, from the Temple of the Five Genii.

Climate, Soil, and Agriculture.—Extending in lat. from 18° 10′ to 44° 50′ N., and from long. about 97° 30′ to about 126° 10′ E., it is only natural to expect that the climate of China should vary in the different quarters of the country. The climate of the coast districts is widely different from that of the remote interior, and even among the coast districts themselves the climate varies, the meteorological conditions being quite different at Canton in the S. and at Pekin in the N. A peculiarity of the climate in general is the low average of the temperature, taken in connection with the fact that a part of China is within the tropics, and that the latitude even of Pekin, in the extreme N., is a degree to the S. of that of Naples. The mean annual temperature of Canton and Macao, which are within the tropics, is no higher than what is usually registered in places on the 30th parallel; while the mean annual temperature of Pekin is ten degrees lower than that of Naples. In winter severe cold is experienced in the northern provinces, though in midsummer the heat is oppressive. The average rainfall is 70 inches in the extreme S. There the N.E. monsoon commences in September and continues till February. The S.W. monsoon, which brings with it the annual rains from the heated ocean to the S., commences in March or April. The hottest months are July, August, and September. In these months the heat is oppressive and exhausting, and it is at this season, when the air is in a condition of extreme rarefaction, that the dreaded typhoons occur. China is a perfect hotbed for virulent and endemic diseases. This is accounted for by the extreme heat and humidity of the climate in summer, the absence of proper sanitary arrangements in the crowded houses on the swarming rivers, and the thronged villages and towns. Famine, arising from the frequent droughts and inundations, too frequently accompanies disease, and fearful destruction is often caused among the people who live afloat by the typhoons that annually visit the southern coasts. The estuary of Canton river is especially subject to these hurricanes, which are understood to spring from that quarter of the Pacific Ocean of which the Philippine Islands are the centre. Though most frequent in the S., they ravage the harbours all along the E. coast as far N. as Shanghai. In the northern and inland provinces of China the climate is pleasant, and in many localities delightful. The *soil* of the country is as various as its climate. There are tracts of champaign country like France and Belgium, swampy districts like Holland, and barren mountain regions. The richest soil is formed by the detritus of the innumerable rivers, and is found occupying immense tracts in the basins of Hoang-ho and Yang-tse, and composing the substance of their deltas.—*Agriculture*, the chief industrial pursuit of the Chinese, is considered a choice occupation, not only by the people but by the nobles and learned men, while even the Emperor himself condescends to plough a furrow on the occasion of the great annual festival of husbandry. All the land is vested in the Emperor as universal landholder. There are four great tracts in which the soil is fertile, and the agriculture specially efficient :—(1) The maritime provinces S. of the Nan-ling, in which the climate and productions are tropical, and the land cultivated like a garden up to the slopes of the forest-clad mountains. (2) The N. and E. slopes of the Nan-ling, in which the tea-shrub and the camphor and varnish-tree (*Dryandra cordata*) are indigenous. (3) The great plain of the Yang-tse, with mild climate and its immense cotton and woollen culture, its vast paddy-fields and tracts of sugar-cane; and (4) The grain-farming land between the Hoang-ho and the mountains in the N.

Vegetable Productions and Animals.—The vegetable productions of China embrace all the fruits, vegetables, and grain grown in temperate as well as in tropical climes: in the tropical provinces of the S., mangoes, grapes, pine-apples, pomegranates, the lichi, the varieties of orange. The tea-shrub is universally cultivated in the warm and sheltered districts; and rice, the staple food of the Chinese, is raised in immense quantities both upon wet, or rather muddy fields, and on dry soils, where its cultivation is carried on like that of ordinary grain. In the N. maize, barley, and wheat are extensively grown. Floriculture is universal. Water-lilies float on every sheet of still water. Artificial islands, constructed on the lakes, are all so many floating gardens; and the care with which the gardeners' azaleas, viburnums, and the host of brilliant flowers are carefully reared in the gardens and nurseries of China justify the application to that country of the name 'Flowery Land.' The tobacco plant and the poppy are also cultivated, and opium is an important article of manufacture. *Animals.*—The zoology of a country so densely peopled and so generally cultivated is not rich in the larger wild animals. The Bengal tiger, however, occurs in Yun-nan, and the bear infests the woods and rocky ravines of the mountains. Wild cats are common in the forests of the S., and are caught and fattened in cages for the table. Muck and moose deer are found, and the buffalo is used to a limited extent in agriculture. Human labour, however, is so cheap in China, that beasts of burden are not so numerous as in most other countries. The sturgeon, sole, flat fish, rock-cod, and the golden carp are very abundant. Locusts visit the southern districts in numbers inconceivable. The air is at times darkened with their flight as with a thundercloud, and the ground is sometimes seen covered with these animals—which are from 3 to 5 inches long—two or three deep.

Great Wall of China.

Industries and Arts.—The cultivation of rice, tea, cotton, hemp, sugar, and grain, and the manufacture of silk, opium, paper, porcelain, and lacquerware, are the principal industries. Curious carvings in ivory and mother-of-pearl are among the most interesting of the minor industrial products. The art-productions in drawing and painting betray an entire want of knowledge of perspective and of light and shade. The musical instruments of the Chinese embrace primitive and crude types of most of the European instruments, but no improvements have been made upon them for ages. The native music is shrill, harsh, and aimless to a European ear, though to the Chinese European singing and music is *disgusting* (an expression implying an incentive to nausea and sickness); many of the Chinese national songs are plaintive airs in the minor key, like the old national melodies of Scotland, Ireland, and Wales. The artistic genius of the country, however, is best displayed in its admirable pottery enamelled-work, engraving on wood and stone, its carvings and antique vessels in bronze, its filigree-work in gold and silver, and its fine lacquerware. The vigour of the inventive and artistic genius of the country in earlier ages, while intellectual life was a living and growing principle among the Chinese, and before the slavish and indiscriminate conservation which their religion inculcates had put a stop to progress, and unalterably stereotyped all ancient forms, however crude, as unsurpassed and unsurpassable, is attested by the fact that China anticipated Europe in many of the most important discoveries of modern times. It is certain that the art of printing was practised in China in the 10th c. Gunpowder was known and used (in the manufacture of fireworks) from a very remote period. The property of loadstone to communicate polarity to iron was understood during the 1st c. of our era, and a Chinese Encyclopædia of the date A.D. 121 describes loadstone as 'a stone with which direction can be given to the needle.' In a work written a hundred years later, the use of the compass is explained. To the Chinese also is due the discovery of the methods of manufacturing silk, paper, and porcelain, which they have carried to higher perfection than any nation in the world.

National Works, Monuments, &c.—The most renowned of the great national works of China is the Great Wall, which, from long. about 98° 30′, is carried eastwards over twenty degrees of long. along the N. frontier of China, over mountains and through valleys, and on bridges across rivers, to the Gulf of Leao-tong,—a distance of 1400 miles. It was built 210 years before the Christian era, as a protection against the inroads of nomadic Tartar tribes. Constructed mainly of earth and rubbish, it is bound in on each side by a coating of brick, and fortified at intervals by towers, which still in many instances have an imposing appearance. The Great Wall is from 15 to 30 feet high, rests on a basis of stone 2 feet thick, is 25 feet thick at the base, and from 15 to 20 feet at the top or platform. The towers are 40 feet square at the base, taper towards the top, and are about 37 feet high. The wall has long been entirely useless as a defence; it has consequently been neglected, and about one half of it has fallen to ruin, and is now little better than a shapeless mound of rubbish. The Grand or Imperial Canal extends from the town of Hang-chow (lat. 30°), in the province of Chi-kiang, N.W. through the maritime provinces of Kiang-su and Shan-tung to the town of Ling-ching (lat. 37°) on the river En-ho,—length about 700 miles. From Ling-chin the river En-ho is available as a continuation to Tien-tsin at its mouth. This great canal was constructed not merely to afford means of communication, but also to drain the plains that lie around the lower courses of the Yang-tse and Hoang-ho. With this view its breadth is unusually great. It is led across numerous rivers, including the two great rivers of China;

and owing to the continual action and reaction of the waters of these streams, there are very few reaches of the canal which are without a distinctly noticeable current. At several points it is cut through rocks; it traverses lakes, and drains numerous swamps. The number of the flood-gates that regulate it, the bridges that span it, and of the cities and provinces between which it forms (with its many branches and the innumerable rivers with which it is connected) a vast, easy, and cheap system of communication, constitute it one of the greatest national works in the world. The part of the canal extending southward from the former bed of the Hoang-ho (q.v.) was constructed during the 7th, or early in the 8th c. The remainder, extending N. through Shan-tung and Pe-chi-li, was the work of Kublai Khan (in the 13th c.) and his successors. Prior to 1853, when the lower course of the Hoang-ho was deflected from E.S.E. to N.E., the rice-fleet, bearing about 430,000 tons annually, passed northward by the canal from the southern part of the great plain of the Yang-tse to the neighbourhood of Pekin, and thus avoided the delay, and the liability to storms and the attacks of pirates, to which the sea-voyage along the winding coast exposed it. The deflection of the great river, however, and the consequent withdrawal of the water-supply from an important reach of the canal, have rendered it impassable for junks. Another great national work, the Mei-ling Pass, across the Nan-ling or southern mountain range, at the height of 8000 feet above sea-level, is a feat of labour and engineering which will compare with any of the Alpine passes. Across this pass nearly all the tea shipped at Canton, prior to the opening of the treaty-ports in the E. and N., was carried on the backs of porters, 200,000 of whom are said to have been engaged in its transport. After the opening of the treaty-ports, which were found to be nearer the great tea-districts than the port of Canton, the traffic over the Mei-ling Pass dwindled away. The empire is also traversed in all directions by great roads, usually from 70 to 80 feet broad in the plains, lined with trees, and carried across rivers by great bridges, which are often built of marble and adorned with innumerable fantastic figures of lions, tigers, dogs, and monkeys. Good cart-roads, also, connect all towns and villages of any importance. The monuments and gigantic idols and carved images of China are a special feature of the country. There are numberless statues in wood and clay of famous emperors and eminent men, mostly of colossal size and gilded. The statue of Confucius, which may be seen standing alone in all the numberless temples dedicated to the memory of the great sage, is never gilded, but is remarkable for its placid expression of features and sombre drapery. Before the tombs of the emperors of the Ming dynasty, in the neighbourhood of Pekin and Nankin, are ranged processions of gigantic figures—men, horses, camels, elephants—in stone.

Trade and Commerce.—The trade of China proper, consisting of an interchange of commodities between its inland provinces and the Russian, Tartar, and Indo-Chinese states on its borders, is very active and extensive, but no official statement of its extent is available to foreign officials. Of the foreign trade or commerce of the country, however, the British consuls at the different ports are in a position to furnish annual returns. Of the ports of China, twenty-four have been thrown open to foreign commerce. The whole of the foreign trade of China—with the exception of one-seventh, which is carried on with the United States and other foreign nations—consists of commerce with Great Britain and its Indian Empire, and with the British possessions of Hong-Kong and the Straits Settlements. The import trade from Great Britain, exclusive of Hong-Kong, passes through Shanghai, Hankow, and Tientsin; while most of the exports to Great Britain are despatched from Shanghai, Foo-Chow, Hankow, and Canton. During the last fifty-four years Great Britain has entered into treaties with the Chinese government, and under these certain ports, called treaty ports, have been thrown open to British commerce. These now number twenty-four, four of which are in the province of Quan-tung, three in Formosa, and three in Kiangsu.

The following tables furnish some information concerning the trade of China:—

Country.	1893.	
	Total imports from—	Total exports to—
	£	£
Great Britain	5,631,215	2,333,942
Hong Kong	16,178,193	9,658,052
India	3,347,912	547,085
U.S. of America	1,088,714	2,345,109
Europe (excluding Russia)	1,043,182	3,171,016
Russia	174,766	1,876,783
Japan	1,570,414	1,867,595

Of the imports to Great Britain more than half in value consists of tea. The following table points out the quantity imported each year from 1889-93 and its value:—

Year.	Value in £.	Quantity in lbs.
1889	3,503,011	88,558,037
1890	2,813,060	73,743,124
1891	2,403,478	62,283,778
1892	2,055,943	57,050,708
1893	1,990,107	56,208,058

Besides tea, the following are the chief exports and the value of the amount of each commodity exported in 1893:—

Raw and manufactured silk	£7,602,805
Sugar	463,743
Paper	351,361
Chinaware, &c.	235,767
Clothing	365,919
Straw-braid	485,816
Hides	150,549

£6,338,279 represented the value of opium imported in the same year, while £9,027,594 was that of cotton goods; £1,152,219 of oil; £1,064,047 of seaweed and products of the sea; £419,212 of coal; and £1,419,684 of metals.

Government.—The present Emperor of China, Tsai-tien, succeeded to the throne in 1875, as explained hereafter at the end of the portion devoted to *History*, on the death of Tung-che, who was nominated to the thrône by his father, Hien-fung (died 22nd August, 1861). In the Chinese constitution (which is written in the Ta-tsing-whei-tien, or *Collected Regulations of the Great Pure Dynasty*), the Emperor, or Whang-ti, is supreme legislator, administrator, commander-in-chief, criminal judge, owner of the soil, and arch-priest. He is called Tien-tse, or Son of Heaven, and theoretically rules over Tien-hin, or all under the skies. The only qualifications of the prerogative are that the Whang-ti must govern according to the classics, and that he is disqualified by incapacity or wickedness, the people having a right to rebel in cases of 'prolonged famine, pestilence, or hordes of robbers.' They have no voice in the election of magistrates, the making of laws, the imposition of taxes. The Whang-ti is visited every morning by the Keun-ki-chu, or Cabinet Council, and on invitation by the Ne-kö, Inner Council, or Great Secretariat. The Li-fan-yuen, or Colonial Office, has charge of Mongolia and Tibet. It includes a Chamber of Compassion for 'fan,' or foreigners, a term which does not extend to outer barbarians, such as English. The Han-lin, Great College of Learned Men, literally Pencil Forest Hall, includes the various Ta-hyo-si, or ministers of state, who see that the constitution and the maxims of Confucius are obeyed, and who collectively control the six Boards of Offices, Revenue, Ceremonies, Military Affairs, Punishment, and Works. This last includes the Chambers of Architecture, Government Stores, Hydraulics, and Mausoleums. The Han-lin is properly a senate to test literary attainments, on which office depends. The Board of Ceremonies is subdivided into the Chamber of Etiquette (which regulates marriage, funerals, public rejoicings, &c.), the Chamber for Regulating Sacrifices, the Chamber for Mutual

Intercourse (which provides a reception for illustrious strangers), a Chamber for Arranging Festivities or Imperial Banquets, and the Board of Music. Quite apart from the executive, but represented at the meetings of all the boards, and having a general power of direct remonstrance or petition to the throne, is the Tu-chah-yuen, or Board of Censors, whose business is to watch the proceedings of mandarins. In each province is a Swuin-fu, or governor, who has the sole power of addressing the throne or council, has the power of life and death, and is the military commander. His office is generally forfeited by the occurrence of a rebellion. Beneath him in each province are the Pie-chung-si, or superintendent of provincial taxes, which he receives from the magistrates and accounts for to the governor; the Ngan-cha-si, or provincial criminal judge, who receives and reports on persons sentenced by the district magistrates to death or banishment; and the Hioh-tai, or educational examiner, who corresponds with the Han-lin, and conducts along with the prefect the primary examinations for the literary degree in the departmental cities. Several departments, grouped together within a province, are placed under a Tau-tai, or intendant of circuit, who has charge of the customs, corresponds with foreign consuls, and hears appeals from the court of the prefect. One species of Tau-tai, the Ping-pae-tau, has a military command, and draws money from the treasury for troops which have often no real existence; another, the Yeu-yun-tau, is sometimes called the salt commissioner. The single department, or 'fu,' is presided over by a Chi-fu, who hears appeals from the lower courts. The 'fu' is divided into several 'liens,' about the size of English counties, in which the Chi-lien or chief mandarin is the sheriff, police superintendent, coroner, receiver of taxes, and literary examiner. Under him are the assistant district-magistrate, inspectors, masters of prisons, writers, tax-gatherers, constables, &c. It may be useful in connection with these names to add the meanings of some terminations constantly used in Chinese:—*Shau*, a hill; *Chung* or *Cheng*, a city; *Chwang*, a large village; *Tsun* or *Tun*, a village; *Kwan*, a fortified pass; *Mun* or *Men*, a gate; *Kow*, a port; *Kiai*, a market street; *Ho*, a river or canal; *Kiang*, a great river; *Hu*, a lake; *Yamun*, a mandarin's office; *Wang*, a prince. Little is accurately known as to the public revenue of China. It would be unsafe to infer anything from the amount of the custom-duties. In 1874 China for the first time contracted foreign debt, viz., £627,675, issued at 95, bearing 8 per cent., and secured on the custom-duties. In July, 1878, another custom-secured loan of £1,604,276 at 8 per cent. was raised, followed by £1,505,000 in 1884, £2,250,000 in 1886, £250,000 in 1887, £3,000,000 in 1893, and £2,000,000 in 1895. The capacity of absorbing European capital was considered to be fairly great in the case of Turkey and the S. American Republics, but it is likely to be reckoned of little account whenever the voracity of China may be compared with the modest applications by the former countries. It may be explained that the Chinese tael = 10 mace = 100 caudareens = 1000 cash = 3s. 11¼d. sterling. It is part of the duty of the mandarins to read periodically to the people from the *Book of Sacred Instructions.* Besides this, the penal laws are printed and circulated among the people (nearly all of whom can read and write), so that no one may plead ignorance of the law for which he is punished. There is in criminal justice a vicarious principle; parents being occasionally punished for the crimes of children, and districts for those of individuals. The Government reserve a power of punishing cases of 'improper conduct' not defined in the penal code. The enormous patronage of the court and the extensive system of espionage contribute to the stability of the empire. See Archdeacon Gray's *History of C.*

Defence.—The army may be divided under two headings; (1) the active or standing army, and (2) the territorial or feudal militia. The former consists of the so-called Eight Banners and the National or Chinese army. The regiments of Eight Banners are drawn from the Manchus, Tartars, Mongols, and Chinese upon whom the present dynasty can rely; these garrison all the great cities, but are shut off by walls and forts from the population. The National corps are not quartered in barracks, but live, as do the militia, in their own houses, and pursue some civil occupation. The Imperial army has been estimated at 850,000 men—678 companies of Manchu and Tartar troops, 211 companies of Mongols and Chinese infantry, and 120,000 men of the militia. Only a comparatively small portion is armed with weapons used in modern warfare, the main body being equipped with bows and arrows, cross-bills, and other such ancient implements. The Tartar cavalry is poorly mounted on undersized and ill-trained horses.

The navy received much attention from the Chinese authorities after the Franco-Chinese War of 1884. Before the war with Japan commenced, which has recently terminated in so disastrous a manner for China, the navy consisted of 2 second class battle-ships, 9 harbour vessels, 50 cruisers, and 41 torpedo craft. The N. squadron was the active fleet, the remainder being raised by, and attached to, certain maritime provinces. Under the able training and administration of Captain Lang of the British navy, the N. squadron became a very fairly efficient, if not actually formidable, marine force; but the jealousy of the Chinamen brought about that officer's resignation in 1891, and the state of efficiency was no longer maintained after he left the service.

Chinese Flower Boat.

In place of boldly advancing upon the Japanese, and attempting to sever their communications between Corea and Japan, the fleet remained in Chinese waters, and, when it came to fighting, although the sailors showed great pluck and an absolute indifference to danger, the Chinese officers turned out to be either traitors, or so grossly ignorant of their duties, that the force under their command played as insignificant a part in the struggle as did the fleet of Turkey in the last Russo-Turkish war.

China possesses at least five arsenals and dockyards, of which the most important is that at Port Arthur, but it is impossible to state how far they are now provided with munitions of war, or with appliances for naval construction. With regard to the navy, such as it is, which still remains in the possession of the Chinese, it is equally impossible to give any definite information.

Religion.—Like the Babylonians, the ancient Chinese erected large square altars and high terraces of earth, stone, and brick. The sacred altars in Peking, on which imperial sacrifices are offered every winter solstice to Shan-ti, are square earthen terraces about 60 yards in circuit, and from 4 to 6 feet in height. There was before Confucius a singular numerical philosophy, which is said to have been received by Ta-yu, B.C. 2200, as a reward for his success in subduing the inundations of the rivers. It contains nine categories—(1) Five elemental energies; (2) five human actions; (3) eight departments of government; (4) five registers of time; (5) the Emperor's perfection in virtue, or himself attaining the summit of virtue; (6) the three virtues; (7) investigation of doubts by the tortoise and diviner's grass; (8) five natural indications; (9) five kinds of happiness and six of misery. This numerical scheme is also seen in the Pa-kwa, or eight diagrams of Fo-hi, a system of whole and broken strokes arranged octangularly, the basis of the 'Book of Changes,' and used on the Chinese mariner's compass. The number eight curiously survives in the number of meats allowed at the imperial dinner, which are bears' paws, deers' tail, ducks' tongues, torpedoes' roe, camels' hump, monkeys' lips, carps' tails, and beef-marrow. Combinations of the five primitive elements are constantly used as the basis of calculation in fortune-telling with the joss-stick, which is largely practised according to printed rules and for fixed charges, chiefly by unsuccessful candidates at the public examinations. This gambling spirit appears everywhere. Tradespeople have bamboo-tubes full of sticks, with numbers burnt into the concealed end, from which the customer draws his price; some even use dice. In the temples, two plane-convex bits of bamboo are tossed by the worshipper, and the omen is good or bad according as they fall; no commercial transaction, no expedition of any kind, however insignificant, ever takes place without an appeal to the 'toss.' It is in his commentaries on the *Ye-king*, the Book of Changes, that the famous Chu-tsze explains the principle of Tae-keih, represented by a circle, on one semi-diameter of which a semicircle is described, and on the other semi-diameter, but in the lower half of the great circle, another semicircle is described. The curved divisions thus obtained represent the *yang* and *yin*, the masculine and feminine, the celestial and terrestrial, the sun and moon. This materialistic theory, resembling the Egyptian fable of the mundane egg and the Brahmanic legends of creation, was applied vigorously to all nature, the whole vegetable and inorganic world being endowed with sex, and numbers themselves having a gender.

There are many minor religions in China, such as Mohammedanism, which is diminishing, but still extensively spread; the Vegetarians of Ningpo, who profess the 'Religion of the White Lily' and the 'No-Hypocrisy Religion,' and distinguish themselves by holding the breath until the face becomes livid and the body stiff; the simple creed of the Pepohoans of Formosa, that the world has existed and will exist for ever, together with its present occupants, who are punished in their next stage of existence for their misdeeds in the present; then the Feng-shui, or Wind-water, *i.e.*, Incomprehensible system, which determines the proper sites of tombs, houses, or cities from the configuration of rivers, trees, and hills. This singular superstition assumes that all evil comes from the S., and that evil travels in straight lines. Hence curved lines are introduced as much as possible; a pagoda or a heap of stones will divert the lines, and protect a considerable district from famine and plague, and most of the temple doors have wooden screens inside, which intercept the evil spirits from proceeding to the altar. Perhaps the strongest among the practical religious feelings of the Chinese is that of predestination. It is well illustrated in a popular almanac of the present day, in which a woodcut represents a fly, a spider, a bird, a sportsman, and a tiger. Each of these animals successively kills his prey, and then they all fall into a well. The chief faith of China has for the last ten centuries undoubtedly been Confucianism, which is not a religion in the sense of having any account of the invisible world, but is a system of self-culture with two great objects—the proper government of one's own family and of the state. It exhorts men to love virtue for itself, without hope of reward or fear of punishment, and it is extremely obnoxious to the Christian missionaries, as laying down the principle that 'man's nature is originally good.' It resembles Christianity, on the other hand, in the importance it attaches in theory to purity of secret thoughts. Practically, however, what distinguishes Confucianism is the sanctity it throws round the existing social relations of dependence and subordination, both public and private. It establishes a power of life and death in the head of the family (*Penal Code*, s. 293), and a despotism (assumed to be benevolent) in the head of the state. The conservative method of Confucius is revealed in the *Li-king*, or Book of Rites, which contains 3000 ceremonial usages, and is administered by one of the public departments. Confucius said: 'I do not know life: how can I understand death?' Hence the state-worship by sacrifices, before referred to, is strictly positivist. Chinese religion, in so far as consciously Confucian, is not, indeed, atheistic, but agnostic. Buddhism, the creed of the Tartar dynasty, began to appear in China about 217 B.C.; and in 120 B.C. a Chinese general, after defeating the barbarians to the N. of Gobi, brought back a golden statue of Buddha as a trophy. In A.D. 65 it was officially recognised by the Emperor Ming-ti as a third state religion. Soon after, the life of Buddha, *Lalita Vistara*, was translated into Chinese under imperial auspices, and three centuries after this began the great stream of Chinese Buddhist pilgrims—Fahian (A.D. 390), Hœi-seng, Song-yun (A.D. 518), Hiouen-thsang (A.D. 648), Khi-nie (A.D. 964), whose travels, along with the *Itineraries* of the fifty-six monks (A.D. 730), are all extant, and some of them translated into European languages. The story of Hiouen-thsang, translated by Stanislas Julien, is a graphic romance and an invaluable history. He returned in honour to China with a great number of Sanskrit works on Buddhism, which he afterwards translated in 1335 volumes. There are now in the Pekin temple wooden blocks for printing upwards of 6000 Buddhist volumes. In Chinese, Brahma became Fan-lon-mo, and Buddha became Fo-to, which was vulgarly shortened to Fo. Buddhism is a creed of ideal purity; its Pentalogue enjoins not only moral duties, but abstinence from marriage and wine. But even these fundamental precepts are disregarded by the mendicant priests of China, whom the best authority has called 'a lying, shameless, wicked class.' They extort money from the poor not merely by begging on false pretences, but by impostures in the temples. Thus, at the shrine of Kuan-yin, goddess of mercy, at Hong-Kong, the goddess prescribes certain drugs, which are sold by an apothecary who has an understanding with the priests; and the priests themselves sell worthless bits of paper as counterfeits for money, which are then burned at the altar—a proof of the Chinese reverence for the 'written word' in whatever form it may appear; even a pawnticket or a newspaper is regarded as something sacred. The centre of Buddhism is the island of Put in the Chusan Archipelago, where since A.D. 550 sixty temples have been governed by an abbot or Tae-hoshang. These are supported by the rent of Church lands, the contributions of pilgrims, and the labour of the priests. Here and there are monasteries of devout and clean men. The great Hall of Saints, Lo Han T'ang, contains 500 gilded images of Buddhist saints, one of whom is supposed to be that good Catholic, Marco Polo, the traveller. The Buddhist pagodas are circular towers, 200 feet in height, containing seven stories, reached by a spiral staircase, each floor having an outside terrace, surrounded by a massive stone balustrading resting on ornamental brackets. They are chiefly found in S. China, and are not known outside China. They were probably built as beacons and watch-towers, and as places of strength in which to guard the relics of Gautama. The tonsure, celibacy, fasting, prayers for the dead at fixed money rates, the baptism in water, the rosaries and chaplets, and the Franciscan dress of the Shamans or Buddhist priests, suggested to Père Gerbillon that they must have been subject to Christian influences from Syria and Armenia. The third great faith is Taouism, which was first taught by Taou or Laou-tsze, a contemporary of Confucius, in the 6th c. B.C. He taught contempt of worldly riches and honour, and thought true happiness was to be found in starving all troublesome wants and living apart in slothful tranquillity. His followers believed that life might be indefinitely prolonged by an elixir, and therefore became alchemists. The mysteries of the Taouist, 'Three Pure Ones,' were announced to man through the 'great barefooted angel,' and are written in the Scripture, Taou-te-king, a copy of which is possessed by the Royal Society. Under the Sung and Tang dynasties this sect became very influential, the title of Tien-sze, or celestial teachers, being given to its professors. Three Taouists, named Chang, excited the rebellion of Yellow-Caps, which put an end to the Han dynasty. But the religion is now represented chiefly by professional jugglers, who traffic in all the grossest superstitions of the people. To the Confucian student the theoretical asceticism of the Buddhist and indifference of the Taouist are both equally culpable; but practically there is very little bigotry shown between the members of the different persuasions.

The three faiths agree, however, in detesting Christianity. This is shown in a poem published in 1874 in the tea-market at Hankow, which, after sarcastically referring to the 'stillness and cleanliness' of Buddhism, and the 'abstruseness and hollow mockery' of Taouism, attacks the gospel *with its secret confusion of sexes.* This spirit is partly political or patriotic, but the spiritual and moral difficulties in the way of the missionaries are enormous. Thus, the Chinese work seven days in the week; there is no restriction on the sale of spirituous liquors, and no drunkenness except from opium; there is no charity, except in the customary support of parents and other relatives and friends; and the result is, that nearly everybody works, although wages are barely sufficient for comfortable subsistence. Accordingly the social evils to be attacked in China are different from those most prominent at home. See Edkin's *Religion in China.*

History.—The fabulous part of Chinese history begins with the Three Emperors, Fo-hi, who invented numbers, music, &c.; Shin-nung, the divine husbandman; and Hoang-ti (B.C. 2637), who divided the land into groups of nine equal squares, of which the centre was owned by the state, and who introduced the cycle of sixty years. Then follow the Five Sovereigns, of whom Chun is connected with the tradition of the Deluge (the overflowing of the Yellow River), and also the first choice by a reigning emperor of his successor, which is still the rule. The following is a list of the dynasties which have since then ruled over China down to the present time:—

The Hia	B.C.	2197—1776
The Chang	,,	1776—1122
The Chow	,,	1122— 255
The Tsin	,,	255— 202
The Han	,,	202— 220 (A.D.)
The Sankoue	A.D.	220— 265
The later Tsin	,,	265— 420
The Song	,,	420— 479
The Tsi	,,	479— 502
The Leang	,,	502— 556
The Chin	,,	556— 580
The Soui	,,	580— 618
The Tang	,,	618— 907
The later Leang, Tang, Tsin, Han, Chow	,,	907— 960
The Sung *	,,	960—1279
The Mongol †	,,	1260—1368
The Ming	,,	1368—1644
The Manchu	,,	1644 (still in power)

* The Kin (in N. China), A.D. 1115—1234.

† Although Kublai Khan began to rule in 1260 he did not obtain possession of the whole of the empire till 1279, when Tiping, the last of the Sungs, was drowned at sea.

After two periods, occupied by the dynasties of *Hia* and *Chang*, a martial king, Wou-Wang, B.C. 1122, revolts and founds the dynasty of Chow, which endured till 255 B.C. It was about the middle of Chow that a partial consolidation of the independent states or dukedoms in Northern China took place. The first true Emperor, Tsin-Chi-Hoang-ti, built the Great Wall, and burned nearly the whole of the classic literature. During the Han period (B.C. 202—A.D. 220), the Tartar becomes troublesome on the N.W. frontier. After an interval of Sankuoe, or 'Three Kingdoms,' the Prince of Wei established the supremacy of the Tsin dynasty on the Salic principle (afterwards disregarded), that 'queens should not reign, nor assist in public matters.' From A.D. 416-585 the cities Nanking and Hünnan appear as the capitals of separate kingdoms, which are afterwards united, and the dynasty of Tang (A.D. 618-907) appears. Among these monarchs Taitsong (A.D. 627-650) is pre-eminent for his wisdom and justice. A chaos of half a century, called the 'Later Five Successions,' follows, in which the features of a feudal land system appear to survive in the tax of 10 per cent., to which the Emperor is still entitled out of all lands. To this period belong the accounts of the early Arabian travellers, who describe the taxes on salt and tea, the use of the bamboo, and the excessive issue of paper money. Under the feeble and vacillating Sung dynasty (A.D. 960-1279) a great impetus was given to the production and multiplication by printing of books, and the manufacture of porcelain was begun at King-teh-chin; but the attitude of the Eastern Tartars grew constantly more threatening, and in A.D. 1115 the Kin dynasty began to rule over N. China while the Sung rulers reigned over S. China. At length China had to call for help to the Mongol chief Peyen (Hundred-eyes), with the usual result of introducing a foreign dynasty, that of Yuen, whose first monarch was Kublai Khan, or Chitsou. He, a Buddhist, tried to suppress Taouism, surrounded Peking with the Grand Canal, and founded the medical college, where the doctrine of the pulse, the diseases of children, and the therapeutics of counter-irritation have ever since been expounded. The narrative of Marco Polo belongs to this time, which is also marked by the establishment of Mohammedanism as the religion of a considerable part of the people. The Mongols rapidly degenerated, and in 1368 Hong-Wou, a Chinese bonze, founded the Ming dynasty, and removed the capital to Nanking. Under this line, which enriched the world with many magnificent metal vases and tripods, gave Macao to the Portuguese, and saw the first of the Jesuit missions (Fathers Ruggino and Ricci, worthily followed by Fathers Schaal and Verviest), a war gradually sprang up between China and the Bogdoi Khans or Manchu princes; and in 1644, after promising freedom from taxation, Chuntche, or Chitsou, founded at Peking the Manchu Tartar, or Taitsing, dynasty, which still rules. To them belong the present uncouth pigtail and costume of China. Their empire was not assured until the long and brilliant reign of Kang-hi (A.D. 1661-1722), who had friendly negotiations with the Pope and with Peter the Great, and who inflicted a decisive defeat upon the Kalmucks. In 1662 he expelled the Dutch from Formosa, and in 1692 he published a decree permitting the exercise of Christianity, which was forfeited by a foolish claim of jurisdiction on the part of the Pope. The Supreme Emperor, Keen-Lung (1735-96, when he abdicated, and died in 1799), received in 1793 Lord Macartney, the first British ambassador to China, who was followed by Lord Amherst in 1816. Keen-Lung (who persuaded the banished tribe of Tourgouths to return from Russian rule in 1772) deserves the highest credit for relieving the East India Company (established with a concession of the right to trade at Canton since 1637) from some of the grievous customs and port duties; but Macartney failed in opening the ports of Ningpo and Tientsin. Amherst's mission, intended as a protest against the avowed Chinese policy of 'treating the barbarians as beasts and not as citizens,' was equally unsuccessful. Taou-Kwang, 'the Glory of Reason' (1821-50), murdered the Mohammedan Tartar Prince Jehanghir, and made a successful campaign on the Kashgar frontier. In 1834 the charter

Chinese Playing Cards.

of the East India Company, which had hitherto regulated trade at Canton, came to an end, and Lord Napier went out as commissioner. The Chinese wished to have a *taepan*, or commercial superintendent without representative character, in order to assist them in dealing with the illicit trade in opium, which had now begun, and against which the Chinese commissioner Lin distinguished himself by his energy and duplicity. This question led to the war of 1840, in which Amoy, Ningpo, and Shanghai were taken, and after which, in 1841, the Treaty of Nanking (Sir Henry Pottinger representing the British) was signed, abolishing the Hong monopoly, opening five ports with a moderate tariff, and ceding the island of Hong-Kong. Another military expedition was rendered necessary by outrages committed in 1847. But the Chinese Government was now seriously shaken by the great Taeping rebellion, led by Hung-tsiuen, the son of a small farmer who lived on the N. river about 30 miles from Canton, against Hien-fung, the Manchu Emperor who succeeded in 1850. Disappointment at failing to pass, or, as he said, indignation at the unfairness of his rejection, at the Civil Service examination, had made him an enemy of the government he had sought to serve. Naturally shrewd and bold, he without demur cast every blame upon the *system* and the Manchu Government which made use of the *system* of so-called competitive examination. Whether he was simply an intriguer or a fanatic is doubtful, but in any case he made the most of the silly superstitions of his neighbours, who gave out that Heaven had appointed him to rule over C. His political object was to restore the Ming dynasty, and therefore he established himself at Nanking, the ancient Ming capital. The course of this great insurrection has been traced by several writers; and its inner spirit will best be seen in the autobiography of Hung or Chung-wang, the Heavenly Chief, published at Shanghai in 1865. The Taeping publications were translated by Medhurst in the *North China Herald*. Meantime, in spite of the prudent action of Sir J. Bowring, Governor of Hong-Kong, the treatment of the English merchants at the ports, especially by Commissioner Yeh, became again intolerable. At last (1856) the *Arrow*, a small British colonial vessel, was violently seized. This led to the first mission of Lord Elgin, described by Oliphant, and the expedition of the allied French and English forces, which resulted in the important commercial Treaty of Tientsin (26th June, 1858), fixing the right of British subjects to travel with passports, throwing open five additional ports, and adjusting a general rate of transit dues. The treaty was not carried out, and this made necessary Lord Elgin's second mission of 1860, described by Loch. There was more fighting, which began with the repulse of Admiral Hope at the Taku forts, but was afterwards better managed by Sir Hope Grant. The palace of Yuen-ming-yuen was burned to the ground as an appropriate punishment of the treachery of certain mandarins. After this, British officers served in suppressing the Taeping rebellion (which lasted till 1864), and British civilians held important posts in the departments. After the failure of the expeditions of Gordon and Sherard Osborn, and the massacre of 30,000 rebels at Foo-chow, the Palmerstonian policy of permitting British subjects to serve in China was abandoned. In 1873 the Chinese brought to a successful close a war which had lasted for seventeen years with the Panthays, a Mohammedan race in the district of Yünnan. At last Talifu, the capital of the Sultan Soleiman, and Momien, were taken with great slaughter by an army of 200,000 under Li-ssa-ta-ye, the general who nearly destroyed Sladen's exploring party from Burma in 1868. In June, 1873, the young Emperor Tsai-shun gave the first public reception to the ministers of the Great Powers. This Emperor, who died 12th January, 1875, was known as Tungche, in accordance with the singular custom that the true imperial name, being sacred, may not be profaned by use. He was cut off suddenly, and when quite a young man, and made no provision as to the succession. The two dowager Empresses, however, arranged the matter between them, so that the infant son of Prince Chun, brother of the late Emperor's father, was nominated to the throne and in due course became Emperor under the name of Tsai-tien, 22nd January, 1875. In 1874 the murder of fifty Japanese sailors led to the expedition under general Saigo to the island of Formosa. The result was a treaty on 31st October, 1874, acknowledging China's sovereign rights in Formosa, but giving to Japan a sum of 500,000 taels, partly in compensation to the families of the murdered sailors, and partly in payment for roads and buildings constructed by the Japanese. In January, 1875, the foulest of all Chinese murders was perpetrated on Margary, of the consular service, at Manwyne. Margary belonged to the party of Browne and Anderson, sent out by Lord Salisbury to discover a through trade route from Burma by the entrepôt Bhamo to Yünnan. Sir T. Wade, British Minister at Pekin, by threatening to break off diplomatic relations, got the Emperor to send Li-han-chang as a commissioner to investigate the matter. The English Government had already sent Grosvenor, Davenport, and Baker for the same purpose. Sir T. Wade also took this opportunity of securing a general inquiry into the taxation of foreign trade; an edict enjoining that all foreigners with passports should be unmolested, or, if wrong-doers, to be given over to the consulate; an undertaking that all foreign treaties should be published in the *Peking Gazette*, the proper rank being given to the foreign ministers, and that there should be regular intercourse between the foreign legations, and not merely the Tsung-li-yamen, a commission of cabinet ministers organised in 1859, but all the departments as well. In the negotiations Prince Kung distinctly laid down the principle that his Government 'have never sanctioned trade carried on within the limits of a subject state.' In September, 1883, a complication arose with France respecting Tonquin, which resulted in a desultory war, finally settled by a treaty of peace, ratified 31st August, 1885. In March, 1887, the young Emperor (aged 16), nominally assumed the government, but in February, 1889, he actually became supreme on the retirement of the Dowager Empress, widow of the late emperor's father.

During the present emperor's reign several attempts have been made to overcome the policy of the obstructive party in China. In June, 1876, a short railroad, constructed without permission of the Court, was opened between Shanghai and Wosung, but in the following year the Government purchased it and forthwith destroyed it. Since then a small mineral railway has been constructed between the Petang river, the Kaiping mines, and Shanhaikwan. A line has been ordered by the Emperor to connect Pekin and Hankow, but nothing had been done before the war with Japan commenced. Short railway communication exists in Formosa, and will probably become largely extended under the management of the Japanese holders of the island. Telegraphs connect most of the Treaty Ports, the capital, Manchuria, the chief towns of the provinces, and the Siberian lines, so that there is now overland communication between Europe and China.

On the murder of an ex-Premier of Corea, a Japanese *protégé*, difficulties arose between the two empires, and in June, 1894, hostilities broke out, which resulted in the total defeat of China, and the signing of a treaty by which the latter undertook to pay an indemnity, hand over Formosa to Japan, and admit the autonomy of Corea.

Language and Literature.—In Chinese no word is allowed more than one consonant and one vowel—the vowels including diphthongs and nasal vowels. The possible number of words is therefore very small, and it is said there are only 450 significant sounds. But each word is made to vary its meaning according to accent and intonation; so that the total number of words in this sense is 43,496. This being the structure of the spoken sounds, a graphic representation of sounds was impossible, and therefore hieroglyphic writing, enlarged by the introduction of determinative signs, was used. Twenty-nine-thirtieths of the language consists of combined signs, one part indicating the general sound, the other indicating the special meaning. Hence the omission of a stroke or a dot entirely alters the idea. But these signs only supply the idea; the number, gender, case, person, tense, mood, any special determination or qualification of the idea, must be expressed by an additional word. Inflection is unknown, and the syntactical relations of the words in a sentence are therefore expressed by position. The earliest Chinese alphabet consisted in the use of a knotted cord; then came Fu-hi's octangular figures; then the 'tadpole' character, consisting of waving lines and blotted heads, seen in old inscriptions and supposed to survive in the 608 simple hieroglyphic signs for the more familiar natural objects; then the 'seal' character, still used in titles of books, inscriptions, &c. The Li and Kiai characters, now generally used, are not older than the beginning of the Christian era; and the more stiff and modern Sung character is also sometimes used in printing, the wooden types being cut out from the copy pasted on to the block. Some abstract ideas are expressed by the combination of hieroglyphs; and by processes resembling those of metonymy and synechdoche in poetry, the meaning of one hieroglyph is gradually extended by association. But from the constant use of abbreviations, and of the 'grass hand,' to which fancy lends some ornament, the old hieroglyphs themselves need interpretation. The paper used is made of the second skin of the bark of bamboo, soaked in water with lime till the woody parts are separated from the pulp. The rice-straw paper is not largely used. As in Japan, brushes, not pens or pencils, are used. Writing and printing are in perpendicular columns. While the book language remains the same, there are 200 or 300 spoken dialects, which are often unintelligible beyond their native province. The *Kwan-hwa* or Mandarin dialect is, however, used by two-thirds of the Chinese. The Canton and Amoy dialects occupy towards Mandarin the position of Latin towards French. On the Amur, and in the military garrisons all over China, in Pekin for the formal ceremonies of court, and also generally for documentary purposes, use is made of the Manchu language, the alphabet of which, representing one thousand syllables, is said to have come from the Syriac through the Nestorian communities of W. Asia, who gave it to the Mongols. Chinese largely enters into Japanese, and one-fifth of Mongol words are Chinese. The language undoubtedly presents great difficulty to strangers, not merely from the novelty of some combinations, but also from the distinction of even and inflected tones, the latter consisting of the 'rising, departing, and entering tones.' The tones are further sub-divided by reference to the heavy or light initial of the syllable. Both the jargon, called Pidgin-English, and the Low Malay, act as common modes of communication between Chinese and foreigners, and also between the members of the different Chinese clans, all of which speak dialects totally different and unlike one another. In Wylie's *Notes on Chinese Literature*, five pages are devoted to the enumeration of thirty well-known and voluminous catalogues of ancient and modern works. The educational books on such subjects as zoology, ethnology, botany, &c., are full of childish nonsense. The missionaries, from Father Ricci (who translated *Euclid's Elements* into Chinese) to those of the present day, have given the Chinese opportunities of progress in mathematics and astronomy; but although there is at present at the imperial college a distinguished mathematician, Le-sheu-lau, the author of *Tae-su-hea*, or Treatise on Algebra, nothing of importance seems to have been done. Similarly, while the medical missionaries, such as Lockhart, Dudgeon, and Maxwell, have done much to extend medical knowledge, and there is now an English professor of anatomy (as of other subjects) at Pekin, it is doubtful whether the Chinese have advanced far since Kublai Khan founded his medical college. A strong prejudice exists against Christian works. The continuity of Chinese historical literature was broken by the burning of books, commanded about 250 B.C. by the first Tsin Emperor; but this has not prevented a large manufacture of native histories from the beginning down to the close of the Ming dynasty in A.D. 1644. Of this, the only interesting portion is the *Sai-kuo-chn*, or History of the Three States. The history of the Manchu Tartar line, named *Tong-hua-lo*, is not yet published. Among biographies, the taste for which was set by the *Yun-lu*, or discourses of Confucius, may be mentioned the *Sing-pu*, in 120 volumes. The dramatic literature is large, and is well represented by the *Heir in Old Age*, translated by Davis from the Collection of One Hundred Plays; and in the *Chalk Circle*, translated by Julien. Several specimens of the Chinese novel have also been translated; *The Two Cousins*, by Rémusat; *The Lasting Resentment of Miss Keaon Lwau Wang*, by Thom; *The Fortunate Union*; and *The Two Young Bluestockings*, by Julien. The earliest monument of Chinese poetry is the *Shi-King*, the first Canonical Work, or Book of Sacred Songs. It describes the manners of different states, and the great deeds of heroes and sages, and also contains hymns for state ceremonies. Much of this is in lines of four words, the monotony of the prevailing monosyllable being varied by its occasional repetition, so as to produce a foot. Rhymed quatrains and a cæsural pause are also used, and much of the poetry is marked by a parallelism or antithetical balance of expression. The golden age of Chinese poetry was in the 8th Christian century.

To conclude, we may safely say that C., in so far as its internal arrangements and government are concerned, is without a counterpart in the history of the world. Everything in C. is done methodically and under strict rules. The tyranny of the Emperor and his court is undoubtedly the most severe and most dangerous ever assumed by man over his fellow creatures. It is characterised by all the fiendish cruelty and indifference to human suffering which have marked the rule of the savage in America and Africa, where there has never been any pretence at all of administering laws in accordance with the principles of justice and equity. In C. nothing illegal is done, or, at all events, supposed to be done, and in C. the laws are framed for the protection of the 'well-disposed,' and the punishment of the 'malefactor'; yet the 'spirit of the law' is always evaded when the interests of the rulers require it, and the programmes of the government of the provinces simply represent so many catalogues of hideously unjust and abominable crimes on the part of those appointed by the Emperor to 'administer justice.' Not that these administrators themselves are in a better position than that occupied by the masses whom they systematically ill-treat, misgovern, and 'squeeze.' Their own fate and that of all their families rest upon the capricious inclination of the Emperor, whose court is ever a very hotbed of intrigue.

Although secret societies abound throughout the Empire, whose object is often to embarrass, and break the power of, the Government, the extent of the territory, the difference of language, the impossibility of establishing or maintaining connection, all these play into the hands of the rulers and enable them to trample out in detail the various sparks of rebellion which are always being ignited in some district of the Empire. The Chinese masses are for the most part absolutely ignorant of, and probably indifferent to, what may be going on in the provinces other than their own. It is indeed most likely that, with the exception of those persons in the provinces actually touched upon by the Japanese or by sea-going traders, the masses are entirely unaware of the war which has been waged between their empire and Japan. They are patient and hard-working to a degree utterly beyond the comprehension of the European. Will they ever combine? Will they ever rise against their tyrants? It would appear impossible for them to do so, so long as the jealous policy of Western nations intervenes and saves the arch-tyrant from destruction.

Chinch Bug, a small hemipterous insect, which occurs in the U.S. of America, and at times is specially destructive in cornfields. Its body is black and hairy, and the covers of its wings are white, tipped with black. The colour of the

Chinch Bug.

beak, legs, &c., is yellowish-red. The females leave their eggs in the ground, and before the end of June the young are at work on the wheat; these are bright red and have no wings. The length of the body of the adult C. B. is a little under $\frac{1}{7}$ of an inch.

Chinese Green Indigo, or *Lo Kao* of the Chinese, a green dye now much used in Europe, prepared from two species of buckthorn, viz., *Rhamnus chlorophorus (globosus)* and *Rhamnus utilis*.

Chi′nese or **Chi′na Sea,** an inlet of the Pacific Ocean, enclosed on the N. by the mainland of China and Formosa, S. by Borneo, W. by Cochin China, Siam, and the Malay Peninsula, and E. by the Philippines. It contains the Gulfs of Siam and Tonquin, is some 2100 miles long from the island of Formosa to Singapore, and has a maximum breadth of 900 miles.

Chi′nese Tall′ow, a white sebaceous substance covering the seeds of *Stillingia sebifera* (natural order *Euphorbiaceæ*), made into candles, &c. It is now acclimatised in Algeria.

Chi′nese Wax, a substance produced by an insect which feeds on the Chinese ash.

Chingleput or **Chengalpat** ('the brick town'), the chief town of the district of the same name, Madras, British India, 36 miles S.W. of Madras by rail. It is meanly built, and has a large tank, which in the dry season gives off malaria. C. is in general, however, a healthy place. Pop. 6180. The French took the place in 1751, and retained it till the following year, when it was captured by Clive. There is a wonderful old fort here, no longer used for military purposes, but occupying a site which must have rendered it impregnable in bygone days. It was from the ruler of C. that the British obtained permission to build Madras. The *district* of C., which lies on the Bay of Bengal, and is rather flat, has an area of 2842 sq. miles, and a pop. of 1,136,928, of whom 1,091,376 are Hindus, 26,236 are Mohammedans, 18,971 are Christians, 325 are Jains, and 11 are Parsees. The soil is generally poor; the chief crops are rice, indigo, pulses, chillies, and tobacco. Cyclones are frequent along the coast, and much damage and loss of property and life have been annually caused by these atmospheric disturbances; whole villages, flocks, and herds, being swept away and destroyed.

Chini′, a village of the Punjab, in the Himalayas, on the right bank of the Sutlej, about 80 miles N.W. of Simla, at an elevation of 8770 feet above the level of the sea. The climate is pleasant and salubrious, and eighteen varieties of the grape are said to be cultivated successfully in the district, these are dried, and, as raisins, form the principal food of the inhabitants. The villagers train large dogs to keep off the bears from the vineyards.

Chin-Kiang-Fu ('River-Guard City'), a city of China, on the Yang-tse, where it is joined by the Grand Canal, 150 miles from the sea. It was a great commercial centre till about 1853, when the Grand Canal was partly destroyed by the Taeping rebels, in consequence of which it has lost its importance. The pop. is said to have dwindled from 500,000 to some 500. The port was opened to foreign trade in 1858 by the Tien-tsin treaty, and in 1864 the English formed a settlement here. The pop. is now estimated at 140,000, the imports at £7087, and the exports at £82,492.

Chi′non (the *Castrum Caino* of the Middle Ages), a town in the department of Indre-et-Loire, France, on the right bank of the Vienne, 26 miles W.S.W. of Tours. It was once fortified. From the tower, in which Jacques Molay, the last grand-master of the Knights Templars, was imprisoned, a fine view of the neighbouring country is obtained. C. has manufactures of druggets, serges, earthenware, and saltpetre, and a trade in grain, wine, brandy, honey, and prunes. In the castle of C. Jeanne d'Arc was first presented to Charles VII. C. is also the birthplace of Rabelais. Pop., of commune 6119; of arrond. 82,535.

Chin′quapin, a name applied in the Eastern States of N. America to *Quercus prinoides*, as well as to *Castanea pumila*, and in the N. Pacific region to *Castanopsis chrysophylla* of California and Oregon.

Chinquapin.

Chinsu′ra, a town on the right bank of the Hoogly, 20 miles N. of Calcutta. It is built in the Dutch style, having been a Dutch settlement till 1825, when it was ceded to Britain in exchange for possessions in Sumatra. The Hoogly College is situated here. C. is famed for its cheroots. C. is now included within the Hoogly (Hughli) municipality, and the combined pop. is estimated at 33,060, of whom 26,936 are Hindus, 5903 are Mohammedans, 198 are Christians, and 3 are Jains.

Chintz (Hind. *chhint*, 'spotted cotton cloth;' *chhintâ*, 'spot,' *chhintnă*, 'to sprinkle'), a highly-glazed cotton fabric, the ground of which is usually light, while the pattern, brought out in flowers, foliage, birds, &c., often in four or five gaudy colours, has a spotty appearance. Owing to the glazed facing of the cloth, dust does not readily adhere to it, and therefore it is much used for bed hangings, furniture coverings, &c.

Chiococc′a, a genus of plants of the natural order *Cinchonaceæ*, chiefly belonging to the tropical and sub-tropical regions, and consisting of small shrubs. The roots of all of them are violently emetic and cathartic, and in Brazil are used as remedies for snake bites, though, according to Martius, it is a doubtful remedy, owing to the action of the drug being almost as dangerous as the snake-poison itself. The species chiefly used are *C. anguifuga* and *C. densifolia*. At one time it was used in Europe as a diuretic and purgative, but owing to its violent action precluding its use unless in extreme cases, it is now rarely seen in legitimate medical practice.

Chioggia, or **Chiozza,** a seaport, N. Italy, province of Venezia, 15 miles S.S.W. of Venice, built on piles on an island of the same name, and connected with the isthmus of Brondolo by a bridge of forty-three arches. The harbour is protected by two forts. C. has manufactures of cordage and lace, some shipbuilding establishments, a good coasting trade, and an active fishery. Pop. 28,525.

Chipp′enham (Old Eng. *Cyppenhamme*, a 'marketplace'), a town in Wiltshire, on the left bank of the Bristol Avon, here crossed by a handsome old stone bridge of twenty-one arches, and a station on the Great Western line, 13 miles N.E. of Bath. It has some silk and woollen manufactures; tanning and malting are carried on extensively, and there is a large flourmill. C. has a monthly market for cattle, and its cheesemarket is one of the most important in the empire. Its parish church was restored (1878) at a cost of £6000. It returned one member to Parliament up to 1885. Pop. parl. div. of county 44,358; mun. bor. 4618; reg. sub-dist. 8500; and civ. par. 5392. C. is the place where the Danish army wintered in 878, when Alfred was in hiding in Athelney.

Chiq'uichiqui Palm, a palm of the N. of Brazil, which yields the Piassaba Fibre (q.v.). It is an inhabitant of swampy or flooded lands on the banks of the Rio Negro and other Venezuelan and Brazilian rivers. The leaves are used in thatching. The fibre, which is twisted into cordage, is obtained from the fibres which hang from the leaf-stalks and cover the stem. It is now exported to Britain from Pará.

Chiquimu'la, the name of an isthmus on the eastern confines of Guatemala, Central America. Its breadth from the Caribbean Sea to the Pacific is 150 miles, no part of which exceeds an elevation of 2000 feet.

Chira'ta, or **Chirett'a,** the *Ophelia Chirata,* a plant used in medicine, belonging to the natural order *Gentianaceæ.* It is about three feet long, has the thickness of a goosequill, and the opposite branches flower in panicles. C. is pulled up by the root and dried. It is an excellent bitter tonic, without astringency.

Chiriqui', the name of a river in Costa Rica, Central America, which flows in a northerly direction, and is received by a deep spacious lagoon of the same name, which is separated from the Caribbean Sea by an archipelago, also called C. A mountain peak in the same state is likewise known by this appellation.

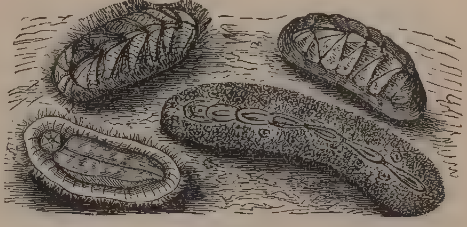
Chirr'a, or **Cherra Pun'ji,** the principal village of the petty state of Cherra, situated in the Khasi Hills, Assam, British India, about 30 miles S. of Shillong, at an elevation of 4588 feet above the sea. It was the headquarters of the chief British official till 1864, when Shillong became used for that purpose. Stone is extensively quarried, and oranges and potatoes are grown for export to Calcutta. Besides these betel-nuts, honey, bamboo (mats and baskets), coal and lime are products of this small state. C. P. is said to be the rainiest spot in the world. The Welsh Calvinistic mission was established here in 1841, and since then has obtained considerable success amongst the native population, which numbers less than 9000.

Chir'u, a species of antelopes (q.v.) found in Tibet and on the Himalayan plateaux. It averages about 2½ feet in height and 5 feet in length, and possesses long annulated horns. A curious soft protuberance exists above each nostril. The C. is gregarious in its habits, and exceedingly wary and shy.

Chis'wick, a thriving village of Middlesex, on the left bank of the Thames, 7½ miles S.W. of St. Paul's (London). The church of St. Nicholas has monuments to Hogarth, Holland the actor, Lord Macartney, the Duchesses of Cleveland and Somerset, the Countess of Falconberg (Cromwell's third daughter), Sharp the engraver, Ugo Foscolo, and many other eminent persons. C. has breweries, coal wharves, and many handsome villas. Here also are the nursery gardens of the Horticultural Society of London, and close by it is Chiswick House, a residence of the Duke of Devonshire. Pop. reg. sub-dist. and civ. par. (each) 21,963.

Chitine'. The solid parts of insects and other articulate animals, corresponding to the skeleton of the vertebrata, are mainly composed of this substance, which derives its name from *chiton* (Gr. 'mantle'). It may be obtained by boiling the wing-cases of beetles (best those of the cockchafer) with water, alcohol, ether, acetic acid, and solution of caustic potash in succession. Thus obtained, C. is a white horny substance, retaining the form of the texture from which it has been obtained. C. appears to belong to the group of bodies called *Glucosides* (q.v.); when boiled with dilute acids, it takes up the elements of water and splits into glucose or grape-sugar and other products.

Chi'ton, a genus of Gasteropodous mollusca, forming the type of the family *Chitonidæ.* These animals are distinguished from all other gasteropods by the possession of a *multivalve* shell, or one consisting of eight transverse plates which overlap each other. By means of the broad ventral foot, the chitons adhere to stones and rocks at low-water mark, after the fashion of the more familiar limpets. The gills form a series of lamellar or plate-like organs, situated posteriorly, and between the foot and the 'mantle' which lines the shell. *C. squamosus* is a familiar species, and *C. magnificus* is also well known. Chitons of large size are met with on tropical shores.

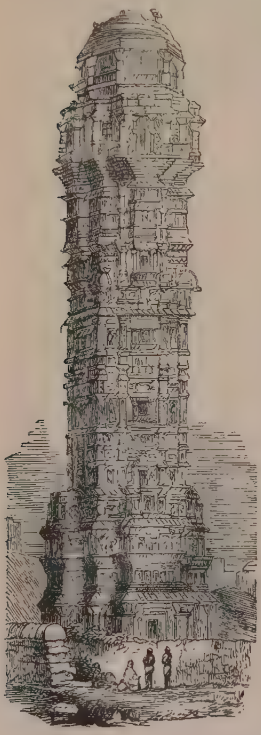


Chiton.

Chitral, a town and district on the southern slopes of the Hindu Kush, through which the Baroghil and Dorah passes lead to Pamir, the outpost of the Russian advance to India. The northern extremity of the Baroghil pass is indeed within 100 miles of Russian territory. The border tribes which inhabit the mountains of C. are hardy, brave, and capable of discipline, but fanatical. Their country extends from Quetta to nearly 100 miles north of Gilgit, and, according to Lord Roberts, 'upon their attitude the successful defence of India must greatly depend.' Owing to the aggressions of a chief, Umra Khan, the Viceroy of India issued an ultimatum to the effect that unless he retired from C., 'a protected state under the suzerainty of Kashmir,' before 1st April, 1895, the Government of India would use force to compel him. Umra Khan did not retire, and an expedition was thereupon despatched against him, with the result that his troops were defeated and he himself was taken prisoner. The sagacity and skill of the leaders of this expedition, and the indomitable steadiness and bravery of the officers and troops under their command met with the recognition and approval of the English Government and people which they deserved. C. has been occupied by British troops, but whether we shall continue to hold the country or retire has not yet been decided upon. It would appear that C. is the one weak spot in our northern frontier of India, where no 'buffer' state, like Afghanistan, exists between British territory and that of Russia.

Chitt'agong, chief town of a division of the same name in the province of Bengal, British India, in the N.E. corner of the Bay of Bengal, on the Kurnafuli river. It is built on the extremity of a spur of hills, separating the Kurnafuli valley from that of the Brahmaputra. On the higher ground are situated the residences of the Europeans, while the native quarter occupies the low lands along the banks of the river. C., formerly called *Islamabad,* was selected by the Portuguese early in the 16th c. as one of their first settlements in this region, and was named by them *Xatigam* or *Porto Grande.* Their energy fostered among the natives a liking for a seafaring life, and to this day C. owns a great many of the native craft that trade about the Indian seas, and supplies a large proportion of the native seamen employed in the Indian marine and merchant service under the name of 'Lascars.' After C. passed into the hands of the English (1760) its prosperity gradually declined, as the produce of the country found its way to Calcutta through the Sunderbunds, though it still continued to build and own a fleet of native vessels, generally styled *Parriahs.* But in 1864 some European merchants began to settle in the place, and its former prosperity is again reviving. Pop. 24,069, among whom are some descendants of the original Portuguese families.—The *division* of C. is flat for about 20 or 30 miles inland, and almost every foot of soil is cultivated. Round the villages are some fruit-trees, but there is no jungle till you reach the hills where the tea estates lie. Area 12,118 sq. miles; pop. 4,190,081. Rice, jute, tobacco, cotton, sugar-cane, corn, and gunny are largely grown and exported. The tea-plant also flourishes, and there is now a considerable tea trade. The wood used in the construction of native vessels is called *jarool*, which, in water, is quite as durable as teak.

Chittagong Wood, the timber of several Indian trees, especially *Cedrela Toona* and *Chickrassia tabularis*. C. W. is valued in India for nearly all the purposes to which mahogany is applied in Britain, more especially when veined and mottled. Furniture made from it is light and beautiful, but apt to warp in dry weather.



Pillar of Victory, Chittor.

Chittor' or **Chittur',** two strong towns in India are so named. 1. C. in the district of N. Arcot, province of Madras, 80 miles W. of Madras, on the right bank of the Puni, a feeder of the Palar, came into the possession of the British in 1801. Some remarkable ancient tombs were discovered in the neighbourhood, not unlike the Druidical remains in Britain. In the hot season (sometimes 140° in the sun) the river and tanks are dried up, and fever, ague, and dysentery prevail. Pop. 9,965.—2. C., a town in the native state of Cochin, where there is a palace of the rajah. One quarter of the town is occupied by Brahmins. The chief trade is weaving. Pop. 11,103.—3. C., formerly the capital town of Odeypore, is 270 miles S.W. of Agra. Numerous temples were built in C. A splendid structure, called the 'pillar of victory,' is to be seen here. Rana Khumbo, ruler of Odeypore from 1418 to 1468, erected it in commemoration of his victory over the armies of Malwa and Gujerat. The height is 122 feet. White marble sculptures decorate the exterior of the pillar, which is made up of nine stories, and is topped by a superb cupola.

Chiu'sa is the name of several small places in Italy, of which the most important are—1. **C. de Pesio,** a town in the province of Cuneo, N. Italy, 8 miles S.E. of Cuneo, with manufactures of silk and glass. Pop. 6565.—2. **C. San Michele,** a village in the province of Torino, N. Italy, on the Dorea Ripense, at the foot of Mount Picheriano, on which stands the once famous Benedictine abbey of San Michele, now a hospice for travellers, and the place of burial of the Sardinian kings.—3. **C. Sclafani,** a town of Sicily, province of Palermo, 33 miles S.S.W. of Palermo, with a pop. of 7355.—4. **C.,** a village of N. Italy, province of Udine, at the southern base of the Carnic Alps, on the Fella, and on the highway from Villach to Venice.

Chiu'si, a town of Central Italy, province of Siena, 37 miles S.E. of Siena, known in antiquity under the name of *Clusium*, one of the twelve Etrurian republics. It is historically famous as the residence of Lars Porsena. On the fall of the Roman Empire it was utterly destroyed. The whole valley in which it lies (*Val di Chiana*) was depopulated, and the place became a pestilential swamp. But in modern times, with improved drainage, C. is again thriving. The excavations of the last forty years have resulted in the recovery of a vast number of Etruscan remains, which are to be seen in the town's museum and also in Florence. Pop. 5270.

Chiv'alry (Fr. *chevalerie*, from *chevalier*, and hence literally meaning cavalry, in which sense the word is still occasionally used in romantic poetry) was a development under the auspices of the Christian Church of the ancient Teutonic custom, by which, after preparatory exercises, and ordeals of skill and courage, the youthful warrior was ceremoniously presented to the tribal assembly, and devoted to the public service. It must not be supposed, however, that the Church took advantage of an existing institution, and adapted it to the defence of the faith against the heathens of the Middle Ages. The fascination of adventure, the excitement of travel and combat, the passionate, if somewhat blind, veneration of woman, even the devotion to religion, then universally symbolised for Europe in one Church of splendid ceremonial and splendid piety; these were all strong, natural feelings, which the white dress, the fast and confession, the purification by water of the neophyte in C., his blessing by the priest, and his oath to defend the Church, served in some measure to express. Of necessity the knights were not free from the superstitious intolerance of their age; their patron saints and the Virgin Mary inspired them to acts of great cruelty and injustice. Much of the literature of C. belongs to the decline of the institution, and may have been written more for amusement than for history. The general tournaments, whether *à l'outrance* or with blunted weapons (the wooden spear-heads were called *rochets*), the special *pas d'armes*, and the judicial combats (in which the *preux chevalier* might always appear for the party without champion) no doubt fostered military skill, and gave the sanction of public renown to the duties of C. One of the most notable of these *pas*, mentioned by Froissart, in whose history is the best contemporary account of military C., was the Just of St. Inglebert, or Sandzing Fields, at which three French knights withstood all comers. The custom of tournaments was shaken by the death in the lists of Henri II. of France (1559). The course of education in C. began when the *page* (about the age of twelve) was placed in the household of some knight or at the royal court, where he learned the use of horses and of arms, the art of hunting, and the duty of serving at table. There was a gentleman-page in the family of Buccleuch so late as the beginning of the 18th c. The page became a squire (Old Fr. *escuyer*, from Lat. *scutarius*, the *scutum* or 'shield'-bearer), who acted as groom and personal attendant on the knight, was entitled himself to carry a shield, and from whom the social accomplishments of the time were expected. If an esquire took a prisoner, the ransom belonged to his master. Later on, there arose a class of independent esquires, who, though never entitled to wear gilded spurs or a complete hauberk, had their own armorial bearings, and led their followers to battle under a pennoncele, or small triangular banner. At the age of twenty-one the squire received the *accolade*, or stroke of knighthood, generally from the knight he had served. This ceremony, performed sometimes on field of battle, often in church, or at a *cour plénière*, consisted in the squire, who had laid aside his brown coat and put on armour, receiving helmet, sword, and spurs, and being dubbed 'Sir' or 'Messire,' 'in the name of God and St. Michael,' or with some other religious formula. Knighthood was a military rank, and conferred the right of assembling, and leading under a swallow-tailed pennon, at least 1000 men. Hence the power of conferring it was latterly monopolised by sovereigns; the knighting of Francis I. by Bayard being altogether exceptional. The surcoat, and the triangular *heater* or buckler shield (both of which bore the scutcheon of the knight), the dagger of mercy, the crest and device (which, like the scutcheon, became hereditary), were characteristic parts of the knight's equipment. When the knights-bachelor had in many cases become poor adventurers, living on the spoils of war or of the tourney, the order of knight-banneret was instituted. This was chiefly a military distinction, confined to knights of wealth and position who could bring to the field fifty men-at-arms with corresponding archers and crossbowmen. It was conferred by the commander-in-chief, who ordered the forked tails of the pennon to be cut off, thus converting it into a rectangular banner. In England a 'banneret' was one who had received knighthood on a field where the royal standard was displayed. The English order of the Garter was instituted by Edward III. after the jealousy of Philippe VI. had destroyed his project of a Round Table at Windsor. The courts of Europe introduced many ornamental titles, which were conferred on royal or noble infants by right of blood as well as on capable knights; and the degree of baronet, invented by James I. ostensibly to encourage the settlements in Nova Scotia and Ulster, being hereditary, was quite opposed to the principles of C. Disgrace of knights occurred on conviction of a heinous crime, or on defeat in the appeal to the judgment of God by single combat. Besides the loss of spurs and swords, peculiar bearings, called abatements, were given by the heralds to disgraced knights. C. first came into definite shape at the end of the 10th c.; its most brilliant period was in the 14th c., and it speedily declined before the introduction of regular mercenary troops, a movement initiated by Charles VII. of France (1445). See Sir Walter Scott's *Essay on C.*, in *C., Romance, and the Drama;* St. Palaye's *Chevalerie, considérée comme un Établissement Politique et Militaire* (Par. 1759-81); and Büsching's *Ritterzeit una Ritterwesen* (Leipz. 1823).

Chiv'alry, Court of, a court of which the Earl Marshal and Lord High Constable were judges. When it was merely a court of honour, the Earl Marshal presided alone, but both judges sat when it was a criminal court. This jurisdiction was established by Edward III., but when it was found to encroach on the common law, its sphere was defined by Richard II. It gave relief in matters of honour to such of the nobility and gentry as proved that they had been oppressed, and it guarded the distinctions of degrees and of quality. It is now quite a thing of the past.

Chivass'o, a town in the province of Torino, N. Italy, on the left bank of the Po, 15 miles N.E. of Turin by railway, has manufactures of earthenware, soap, and bricks, and is noted for its lampreys. The French razed the fortifications of C. in 1804. Pop. 10,137.

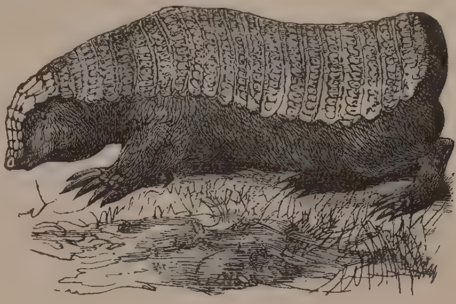
Chive, or **Cive,** a plant of the natural order *Liliaceæ*, and a congener of the leek and onion. See ALLIUM. It is a native of marshy or flooded places in Europe and Asia. It is in Britain a common garden vegetable, used for flavouring soups and dishes, in much the same way that onions are.

Chiz'erot, or **Bu'rin,** a name applied to several communities scattered over Sermoyer, Arbigny, Boz, and Ozan, communes of the department of Ain, and the arrondissement of Bourg-en-Bresse, canton Pont de Vaux. Like the Marans of Auvergne and the Lyzelards of St. Omer, they do not intermarry with their neighbours, who hold them in contempt. They are chiefly labourers, cattle-breeders, and butchers, and are both industrious and rich. The women are fair, pretty, with quick black eyes, and form rather inclined to roundness. An incredible legend gives them a Saracenic origin. The Sermoyers, in particular, have come into collision with their neighbours about the pastures of the Saône.

Chlad'ni, Ernst Florenz Friedrich, the founder of the true theory of acoustics and music, was born 30th November, 1756, at Wittenberg. He travelled for many years through Germany, Holland, France, Italy, Russia, and Denmark, expounding his discoveries in popular lectures, and died 3rd April, 1827, at Breslau.

Chlæna'ceæ, a small order of Dicotyledonous trees and shrubs, containing only eight species, all natives of Madagascar. *Sarcolæna* and *Leptolæna* are examples of the genera, of which there are four described, but the properties or uses of none of the species are known. They are closely allied to *Sterculiaceæ.*

Chlamyph'orus, a genus of Edentate (q.v.) mammals (see also ARMADILLO), allied to the *Dasypodidæ* or armadilloes of S. America, and represented by the species *C. truncatus* of Chili, the average length of which is about 6 inches. The C. is sometimes known as the 'pichiciago.' As in other armadilloes, the integument secretes bony plates, and these are disposed in C. in the form of an armour-casing of square plates, investing the top of the head, back, and hind quarters, the plates terminating abruptly at the hind quarters. The other parts of the body are covered with a silky fur. The feet are provided with strong claws adapted for digging.



Chlamyphorus.

The tail is scaly, and is generally applied closely to the belly; but it has been suggested that it may be used for throwing out the earth behind the animal as it burrows forwards.

Chlo'picki, Joseph, a Polish soldier and patriot, was born in Galicia in 1772, and fought under Kosciusko in 1787. He subsequently served under Bonaparte, commanding the Polish legion at Eylau and Friedland during the Russian campaign. In 1814, on his return to Poland, he was well received by the Czar Alexander; but when the Polish insurrection of 1830 broke out, he was called upon by his countrymen, and made Dictator. The following year he resigned the office, on account of differences with colleagues of more extreme views. After the insurrection was crushed, he retired into private life. He died at Cracow, 30th September, 1854.

Chlo'ral is a substance which of late years has become of great importance on account of its narcotic properties. It was discovered by Liebig in 1832, but was first employed in medicine many years later by Liebreich. To prepare C. dry chlorine gas is passed into absolute alcohol as long as it is absorbed. The resulting liquid is then mixed with three times its volume of sulphuric acid, and allowed to remain for some time at rest, when it separates into two layers. The upper of these is C.; it is siphoned off and purified by rectification. C. is a colourless liquid, possessing a peculiar and disagreeable odour and taste. Its specific gravity is 1·802, and it boils at 99·6°. C. is *Aldehyde*, in which three atoms of hydrogen are replaced by chlorine. C. unites with water to form a crystalline hydrate. This hydrate is the preparation of C. used in medicine. Administered internally or by subcutaneous injection in doses of about 30 grains, it speedily procures sleep. Treated with alkalies, C. splits into formic acid and chloroform—a decomposition which by many has been supposed to occur in the body, thus explaining the therapeutic action of C. On account of the high price of alcohol in this country (owing to the duty), C. is chiefly manufactured on the Continent.

Chlorantha'ceæ, a natural order of Dicotyledonous plants, natives of tropical regions. There are about fifteen species, which possess aromatic stimulant properties. The roots of *Chloranthus officinalis* and *C. brachystachys* are used in Java as stimulants in malignant fevers, &c., and as antispasmodics. The flowers of *C. inconspicuus* (the 'chulan' of the Chinese) are used in China to give the 'cowslip flavour' to tea. Species of *Hedyosmum* are used in the W. Indies for much the same medical purposes as *Chloranthus.*

Chlo'rate of Potash is the potassium salt of chloric acid and has become of importance in the manufacture of fireworks, of oxygen gas for the Lime Light (q.v.), and of Safety Matches (q.v.). It is prepared commercially by acting upon a warm solution of chloride of potassium, in which slaked lime is suspended, with chlorine gas, when in addition to C. of P., chloride of calcium is produced. The solution containing the two salts is evaporated, and when sufficiently concentrated, allowed to cool. C. of P. being far less soluble than chloride of calcium, crystallises out and leaves the latter salt in solution. C. of P. gives up the whole of its oxygen when heated, a reaction which is turned to account in the preparation of that gas. Mixed with charcoal, sulphur, or other oxidisable substances, it forms explosive or combustible mixtures, largely used in pyrotechny. C. of P. is also employed in medicine.

Chlorim'etry is the process by which the available chlorine in *bleaching powder* or *chloride of lime* is determined. By available chlorine is understood the chlorine which is set free when the bleaching powder is treated with an acid. The following is one of the many chlorimetric methods which are in use: it depends upon the oxidising properties of chlorine in presence of water. When arsenious acid is added to a solution of chloride of lime, the chlorine in the latter by removing hydrogen from the water sets free oxygen, which in the nascent state converts the arsenious acid into arsenic acid. From the amount of arsenious acid which can thus be converted into arsenic acid by a given weight of chloride of lime, the quantity of available chlorine in the latter can be determined. The actual process is as follows:—10 grammes of the bleaching powder to be tested are rubbed in a mortar with water, the mixture decanted into a flask, and the mortar rinsed out with water, which is also put into the flask. The contents of the flask are then diluted till they occupy 1 litre. Next, a standard solution of arsenious acid is prepared by warming 6·972 grammes of the acid with a solution of 10 grammes of dry carbonate of soda, till it is dissolved. The solution when cold is diluted to 1 litre. The solutions having been thus prepared, 50 cubic centimetres of the chloride of lime solution (equivalent to 0·5 grammes by weight) are placed in a flask or beaker, and the solution of arsenious acid gradually added from a burette, till a drop of the mixture ceases to strike a blue colour, when placed on a slip of paper which has been soaked in starch paste to which a little iodide of potassium has been added. When this point has been reached, all the available chlorine in the bleaching powder has been used up to oxidise the arsenious acid. With the above quantities every cubic centimetre of the arsenious acid solution is equivalent to 1 per cent. of available chlorine, hence the number of cubic centimetres added to the chloride of lime also represents the percentage of available chlorine in the latter.

Chlo'rine is one of the non-metallic elements, and under ordinary conditions is gaseous. It was discovered in 1774 by Scheele, and was called by him *dephlogisticated muriatic acid.* Sir Humphrey Davy first recognised its true nature, and gave it the name of chlorine from the Greek word *chloros*, signifying pale green.

C. occurs in nature in combination with metals; chloride of sodium or common salt being its most abundant compound. C. may be obtained by heating hydrochloric acid with binoxide of manganese, water and chloride of manganese being the other products of the reaction; also, and more economically, by heating a mixture of common salt, sulphuric acid, and binoxide of manganese. C. at ordinary temperature is a greenish-yellow gas, highly irritating to the lungs and mucous membranes, and exerting a corrosive action on all organised tissues. It is soluble to a considerable extent in water, and forms with that liquid, at a temperature of 0° C., a crystalline compound. Under a pressure of four atmospheres C. condenses to a yellow liquid, but this liquid has never been frozen. C. is not itself combustible, but is a supporter of combustion. A candle burns with a smoky flame when plunged into it. Copper and antimony, in a state of fine division, ignite spontaneously when introduced into the gas. C. has a very strong affinity for hydrogen, and forms with it an important compound called hydrochloric acid. A mixture of C. and hydrogen may be made in the dark without combination taking place, but if this mixture be ignited, an electric spark passed through it, or even be brought into sunlight, the two gases combine with a powerful explosion. The bleaching properties of C. are entirely due to its strong affinity for hydrogen. Moistened coloured fabrics at once lose their colour if plunged into C., but unless they be moist no effect is produced. The reason for this is, that the C. seizes on the hydrogen of the water to form hydrochloric acid, whilst oxygen (the other constituent of water) in the nascent state combines with the colouring matters, forming colourless compounds. C. is employed in immense quantities in the manufacture of *Bleaching Powder* (q.v.). Diffused in small quantities in the air, it is an admirable disinfectant. C. forms important compounds with the other elements, which will be considered elsewhere. Its compounds with oxygen are for the greater part unstable and readily explosive. C. has an atomic weight of 35·5.

Chloroc'odon, a genus of Natal climbing plants belonging to the natural order *Asclepiadaceæ.* The roots, *C. Whitei*, are used by the native tribes under the name of 'mundi' or 'mindi' as a stomachic.

Chlor'oform is a substance of immense value to the surgeon as an anæsthetic. It was discovered almost simultaneously by Soubeiran in France and by Liebig in Germany in 1831. The latter chemist, believing it to be a compound of carbon and chlorine, gave it the name of *perchloride* or *terchloride of carbon;* but in 1835 Dumas discovered its true composition, and observing that when treated with caustic potash, formic acid and chloride of potassium resulted, gave it its present name of C. Its anæsthetic properties were first recognised by Simpson and Bell.

C. is obtained by distilling a mixture of water, lime, chloride of lime (bleaching powder), and alcohol, when it passes over along with water, and is caught in the receiver. Being much heavier than water, C. is readily separated from it by decantation; it is next washed with water to remove alcohol, and later with a solution of carbonate of potash; afterwards it is dried with chloride of calcium and rectified. C. is a colourless mobile liquid of sp. gr. 1·48, and boils at 60·8° C.; it has a pleasant odour and sweet taste. It is an excellent solvent of caoutchouc, phosphorus, iodine, fats, many alkaloids, &c. Good C. is known by the following characters:—it should produce no colour when agitated with oil of vitriol, and no turbidity when mixed with a little water; a few drops evaporated on the hand should leave no unpleasant odour. C. contains carbon, hydrogen, and chlorine. About 2800 lbs. are annually exported from the United Kingdom, and over 2000 lbs. of this amount are sent to British possessions.

Chlor'ophyll, literally leaf-green (Gr. *chlōros*, green; *phullon*, leaf), the substance in the cells of Plants (q.v.) which gives the green colour to the leaves, stems, &c., of plants. In the higher plants C. occurs in grains, each grain consisting of a plastic material and the colouring matter. According to Sachs, starch is formed by the C. granules; but this view, like many others of the same botanist, rests more upon imagination than fact. Withdrawn from the action of light the plant develops no C., and it has also been found that the presence of iron is essential to its formation. At one time it was believed to be only present in plants, but it is now known to give the green colour to *Hydra viridis*, *Stentor*, &c. The very various and often contradictory views which are held regarding it may be found stated in Brown's *Manual*, pp. 23-33, 219, and in Sachs' *Lehrbuch*, and in other recent works.

Chloro'sis, in botany, a disease of plants, consisting of a pallid condition, 'in which the tissues are weak and unable to contend against severe changes, and the cells are more or less destitute of chlorophyll.' It may exist in plants exposed to direct light, and often the best culture will not restore the health of the plant. It is often beyond cure, but the best remedy, according to Berkeley, is to water the plant with a very weak solution of sulphate of iron.

Chlorosper'meæ, one of three divisions of *Algæ* or seaweeds, comprising three species, which have green spores; most of them have also green fronds.

Cho'card, or **Choquard,** the name given to a genus of *Corvidæ* or crows, allied to the choughs, but possessing a shorter bill than the last-named genus. The Alpine crow is the typical species of this genus.

Cho'co, a name given in the U.S. of Colombia, S. America, to a bay, which is also called Buenaventura. It is an opening on the Pacific coast of the republic, in the department of Cauca.

Cho'colate (Sp. *chocolate*, from Mexican *chocolatl; choco*, 'cocoa,' and *latl*, 'water'), the ground seeds of *Theobroma Cacao* (see COCOA) made into a paste and mixed with sugar and various spices, and then formed into moulds and allowed to harden. It is eaten either solid, or dissolved in hot water, and taken like tea or cocoa. It is extensively used, especially on the Continent, and its nourishing qualities were proved during the siege of Paris in 1870-71, when it formed a great portion of the food of the inhabitants. It is adulterated with rice, meal, oatmeal, flour, starch, &c., and with benzoin, storax, &c., in place of vanilla and the other spices used to flavour it.

Choir (Fr. *chœur*, Lat. *chorus*, see CHORUS), that part of a cathedral extending eastward from the nave to the altar, and including the whole area set apart for the celebration of the services of the church. It is generally raised, at least, one step above the nave, and around its sides are rows of seats or stalls. The term is also applied to the staff of choristers or singers of a cathedral or church.

Choir-screen, a partition of open work in wood or stone surrounding the C., and separating it from the nave and side aisles. It is often encircled with niches, statues, &c., which are sometimes coloured and gilt.

Choi'seul, an ancient French family, which takes its name from the lands of C. in Champagne. According to Viguier, its founder was a certain Comte de Bassigny et de Boulogne-sur-Mer, who flourished in the 10th c.; but le Laboureur, whose opinion is more weighty, considers the family an offshoot of the old Comtes de Langres. It was in time divided into four great branches—C.-Beaupré, C.-Gouffier, C.-Praslin, and C.-Stainville—all of which are historically conspicuous, and furnished soldiers, prelates, and statesmen to their country. The last, however, which originated in the marriage of a C.-Beaupré (d. 1711) with his cousin-german Nicole de Stainville, may be regarded as the most illustrious. To it belongs **Étienne François, Duc de C.**, an able and patriotic French statesman in the latter half of the 18th c. He was born 28th June, 1719. After serving as Comte de Stainville with credit in the wars with Austria, he obtained the favour of Madame de Pompadour, and, through her, was appointed ambassador to Rome and Vienna (1756), and raised to the dignity of Duc de C. (1758). Under her he became in reality Prime Minister of France, and made himself very popular by a series of able diplomatic measures. He arranged the 'Family Compact' of the Bourbon sovereigns, secured for his country at the disastrous close of the war in 1763 better terms than had been expected, extended French commerce and influence especially in the W. Indies, where Domingo, Martinique, and Guadeloupe rose into importance, expelled the Jesuits (1764), and almost succeeded in freeing the Church of France from papal authority. For some years after the death of Madame de Pompadour, his influence in France and Europe continued great, and he was nicknamed by the Empress of Russia *Le Cocher de l'Europe* ('The Driver of Europe'). The rise of Madame Dubarry proved fatal to C.'s power, however, and he was compelled (1770) to retire to his estate at Chanteloup. His advice in political matters was frequently taken in the early part of the reign of Louis XVI. He died 7th May, 1785. See the *Mémoires de M. le Duc E. F. de C., écrits par lui-même*, and Soulavie's *Mémoire de M. le Duc E. F. de C.*

Choke-damp remains in coal mines after an explosion of *fire-damp*, and consists of Carbonic Acid (q.v.).

Cho'king, in the human subject, may be caused by any substance, as a piece of meat, being arrested in its passage downwards, before it reaches the stomach, and producing suffocation by pressing on the Trachea (q.v.) or Larynx (q.v.), or by spasm of the muscles of those parts. Unless the obstruction be removed it may speedily produce death. The patient should be made to reject the obstruction by tickling the back part of his throat, or the substance should be forced down into the stomach by drinking water.

Chol'era, most probably from *cholas*, the bowels, and *rheo*, to flow, is one of the most fatal diseases known to man. The suddenness of the attack, the severity of the symptoms, and the great mortality of those affected, all tend to render it one of the most dreaded of diseases. The most prominent symptoms of C. are vertigo, a feeling of oppression in the præcordial region, nausea, griping pains, profuse perspiration, &c. As the disease advances, there is coldness of the extremities; the skin of the hands and feet becomes shrivelled and dusky; the eyes sunken, the features pinched, cramps are felt in the limbs; there are oppressed breathing, intense thirst, rapid and small pulse, and sepulchral voice: the skin becomes cold and clammy, and a peculiar sickly odour is exhaled from the body and breath. Reaction may supervene, or the disease may terminate within a few hours in fatal collapse. The early Sanskrit writers describe a disease called 'Vishuka,' the symptoms of which are identical with those of C. Hippocrates and Galen describe a similar disease in Europe, and Whang-shooho in China. Gaspar Correa, a Portuguese, was the first European who described an epidemic outbreak in Hindustan in 1503, and Sydenham states that C. morbus was raging in London in 1676. C. is endemic in the valley of the Ganges, and in all the large towns along the seaboard of British India, including Chittagong, and part of the Pegu division; but it frequently passes out of the endemic area, and becomes epidemic. C. has visited almost every country, the exceptions being remote islands and isolated populations. Great Britain has been visited four times within the present century (1831-32, 1848-49, 1853-54, and 1865-66). The returns concerning the second, third, and fourth epidemics give 53,293, 20,097, and 14,378 as the number of deaths in England and Wales on those occasions; while 1170 deaths were reported to have occurred in 1866 in Scotland where several counties escaped, and in many the cases of C. were sterile.

In 1869, C. appeared in the government of Kiev, Russia, and in the neighbouring districts, in 1870 it had spread to Moscow, Novgorod, St. Petersburg, and the Baltic provinces. By that time, it was raging throughout S. Russia and in Trans-Caucasia. In 1871 the disease had become generally diffused throughout European Russia, and, advancing westward, it attacked Königsberg, Memel, Danzig, Berlin, Hamburg, and Altona. Later on in the same year, it was carried by the passengers of an emigrant ship from Copenhagen and Christiansand to Halifax, Nova Scotia. Only two cases occurred in England, and these were brought by steamer from Hamburg to Hartlepool. In 1873, there was another outbreak on the Continent. In 1881 there were two contemporaneous inroads of C. into Europe. One line was the same the disease had taken in 1869, the other was from the Persian Gulf, up the Euphrates Valley, through Asia Minor, across to Constantinople and thence northward. In 1883 there was a severe outbreak in Egypt. In 1884 C. again invaded Europe, and commencing at the Mediterranean ports of France, it then attacked Italy, and became somewhat widely diffused throughout the Continent. By the spring of 1885 all traces of C. had disappeared except for a scattered prevalence in Spain, where it showed alarming malignancy during the year and carried off 120,000 persons. France and Italy also suffered during the autumn, but England escaped except for a few cases imported from the Mediterranean. A slight outbreak occurred in 1886 in Spain and Italy.

In Paris alone, 18,402 deaths were due to C. in 1832; 19,184 in 1849; 7626 in 1853-4; 11,008 in 1865-66; and 1708 in 1873. In 1884, France altogether lost 5000 through C., and Italy 14,299. In the latter country there were 3459 deaths from C. in 1885.

In May, 1885, a conference was held at Rome of all the Great Powers to consider the whole subject of C. and, if possible, to devise some plan to prevent any recurrence of the disease in Europe. The representatives of the different countries disagreed on so many points that the meeting broke up without having come to any definite understanding and did not hold any further sittings.

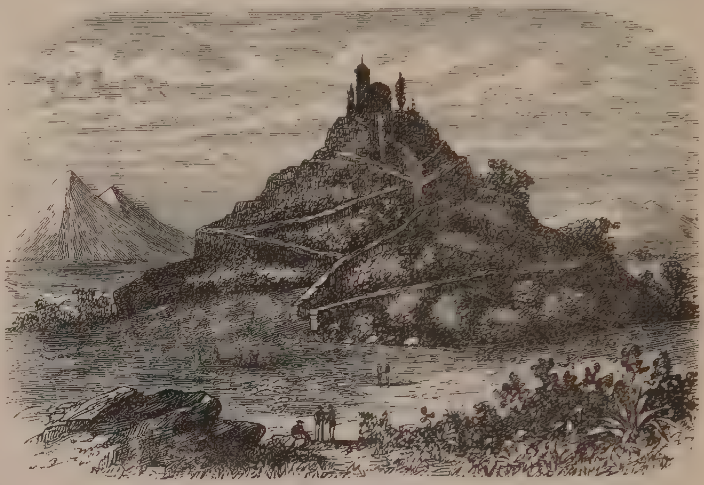
In 1892, Asiatic Russia, Persia, and Turkestan, suffered from a moderately violent outbreak of C. which, however, crossed over into European Russia and killed 300,000 persons. In May and June a few cases occurred in France, and in September and October, although the death-rate rose, the disease seemed to have taken no hold of the country, and eventually disappeared as the cold weather arrived. Hamburg on this occasion suffered severely, the cases were numerous and 9000 deaths occurred. Berlin, Buda-Pest, Rotterdam, and Antwerp were also attacked, but deaths were comparatively few at each town. England again escaped, as did America also, where quarantine regulations were carried out on the strictest lines. During the same year China, where C. is always more or less terribly active, suffered most severely, and in 1893 and 1894 an extremely malignant form of plague decimated the populations of some of the provinces.

C. is propagated along the highways of human intercourse, and its dissemination bears definite relations to that intercourse. The morbific agent has the property of imparting its infective power to large volumes of water, and the danger to which a community is exposed is in exact proportion to the liability of its water supply being contaminated with C. germs. A solitary case may be sterile, or may give rise to a general epidemic, according as the conditions for propagation are present or absent. According to Ernest Hart, C. is 'an exclusively water-carried disease.' At Mecca, in 1865, where the pilgrims used a *single* or common water supply, there were 10,000 deaths in about six days; and in Zanzibar in 1869, where there were many wells liable to contamination, there were 10,000 deaths within six weeks. C. is propagated to distant localities in a few days by those suffering from the disease during the period of incubation; or by means of contaminated clothing, the morbific matter being capable of producing its effects after fifteen or more days; but there is every reason to suppose that tainted water and air are the essential conditions of its local spread. Sanitary and hygienic measures, necessary for the maintenance of the general good health of a community, are sufficient to secure it against the ravages of C., and powers to enforce such measures are vested in local authorities. There is no disinfectant known which has the power of destroying the germs of the disease, but several are of great value, and should be used freely, such as chloride of lime, cupralum, ferralum, terebine, &c. There is no known specific antidote to the disease, but the administration of carbolic acid, on the first accession of symptoms, has been attended with favourable results, and Anti-Choleraic Vaccination, as practised by Pasteur and Hoffkine, is understood to be more or less a preventive to the spreading of the disease.

Choles'terine (*kole*, bile, and *steros*, solid) is a crystalline substance, which was discovered by Conradi in 1775 in human gall-stones. It occurs also as a normal constituent of bile; in the brain, spinal marrow, and yolk of egg, and in various morbid growths. It has also been found in plants, in peas, maize, olives, &c. C. possesses the properties of an Alcohol (q.v.), and is usually regarded as such.

Chol'et, a town in the department of Maine-et-Loire, France, on the Maine, 32 miles S.S.W. of Angers by railway, has large manufactures of cambric, calicoes, flannels, &c., and an active trade in corn, cattle, and wine. The republicans gained two decisive victories at C. during the Vendean war in 1793. Pop. of commune 16,891; of arrond. 123,128.

Cholu'la, an ancient town of Mexico, state of Puebla, 60 miles E.S.E. of the city of Mexico, on the tableland of Anahuac, and 6912 feet above the sea. It was the second largest city of the Aztecs, and at the time of the Spanish invasion had 20,000 houses and 400 temples. Cortes, although received kindly, pillaged the city and slaughtered the inhabitants, pleading in excuse that he suspected treachery. It is now rich in remains, the principal of which is the pyramidal temple of the Quetzalcoatl, 177 feet high, now surmounted by a Catholic church erected by the Spaniards. The pyramid is 160 feet in height and covers 45 acres. The space at the top is over an acre, and its sides, which were cased with adobe, plaster, and stone, are now covered with trees and shrubs. C., in the time of the Aztecs, was considered a holy city and was visited by pilgrims and worshippers of the god, who came from all parts to witness the human sacrifices, which amounted to 6000 annually. A golden collar encircled the neck of the god; he wore tortoise earrings, and a plumed mitre.



The Pyramid, Cholula.

Chon'da, a village in the protected state of Gwalior, India, 18 miles N.W. of the town of Gwalior, and notable as the place where Sir Hugh Gough signally defeated the Mahrattas, 29th December, 1843.

Chon'drine, a substance obtained by boiling the cartilages of an animal's ribs, larynx, or joints in water for forty-eight hours, allowing the fluid to gelatinise, and treating the residue with ether to free it from fat. When dry, C. is a hard, horny, translucent substance, dissolving in hot water, but insoluble in alcohol or ether. It is precipitated by all acids, as well as by alum, sulphate of alumina, acetate of lead, sulphate of copper, ferric and ferrous sulphates, and mercurous and mercuric nitrates. It cannot be supposed to exist as C. in the body, but is the chemical result of certain substances after prolonged boiling in water.

Chondroden'drum, a genus of climbing shrubs belonging to the order *Menispermaceæ*. *C. convolvulaceum* is the wild grape of the Peruvians, so called on account of the form and flavour of its fruits being not unlike that of the vine. The bark is used as a febrifuge.

Chon'etes, an important genus of extinct Brachiopodous shellfish, belonging to the family *Productidæ*. They occur in Silurian and Devonian, but especially in Carboniferous rocks. The shell is concavo-convex, of oblong shape, and with a straight hinge-line. A row of tubular spines exists at the hinge-area of the ventral valve.

Cho'nos Archipelago consists of two large and about thirty small islands, which lie along a part of the W. coast off Chili, and between the island of Chiloë and the peninsula of Taytas. They are extremely barren, and are inhabited only by a few tribes of Chonos, who live by fishing.

Cho'pin, Frederic Francis, a Polish musician, was born

1st March, 1809, near Warsaw, where he studied music under Elsner. Exiled after the revolution of 1830, he took up his abode in Paris. There he was personally very popular; his music also was much admired, but his health was bad, and he suffered much from depression of spirits. He visited England in 1848, and was most cordially received, but the journey seems to have been too much for his strength. He died in Paris, 17th October, 1849. He wrote largely for the pianoforte, chiefly in the form of nocturnes, polonaises, waltzes, &c.; his compositions are full of poetry and imagination. A monument was erected to him at Warsaw in 1869. See the sketches of Liszt (1852), Barbadette (2nd ed. 1869), and Karasowski (1877).

Chop'in, a liquid measure in use before the present system of weights and measures was sanctioned by Act of Parliament. It contained in England ½ pint. In Scotland (under the form *Chapin* or *Chappin*) the name is still applied to a measure, used especially for milk, which is equal to a wine quart.

Chopines.

Chopines, wooden clogs, somewhat resembling those in use at the present day in Japan. At one time C. were generally worn in Italy, whence the fashion spread to England in the 15th c. After the 16th c. they seem to have been no longer in demand. Mention is made of the C. by Shakespeare in *Hamlet* (Act ii. scene 2).

Chora'gic Monuments. The Choregus was the Athenian citizen appointed by his tribe to provide the various choruses that took part in the festive and religious celebrations. The Choregus who was thought to have best discharged this duty received a tripod as a prize. He had, however, to pay the cost not only of the prize itself, but also of erecting a chapel in which it was dedicated. A street in Athens contained so many of these monuments that it was called the Street of the Tripods. The names of the Choregus and his tribe were inscribed on the monument.

Chora'le, the psalm or hymn tune of the Protestant churches of Germany. It has generally a simple diatonic melody, which is sung in unison by the congregation, the harmonies being supplied by the organ, and sometimes by a choir and orchestra. The C. appears frequently in the works of the great German composers, and notably in those of Johann Sebastian Bach (q.v.). Bach's harmonies to many of the old Church melodies, while retaining an ancient form and ancient strict adherence to rule, remain unsurpassed and unsurpassable in intrinsic beauty, and give to the bare melody wonderful richness and loftiness.

Cho'ral Music, a term applied generally to all music written for a choir or chorus having a number of voices in each part. It includes, therefore, oratorios, cantatas, masses, motetts, and most anthems, as well as part songs, madrigals, &c., although it is not often used for the latter. See CHORUS.

Choral Service, the service of the Church of England as generally performed with intoned responses and psalms, and the use of music throughout wherever it is authorised.

Chord, in music, a combination of notes performed simultaneously. Chords may be consonant or dissonant (see CONSONANCE), according to whether the intervals between each one of the notes of the C. and every other are concords or not. The consonant chords are those known as 'common' chords, and consist of a note with a third and fifth above it, or their octaves. When the combination is so made that either the third or the fifth are below the fundamental note itself, the C. is said to be inverted. Common chords may be built upon all the notes of the scale, but the C. of the Mediant (Si or Me) is seldom required, and that of Sub-tonic (Mi or Te) has an imperfect fifth, and on this account has often been excluded from the list of consonant chords. It is so very similar in effect to the much commoner common C. of the dominant with the seventh added ('dominant seventh' C.), that it is in any case unimportant. Common chords are called major or minor, according to the nature of their third. A seventh, a ninth, and so on, may be added to the common chords, and dissonant chords thus constructed. All these chords have their inversions like the common chords, and by this means they have immense variety in construction and effect. The ear can take pleasure in dissonance as well as in consonance, but it cannot dwell upon the former as it can upon the latter, and for this reason the rules of Harmony (q.v.) prescribe certain *resolutions* of the sevenths, ninths, &c., which require to be attended to in all cases except those in which some special effect can be gained by disregarding them. One of the most useful dissonant chords found in modern music is known as the C. of the *diminished seventh*, and consists of three minor thirds, one above the other, as, for example, the G ♯ BDF. Besides its own peculiar effects, which vary very much with the notes of the key of which it is composed, it offers specially great facilities for modulation.

Chord, in geometry, is the straight line joining the extremities of an arc. Tables of chords, so common in old trigonometrical tables, are now superseded by tables of sines, which are much more convenient for calculating purposes. *C. of Curvature* is any C. of the circle of curvature drawn from the point whose curvature is represented by this circle.

Chor'dadorsa'lis, a name given to a delicate semi-transparent thread, at first cellular, but afterwards cartilaginous, which appears beneath the primitive groove in the early embryo. It is seen in the chick as early as three to eighteen hours after incubation. It ultimately contributes to the formation of the bodies of the vertebræ, part of it remaining persistent in the form of the intervertebral disks. It remains persistent in its cartilaginous condition in the lowest or Myxenoid fishes, such as in the lancelet or *Amphioxus lanceolatus*, the lamprey, the sharks, rays, and the *Chimæra*.

Chor'dæ Voca'les are the true vocal chords found in the larynx or organ of voice. They are the superior *thyroanytenoid* ligaments. Attached by one border to the side of the larynx, the other border is free, and by its vibrations, caused by the current of air forced upwards through the trachea by the lungs, voice is produced.

Chore'a (Gr. *choreia*, a dancing or jumping), St. Vitus' Dance, is an affection of the nervous system, characterised by peculiar tremulous movements of certain of the voluntary muscles especially of the face and limbs. It generally occurs in children from six to sixteen years of age, and is more common in girls than boys. C. may be caused by fright, blows, teething, &c. It may be regarded as a form of bad health, and the proper treatment is to try to remove the cause by the use of good nourishing food, with iron tonics.

Choris'ia is a genus of small prickly-stemmed trees of S. America, belonging to the natural order *Sterculiaceæ*. The silky hairs which cover the seeds of *C. speciosa* are used in Brazil (where it is known as *Arvore de Paina*) for stuffing cushions, pillows, &c. The tough bark of *C. crispiflora* is used in the same country for making cordage.

Chor'ley, a flourishing town of Lancashire, on the Chor, 25 miles N.E. of Liverpool by railway, with manufactures of muslins, calicoes, cotton yarn, ginghams, and jaconets. There are also numerous bleachfields and dye-works, and near the town are several coal, lead, and iron mines, and quarries of millstones and slates. Pop. parl. div. of county 67,854; reg. sub-dist. 26,635; mun. bor. and civ. par. (each) 23,087.

Chor'oid, a term applied in anatomy to various textures characterised by a shaggy appearance and a rich supply of blood-vessels. There is the C. plexus, and the C. coat of the eye (see EYE).

Cho'rus, in music, signifies both a composition for numerous voices and the singers who perform the composition. Choruses are commonly parts of some large work, such as an opera or oratorio. In the former they are generally simple in construction, and often in three parts only, and have therefore come to be almost contemptible, while in the latter they play a most important part, and are correspondingly elaborate. The oratorio C. is generally in four parts (soprano, alto, tenor, and bass), but in some cases—notably in Bach's Matthew-Passion and Handel's Israel in Egypt—a double C. is employed.

Chose in Action, a term of English law denoting a thing of which no one has actual possession, and to which a right can only be constituted by legal decree. Thus a debt, or a bond, is a C. in A. According to the Common Law, a C. in A. could not be transferred to a third party; and, with the exception of negotiable instruments, bills of exchange, an *interesse termini*, and one or two other securities, no C. in A. was transferable, without the assent of the debtor, until 1873, when by the Judicature Act of that year every C. in A. became assignable by the assignor doing so in writing to a third party, provided notice were given to the debtor, or any other party from whom the assignor could claim the debt, &c.

C. in Possession, that which a party actually enjoys, having the right to enjoy it.

Chou'ans, the name given to the insurgent royalists of Bretagne, from their first leader, Jean Cottereau, a smuggler and clogmaker, who inherited the sobriquet of Chouan (*chat-huant*, *i.e.*, screech-owl) from his grandfather, so designated from his sad and silent humour. Another explanation of the name refers it to the signal of danger among the smugglers—an imitation of the cry of the screech-owl—which was adopted by the insurgents. In 1792 an insurrection was planned by the Marquis de la Rouarie in conjunction with the brothers of Louis XVI., and communications were opened up with Cottereau, who had organised a band of smugglers. The arrest of the Marquis transferred the chief control of the movement to Cottereau, and the insurrection was henceforth named the *Chouanerie*. After some short-lived successes Cottereau was mortally wounded, 28th July, 1794, near the wood of Misdon, having proved himself an intrepid soldier and a leader of considerable capacity. The movement, however, was not suppressed by the death of Cottereau, but under George Cadoudal (q.v.) and Charette assumed threatening proportions. The events of the 18th Brumaire dashed the hopes of the insurgents, but they were not finally suppressed till 1803, some time after the Vendeans had submitted to the First Consul. Occasional outbursts of an insurrectionary spirit exhibited themselves as late as 1830, following on the insurrection of July.

Chough, a genus of *Corvidæ* or crows, included in the sub-family *Pyrrhocoracinæ*. The C. differs from the true crows in having the bill notched slightly at its tip. The wings are also long and pointed, and the bill slender, long, and of curved shape. The tarsi are either scaly or covered with a single long plate. The choughs are gregarious in habits, and build their nests in rocks, steeples, and like situations. The Cornish C. (*Fregilus graculus*) is the best-known species. This bird is not now peculiar to Cornwall, but may be met with elsewhere, and usually near the sea-coast. It possesses red legs and bill, and is hence sometimes named the Red-legged C. or crow. The Chocard (q.v.), or Alpine crow, is the only other European species of C. The Cornish C. also occurs on the Continent, in N. Africa, Persia, and India. The food consists of grain, berries, and insects.

Chough.

Chrism (Gr. *chrisma*, an 'ointment'), the unguent consecrated by the bishops in the Roman Catholic and Greek Churches for use in the sacraments of baptism, confirmation, orders, and extreme unction; being composed for the first three of oil and balsam (or in the Greek Church forty different spices), for the last, simply of oil.

Chris'ome was a white cloth, which used to be laid on a newly-baptised child after it was anointed with Chrism (q.v.), doubtless a relic of the white robe with which baptised persons were clothed in the early Church. See CANDIDATE.

Christ is the literal Greek translation (*Christos*, 'anointed') of the Hebrew word Messiah, and as applied to Jesus it means that he was the Messiah expected by the Jews.

Christadelph'ians. See THOMAS, Dr. JOHN.

Christ, Orders of. An order of this name was instituted in 1205 by Albrecht, Bishop of Riga, to guard the Christians of Livonia against the heathens. Another was founded by Pope John XXII. in 1322, and reformed by Paul V. in 1615 as the Order of Jesus and Mary. The Portuguese Order of C. was formed in 1317 by Denis, or Dionysius, King of Portugal, from the Knights Templars (q.v.), whom Philippe le Bel expelled from France. The headquarters of the order were first at Castromarino, and afterwards at Tomar, whence they could more easily assail the Moorish kingdom of Granada. They shared in the wars with the Moors, and in the Portuguese expeditions to India. At first they held the lands they conquered, but these were afterwards handed over to the Portuguese crown. They still exist, and are said to possess twenty-six villages. Entrance to the order is granted only to Catholics of high birth.

Christ, Pictures of. In the records left to us of the life of C. there is not a single hint from which we could form the faintest conception of his personal appearance. But very soon attempts were made to satisfy the natural craving, which the early Christians must have felt, to know the personal appearance of one who was so dear to them. Two apparently contradictory views as to what his appearance ought to have been prevailed at different periods, the one being chiefly prevalent in the Eastern Church, the other in the Western, but without any contemporary controversy, as is sometimes asserted. The idea most consonant with the feelings of the humble and persecuted Christians of the second and third centuries, was that expressed in the words of Isaiah liii. 2, 'He hath no form nor comeliness, and when we shall see him, there is no beauty that we should desire him;' and the Christians of this period were ridiculed by Celsus for representing their God as of 'a mean aspect.' But the triumph of Christianity in the 4th c. brought a reaction, and the tendency then arose to represent him according to the words of the Psalm (xlv.), 'Thou art fairer than the sons of men.'

The first definite conceptions of C.'s appearance were portrayed by fictitious descriptions, of which two especially survive: the first in the letter of Publius Lentulus, a fabrication of the 3d c., in which C. is described as 'a man of lofty stature and handsome, with wavy glossy hair, the colour of wine, and golden at the root, flowing down on his shoulders, and parted in the middle; his forehead smooth, his countenance beautiful, with a slight blush, and his eyes bright and sparkling; his beard abundant and reddish, not long, but forked.' Another description occurs in the writings of Joannes Damascenus (8th c.), according to which C. was 'stately, with eyebrows joined together, beautiful eyes, curly hair, black beard, and yellow complexion.' The descriptions, of which these two were doubtless but specimens, were followed by pictures attempting to embody them, for the faithfulness of which various evidence was found, as, *e.g.*, that Luke, as well as Pilate, took C.'s likeness, and that Peter drew it from memory.

There were various legends also regarding P. of C. said to have been impressed upon cloths. One of these was possessed by Abgarus, King of Edessa, who, being afflicted with an incurable disease, and having heard of the miracles of C., sent a letter to him, asking him to come and heal him, on which he received a letter from C. and his portrait impressed on a cloth. According to another legend, a similar portrait came into the possession of Veronica or Bernice, the woman cured by touching C.'s garment (Mark v.) [otherwise merely a woman of Jerusalem, who offered him her veil to wipe his face on the way to Calvary], who greatly desired to have his portrait, and found it impressed on the cloth with which he dried his face on washing when he came to visit her. The woman is manifestly a second invention to help out the first, her name being merely a corruption of *vera icon*, true image, the name given to the picture.

As to the physiognomy given to C. in his portraits, the type of features with which we are now most familiar—oval face, straight nose, and long curling hair parted in the middle—was not invariably adhered to, but was confined to the Byzantine school of art, and even in it was not constant. The fact is, that so long as C. was represented like other men, the type of his head was, generally speaking, the characteristic head of the different nations. He was left with a character of his own only when the Italian masters of the Renaissance, headed by Fra Angelico, gave a personal individuality to those about him, and then the characteristic expression which above all was given to him was *sympathy*. Perhaps the noblest conception of the Son of Man to which art attained was that of Leonardo da Vinci, in his picture of 'The Last Supper.' But the attention of the great painters was devoted to depicting the features of C. when dead or glorified rather than when alive; the Madonna and Child being also a favourite subject. See Lord Lindsay's *History of Christian Art* (Lond. 1847), *The History of Our Lord, &c.* (1864), by Mrs. Jameson and Lady Eastlake, and a series of articles in the *Art Journal* for 1861.

Christ or **Chris Cross Row,** the alphabet arranged in the form of a cross, with the letter A at the top and Z at the foot.

Christ'church, a municipal and parliamentary borough and seaport in the county of Southampton (Hants), at the confluence of the Avon and the Stour (hence its old English name *Tweon-ea*, 'between the rivers'), 24 miles S.W. of Southampton. The priory church (restored 1861) dates from the reign of William Rufus, and contains an old sculptured altar-piece said to be one of the finest in England. There is also a free grammar-school. C. has breweries and some manufactures of watch-springs and hosiery. Pop. parl. bor. (which includes the parishes of Holdenhurst and C.) 53,270; mun. bor. 3994; reg. sub-dist. 54,217; and civ. par. 25,476. Roman remains have been found in the neighbourhood.—*C. Bay* is a spacious harbour, with a double tide every twelve hours, but is obstructed by a moving sand-bar, so that vessels drawing 5 or 6 feet can only enter at high tide. C. returns one member to Parliament.

Christ-Church, one of the chief towns of New Zealand, and capital of the province of Canterbury, is situated on the E. coast of South Island, on Pegasus Bay, to the N. of Banks' Peninsula. It lies on the river Avon, 9 miles from the port of Littleton by railway, and is also the point where two coast lines of railway, from N. and S. respectively, converge. There is an extensive export trade, chiefly in gold, wool, corn and flour, gum, and preserved meats. Pop. 16,223.

Christ-Church, The Cathedral of. The foundation at Oxford of C.-C. was projected on a scale of great magnificence by Cardinal Wolsey, who in 1526 obtained from Pope Clement VII. a bull for the suppression of twenty-two monasteries, the site of one of which he selected for the erection of a college, to be called in honour of himself Cardinal College. On his disgrace in 1529, Henry VIII. took possession of it, and three years later refounded it as King Henry VIII.'s College, a title exchanged in 1546-47 for that of C.-C., which it still bears. The foundation consisted of a dean, eight canons (since reduced to six), one hundred students (to which one was added in 1664, by a benefaction from William Thurstone, Esq.), eight chaplains, a schoolmaster and organist, eight clerks and eight choristers. The canonries, which at first had no duties assigned to them, have been from time to time annexed to professorships in the university, and no canonry can now be held except by a professor, the archdeacon, or the sub-dean. Under the Ordinances of 1858 and 1867 and the statutes of 1882, the students were divided into two classes, official and non-official. These students are equivalent to the Fellows of other colleges. There are now five official students and twenty-six non-official; also two lecturers, twelve honorary students, forty-three scholars (three elected annually from Westminster School), two Dixon scholars, two Indian Civil Service scholars, thirteen College Exhibitioners, three Fell Exhibitioners, six Westminster Exhibitioners, seventeen Careswell Exhibitioners, two Holford Exhibitioners, one Dukes Prize (French), and one Slade (German) Exhibitioner, besides six chaplains, &c. The members on the books are 1352, not including unmatriculated members of the choir. The college has the patronage of ninety benefices.

Chris'tening, as a synonym for Baptism, properly conveys the notion that a person is made a Christian in, or by, that rite; and is used in this sense by those who believe in baptismal regeneration, but is also used without any such reference.

Christian, the name of nine Kings of Denmark, of whom the following are the most notable:—**Christian I.,** son of Dietrich, the Lucky, Count of Oldenburg and Delmenhorst, born in 1426, became King of Denmark in 1448, and was King of Sweden from 1457 to 1467. He founded the University of Copenhagen in 1478, and died 22nd May, 1481.—**Christian II.,** King of Denmark and Norway, and Duke of Slesvig-Holstein, surnamed the Wicked, was born at Nyborg, Fünen, 2nd July, 1481. He was elected heir-apparent to the throne of Sweden in 1499, and became King of Denmark and Norway in 1513. To ally himself to the most powerful house in Europe, he married Isabella, sister of Karl V., at Copenhagen, 12th August, 1515. Meanwhile he sought to develop the trade of Denmark, and raise the status of the burgher class, after the model of the Netherlands, thereby exciting at once the jealousy both of the Hanse towns and of the nobility. His war against Sweden (1518-20) was marked by a horrible massacre known as the 'Stockholm Blood-bath,' which roused the Swedes to assert their independence under Gustavus Vasa (q.v.). Attacked by the Hanse towns, and abandoned by his Danish nobles, C. fled for safety and help to Holland (1523), returned and landed in the S. of Norway 1531, but was defeated and taken prisoner at Aggerhuus in 1532. He died 25th January, 1559, a captive in the castle of Kallundborg.—**Christian IV.,** King of Denmark and Norway, and Duke of Slesvig-Holstein, was born at Fredricksburg, Zealand, 12th April, 1577. After the death of his father he was elected by the States to the throne, 4th April, 1588, and undertook the government of the kingdom himself in 1596. Though bold and enterprising, his foreign policy was unsuccessful, with the exception of his war against Sweden (1611-13). Fortune favoured him neither in the Thirty Years' War nor in his second Swedish war (1643-45); but he was, notwithstanding, the most popular sovereign of the Oldenburg stock. His legislative and administrative reforms were highly beneficial to his country; he did much for the development of trade and commerce, and acquired Tranquebar, the first Danish colony in the E. Indies. He died 28th February, 1648.—**Christian VII.,** King of Denmark and Duke of Slesvig-Holstein, was born at Copenhagen, 29th January, 1749, and succeeded his father, Fredrick V., 14th January, 1766, marrying the Princess Caroline Matilda of England on November 8th of the same year. Soon after he exhibited symptoms of mental aberration, and the possession of supreme authority became the subject of factious strife. For some time Court Bernstorff and the ministers of the late king administered the state, but in 1770 they fell before the influence of Struensee (q.v.), who in turn succumbed to the superior energy and sagacity of the queen-mother, aided by her son Prince Fredrick. Henceforth C. was king only in name. His son, Fredrick VI., 14th April, 1784, displaced his uncle, the crown-prince, and the queen-dowager, and assumed the government himself, assisted by the advice of the young Andreas Peter Bernstorff. C. died 13th March, 1808.—**Christian VIII.,** King of Denmark and Duke of Slesvig-Holstein and Lauenburg, was born 18th September, 1786. He was acting as Stadtholder in Norway when his father, Fredrick, by the treaty of Kiel (14th January, 1814), was compelled to cede that country to

Sweden. C. tried to maintain himself in the country by the force of popular feeling, but an English fleet and a Swedish army were too much for him, and he was compelled to withdraw. Succeeding his father as King of Denmark in 1839, the remainder of his life was devoted to the purpose of thoroughly incorporating the Slesvig-Holstein duchies with the Danish monarchy. He died 20th January, 1848, in the midst of a work that led to the gravest European complications, but the issue of which has been very different from what C. anticipated.

Christian Charity, Knights of, a French order founded by King Henri III. for the support of meritorious officers and soldiers who had been maimed in warfare, the revenues of which were drawn from all the hospitals in the kingdom. Henri IV. gave solidity to the institution by placing it under the charge of the marshals and colonels of France. It was the germ of *Les Invalides*, founded by Louis XIV., on the model of which the British hospitals of Chelsea and Greenwich were founded.

Christian Connection, in the United States, is a sect formed from offshoots of the Methodist, Baptist, and Presbyterian Churches in the early years of the present century. Its members regard the Bible as their only rule of faith and practice, and 'Christian' as their only name, but they deny Christ's divinity. They practise immersion and encourage revivals. The body has churches, colleges, academies, and periodicals.

Christian Knowledge, Society for Promoting, under the patronage of the Queen, and the presidency of the Archbishop of Canterbury, is the oldest association of the kind in connection with the Church of England. Established in 1698, under the name of 'The Society for the Propagation of the Gospel,' chiefly by the exertions of Thomas Bray, who afterwards distinguished himself as a missionary in Maryland, and wrote *Proposals for the Encouragement and Promoting of Religion in the Foreign Plantations*, it was incorporated under its present name in 1701. Its object is chiefly the establishment of churches, schools, and libraries, and the circulation of Bibles and other religious literature in the colonies, where its income is chiefly expended. The central offices are in Northumberland Avenue, London.

Christian'ia (Norw. *Kristiania*), the capital of Norway, romantically situated on the innermost bay of the C. Fiord, which stretches 70 miles N. from Skager Rack. It lies in a fine valley, at the base of the Egeberg, a wooded mass of gneiss, and is the residence of the king, and the seat of the government, of a bishop, and of the superior courts. Its chief buildings are the old feudal castle of Aggerhuus, a fine modern cathedral, a university (since 1811) with 1290 students, and a library of 170,000 books, a royal villa (Oscar's Hall) of Gothic architecture, an exchange, and a theatre. The town is now lighted with gas, and supplied with water from the beautiful Maridall Lake. There are large manufactures of cottons, woollens, paper, oil, soap, brandy, beer, tobacco, &c., and an export trade chiefly in timber, skins, iron, herrings, anchovies, and game. C. has regular steamboat communication with various ports of Germany and Britain, and is the key to the railway system of Scandinavia. Imports in 1893 were valued at £5,441,645 and exports at £1,677,515. In 1892, 2270 vessels of 923,996 tons entered, and 1467 vessels of 621,692 cleared the port, which is free of ice for eight months of the year. In the fiord, near C., are many picturesque islands, on one of which (Hovedö) stands the ruins of a convent founded by Cistercian monks from Lincoln in 1147. The vicinity is rich in the wild scenery of fiord, and fell, and rushing river. Pop. 151,239. C. occupies the site of the old royal town of Opslo, which was burned by Christian IV. in 1624 to make way for the present city.—The *stift* or *province* of C. has an area of 10,347 sq. miles, and a pop. of 576,436. See *Norway: an Illustrated Handbook for Travellers* (Lond. Trübner & Co.).

Christiani'ty is the religion founded by Jesus Christ (q.v.), by whom, its professors maintain, the highest manifestation of God to man was made. As compared with other systems of religion—Polytheistic, Dualistic, Pantheistic—C. is to be considered Monotheistic. Here, however, a distinction is made by some between the C. of Christ and that of the Church, which latter is charged with running into Ditheism (see CHRISTOLOGY), a charge, however, always strenuously repelled by the Church. The C. of Christ had for its essential features the 'fatherhood of God and the brotherhood of man; the necessity and the value of the feelings of repentance, and assurance of pardon; a faith in the unseen and eternal, in the ultimate triumph of good and subjugation of evil, and in a retribution which shall render to every man according to his deeds.' The sum of this religion was a divine life springing from faith in God; or, as the apostles preferred to conceive it, from faith in Christ as the Revealer of God. No other religion depends so much on the person of its founder as C.; other religions rest exclusively on the teaching of their founders, but it, on what Christ was and did. The earliest Christian writers soon began to maintain that moral transgressions were of less importance than errors in doctrine, and the C. of the Church by-and-by came to be identified with a belief of the elaborate system of doctrine which was gradually developed during the first six centuries.

It is interesting and instructive to notice how far the Christian ceremonial in honour of Christ corresponds with the pagan Sun-worship, and even how far incidents in the life of Christ coincide with the same. In the worship of Hercules, Adonis, Apollo, Bacchus, Mithra, Krishna, &c., the sun was adored as incarnate in human form, born of a virgin, underground (the birthplace of Christ is now shown in an underground grotto), in his infancy subjected to perils, and afterwards killed through the serpent or principle of evil, but by his death redeeming mankind, rising again and ascending into heaven, to become the arbiter of life and death. The birthday of the sun-god was at the winter solstice, at which time falls also the Christian festival of Christmas; and he rose again from the dead at the spring equinox, at which time is the festival of Easter (q.v.). Similar coincidences exist in connection with the Virgin Mary (q.v.). Even the sacrament of the Eucharist or the Lord's Supper has a remarkable coincidence with the Eleusinian mysteries, from which the name of Holy Mysteries, as well as some of its rites and symbols, were borrowed, including the monogram IHS surrounded by (the sun's) rays of glory. These Greek letters, representing **I**akchos **E**mōn **S**ōtēr (Bacchus our Saviour), are made to represent the Latin words Jesus Hominum Salvator (Jesus the Saviour of men), although the Greek character H is E, not H. It is not, however, to be supposed that these coincidences in any way invalidate the claim of C. to be considered a religion of divine origin. The life of Christ was not an artificial, imaginary, or non-natural life; on the contrary, it was profoundly real and human. What else, then, could be expected, but that in its great outlines it would exhibit striking resemblances to the lives of heroes and demigods in all the legends of religious history? A divine life must have innumerable 'imitations.' Men everywhere, but most conspicuously in the higher forms of ethnic religion, are ever striving after that ideal which was revealed in the Son of God. Moreover, it should not be forgotten that when C. came into the world it did not find the religious sentiment a blank, or religious rites and usages unknown. The earth was full of these. C. appropriated them wherever this could be done without hurt to its divine character. Half the ritual of the Church has its root in Roman or Teutonic paganism; but it is puerile to argue on this ground that C. has a pagan element. It drew to itself, baptised and purged of all impure or discordant associations, the numberless usages of an overthrown worship, but it did this in obedience to a wise instinct, and by doing so, consciously or unconsciously, testified to the sincerity of its pretensions as a universal religion.

The period when C. arose was that of the Mishnic development of the Talmud, and such terms as redemption, baptism, grace, faith, salvation, regeneration, Son of Man, Son of God, kingdom of heaven, were household words of Talmudic Judaism. The ethics, also, of the Talmud and of C. are, in their broad outlines, identical, including the golden rule, which was quoted as a well-known saying, 'comprising the whole law,' by Rabbi Hillel, who died when Jesus was ten years old. The glory of C. is not to have invented these ideas, but, as has been said, 'to have carried those golden germs, hidden in the schools and among the silent community of the learned, into the market of humanity.' C. was also affected by pagan philosophy, chiefly through the Alexandrian Philo, whose theology was 'in great measure founded on his peculiar combination of the Jewish, the Platonic, and the Neo-Platonic conception of God.' The teaching of the Jerusalem rabbis —*e.g.*, Hillel and Gamaliel—was tinged with Philonism, and the Apostle Paul, the disciple of the latter, was undoubtedly imbued with these Alexandrine ideas, which he introduced into C.

See Parker's *Discourse of Religion ;* Paley, Chalmers, &c., on the *Evidences ;* Greg's *Creed of Christendom* (3rd ed. 1874) ; E. Deutsch on the *Talmud* (*Quart. Rev.* October, 1867, or *Lit. Rems.* 1874) ; Philo's Works (cf. Jones's *Ecclesiastical Researches*) ; Milman's *Hist. of C.*

Chris'tiansand (Norw. *Kristiansand*), the harbour and chief town of a province of the same name, Norway, in the *amt* or *bailivik* of Mandal, at the mouth of the Torredalselv (*Otteraa*), on the Christiansandfjord, is the seat of a bishop and of the provincial courts, and is also a naval station, with a growing trade in wood, copper, iron, dried fish, salmon, &c. It is also a naval arsenal, and forms the central point of the Scandinavian steam navigation. There are manufactures of leather, tobacco, cotton, and beer, besides extensive dyeworks and shipbuilding yards. The cathedral is the principal building. Pop. 12,813. C. was founded by Christian IV. in 1641, after whom it is named. The province or *stift* of C. lies in the S.W. of Norway, includes the districts of Nedenäs, Lister, Mandal, and Stavanger, with Bratsberg, and has an area of 15,811 sq. miles, and a pop. of 368,823.

Chris'tianstad (Swed. *Kristianstad*), a fortified town of Sweden, and capital of a province of the same name, on the estuary of the Helge, in the Baltic, 270 miles S.W. of Stockholm by railway. It has an arsenal, a fine church, a senate-house, several high-class schools, and its manufactures are chiefly woollens, leather, gloves, and tobacco. Pop. 10,670. C. was founded in 1614 by Christian IV., from whom it takes its name. The *län*, or province, has an area of 2486 sq. miles, and a pop. of 207,165.

Chris'tiansted, the capital of the Danish island of St. Croix, W. Indies, lies on the N.E. coast of the island, and is defended by a battery. It is the residence of the Danish governor of the W. Indies, and has a good harbour and some trade. Pop. 5027.

Chris'tiansund (Norw. *Kristiansund*), a town frequently confounded with Christiansand, is situated in the amt or bailivik of Romsdal, in the N. of Norway, and has an export trade in wood and fish. It was a flourishing place of trade in the 17th c., and bore the name Lille-Fosen till 1742. Pop. 11,905.

Christi'na, Queen of Sweden, the only child of Gustav Adolf and of Maria Eleonora, Princess of Brandenburg, was born 6th December, 1626. She succeeded her father in 1632, assumed the reins of government in 1644, and in 1650 was crowned *king*. The originally masculine character of her mind was intensified by a too robust education. She hated to be dressed like a woman, often clothing herself in male attire, and was keenly fond of riding and hunting. Yet for some years she ruled with vigour and intelligence, patronising scientific and learned men. Indeed, so long as the great chancellor Oxenstierna lived she did well. But eccentricity, if not insanity, began to develop itself in her, and in 1654 she abdicated the crown in favour of her cousin, Karl Gustav, reserving to herself sufficient revenues to maintain her in royal state. C. next went to Rome, and embraced Roman Catholicism under the name of Alessandra. For a time she resided in France, where she incurred great odium by the execution for treason of her equerry, the Marquis Monaldeschi. Attempts subsequently made on the crowns both of Sweden and Poland failing, she spent the remainder of her life in Rome in artistic and scientific studies. She died 19th April, 1689. C. left behind her some small works, which may be found in Archenholz's *Memoiren der Königin C.* (Berl. 1751-60). The genuineness of the 'Letters' which appeared under her name in 1762 is undoubted.

Chris'tison, Sir Robert, D.C.L., born 18th July, 1797, at Edinburgh, where his father, the late Alexander Christison, was Professor of Humanity in the University. After graduating here in 1819 as M.D., C. spent some time in London and Paris, applying himself to the study of toxicology, in connection with which his name is deservedly famous. After his return to Edinburgh, he was appointed Professor of Medical Jurisprudence in 1822, and ten years later Professor of Materia Medica, which chair he resigned in 1877. His *Treatise on Poisons* (1829) has a world-wide reputation, and is the standard work on the subject. C. was Ordinary Physician to the Queen in Scotland, was twice President of the Royal College of Physicians, was created a baronet in 1871, was President of the Royal Society of Edinburgh (1868-73), received the degree of D.C.L. from Oxford (1866), that of LL.D. from Edinburgh (1872), and died at Edinburgh, 27th January, 1882.

Christ'mas is the anniversary of the birth of Jesus Christ, observed on the 25th December. The Western Church, in which it appears as generally celebrated after the middle of the 4th c., has always kept to this day; the Eastern observed it first on the 20th April or 20th May, then, along with the Feast of the Epiphany (q.v.), on the 6th January, but at the close of the 4th c. altered its practice to suit Western usage. St. Chrysostom, in advocating this change in the East to the true day, which, formerly uncertain, had been made known by some coming from the West, indicates the existence of a tradition in the West that the angel appeared to Zacharias to announce the birth of John the Baptist on the great day of atonement—23rd September, from which C. was reckoned. Nine months from this date gives 24th June, John Baptist's Day ; and six months more (cf. Luke i. 26 and 36) gives 25th December. This was the date of the great heathen festival of midwinter, and it may be that the tradition was moulded to suit that circumstance. The winter solstice was the birthtime of the sun about to return towards the earth, which was celebrated with all manner of rejoicing and revelry. At Rome this was the Saturnalia (q.v.), which included the Sigillaria or *festival of the infants*. The Church was probably unable to abolish the pagan revelry, but it could at least surround it with other and more sacred associations, and thus gradually wean its converts from all memories or attachments incompatible with their new faith.

Christmas-Box, a gift in money which it was formerly a prevailing custom in England to give on the day after Christmas—Boxing-Day—to domestic servants, apprentices, &c. Tradesmen used to be expected to give a C.-B. to the male and female servants of their customers ; even messengers and other subordinate Government servants looked for it from their superiors. The usage led to so much abuse, the recipients becoming clamorous for it as a right, that tradesmen in London and elsewhere put notices in their windows that the payment of a C.-B. had been discontinued ; and Government backed them in putting an end to it by discontinuing, at Christmas, 1836, the customary gifts. Since then the practice has been on the decrease, but postmen, among others, still expect their C.-B.

Christmas Carols, festal chorals or part-songs, still sung in many rural districts of England in celebration of Christmas. (The word 'carol' is the French *carole*, Ital. *carola*, 'a round dance ;' probably from Lat. *corolla*.) These songs, while mainly religious, were also at times quite secular in their feeling, as one may see from the 'Wassailers,' 'Boar's Head,' and 'Holly and Ivy' C. C. ; but those most popular now are either legendary and narrative, as 'God rest you, merry gentlemen,' or filled with a jubilant religious spirit, as the '*In Excelsis Gloria*' (supposed to have been written about 1500), 'Christ was born on Christmas-Day,' 'Hark ! all around the welkin rings,' &c. Regarded strictly as songs of joyous thanksgiving and praise commemorative of the birth of the

Saviour, the antiquity of the C. C. must reach back to an early period in the history of Christian nations. The most ancient known, however, date from the Middle Ages, and consist generally of portions of miracle-plays, mysteries, and legends. The earliest English C. C. date from the 15th c.; and they continued to be commonly sung down to the reign of Charles I. The Puritans suppressed them, and all other old Christmas customs, by Act of Parliament; but they came into favour again at the Restoration, after which period a number of free and noisy carols were composed. Since then C. C. have gradually fallen into disuse, except in the remoter country districts. The C. C. belong distinctly to the ballad form of poetry. The 'Carol for St. Stephen's Day' is identical in tone and poetic structure with the earliest English and Scotch ballads; and a similar license of incident and expression was claimed by the writers of carols and the contemporary writers of ballads. For example, a number of C. C. have sprung out of a miracle-play, in which Adam, Eve, Herod, and the Duke of Marlborough figure among the *dramatis personæ*. Again, in the carol 'I saw three ships,' the author says, 'O they sailed into Bethlehem,' thus performing a geographical feat equal to Shakespeare's anchoring his fleet in Bohemia. Many of the old C. C., however, are of high merit, and give expression to pure religious feeling in language at once simple and picturesque. Collections of C. C. have been published by Davies Gilbert, Sandys, Rimbault, and Thomas Wright. See also *A Garland of C. C., Ancient and Modern*, edited by Joshua Sylvester (Lond. 1861).

Christol'ogy is the doctrine of the Church regarding Christ. The two influences which were at work in the Church in the first and second centuries—the Hebrew and the Greek—gave rise at once to two antagonistic systems of C., that of the Ebionites (q.v.), and that of the Docetæ (q.v.) and Gnostics (q.v.). According to the former Jesus was a mere man; according to the latter, his body was a mere phantom possessed by a divine being; and the history of C. till the beginning of the Middle Ages is simply a history of the continual tendency of popular piety to exalt the divine element in his nature.

Before the time of Christ the notion of one supreme deity had undergone some modification. The primal deity had been removed entirely beyond the sphere of human sense, and his intercourse with man was supposed to be carried on, and even the creation of the world to have been effected, by an intermediate *inferior* being. This doctrine prevailed from Greece to China. It was the basis of the Indian religion and philosophy, of Zoroastrianism, Platonism, and the Platonic Judaism of Alexandria. According to the Jewish rabbis, the ordinary medium of intercourse between God and the prophets was the Memra or Divine Word, a name which occurs in the Indian, Persian, Platonic, and Alexandrian systems. The great master of the art of allegorising Scripture was Philo of Alexandria, who, in entire ignorance of Jesus, described the Word (Gr. *logos*) as 'the Son of God the Father,' 'the first-begotten of God,' 'the image and likeness of God,' 'the instrument by whom the world was made,' 'the light of the world,' 'alone able to see God,' 'the shepherd of God's flock,' 'the physician that heals all evil,' &c. In the Epistles of Paul and John, and that to the Hebrews, in the Fourth Gospel, and in the Apologies of Justin Martyr, the same ideas regarding the Word are applied to Jesus of Nazareth. By the middle of the 3rd c. this doctrine of the Word, variously understood—the expression 'Son of God' being adopted by Origen—was generally accepted both in the East and in the West; although not without protest from some, hence called Alogists, to whom it appeared that this doctrine of a God of secondary rank incarnate in Jesus was closely akin to Ditheism. To avoid this, therefore, the theory, first propounded by the Shepherd of Hermas (q.v.), that the Son was simply the man Jesus possessed by the Spirit of God, was extended and completed by Sabellius (q.v.), according to whom the three names of Father, Son, and Holy Spirit signified merely three modes of the deity. Another form of the Unitarian protest was typified in the theory of Paul of Samosata, according to whom the Word was, in God and man alike, the principle of thought, by the action of which Jesus became perfectly united to God, and in him God revealed himself to save the human race.

The orthodox doctrine of the Church at the end of the 3rd c. was expressed by the Council of Antioch (269), which condemned Paul of Samosata, when, seeking to avoid both Sabellianism and Ditheism, it decreed that the Son was not consubstantial with the Father. But the tendency was still further to glorify Christ. For logically stating the subordination of the Son implied in the decree of the Council of Antioch, Arius was condemned as a heretic by the Council of Nice (325), which at the same time decreed that the Son was consubstantial (Gr. *homoousios*) with the Father, and perfect God. A middle party between the Arians and the orthodox, hence called Semi-Arians, charged the latter with Sabellianism, and adopted themselves the term *homoiousia* (Gr., similarity of substance); but that party triumphed which most exalted Christ, because they were moving with the current of popular sentiment, while the others were striving against it.

But now arose the difficulty of how to adjust the humanity of Jesus to his perfect deity. Apollinaris did not hesitate to say that a god-man was a logical monster, comparable to a minotaur, and held that the *soul* and *body* in Jesus alone were human, while the Word supplied in him the place of the *mind* in other men, and that he had thus in reality only one nature. Apollinaris was condemned by the Council of Constantinople (384), but his ideas survived under the name of Monophysism (q.v.). To avoid annihilating either the one nature or the other, theologians were driven now to speak of the two natures as separate. Consequently Nestorius (q.v.) refused to call the Virgin Mary *Mother of God*, because, he said, she could only be the mother of the human nature assumed by the Logos. But popular piety demanded this also; Nestorius was condemned by the Council of Ephesus (431), and with the materials now collected the *Athanasian Creed* (q.v.) was constructed, which contains in its essential points the C. which is held both in the Roman Catholic and Protestant Churches.

At the Reformation the C. of the reformers turned on their theories regarding the Lord's Supper. Luther adopted the view called Communion of Attributes, which amounts to this, that the human nature of Jesus had become a participator in the proper attributes of deity. Calvinism greatly toned down the harshness of the notion of personality as applied to the Trinity, the persons being simply divine attributes, which is very like Sabellianism, and denied that worship should be paid to Christ. The scattered Unitarianism of the 16th c. took the name of Socinianism, and maintained that the doctrine of the Trinity is a patent and crying contradiction in itself, and is besides opposed to the idea of the divine perfection. Arminianism taught what very closely resembled the Arianism of the 3rd c. In more recent times there has arisen a feeling of reluctance to pursue C. as a branch of theological speculation. Experience has convinced religious men that it is not a fit subject for precise and dogmatic expression. Yet it cannot be said that there is any visible leaning towards the old Arian or Unitarian view; there seems rather to root itself deeper and deeper in the Christian conscience an indestructible sense of the unique grandeur of Christ's nature, which better accords with the mysterious teaching of the Church than with the Rationalistic protest. See Hagenbach's *Hist. of Doctrine*, Reville's *Deity of Christ*, and Dorner's *History of the Development of the Doctrine of the Person of Christ*.

Chris'tophe, Henri, King of Haiti, born in Grenada, 6th October, 1767, of negro parents, and for some time a slave, became in 1793 one of the leaders of the black insurgents against the French, and in 1797 was raised to the rank of brigadier-general by Toussaint-l'Ouverture. In 1802 he defended Cape Town against General Leclerc, who had conducted an expedition from France to regain Santo Domingo from the blacks. On the death of Dessalines, C. intrigued to succeed him, but Petion, a man of colour, proclaimed a republic at Port-au-Prince. C., however, contrived to have himself proclaimed President of Haiti for life (17th February, 1807), and in 1811 he took the title of King as Henri I. He next created a nobility, established a code of laws, encouraged education, and imitated as far as practicable the proceedings of Napoleon. On the death of Petion in 1818, he attempted to unite the S. and W. of the island with the N., but was defeated by General Boyer, the successor of Petion. An insurrection broke out in 1820, and C., deserted by his bodyguard, shot himself, 24th October, 1820. He was a man of courage, energy, and considerable accomplishments.

Chris'topher, St. (Gr. 'bearer of Christ'), in the tradition of the Church a saint, reputed to be a native of Syria or Palestine, and a martyr, under Decius, in the 3rd c. A.D. He is represented as a man of huge size and strength, who did penance for his early sins and personal attendance on the devil by carrying pilgrims across a river. Once, says the legend, he carried over Christ in the form of a little child, who, when he was sinking under his burden, bade him push his staff into the ground, where it changed before the next day into a fruit-bearing palm. This miracle led to numerous conversions. Relics of C. are especially abundant in Spain. Carved and painted representations of him were very common in mediæval churches. He was invoked during plagues, and to drive away the spirits guarding hidden treasures, was assigned tutelage over fishing, and was very popular among the lower classes, who held a figure of St. C. to be a preventive of secret dangers. Thus Chaucer's yeoman carried 'a Cristofre on his brest of silver schene.' An order of St. C. was founded in Austria in 1517. The Greek Church holds his festival on the 9th of May; the Roman Catholic on the 25th of July.

Christopher's, St., or **St. Kitt's**, one of the Leeward Islands, called by the natives 'the fertile isle,' was discovered in 1493 by Columbus, who gave it his own Christian name, and colonised in 1623 by the English, who were confirmed in their possession of it by the Treaty of Utrecht (1713). It lies N.W. and S.E., and is 23 miles in length, with a very unequal breadth. Area, 89½ sq. miles; pop. 30,876, of whom only 2343 are white. Rugged, sterile mountains of volcanic origin, containing brackish hot springs, traverse the island, culminating in Mount Misery, an exhausted volcano, with a height of 3711 feet. Sugar, rum, and molasses are the staple exports. It has a rich, fertile, and highly cultivated soil; pasture and woodlands ascend almost to the mountain summits. The climate is dry and healthy. The soil is particularly adapted for sugar plantations. The capital is Basseterre (q.v.). In 1866 St. George's Church was built here at an expense of £15,000; and on 31st July, 1865, a terrific fire took place, in which 1000 houses were destroyed, but fortunately only one life was lost.

Christ's College, Cambridge, into which was merged an earlier college founded in 1439 by Henry VI., was founded in 1505 for a Master, 12 Fellows, and 47 scholars, by the Lady Margaret, mother of King Henry VII., and enriched by Edward VI., Sir John Finch, Sir Thomas Baines, Mr. Christopher Tancred, and others. Its scholarships and fellowships have frequently been increased in value. Among the most celebrated students at C. C. have been Bishop Latimer, Milton, Henry More, Ralph Cudworth, and Archdeacon Paley. The college has the presentation to eighteen livings. The fellowships are now divided into senior and junior, and are open, as are the scholarships, to all the subjects of the Queen, without restriction. There are now fifteen fellows, two honorary fellows, thirty-seven scholars, one exhibitioner, and four Tancred students. There are now 680 members on the boards.

Christ's Hospital, popularly known as the Blue-Coat School, and situated in Newgate Street, London, is one of the five great hospitals of the metropolis, and was founded on the solicitation of a number of citizens by Edward VI. a few days before his death, for orphans and foundlings, the site of the building being the Old Greyfriars Monastery. Frequent reforms, the chief of which were made by the governors in 1856, have practically converted C. H. from an hospital into a public school for the sons of London Freemen and Anglican clergymen; but the picturesque dress—a blue tunic and petticoat, yellow breeches and stockings, red waistband, and a worsted cap—has with the exception of the petticoat and cap remained to the present time. Various changes have been introduced into the curriculum and conduct of the school. Under the scheme, compiled by the Charity Commissioners, which came into force in 1890, two day-schools for 600 boys and 400 girls were opened in addition to the hospital or boarding schools—London senior boys 700; Hertford junior boys 120, and girls 350. The Council of Almoners are authorised to examine into each case of admission to the boarding schools, and, if they be of opinion that the parents or next friends of a pupil can afford the contribution, a charge of £10 to £20 may be made. As regards the admission of the children to the boarding schools: 325 presentations belong to the President, some of the City Companies and certain officials, 100 nominations may be made by the Council of Almoners (43 members), and 150 places in the schools are thrown open to competition among children approved of by donation governors. The other places are filled up by 179 children from the public elementary schools of the metropolis, subject to success in the competitive examination, by 12 children nominated by parishes which before 1890 possessed the right to nominate, and by 384 children nominated by the governors of endowed schools after a school attendance of two years. The income of C. H. amounts to between £50,000 and £60,000, the original foundation having been enriched by various subsequent ones, particularly that of King Charles II. of £7000. In 1683 a preparatory school was founded for both girls and boys at Hertford, the former, however, remaining there permanently, while the boys go to London when they are old enough. The age of entrance is nine, and of leaving fifteen, although 'King's Boys' (those who attend the mathematical school, founded by Charles II.) and 'Grecians,' *i.e.*, the highest class, eight of whom are sent on scholarships either to Oxford or to Cambridge, remain longer. Besides these scholarships there are several exhibitions, prizes, and other scholarships. The building of C. H. has had numerous vicissitudes; it was destroyed in the Great Fire of 1666, and has been twice rebuilt, first by Sir Christopher Wren, and secondly, in 1825, by Shaw. The number of masters, including lecturers, at the London Hospital School is thirty and the subjects taught include classics, mathematics, modern languages, drawing and music; boys who require it are trained for commercial posts. Some very eminent men have received the earlier part of their education at C. H.; among others Camden, Stillingfleet, Richardson, Coleridge, Charles Lamb, and Leigh Hunt. Attempts have been made to remove the London scholars to the country, and a site has actually been purchased, but owing to the strong opposition of certain persons who support the school, no further steps have been taken. For interesting accounts of the school, see, among other books, *Annal of C. H. by a Blue*, and *Taunton's Great Schools of England.*

Christ's Hospital.

Chromat'ic passages, in music, are passages proceeding by, or containing, intervals differing (by a semitone in tempered instruments) from those of the ordinary or diatonic scale of the key in which the passages are written. They are used for the sake of variety or piquancy, or to attain some special effect, and under these circumstances are agreeable; but if employed too often, the ear tires of them, and the music (as is so often the case with Spohr's compositions) loses strength and vigour. The expression *C. scale* is often (incorrectly) applied to a series of consecutive semitones like the notes of the pianoforte.

Chromatic, in optics, opposed to Achromatic (q.v.).

Chromatics, that part of optics which treats of colour. A pencil of sunlight, when passed through a prism, decomposes into a beautiful series of various coloured tints, passing by continuous gradation into each other. Newton believed this series to be composed of seven primary colours, the intermediate shades being produced by the intermixture of two of the primary ones. It was Brewster's opinion, and in this he is supported by Clerk-Maxwell, that there are only three primary colours—red, yellow, and blue. See SPECTRUM ANALYSIS.

The colours of natural bodies are dependent upon their power of absorption for the different coloured rays. Every body, if thin enough, is transparent; hence, if a pencil of light fall upon a body, it penetrates to a certain distance, and naturally a portion of the radiant energy of the light is absorbed and transformed into another kind of energy, probably heat. If blue be absorbed in this way, the body will appear orange; if green, red; and so on. The varied tints of mother-of-pearl are due to reflection from a corrugated surface.

Chrome Alum is the double sulphate of chromium and potassium, analogous in composition to the double sulphate of aluminium and potassium, or alum. It may be obtained in large violet octahedra by a spontaneous evaporation of its solution, prepared by boiling a solution of bichromate of potash to which oil of vitriol has been added with alcohol, as long as the smell of aldehyde is perceptible. Solution of C. A., if prepared in the cold, is violet coloured, but when heated becomes green, and from this green solution no crystals separate; on standing for some weeks, however, the green solution becomes violet, and deposits the salt.

Chrome Green (the sesquioxide of chromium) is a beautiful dark-green pigment used in painting porcelain and as an ingredient in green glass and enamel.

Chrome Red (a basic chromate of lead), of various shades of red and orange, is used in calico-printing and the arts generally.

Chrome Yellow (chromate of lead) is most useful in the arts, and exhibits distinct shades according to the mode of its preparation, known as *lemon yellow*, *Paris yellow*, *Leipsic yellow*, &c.

Chro'mium is a metal, and was discovered in 1797 by Vauquelin in a Siberian mineral, called by mineralogists *red-lead*,—a compound of C. with lead and oxygen. C. derives its name from the fact that its compounds are coloured (Gr. *chroma*, 'colour'). Its most abundant ore is *chrome iron*, a compound of its oxide with oxide of iron. The colours of *emerald*, *olivine*, *serpentine*, *spinelle*, &c., are due to its presence. Metallic C. may be obtained by subjecting a mixture of its oxide and charcoal to an intense white heat. It is steel-grey in colour, brittle, and after having been fused, is so hard that it will scratch glass. Its atomic weight is 52·4. Bichromate of potash is the most important compound of C., and from it all other derivatives of the metal are prepared. It is manufactured for commercial purposes by strongly heating chrome iron (previously reduced to a fine powder) with a mixture of carbonate of potash and nitrate, in a reverberatory furnace. After a sufficiently long fusion the resulting mass is broken up and treated with boiling water, when chromate of potash is dissolved out. In order to convert the chromate into bichromate, the solution of the former is mixed with acetic acid, and the whole evaporated to the crystallising point, when the bichromate separates in large prisms, having a beautiful orange-red colour, whilst acetate of potash remains in solution.

Chro'motism, or **Chromism,** a disease of plants consisting of an unnatural colouring of leaves, such as when they become red, variegated, &c.

Chro'motype. Under this name Robert Hunt published in 1843 a photographic process, in which a solution of sulphate of copper and bichromate of potash is employed to prepare a sensitive surface, nitrate of silver to develop the picture, and washing in water to fix it. The process never had any great success, but it is recommended as yielding excellent results in copying botanical specimens and engravings.

Chron'icle (Fr. *chronique*, Lat. *chronica*, from Gr. *chronos*, 'time'), a form of history in which events are narrated simply according to their sequence in time. Chronicles exist both in prose and rhyme. Much of early European history is preserved in this shape. For our own country, the most valuable record of this kind is the old English *C.*, commencing with the Christian era, or rather with the invasion of Britain by Julius Cæsar, and reaching down to the accession of Henry II.

Chron'ogram, or **Chron'ograph** (Gr. *chronos*, 'time,' and *gramma*, 'a letter,' or *graphein*, 'to write'), a device by which a date is expressed by certain letters of an inscription being printed in a larger type than the others. In the C.—

georgIVs DVX bVCkIngaMIæ,

from the name of George, Duke of Buckingham, the date, MDCXVVVIII. (1628), is that of the year of his assassination by Felton. The close of the Seven Years' War is thus finely expressed—

Aspera beLLa sILent: reDIIt bona gratIa paCIs;
O sI parta foret seMper In orbe qVIes,

which gives the year 1763. An anagram was sometimes united with a C., as in this on General Monk—

GeorgiVs MonCe DVx de AumarLe,

which is intended to be read thus—

Ego Regem reduxi, Ano. Sa. MDCLVV.

Chron'ograph, an instrument for registering very small intervals of time. The principle upon which all such instruments depend is that of uniform motion. A graduated dial-plate or cylinder is made to rotate uniformly under the action of clockwork, and a mark or dot is made at the instant of occurrence of any phenomenon. The permanent mark is made either by the observer himself, as in Benson's race-C. and in Strange's astronomical C., or by the action of electric currents and electro-magnets. To this latter class belong the chronographs of Navez, Boulengé, Leurs, Noble, and Bashforth, whose work on the *Motion of Projectiles* gives descriptions of two of his instruments, and accounts of interesting experiments upon the velocities of bullets. See also Owen's *Modern Artillery*.

Chronol'ogy is the science of the measurement of time. That part of it which treats of the units of time as regulated by the heavenly bodies is properly Theoretical or Mathematical C.; that which treats of the methods adopted by different nations of dividing these units into smaller, and uniting them into longer periods of time is Technical or Applied C., and that which treats of the lapse of time in the history of nations is Historical C. The principal parts of the first two of these divisions will be found discussed under HOUR, DAY, WEEK, MONTH, YEAR, &c.; only the last can be briefly noticed here.

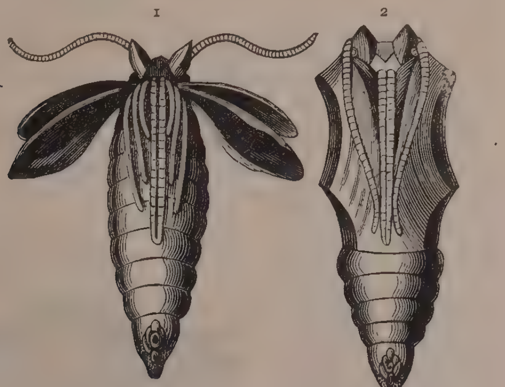
To fix the *date* of an event is to tell how long ago it happened. This is done by counting the time, measured by years, &c., from some *epoch*, that is, a point of time marked by some very striking event. A long period of time, which is measured by events in it being reckoned from a certain epoch, is called an *era*. Thus all Christendom reckons its time from the birth of Christ, and the period from that epoch to the present time is the Christian era. The Greeks reckoned from the first Olympiad at which the victor's name was recorded, *i.e.*, B.C. 776; the Romans from the foundation of Rome, B.C. 753; the Mohammedans from the flight of Mohammed, A.D. 622. The Egyptians, Hindus, Chinese, Assyrians, Babylonians, Persians, &c., all had their systems of C. The Hebrew system has always been regarded by Christians, who hold the Hebrew Scriptures to be inspired, as the most important, because by it the age of the world and of mankind is supposed to be fixed. According to Hebrew C., which is counted almost entirely by lives of men, from the Creation to the Deluge (q.v.) was 1656 years, from the Deluge to the birth of Christ, 2348. In modern times the science of geology has shown this 6000 years to be too short for the age of the world and of man; and authentic records of the Egyptians and Assyrians have shown the time allowed from the Deluge to be too short. Accordingly various plans have been adopted for allowing more time, without imperilling the infallibility of Scripture. The latest chronologers, on this principle, taking into account the variations of the LXX., &c., fix the Deluge at B.C. 3099, or 3159, and the creation of Adam about B.C. 5361, or 5421.

Chronom'eter (Gr. *chronos*, 'time,' and *metron*, 'a measure'), the name usually given to an instrument, constructed upon the same principle as a watch, but much more delicate and trustworthy, the irregularities arising from changes of temperature and other external influences being as far as possible compensated for. The C. is indispensable for the determination of longitude at sea. See Horology.

Chron'oscope (Gr. *chronos*, 'time,' and *scopos*, a 'mark'), one of the many inventions of Sir Charles Wheatstone, is an instrument which is capable of measuring the duration of short-lived flames, and of showing discontinuities in certain luminous streaks. A mirror is made to move rapidly in such a manner that the reflection of a continuous flame would be a complete circle, that of a flame of short duration a greater or less arc, that of an instantaneous flash a point, and that of a discontinuous flame a succession of points. The electric spark is found by this means to be instantaneous.

Chru'dim, a walled town of Bohemia, on the Chrudimka, about 62 miles S.E. of Prague, with a splendid collegiate church, a Capuchin convent, and high school. Cloth is manufactured, and there are great horse markets. Pop. town 12,220; district 48,338.

Chrys'alis (Gr. *chrusallis*, 'the gold-coloured sheath of butterflies'), the name popularly applied to the second or pupa stage in the metamorphosis of insects, and more notably to those pupæ which exhibited golden spots or lustres. There are infinite variations, not only in the coloration, but in the general form and attachments of chrysalids, and for fuller information the reader may consult the articles Insect, Transformation, Metamorphosis, Butterfly, Moth, &c.



Chrysalis of large Tortoise-shell Butterfly, magnified.

1. With the upper parts opened; 2. With the upper parts pressed down and adhering to the body.

Chrysanthemum (Gr. *chrusos*, 'gold,' and *anthemon* =*anthos*, 'a flower,'), a genus of Herbaceous or somewhat shrubby plants, belonging to the natural order *Compositæ*, chiefly natives of the temperate parts of the Old World. There are only two native species in Britain, the ox-eye daisy and the corn-marigold, the former having a white flower with a yellow disk, the latter a bright yellow flower, often very common in corn-fields. Many foreign species have been long cultivated in our gardens, but the flower popularly known as the C. is *Pyrethrum Sinense*.

Chrysipp'us, an ancient Greek philosopher, born in Cilicia, B.C. 280. After losing his property, he attached himself to the Stoic lecturer Cleanthes, became the head of the Porch, and attacked with great spirit and a keen logic Epicureans, Academicians, and Aristotelians. It is said that he was for a time converted to scepticism by Arcesilaus, and then composed his work on Custom. Undoubtedly C. was more accurate than his predecessors, tracing the Cataleptic Phantasm (or true perception) to repeated and intense modifications of the soul, and taking as the principle of duty the nature of man, and not of the universe. The latter view he carried into great detail, insisting on the duty of preserving health and of acquiring riches, while still condemning most of the emotions to eradication. C., who was said to have written 700 books, discoursed on the education of children. In logic his name is connected with the elaboration of the *Sorites*. In physics he adopted the usual optimist theory of the Stoics based on a passive matter and an active reason. Only fragments of his numerous writings remain. See Petersen's *Philosophiæ Chrysippeæ Fundamenta* (Hamb. 1827).

Chrys'is (Gr. 'golden'), a genus of Hymenopterous insects, including those forms popularly known as 'ruby-tailed' flies. The *C. ignita*, or 'ruby-tail' of this country, is the most familiar species. These insects belong to the tribe *Tubulifera* of the Hymenopterous order, and are generally found on walls, palings, sandbanks, and like situations. The larvæ of C. attack bees in their hives.

Chrysobalana'ceæ, a family of Dicotyledons allied to the order *Rosaceæ*, of which order, indeed, it is sometimes looked upon as only a subdivision. There are nearly 100 species—all trees or shrubs—natives of the tropics of the Old and New Worlds, though more abundant in the latter.

Chrysobalanus, a genus of plants of the natural order *Chrysobalanaceæ* containing four species, natives of the tropical parts of Africa and of America. One of the most common species is the cocoa-plum, which in the W. Indies forms a favourite conserve with the Spanish colonists, especially in Cuba. The kernels yield a fixed oil, and when made into an emulsion they are said to be a useful medicine.

Chrys'oberyl (Gr. *chrusos*, 'gold,' and *berullos*, a 'gem'), a transparent or translucent gem of great hardness, composed of alumina and glucina, coloured various tints of pale green by protoxide of iron, and sometimes with a bluish-white opalescence internally. When cut in facets, it exhibits a resplendent lustre almost equal to the yellow diamond. The opalescent variety shows best *en cabochon*, that is, with a convex surface The C. is chiefly found in alluvial deposits of rivers of Brazil and Ceylon; it also occurs in granite of the Mourne Mountains, in Ireland, and a variety called *Alexandrite*, after Czar Alexander I., is obtained from mica-schist in the Ural Mountains.

Chrysochlo'ris, a genus of Insectivorous mammalia represented by the golden mole of S. Africa. The C. resembles the Common Mole (q.v.) in form, but is somewhat less in size. Its peculiarity consists in the iridescence of its fur; the beautiful play of metallic tints and lustres exhibited by this form procuring for it its name of golden, changeable, or shining mole. The *setæ* or bristles of the sea-mouse amongst the worms of *Annelida* (q.v.) exhibit the same iridescent lines. The front feet have four toes, and the hinder ones are five-toed. No outer ears and tail are developed. The teeth of both jaws fit exactly into each other, and the food consists of insects and worms.

Chrysocoll'a, an impure hydrous silicate of copper of a green or bluish-green colour, found associated with copper ores. C. means 'golden glue,' an illusion to its resinous lustre and transparent edges.

Chrys'olite (Gr. *chrusos*, 'gold,' and *lithos*, 'a stone'). Transparent greenish-yellow crystals of olivine are so called. They are seldom an inch long, and are little used in jewellery on account of their brittleness. The best stones are brought from the Levant. *Peridot*, which, like the C., is a silicate of magnesia coloured by protoxide of iron, is sometimes used synonymously with it; but peridot is much softer, and of a yellowish-green colour.

Chrysolo'ras, Manuel, one of the scholars who promoted the great revival of learning, was born of noble family, at Byzantium, about 1350. He was sent, probably in 1389, by Joannes Palæologus, the Byzantine emperor, to France, Italy, and England to solicit aid against the Turks. Though his embassy was not successful, C. made many friends in the W., and in 1397 he settled, as teacher of Greek literature, at Florence, where he attracted numerous audiences, and had among his pupils Aretino, Guarini, Leonardo Bruni, Poggio, and Filelfo. He taught also at Milan, Pavia, and Rome, where he won the esteem of the Pope, who intrusted him with a mission to the Emperor Sigismund. He died on 15th April, 1415, at Constance, whither he had gone in 1413 to represent the Greek Church at the Council held there. C. is the author of numerous works which exist in MS. in the different libraries of Italy. Only two have been printed, the *Erotemata* (1488), a Greek grammar, 'the first, and long the only channel to a knowledge of that language, save oral instruction' (Hallam's *Intr. to Lit. of Europe*, ch. i.); and *Epistolæ tres de Comparatione veteris et novæ Romæ* (Par. 1655).

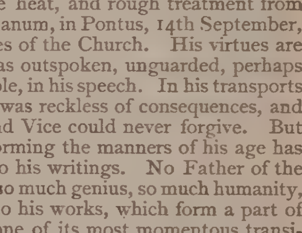
Chrys'oprase (Gr. *chrusos*, 'gold,' and *prasinos*, 'leek-green'), a variety of chalcedony, of an apple or leek-green colour, due to the presence of oxide of nickel. It is found in Lower Silesia, and in different localities in the U. S., and although made into brooches, bracelets, seals, &c., it is not held in great esteem by jewellers. The chrysoberyl of the ancients is supposed to have been C.

Chrysosple'nium, a genus of Saxifrages. *C. oppositifolum* and *alternifolum* are two common British species, the former being, however, rather more generally distributed than the latter. There are various other species scattered over the world, but none of any great beauty. In the Vosges they are used as a salad under the name of *cresson de roche* (rock cress).

Chrys'ostom, Joannes, Archbishop of Constantinople, and the most eloquent of the Christian Fathers (hence his name, Gr. *Chrusostomos*, 'golden-mouthed'), was born at Antioch in 347. His father Secundus, imperial general in Syria, died shortly after C.'s birth, but his pious mother Anthusa, who had been left a widow at the age of twenty, procured for him the best teachers in all the branches of learning. At first intended for the law, he studied rhetoric under the great pagan Libanius, who said, with bitterness on his deathbed, 'I would have left the care of my school to Joannes, but the Christians have snatched him from me.' After remaining three years with Bishop Meletius, he was induced to receive Christian baptism, abandon his profession, and enter the Church. He then spent six years of ascetic seclusion in the mountains of Antioch, engaged in a profound study of the Scriptures under the abbot Diodorus (afterwards Bishop of Tarsus), and having for companions Basil (St.), Gregory (Nazianzen), and Theodore (of Mopsuestia). Worn out with austerities, he returned to Antioch, and was ordained a deacon by Meletius in 381, and a priest by Flavianus in 386. For twelve years he preached at Antioch, delivering an immense number of sermons, orations, and homilies. Eutropius, the minister of the Emperor Arcadius, had heard the great preacher, and now inveigled him to Constantinople, much against his will, to fill the vacant archbishopric. But his life was too austere, his discipline too strict, and his denunciation of every kind of profligacy and error too faithful for that corrupt metropolis: the lax clergy (headed by Theophilus, Patriarch of Alexandria), many courtiers, and the Empress Eudoxia, combined against him, got him condemned by a packed synod (403). The charges brought against him were secret intemperance, inhospitality, violence towards his own clergy to the extent of striking them, reckless dissipation of the wealth of his church, impious and arbitrary acts, infractions of canonical laws, toleration of pagans (whom he too easily admitted to baptism), and an attachment to the doctrines of Origen. That C. indignantly repelled these accusations mattered nothing. The forty-five bishops were bent on his ruin, and they succeeded. C. was banished. When the populace of Constantinople heard the news they were stirred with fierce indignation. It was thought prudent to bring the great preacher back from his exile at Prinetos, in the Gulf of Nicomedia. But only a few months later he burst forth in church with a stern denunciation of the excesses that had marked the games held in honour of the empress. Eudoxia was furious. A council was again held at Constantinople, and the previous condemnation was confirmed. It was in vain that C. appealed to the Pope. Rome was helpless. The Goth was almost at her gates. On the 20th of June C. was carried off from his see by an armed force. His residence was fixed at Cucusus, in Armenia; but when his indefatigable pen, and the fame of his apostolic virtues, made him as powerful in adversity as on his episcopal throne, Arcadius ordered him to be transported to the remotest limits of the empire, under the shadow of Caucasus. On the way thither he sank under the fatigue of the journey, made on foot, the heat, and rough treatment from his guard; and died at Comanum, in Pontus, 14th September, 407. C. is one of the heroes of the Church. His virtues are noble and exalted. He was outspoken, unguarded, perhaps we may even say ungovernable, in his speech. In his transports of Christian indignation he was reckless of consequences, and uttered words that Pride and Vice could never forgive. But this sacred passion for reforming the manners of his age has given an immortal vitality to his writings. No Father of the Eastern Church has thrown so much genius, so much humanity, so much of his own age into his works, which form a part of Byzantine history during one of its most momentous transitions. They embrace homilies, sermons, commentaries, and epistles. Of the complete editions we may note those of H. Savile (Eton 1612); and Montfaucon and the Benedictines (1718-38).

Chrys'otype (Gr. *chrusos*, 'gold,' and *tupos*, 'impression'), a photographic process invented by Herschel, and one among the many modes of directly receiving the impression upon paper. The paper is prepared by immersion in a ferric salt, which is reduced by the action of light to a ferrous salt. Upon the reduced portions metallic gold is then precipitated, and the picture fixed by several washings in water and in a weak solution of potassic iodide.

Chub, a Teleostean fish, included in the Carp family, and found in most English and southern Scotch rivers. The average weight is about five pounds. It is coloured of a bluish-black on the upper parts, and silvery-white beneath. The sides of the head and gill-covers are yellow. It also occurs in European rivers, and spawns in April and May. The flesh is somewhat coarse, and hence the C. is not esteemed as a table-fish. The food consists of worms and insects; and the C. may be caught by means of insect-bait—real or artificial. The flesh is most seasonable in June or July. The scales used to be employed, like those of the dace and bleak, in inlaying-work, and in manufacturing artificial pearls.



Chub.

Chubb, Thomas, one of the English Deists of the first half of the 18th c., was born at East Harnham, near Salisbury, 29th September, 1679. First a glover, then a chandler in Salisbury, he was essentially an illiterate man, but had a mind which was fascinated by the theological controversy then raging, and he acquired facility in writing by making notes and observations on the deistical writings which were eagerly read by him. He produced a multitude of tracts similar to the writings of the time on the same side. C. died at Salisbury, 8th February, 1747. His posthumous works were published in 1748.

Chuck-Will's-Widow, a Fissirostral bird, belonging to the order *Insessores*, and to the family of Goatsuckers. This name is applied to it from its peculiar cry. It inhabits the southern regions of the U.S. of America, and is allied to the Whip-poor-will (q.v.).

Chucui'to, a town of Peru, department of Puno, on the W. shore of Lake Titicaaca, 15 miles S.E. of Puno, was a flourishing place till the 18th c., when it is said to have had a pop. of 300,000, which has now dwindled to 4520.

Chumbul' or **Chambal'**, a river of India, rises in the Vindhya range, and in the Malwa agency, flows N. and N.E. through a region of wild beauty, and joins the Jumna 90 miles S.E. of Agra, after a course of 570 miles. It has a rapid current, and receives many affluents, of which the chief are the Kally Sind, Parbutti, and Bumnass.

Chu'nam, the Indian name for lime obtained by calcining sea-shells, as well as for mortar or plaster prepared from it. The walls of houses in Madras usually receive three coats of plaster, the two first being composed of lime and fine river-sand, and the third of lime mixed with 'jaggery' (palm-sugar), and moistened with a strong infusion of coco-nut husks. When polished with rock-crystal rubbers, and stained, the plaster resembles the finest marble, and indeed almost equals it in durability.

Chunar', or **Chanar**, a town in the district of Mirzapore, N.W. Provinces, British India, on the Ganges, 17 miles S.W. of Benares. It has a strong fortress, overlooking the native town, and containing an old palace, an excavated well, a hospital, a prison, &c. The British gained possession of C. in 1764, and it was here that the treaty between Warren Hastings and the Governor of Oude was signed in 1781. Pop. 11,423.

Chuquisa'ca, also **Sucre**, formerly **Charcas** or **La Plata**, the capital of Bolivia, S. America, on the Chachimayo, in a sheltered plain 9000 feet above the sea. It is the seat of the government and of an archbishop, has a cathedral and other churches, a palace, the University of St. Xavier, a hospital, and a military academy. Pop. 24,120. C. was founded by the Spaniards in 1538, on the site of the native *Choqua Chaka* (*i.e.*, 'Bridge of Gold'), and received the name of La Plata from being near to the silver mines of Porco. Sucre, its latest name, was that of a general in the war of Bolivian independence. The *province* of C. contains rich silver mines and splendid antiquities, and has an area of 39,871 sq. miles, and a pop. of 285,980.

Church. It has been suggested that the word C., in Old Eng. *circ*, *cyrc*, or *cyrice*, is the Latin *circus*, and that it was first applied to the stone circle or Druidical temple of the Britons, and afterwards transferred to the Christian building. But this would leave unexplained the occurrence of the word in the other Teutonic tongues—*e.g.*, Dutch *kerk*; Ger. *kirche*. It is therefore more probable that the origin of the word is the Gr. *kuriake*, 'the Lord's house;' though it is sufficiently perplexing to understand how a nation like the English, who got their religion from Rome, should not have adopted the Roman name for a C. Perhaps Theodore of Tarsus, Archbishop of Canterbury, himself an Eastern by birth, may have had something to do with it. Its use among the other Teutonic races is more easily explained through the influence of Ulfilas (q.v.) and the Mœso-Goths. C. is the word used in the English version of the New Testament to translate the Greek *ekklēsia*, except when the latter occurs in its original civil sense (a number of people called together from among others), in which case 'assembly' is employed (Acts xix. 32). It was applied to the Jews, as the worshippers of Jehovah called from among the heathen (Acts vii. 38), and also, among them, to a congregation of worshippers (Ps. xxii. 22; *cf.* Heb. ii. 12). As used by Christians, it has several shades of meaning:—1. An assembly of Christians who meet for worship in a particular place (Rom. xvi. 5). 2. The collective Christians in a certain place, or as it were a national C. (Acts xi. 22, 26). 3. The whole body of Christian people, of all times and of all places, understood as called out from the whole body of mankind. 4. The idea of C., as a building, which is not found in the New Testament, unless it be in Matt. xvi. 18, but in the 4th c. the word had come to be generally used in that sense.

C., like the Gr. *kuriakē*, and Lat. *dominicum*, has the meaning of the Lord's house, or the building in which Christians meet for worship. Originally they were oblong, standing E. and W., with chambers for the clergy on both sides, and two doors in the W. end as separate entrances for men and women. They afterwards came to be built in various shapes—round, square, and especially in the form of a cross, sometimes with the eastern division inclined off the straight line towards the S., to indicate, it is said, the drooping of the Saviour's head upon the cross. All had an Apse (q.v.) borrowed from the Roman *basilica*. The threefold division lengthwise, of nave, choir, and sanctuary, is derived from the Jewish temple, with its court of the Gentiles, holy place, and holy of holies. There is also properly a threefold division latterly, formed by the nave and the aisles, and a triple elevation, the base-arcade, triforium, and clerestory. Churches are distinguished into various grades:—*Cathedral*, which contains a bishop's cathedra or throne; *collegiate*, served by a dean and chapter; *conventual* or minster, if connected with a convent or monastery; *abbey* or *priory*, if governed by an abbot or prior; *parochial*, if furnished with a font.

The following incidents in connection with churches may be worth recalling:—In Burnham Norton Church, Norfolk, seven stone weight of honey was found in a cavity of the roof, and in the parish church of Long Clawson, a comb of honey was discovered, measuring 5 by 2 feet. In the episcopal church of Tulare Co., California, a swarm of bees settled in the loft and comb after comb of honey was attached to the rafters until the temperature reached the melting point when the wax succumbed and altar, pulpit, chancel, and pews beneath were flooded with hundreds of pounds of the finest honey. At St. Mary's Church, Bristol, the horns of a cow are preserved in memory of the animal which kept many children alive with its plentiful supply of milk during a great dearth of pure water in the city. One of the most ancient churches in England, namely that of Greenstead-Ongar, Essex, is possessed of a nave composed of half trunks of oaks, set upright and close to one another. The trunks, about 1½ foot in diameter, have been split through the centre and roughly hewn at each end so that they are fixed in a plank at the top and in a sill at the bottom by means of wooden pegs. The length of the nave is 29 feet 9 inches, and the width 14 feet, and it is said to have served at the commencement of the 11th c. as a shrine of King Edmond the Martyr. Of all the churches in England, St. Michael's at Coventry has the widest nave, which is 125 feet in width. That of York Minster is 104½ feet wide, and next to it comes that of the Brompton Oratory. The nave of St. Paul's Cathedral is 102 feet in width, while that of Westminster Abbey is but 71¾ feet. St. Mary Magdalen at Oxford possesses the widest nave in proportion to its length of any church in England; the width is 90 feet while the length of the church is not more than 78 feet.

As a rule only one church is to be found in a churchyard, but there are exceptions. In the yard at Reepham, Norfolk, there are three churches, one in ruins being that of Hackford (All Saints) which suffered in the conflagration of 1600, the other two being actually in use, St. Mary's, Reepham, and St. Michael's, Whitewell. In the Priory grounds at St. Andrews, Fife, there are three churches in one yard—the Cathedral, the church of St. Regulus, and the church of St. Leonard's Priory—all in ruins. But there are several yards containing two churches; well-known examples being—the

Abbey and St. Margaret's, Westminster; St. James' and St. Mary's, Bury St. Edmunds; the Old and the New Grey Friars, Edinburgh, &c.; where service is held in both. There are also cases of two churches in one yard where one is in ruins or nearly so, such as Westbury-on-Severn, Overstrand (Norfolk), Heptonstall (Yorkshire), Hornsey (Middlesex). Many of our church steeples are covered with copper. St. Sidwell's at Exeter received a copper sheeting in 1825, and in 1745 St. John's, Hampstead, was covered with copper which has not been removed. St. Nicholas, Yarmouth, is understood to be the largest parish church, superficially, in England. It covers 23,085 sq. feet and contains over 3000 sittings, with standing room for 10,000 persons. Next to this church come St. Michael's, Coventry, with 23,080 sq. feet; St. Botolph's, Boston, with 22,270 sq. feet; St. Nicholas', Newcastle, with 20,110 sq. feet; Holy Trinity, Hull, with 20,036 sq. feet; and St. Saviour's, Southwark, with 18,200 sq. feet.

Church Dis'cipline. From the earliest times the principle was maintained in the Church that those who had violated their baptismal vows by scandalous transgressions should be excluded from participating in the Communion, and should not be again admitted to it till they had given satisfactory proofs of repentance. When this was done they were again admitted to the standing of Catechumens (q.v.), being divided into the same classes. Their penitence having thus been satisfactorily proved, they received absolution and benediction before the congregation, and were restored to the fellowship of the Church. This was the first form of Penance (q.v.) which the Church of Rome systematised, in connection with the Confession (q.v.), for all kinds of sins, even the most secret. But nowhere was C. D. more consistently and rigorously carried out than at Geneva, under Calvin, and nowhere has it lingered longer, in anything like its original form, than in the Calvinistic Churches of Scotland.

Church Discipline Act, is the statute, 3 and 4 Vict. c. 86, which repealed statute 1 Hen. VII. c. 4. By this, any clerk in holy orders, as to whose conduct doctrinally, ritually, or morally there may be some scandal or offence, may be proceeded against—first before a commission whose members are nominated by the bishop of the diocese where the offence is said to be perpetrated; and, secondly, before the bishop himself, sitting with assessors. The Judicial Committee of the Privy Council possess appellate jurisdiction in these cases.

Churchill, Lord Randolph Henry Spencer, third son of the sixth Duke of Marlborough, was born 13th February, 1849. He studied at Eton and Merton College, Oxford, where he graduated in 1871. He entered Parliament in 1874 as member for Woodstock, which place he represented till 1885, when he was elected member for South Paddington, which seat he retained till his death in January, 1895. At the general election in 1885 he was also a candidate for one of the divisions of Birmingham and was defeated. As leader of a small section of Conservatives, called 'the Fourth Party,' he became a power in the House of Commons, and his abilities were recognised in his being appointed in 1885 Secretary for India, and in 1886 Chancellor of the Exchequer, which he soon afterwards resigned. Though standing high in Tory favour, he did not conceal his democratic opinions, and pronounced again and again for Liberal measures. He was consequently observed with curiosity by both political parties. His oratory and his whole political bearing were characterised by a thoroughgoing audacity. He was dauntless in attack, and never yielded before the most hostile criticism. In 1893 C. returned from a lengthened tour in South Africa. In 1894 he visited America, travelled round the world, was taken ill on the journey, and returned to England in a comatose state, from which he did not recover. See *Life of Lord R. C.*, by T. H. S. Escott (Lond. 1895).

Church History is usually divided into *external* and *internal*. The former, which is C. H. proper, would at first be synonymous with a history of the propagation of Christianity, and would always be concerned chiefly with the relation of Christianity to the civil and religious state of the countries in which it was propagated, on which the fate of the Church would depend. The latter, which is properly the history of the Christian religion, is concerned chiefly with the doctrine and government of the Church. The first Church historian was Eusebius (261-340, q.v.), who wrote a history of the Church, 'from the very origin of the dispensation of our Lord,' to the accession of Constantine as sole emperor (324). He seems to have relied upon something like inspiration to guide his researches, for he acknowledges that his materials were next to none. His work was continued by Theodoret (q.v.) down to 429. The next who wrote was Socrates (q.v.), whose C. H. extended from the accession of Constantine (306) to 439. Sozomen (5th c.) wrote a history of the same period as the last two. Next Philostorgius (born 358), an Arian, wrote a history of Arianism from about 300 to 425. Evagrios wrote a C. H. of the period from 431 to 594. Sulpicius Severus (end of the 4th c.) wrote a sacred history from the Creation to A.D. 400. These are the chief writers of C. H. proper near the fountain-head, from whom the legion of later writers must all derive their materials. For a history of doctrines, which is a branch of C. H., of rites and ceremonies, and of some other matters connected with it, much information is also to be found in the numerous and voluminous writings of the early Christian Fathers. On the rise of separate states in Western Europe, after the dismemberment of the Roman Empire, each country in due time produced its roll of Church historians, of whom the most interesting and important for Englishmen is the Venerable Bede (q.v.). Since the Reformation C. H. has been written from the Roman Catholic and Protestant points of view by many erudite and able scholars. Others, again, like Neander in Germany and Milman in England, have sought to exhibit the historical development of the Christian Church without any polemical bias. A full account of all the writers of C. H. up to the middle of the 18th c. will be found in Walch's *Bibliotheca Theologica Selecta;* of more recent ones in Lowndes' *British Librarian.*

Church Rates, in England, constitutes a tax on the parishioners to defray the expense of upholding and repairing a church and its appurtenances. The rate was imposed by the parishioners, convened by the Churchwardens (q.v.), and the vote of the majority was binding on the whole. There is no law which obliges the parishioners to provide C. R., consequently when Dissent is in a majority, or even possesses a strong minority, there is often no fund to repair churches—many have consequently become ruinous. The levying of C. R., and questions in connection with so doing, was long a source of animosity in England; but by the Act of 1868 (31 and 32 Vict. c. 109) compulsory payment has been abolished. Voluntary contributions and bequests, for the ecclesiastical purposes of a parish, are, under the Act, now administered by a body of Church trustees. Those who do not contribute are by the statute disqualified from interfering with the administration of the funds raised as C. R. But by the same statute C. R. were continued in those parishes where at the time (1868) money had been borrowed and remained due on the security of the C. R. The statute did not interfere where the rates were applied to purposes not ecclesiastical, or where they had been imposed by special legislation in lieu of tithes or other valuable consideration.

Churchwardens, in England, are ecclesiastical officers whose function it is to take care of the edifice of the church, and all that belongs to it. They are also expected to take cognisance of the behaviour of the congregation in all matters within ecclesiastical jurisdiction. They are chosen annually in Easter week, either by the clergyman or by the parish, or by both together, and generally are two in number. They are obliged to serve after being chosen and are sworn to serve faithfully. The following are not compelled to serve: peers of the realm, members of Parliament, sheriffs, acting justices of the peace, clergymen, solicitors, practising physicians or surgeons in London, practising apothecaries, Roman Catholic clergymen, officers in navy, army, or marines (even when on half-pay), registrars of births, &c.; excise, custom, and post office officials, non-residents within the parish, if they do not occupy there a house of trade.

Church′yard. In England a C. has been legally described by Sir William Scott as 'a consecrated place, entitled to public protection, and in which nothing should be done but under the direction of a public authority.' In Scotland, there is no rite of *consecration* either according to civil or ecclesiastical laws; but the C. is entitled to legal protection. The rector or vicar is the freeholder of the C.

Churchill, Charles, an English satirist, whose profligacy has perhaps hindered justice from being done to his genius, was born at Westminster in February, 1731, and educated at Westminster School, where he neglected his studies, and contracted a clandestine marriage in his eighteenth year. In 1756 he took holy orders, and in 1758 succeeded his father as curate of St. John's, Westminster. In 1761 he published anonymously the *Rosciad*, a clever satire on actors and theatrical managers, which took London by storm. 'The noise in the theatrical world was like that caused by the report of a gun in a rookery. The actors ran about the town, spreading their own grievances, and the satirist's name at the same time' (Hannay). Now avowing the authorship, he published in rapid succession *The Apology* (addressed to the writers of the *Critical Review*), *Night*, *The Ghost*, and other satires. Meanwhile he had been living so dissipated a life that he had to resign his curacy. His health failed, and he died at Boulogne on a visit to Wilkes, of whom he was a warm partizan, 4th November, 1764. C. was once known as the British Juvenal, and even yet, all who can forget the man and look only at his works must admit him to be a true poet. See Bell and Daldy's edition of his poetical works, with a Memoir by James Hannay.

Churching of Women, or *Thanksgiving after Childbirth*, is a usage of the early Church, borrowed from the Jewish rite of purification (Lev. xii.), still retained as compulsory in the Roman Catholic and Greek Churches, and for which there is also a service in the Liturgy of the Church of England.

Churn (Old Eng. *cyrn*, from *cerran*, 'to turn;' Low Sc. *kirn*), an implement for preparing butter from cream or milk. For the separation of the fatty particles which form butter, it is necessary that the minute sacs in which the fat is enclosed should be ruptured, and this is accomplished by violent agitation or 'turning' about of the fluid in a C. The object of churning is therefore to enable the solid fat to come together in the masses which constitute butter. A great many plans for the construction of churns have been adopted, and as the operation they have to perform is simple, they are all more or less efficient. The chief aim in the construction of the C. is to save time and labour, and to separate the butter completely. The most common form of the C. is the upright plunger, which consists of a long narrow tube or cylinder of cooper-work, tapering gently upwards, with a movable cover on the top. Through the centre of this cover the staff of the plunger is made to work piston-wise, at the lower extremity of which the agitator is secured. The agitator consists of a reticulated framework of wood, of a diameter sufficient to work easily within the C. Another common form is the Box-C., which consists of a box of birch or plain wood very carefully jointed, having an agitator formed of four radial arms joined by cross-bars, which is worked by a winch-handle. Some churns have a reciprocating motion, and others a see-saw or cradle motion, but they are little used. The atmospheric C. is a form which has also come into favour. Its peculiarity consists in an arrangement by which air is introduced into the fluid, and by its bubbling out causes a very effective agitation. It is said to save considerable time and labour, while at the same time it thoroughly separates the butter.

Chusan′, the principal island in a small group off the E. coast of China, 45 miles N.E. of Ningpo, is about 18 miles long and 10 broad, and 50 miles in circumference. It is mostly mountainous, but is intersected by cultivated valleys, yielding tea, rice, wheat, sweet potatoes, cotton, tobacco, chestnuts, &c., and growing bamboo, camphor, and tallow-trees. Ting-hai, the capital, is surrounded by walls, and has a fine Buddhist temple. C., called 'the key of China,' was taken in 1840 by the British, who evacuated after eight months' occupation, but again seized it in October, 1841, and held it till the end of the Chinese war. It was again taken by them in 1860, but was ceded to China by the convention of Pekin. The sacred island of Pu-tu is the next in importance of the group to which C. gives name. It is inhabited solely by Bonzes and others of the religious class, and contains many fine pagodas and Buddhist temples.

Chut′ney, a condiment of Indian origin, used with meat, game, fish, and animal food generally. The basis of the preparation is an acid or sub-acid fruit, to which spices and flavouring ingredients are added. The fruit most usually employed as a basis of C. is the mango, and numerous varieties are prepared for use, the recipes for which vary. The banana and lime are also used in the preparation of C.

Chyle (Gr. *chulos*, 'a juice,' from *chein*, 'to pour'), the name given to the matter absorbed by the lacteals in the villi of the small intestine. It is found in two conditions—first, before, and second, after, it has passed through the mesenteric glands. To the naked eye, in both conditions it presents much the same appearance; but when examined under a magnifying power of 250 diameters, it is found to present a marked difference. Before passing to the mesenteric glands it consists of a fluid in which there are multitudes of very small molecules which refract light strongly, and evidently consist of fat. These molecules have been termed the *molecular basis of the C.* When examined after passing through the glands into a special cavity called the *receptaculum chyli*, it is found that the molecular matter is much more scanty, while there are numerous corpuscles present, resembling either the colourless cells of the blood, or biscuit-shaped cells, not unlike the coloured corpuscles. The C. passes from the receptacle just alluded to through the thorax along the thoracic duct, and is poured into the venous system at the root of the neck, at the junction of the left internal jugular vein with the left subclavian vein. C. has been found to contain fibrin, albumen, fat, alkalies, and a small amount of iron. During fasting the C. is poor in solid matters, more especially in fat. A diet containing fat increases the milky appearance of C. owing to the increased amount of fat absorbed. The C. of a cat, according to Nasse, yielded in 1000 parts the following constituents:—Water 905·7, and solid matter, 94·3. The solid matter was composed of—fibrin, 1·3; fatty matter, 32·7; albumen, 48·9; chloride of sodium, 7·1; other soluble salts and traces of iron, 2·3; and earthy salts, 2·0. See Digestion, Lacteals, Villus.

Chyme (Gr. *chumos*, 'a liquid or juice,' from *chein*, 'to pour'), the name given to food after it has been digested in the stomach, and before it has been acted on by the biliary, pancreatic, and intestinal secretions. Some apply the term to food while in the stomach or small intestine. In the latter, part of it becomes absorbed either by the blood-vessels or by the lacteals. See Digestion.

Cialdi′ni, Enrico, an Italian general and politician, was born at Lombardinæ, Modena, 8th August, 1811. Exiled for sharing in a rising against the Austrians in 1831, he studied at Paris and fought against Don Carlos in the Spanish war of succession. He played a brilliant part in the Venetian campaign of 1848-49, and served as colonel among the Piedmontese who engaged in the Crimean war. He won distinction in the Italian war of 1859; defeated the Papal troops at Castelfidardo in 1860; was made, after capturing the citadel of Messina, general of the army; and in 1861 succeeded San Martino as lieutenant-general of Naples, where he strove vigorously to suppress brigandage. He was elected senator in 1864. He ably opposed the Austrians in the Venetian campaign of 1866, and was in the same year made commander-in-chief of the troops of Central Italy.

Cibb′er, Coll′y, English dramatist, was the son of Caius Gabriel Cibber or Cibbert, a sculptor from Holstein, and was born in London, 6th November, 1671. About 1690 he became an actor, and came before the world as a writer of plays in 1695, when he produced the *Love's Last Shift*, soon followed by *The Woman's Wit*, *Careless Husband*, &c., which were very popular at the time, and brought C. much money. In 1711 he became one of the joint patentees of Drury Lane, and in 1730 was made poet-laureate, an appointment which secured him an unenviable immortality in the *Dunciad*, to the author of which he had given offence. He died 12th December, 1757. Some of C.'s pieces are still acted, but the work by which he is best known is his amusing *Apology for his own Life*.

Cibra'rio, Luigi, an Italian jurisconsult and historian, born at Turin, 23rd February, 1802, where he graduated as doctor of civil and common law in 1824. Nominated a senator in 1848, he was, after the fall of Carlo Alberto and his retirement to Oporto, deputed by his colleagues to visit him in his voluntary exile, and try to induce him to return to his kingdom. The result of this unsuccessful mission he published in 1850 in *Ricordi di una Missione in Portogallo al Re Carlo Alberto*, which threw a vivid light on the Italian Revolution of 1848. Besides these he published several histories, as well as numerous editions of ancient Italian authors, illustrated by valuable notes. Under Vittorio Emanuele he was appointed superintendent-general of customs in 1850, Minister of Public Instruction in 1852, Minister of Foreign Affairs in 1855, and afterwards principal secretary to the King. His *Operette Varie* were published at Turin in 1860. C. died at Salo, in Brescia, 1st October, 1870.

Cica'da, a genus of Homopterous insects, included in the section *Trimera* (three-jointed tarsi). These insects belong to the Hemipterous group of the order Homoptera, and possess short broad heads. The eyes are large and prominent, and three ocelli exist, placed in the back of the head. The beak or rostrum is long and three-jointed. The males possess peculiar 'drums' at the base of the abdomen, whereby they produce loud sounds. The females possess ovipositors, saw-like in form. The antennæ are seven-jointed. The sound of the males is very loud, and can be heard at a great distance. The colour of the insect is yellowish. The wings are firm, transparent, and shining, and the nervures are distinct. These insects are mostly tropical in habits, one species occurring in the S. of England. Several species are eaten like locusts. The ancients knew of these insects, and said that the cicadas should be happy insects, since they had 'voiceless wives.'

Cicc'a, a genus of plants of the natural order *Euphorbiaceæ*, consisting of small trees and shrubs, natives of tropical India, Africa, and America. The 'Otaheite gooseberry,' is a C., and is a native of India, but is cultivated in that and in many other countries for the sake of its fruits, which are used either raw or cooked in various ways. The Europeans pickle or preserve them, or bake them in tarts. In Java they are sold in the market for about threepence per gallon. A decoction of the leaves causes perspiration, and the roots are a violent emetic. The wood of the *Indian C.*, of Bombay and Ceylon, is white and tough, and is used for shipbuilding in the latter country. Its light-blue seeds constitute a favourite food of the green pigeon.

Cic'ely, a genus of umbelliferous plants, of which one species, the sweet C., is common in Southern and Central Europe, though in Britain, from being generally found near human habitations, it is looked upon as introduced. It is allied to the *Chevril* (q.v.), and indeed is sometimes so called; in Scotland it is known as *Myrrh*. In Germany the seeds, roots, and young leaves are used for giving an anise-like flavour to soups, &c., and at one time they were used as an aromatic in medicine. In America, *Osmorrhiza* is called *sweet C.*

Cic'ero, Marcus Tullius, the prince of Roman orators, and famous also as a statesman and man of letters, was born near the town of Arpinum, under the Volscian Hills, 3rd January, B.C. 106. His family belonged to the equestrian order, but was not accounted 'noble.' C.'s father—a quiet country gentleman—anxious to give his sons the best education in his power, had them removed to Rome, where the future orator was instructed under Greek teachers in all the branches of a liberal education. At the age of sixteen he entered on his special studies for the bar. In the Marsic War, in 89, he acquired a knowledge of military tactics under Sulla; but after a brief period of service he returned to philosophical studies. He made his first appearance as a pleader at the age of twenty-five, and two years after secured the acquittal of Roscius, who had been charged with parricide by Chrysogonus, one of Sulla's favourites. Briefs now poured in upon him, and after a time of intense exertion, which threatened to impair a constitution never robust, he retired for a while to Athens and Asia Minor, to pursue the congenial studies of elocution and philosophy. Fame and honours awaited him on his return. Elected Quæstor in 76, he earned by his able and just administration of the government of Sicily in the following year the gratitude of the Sicilians, to whom he still further endeared himself by his successful impeachment of their Prætor, Verres, B.C. 70. After passing through the offices of Ædile, in 69, and Prætor, in 66, he was elected Consul in 64 by acclamation rather than by vote. In the following year, with consummate courage, caution, and decision, he denounced and crushed the famous conspiracy of Catiline (see CATILINE), for which he received the thanks of the people, and was hailed 'Father of his country.' Public thanksgivings in his name were voted to the gods, an honour hitherto accorded only to victorious generals. But in putting the imprisoned conspirators to death without trial, C. had been guilty of an act which, though perhaps morally justified by the emergency, was clearly illegal, and he was called to account for it by Metellus Celer. The enthusiasm of the people proved all-sufficient for him at the time, and but for the vehemence with which he attacked Clodius for invading the rites of the Bona Dea, the charge might have been allowed to rest for ever. Clodius, however, bent on revenge, sought, and in time obtained, the tribuneship, revived the charge, and compassed C.'s banishment, April, 58. On 4th August, 57, a bill for his recall was submitted to the Comitia Centuriata and carried; whereon he set out for Rome, which he reached on 4th September, 'borne back,' as he himself says, 'on the shoulders of Italy.' But his spirit had been broken by exile, and he tamely submitted to many degradations, and condescended to acts of servility towards men whom he despised. His time-serving policy with regard to Cæsar and Pompey was fraught with mischief to the state, and marred his reputation as a patriot. On the other hand, the independence evinced by his defence of Milo is a redeeming feature in his character. During the years 57-52 were composed his *De Oratore*, *De Republica*, and *De Legibus*. In 53 C. was elected into the College of Augurs, and in the following year appointed to the government of Cilicia, which he managed with great ability and success (51-50). He returned to Rome by Ephesus and Athens at the outbreak of the civil war, in 49, and after much vacillation joined the side of Pompey, whose standard he forsook after the battle of Pharsalia, B.C. 48. Having obtained a reconciliation with Cæsar, he retired to the country and wrote many philosophical and theological works, chief of which were *Orator*, *De Finibus*, *Hortensius*, *Tusculanæ Disputationes*, *De Natura Deorum*, *De Senectute*, *De Amicitia*, *De Officiis*. On the murder of Cæsar, in 44, C., who was inclined to throw in his lot with Brutus and Cassius, advised an adjustment of the differences between Antony and the Senate, but to no purpose. Then followed those terrible Philippics—of fame how fruitful, to himself how fatal!—in which he denounced Antony with relentless bitterness. The dazzling glory with which he had been for a few brief months encircled now paled; the defection of Octavian, in whom he had placed unlimited confidence, was followed by the second triumvirate, and the name of C. was in the list of the proscribed. Octavian made no effort to save him, and the emissaries of Antony overtook him near Formiæ as he fled in a litter to Cajeta. Deeming resistance vain, with becoming fortitude and resignation he extended his head from the litter, and it was severed from his body by

Herennius, 7th December, B.C. 43, in the sixty-third year of his age.

Middleton, in his charming but partial biography of the orator, has exhibited him as a pattern of splendid virtue and blameless honour; while Drumann and Mommsen have assailed him with great bitterness and severity. C.'s character was of the Asiatic type. He was ambitious, fond of pomp, greedy of applause, timid, and irresolute. In private life he was kind and amiable. In his literary compositions his fame is of the highest, and his style is a model of purity. His philosophical works breathe the strictest morality, and are especially valuable as reflecting the different views of the Greek schools of philosophy. As a poet he ignominiously failed. As a statesman his abilities were great, but often misdirected; to the active virtues of a patriot he can lay no claim. As an orator he was without a rival.

The *editio princeps* of C.'s collected works was printed at Milan in 1498.

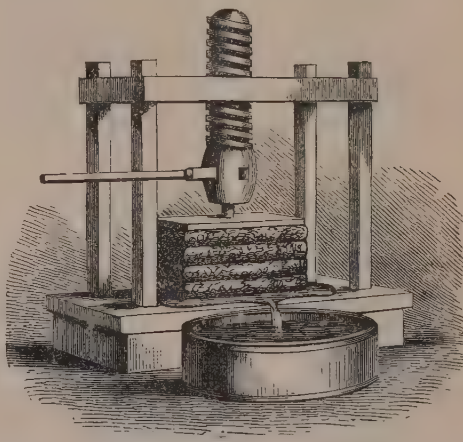
Cicero'ne (from *Cicero*, the orator), a term given by the Italians to those persons who point out to strangers the curiosities of a place, and now generally applied to any one who acts as a guide. The etymology of the word indicates ironically the noted garrulity of such officials.

Cicisbe'o, an Italian term for a gallant, a dangler after ladies. In the *Dizionario della Crusca* it is applied to the knot of ribands formerly attached to the hilts of swords or to the handles of fans. So a C. is a man in constant attendance upon a lady, and at hand to receive her commands. The term was applied more particularly to a class of men who attended on married ladies, and is synonymous with *cavaliere servente*. The custom, formerly prevalent in fashionable Italian society, has now almost disappeared.

Cid, The, Don Rodrigo Diaz de Bivar ('he of the perfect beard'), was born at Burgos in the year 1025, in the reign of Sancho III. of Navarra, and of a family from whom had been chosen the 'judges of Castilla.' C. is derived from the Arabic *Said*, or master: his other title, *El Campeador* (corrupted by the Arabs into *Cambitûr*), means either national champion or umpire. Soon after his birth, the dynasty of Ommeyad Caliphs at Cordoba was broken up, and Fernando I. of Castilla united the petty Christian states of N.W. Spain. The story of *The C.*, told by Corneille and Voltaire in their dramas so named, of his love for Ximena, the daughter of Count Lozano of Gormaz, whom he had slain to avenge an insult offered to his father, of his conquest of five Moorish chieftains who had invaded Castilla, of his horse Babieca (or Booby), on which he drove the Moors from Estremadura (on E. bank of Douro) and captured Coimbra, how he resisted the imperial pretensions of Henry III., and assisted Sancho II. of Castilla to annex his brother's inheritances of Leon and Galicia, of his banishment by King Alfonso, and his great deeds at Barcelona, Zaragoza, Valencia, Alicante, and other places on the E. coast, how he defended Valencia against the Moors, how the cause of the C. and the Counts of Canion was tried before the Cortes at Toledo: all this is told in the prose *Chronicles of the C.*, belonging to the end of the 13th c. (one of which has been translated and edited by Southey), and in the *Ballads of the C.*, collected by Juan de Escobar in 1615, which have been translated into German by Herder, and partly into English by Frere, Lockhart, and Dennis. These ballads are among the finest and earliest of the Spanish *redondilhas* sung by the *Juglares*, the form of which has been connected with Arabian poetry, and also with the songs of the Roman soldiery. They are written in *coplas* of four lines, each line with seven or eight syllables, or three and a half feet, generally trochaic; the chief feature being the assonant rhyme, according to which the *last vowel*, when the line ends with a single syllable (a half foot), or the *last two vowels* when it ends in a trochee, should correspond in every alternate line, be the consonants what they may. The *Poem of the C.* is in Alexandrines. See Southey's *Chronicle of the C.* (Lond. 1808).

Cid'aris, a genus of Sea-urchins, included in the family *Cidaridæ*, and distinguished by having the mouth central in position. The ambulacra, or perforated areas of the shell, are prolonged on the buccal membrane, or that surrounding the mouth, and no buccal branchiæ, or gill-like processes surrounding the mouth are developed. *C. papillata* is a familiar species of these forms.

Ci'der, or **Apple-Wine,** a fermented drink prepared from the juice of apples, for which particular varieties of apples are cultivated in Herefordshire, Somerset, and Devonshire, Normandy and Holland, the most famous C.-producing districts. The apples, when thoroughly ripened and matured, are reduced to a pulp in a grinding mill under edge rollers, with a small quantity of water added, and after being left in a tub for twenty-four hours, the juice is pressed out by the application of strong pressure. The expressed juice, after being put into barrels, soon begins to ferment violently, and when the fermentation has sufficiently advanced, which happens in from two to ten days, according to the strength of the must, and the amount of alcohol desired, the C. is racked off into stone barrels. C. contains generally malic acid, alcohol, and sugar, besides water, &c., its alcoholic strength varying from 5 to 10 per cent.



Cider Press.

Cïe'za, a town in the province of Murcia, Spain, 25 miles N.W. of Murcia, near the river Segura, has manufactures of linens, silk, and hemp, and a trade in oil and wine. Pop. 10,905.

Cigar' (Span. *cigarro*), a loosely wound spindle-like roll of tobacco-leaf for smoking, supposed to be of Spanish origin. A *cheroot* is a variety of C. in the form of a slightly conoidal cylinder, with the tips cut straight. A *cigarette* (Span. *cigarrito*) is a small roller of finely-cut tobacco, or of triturated leaf (as in Spain), wrapped in a binder of unsized paper or the leafy covering of Indian corn. Cigars are manufactured in enormous quantities wherever the tobacco plant is cultivated. Those made from Havannah tobacco are unsurpassed for fine flavour, aroma of smoke, and firmness and whiteness of ash, and next in order of excellence stand the Manilla cigars and cheroots; it should be stated, however, that the smokers of Indian tobacco, especially of the cheroots called *Trichinopolies*, and the smokers of Sumatra and Borneo cigars, think very highly of the different brands submitted to them by the dealers in those regions. The value of a C. does not increase in direct ratio with its size, for the difficulty of obtaining wrappers of proper length, colour, and fineness for the larger sizes, immensely augments the expense of manufacture. A duty of 5s. per lb. is levied upon cigars imported into Great Britain. Simple and well-contrived machines for making cigars and cigarettes are in extensive use. The following is a table, setting forth the weight of cigars, together with their value, imported into the United Kingdom from foreign countries and British possessions during the year 1894. Of the total weight imported 2,065,362 lbs. were registered for home consumption. The gross amount of duty paid was £516,336:—

Country.	Weight in lbs.	Value in £.
From Germany	60,667	21,129
,, Holland	101,652	32,188
,, Belgium	171,275	53,570
,, France	228,268	84,454
,, Spain	12,025	4,617
,, Canary Islands . .	8,306	2,963

Cig'oli, Ludovico Cardi da, an Italian painter, was born at Cigoli in Tuscany in 1559, studied Correggio assiduously, and was among the first of the Florentine school to successfully oppose the anatomical style of the imitators of Michael Angelo and the other mannerists of his day. His design is correct, his colour is remarkable for force, warmth, and harmony, and his handling exhibits much vigour and *abandon.* His 'Apostle healing the Lame' in St. Peter's was declared by Andrea Sacchi to be surpassed by only two pictures in Rome—the 'Transfiguration' of Raphael, and the 'Communion of St. Jerome' by Domenichino. Tuscany is particularly rich in specimens of his work. The 'Martyrdom of St. Stephen,' in the palace of the Uffizi, Florence, is reckoned one of his finest efforts. C. died at Rome in 1613.

Cil'ia. These are small hair-like bodies, having a power of motion, attached to a variety of epithelial cells. A layer of cells of this variety is called a layer of *ciliated epithelium.* Such cells are of a columnar shape, bearing the C. on one extremity, while the other lies on, or is attached to, subjacent tissue. The cells are usually arranged in three or four layers deep, but the external layer is the only one fully developed, the deeper layers being destitute of C. Ciliated epithelial cells vary in size. In the human trachea or windpipe, they are about $\frac{1}{4000}$th to $\frac{1}{2500}$th of an inch in length, but in many of the invertebrata they are much larger. The following are some of the situations in the human body where C. are found:—(1) On the mucous membrane of the respiratory tract, from the base of the epiglottis to the smallest bronchial tubes in the lung. The vocal cords and the air-cells of the lung are not covered by C. (2) On the mucous membrane of the nose, with the exception of the area in the upper chambers devoted to the sense of smell. (3) In the Eustachian tube and in the middle ear or tympanum.

Form of Cilia.—They are slender, conical, or sabre-shaped filaments, narrow at the free extremity, and broad at the base. Under the highest powers, they show no indication of definite internal structure.

Motion of Cilia.—This may be best studied by examination of a portion of the gills of the common mussel. It is seen to be a sort of lashing movement, and when many act together on the same bar or surface, the motion gives rise to the optical effect of a series of waves passing along the free border of the ciliated surface, like the waves caused by the wind passing over a field of corn. Occasionally the movement is so rapid that the C. are not seen, but their presence is indicated by the movements of particles of matter in their vicinity. Adopting the classification of Valentin and Purkinje, the movements of C. may be divided into (1) the *hook-like,* in which the movements are like those of a finger alternately flexed and extended; (2) the *funnel-shaped,* in which there is a kind of twisting action of the cilium by which its apex describes a circle or ellipse, and the whole cilium a cone having the base uppermost; (3) the *oscillating,* in which it swings like a pendulum; and (4) the *undulating,* or flail-like, in which it acts like the lash of a whip. Few objects are more beautiful than a mass of C. in vigorous action. In cold-blooded animals the motion of the C. may continue for hours, or even days after the death of the animal, but in warm-blooded animals they rarely act for more than two hours.

Effects of physical and chemical applications on Cilia.—(1) *Temperature.*—A rise of temperature increases the activity of the movement, but it ceases at 57° or 60° F. Cold does not retard the action even when reduced to freezing-point. (2) *Water.*—Fresh water retards or destroys the action of C. of sea-animals, while salt water has a similar effect on those which frequent fresh water. (3) Bile, alkalies, acids, and alcohols arrest the motion. (4) Vapour of chloroform arrests the motion for a time, if not applied for too long a period. (5) Oxygen is required for the activity of C.; deprivation of it, or an atmosphere of hydrogen, arrests the movement. (6) A stream of carbonic acid retards the action. (7) Continuous or Faradic currents of electricity, or a discharge from a Leyden jar, have no effect unless extremely powerful, when they cause either electrolysis or sudden stoppage.

C. are endowed with the vital property of contractility, and it is in virtue of this they move. Their actions are not dependent directly on the integrity of the nervous or circulatory systems, as they work vigorously for some time after the death of the animal. See CONTRACTILITY.

Cili'cia, anciently a province of Asia Minor, coinciding partly with the modern vilayet of Adana, bounded on the N. by Taurus, on the S. by the Levant, on the W. by Pamphylia, and on the E. by the range of Amanus. Its physical characteristics divided it into two parts, the Western or Rough C., and the Eastern or Plain C., the former clothed with forests, and the latter producing corn and wine. C. was governed by native kings, even after it became a Persian satrapy. After the victory at Issos (B.C. 333) it became a Macedonian province, and on the death of Alexander it became part of the kingdom of the Seleucidæ, till Pompey made it a Roman province, B.C. 63.

Cimabu'e, Giovanni Gualtieri, an early Italian painter, was born at Florence in 1240. Being sent while a youth for purposes of education to the convent of Santa Maria Novella, he there learnt his art from certain Grecian painters, who were engaged in decorating the church of the convent, and soon acquired so much celebrity that in 1263 he was commissioned to adorn with frescoes the church of St. Francis at Assisi. Among his subjects were the 'Life of Christ,' 'Life of St. Francis,' 'Life of the Virgin,' 'Four Evangelists,' &c., portions of which still remain. Returning to his native city, C. painted his famous 'Madonna' (still preserved), which was regarded as a marvel of art, and excited such enthusiasm that the people bore it in procession from his studio to the Church of Santa Maria. He died at Florence, probably in 1302. His chief distinction is, that he materially helped to emancipate Italian art from Byzantine traditions. He ceased to be a copyist, turned his attention towards nature, and diversified the mechanical *pose* of Greek figures by study from living models. In this restoration of art, however, C. cannot be regarded as having done more than prepare the way for Giotto (q.v.), who was his pupil and *protégé.*

Cimaro'sa, Domenico, an Italian musician, was born at Naples in 1754, and studied under Sacchini at Loretto. He very early attained celebrity as a composer of operas, of which one—*Il Matrimonio Segreto*—is still well known. C. undertook musical engagements at St. Petersburg, Vienna, and other European courts, but eventually returned to Italy, and died at Venice, 11th January, 1801.

Cim'balo, an old keyed instrument, one of the precursors of the harpsichord.

Cim'bri, or **Kim'bri,** a people who, in conjunction with the Teutones, invaded Southern Europe towards the close of the 2nd c. B.C., and defeated several Roman armies in succession, till they themselves were conquered by C. Marius, B.C. 101, in the Campi Raudii, near Vercelli, with a loss estimated at from 100,000 to 140,000 men. Who these C. were has given rise to much discussion. Tacitus, Pliny, and Strabo agree in making their original country the Chersonesus Cimbrica, now the peninsula of Jutland. The preponderance of ancient testimony is in favour of their Celtic origin, and H. Müller, in his *Die Marken des Vaterlandes*, holds to this opinion, and contends that the name is identical with *Kymri*, the designation of the modern Celts of Wales. Modern opinion, however, favours their Germanic origin; and the definite facts that support this hypothesis are stated by Mommsen, *History of Rome*, vol. iii. pp. 178, 179 (Dickson's translation). The name C., or *Chempho*, is certainly Teutonic (comp. Old Eng. *Kempa*, and Ger. *Kämpfer*), and means the 'champions,' which their enemies translated the 'robbers.' Mommsen suggests that 'round a nucleus of Germanic emigrants from the Baltic' had gathered in the course of their wanderings 'an immense multitude of various origin.' This would satisfactorily account for many Celtic traits which the motley host exhibited.

Cimicifu'ga, or **Bugbane,** a genus of plants belonging to the order *Ranunculaceæ*, natives of Eastern Europe, Siberia, and N. America. The European *C. fœtida* is extremely fetid, and is used to drive away vermin.

Cimme'rians, or **Cimme'rii,** a people of whom Homer may be said to give a dim, fabulous tradition, and Herodotus a definite and partially historical account. In the Odyssey they are represented as dwelling in darkness beyond the ocean-stream. In Herodotus they occupy the territory between the Borysthenes (Dnieper) and the Tanais (Don), and are represented as having invaded Asia after they were expelled from their own country by the Scythians. They seem to have occupied the Tauric Chersonesus (Crimea), and from them the Cimmerian Bosporus (Strait of Yenikale) takes its name. They were a nomadic race.

Ci'mon, a famous Athenian general, son of the Miltiades who conquered at Marathon, was born B.C. 510. His life was mainly devoted to the overthrow and humiliation of his country's great enemy, Persia. In 477 he shared with Aristides the command of the Athenian contingent of the Greek armament under Pausanias, reduced Eion on the Strymon, and in 476 subdued and colonised the island of Scyros. In 466 he completely defeated a great Persian fleet at the river Eurymedon, and subsequently expelled the Persians from the Chersonese. C. regarded Sparta as the 'yoke-fellow' of Athens, and on the revolt of the Helots headed two expeditions to aid the Spartans. Having been, however, on the second occasion, insultingly dismissed by them, C. lost his popularity at Athens, failed in the struggle against Ephialtes and Pericles, and was eventually ostracised. He was recalled five years later, and under his influence the Athenians made peace with Sparta, and renewed the war with Persia. In 449 he sailed with 200 ships to Cyprus, where he died at the siege of Citium.

Cincho'na, an important genus of evergreen shrubs or trees, natives of the valleys of the Andes, which gave the name to the order to which they belong (*Cinchonaceæ*). They are found from about lat. 19° S. to Caracas, in about 10° N. lat., and at heights from 4000 to nearly 12,000 feet above the sea-level. There are many species, but all do not yield the medicinal bark known in medicine and commerce as C. or Peruvian bark. The different species have been the subject of elaborate investigation, by Weddell, Howard, Markham, Spruce, and others, and the general result of their investigations is, that the Calisaya or yellow bark is the produce of *C. Calisaya*, the grey or Huanco bark of *C. micrantha* and *C. nitida*, Loxa or crown bark of *C. Condaminea* (*officinalis*), while the red bark is furnished by *C. succrirubra*. The value of C. bark as a tonic and remedy for fever is owing to the presence of the alkaloids *quinia*, *quinidia*, *cinchonia*, and *cinchonidinia*—some of the barks, however, containing more than others. For instance, *quinia*, the most useful of all of them, is found in greatest quantity in Calisaya bark, *cinchonia* in grey and red bark, while *quinidia* exists in largest amount in Loxa bark. All of these alkaloids, though varying in degree of strength, have similar properties. The C.-trees grow in the forests of Bolivia, Peru, and neighbouring countries in small groups. The *cascarilleros* or bark-gatherers are native Indians or half-castes, whose occupation is one attended with great labour. After a tree is cut down, the bark is stripped off, and the larger pieces stacked to dry, while the thinner bark from the twigs and branches rolls up in 'quills' like that of the cinnamon-tree. The bark nearest the root is most esteemed, on account of the quality of alkaloids contained in it. After being dried, it is conveyed to the coast on the backs of the *cascarilleros*, or in any other way that the circuitous paths through the mountainous forest will admit of. The object of the *cascarilleros* being to collect the greatest quantity of bark in the shortest possible space of time, they indulge in the most wasteful destruction of the C. forests, young trees and old being indiscriminately cut down without any attempt to replace them by planting others. In course of time the effects of this suicidal policy began to be apparent. The supplies of bark became more and more difficult to obtain, and it was evident that in time the tree yielding this drug, so all-important in tropical countries, would soon become practically extinct. Accordingly the Indian Government took measures to neutralise it in the cooler hill-regions of India. This task was committed to C. R. Markham, R. Spruce, M‘Ivor, and others, and was performed with such success, that extensive forests are now growing in various parts of India, and promise to yield, in course of time, a supply of C. much greater than ever was obtained by the precarious labours of the S. American *cascarilleros*. Owing also to the scientific skill with which the trees are cultivated, it is found that the Indian-grown bark yields a greater supply of the alkaloids than the wild trees. It is also now naturalised in Jamaica and Java. C. bark was first employed in Europe about the middle of the 17th c., though its valuable properties as a febrifuge were long known to the natives of Peru. It was first brought from that country to Europe in 1639 by the Countess del Chinchon, wife of the then Viceroy of Peru, and from whom the genus is now named, though—notwithstanding the appeal of Markham for the correct spelling of the word, C*h*inchona—long usage has now established the genus without the *h*. From the fact of the Jesuits using it as a remedy in intermittent fever, the C. bark was at one time generally known as, and is still sometimes yet called, 'Jesuit's bark.' It is also called China bark, Quinia, Quinquina, &c. It is now generally administered in the form of its alkaloid quinine, or in the sulphate or bisulphate of quinine, in doses of from 1 to 20 grains. In addition to its antiperiodic febrifugal and tonic properties,

Cinchona.

the bark is somewhat astringent, and has been occasionally found serviceable as a topical astringent and antiseptic. See Pereira's *Materia Medica;* Moquin-Tandon's *Botanique Médicale*, and the various works and reports of Markham, Weddell, Howard, Spruce, and others on the subject.

Cinchona'ceæ, a natural order of Dicotyledonous plants, of which the genus *Cinchona* (q.v.) is the type. By some botanists it is considered only a division of *Rubiaceæ* (q.v.). There are about 2600 species, distributed over 300 known genera, consisting of trees, shrubs, and herbs, all natives of tropical and warm regions. It is very important as furnishing many plants useful in medicine, the arts, and domestic economy. Some possess tonic, febrifugal, or astringent properties; others yield dye and tanning agents; while a third group possess edible fruits and seeds. A few are reputed to be intoxicating and even poisonous, and several are cultivated for the sake of their beauty and the fragrance of their flowers. In addition to Cinchona, Coffee (q.v.), Ipecacuanha (q.v.), *Morinda citrifolia*, the root of which yields Soorangie dye, *Uncaria Gambir*, which yields white Gambir, a variety of catechu, *Gardenia*, and other plants yielding pleasant fruits, Chayroot (q.v.), &c., may be mentioned as some of the more important economic plants of this order.

Cin'chonine and **Cinchon'idine** are isomeric alkaloids (q.v.), contained, along with the quinine alkaloids, in the bark of the different varieties of Cinchona. Pale Peruvian bark is richest in C. and its isomer; yellow Peruvian bark in quinine. Another alkaloid called *Cinchonicine*, isomeric with C. and C., is obtained under certain conditions by heating the latter substance. Sulphate of C. is used in medicine, and is similar in its physiological action to sulphate of quinine. See QUININE.

Cincinde'la, a genus of Beetles, forming the type of the family *Cincindelidæ*, and popularly known as 'Tiger-beetles' or 'Sparklers,' from their carnivorous habits, and from the brilliant hues and lustres of their bodies. The tiger-beetle is a familiar British species, and is noted for its voracious habits, feeding on other insects, and being able to pursue its prey into the air. It exudes a powerful odour or scent, like that of a crushed verbena leaf. The Indian tiger-beetle is another well-known species. These insects have five-jointed tarsi; the head is wider than the chest, and the mandibles are large, sharp, and toothed.

Cincinna'ti, the 'Queen City of the West,' is the chief town in Ohio, and is situated on the N. bank of the Ohio river. It is built on two terraces, the one 50, the other 100 feet above the river. The streets and the environs of the city are alike beautiful. C. has many fine buildings, as the C. College, the custom-house, the post-office, and Burnet House. There are two Roman Catholic colleges, and one Methodist; a Presbyterian theological seminary, a law school, several medical and ladies' institutions, besides many free schools, and about a hundred churches. C. is connected with Covington, on the Kentucky side of the Ohio, by a magnificent suspension-bridge, 100 feet above low-water. The city is supplied with water from the Ohio by a reservoir which cost $796,000. C. is one of the greatest pork-markets in America, the packing being an immense industry; the value of the annual production being over 9½ millions of dollars. Wine, from the native Catawba (q.v.) grape, is also an extensive article of trade, and there are large manufactories for iron, steam-engines, lard, flour, soap, and candles. The Ohio is the great outlet for traffic, the river being navigable to its junction with the Mississippi, 500 miles below, and to Pittsburg, 460 miles above the city. C. was founded in 1788, and had only 500 inhabitants in 1800; in 1830 it had 24,830; in 1870, 216,289; and in 1890, 296,908.

Cincinnati (Order), a society in the United States, which was formed in 1783 by the officers of the revolutionary army, to perpetuate their friendship, and to provide for the widows and orphans of those who had fallen in the war. The badge of the society is a bald eagle of gold, with the motto *Omnia reliquit servare rempublicam.* It is suspended by a deep-blue ribbon edged with white. The order was to be hereditary; hence it met with much opposition. It still, however, exists in some of the States, and meets on the 4th of July.

Cincinna'tus, Lucius Quinctius, a Roman statesman and soldier, famous in the national legend preserved by Livy for the simplicity of his life and manners. He was born some time before the expulsion of the Tarquins. In 460 he was illegally appointed *consul suffectus;* and two years afterwards, being made dictator, he extricated the Roman consul and army from imminent destruction at the hands of the Æqui. Livy's narrative of the manner in which he effected this is rejected by Niebuhr as transparently mythical. In 439 B.C., at the age of eighty, he was a second time appointed dictator, to suppress a plebeian discontent fostered by Spurius Mælius, after which he disappears from history.

Cin'erary Urns (Lat. *cinis*, 'ashes') were the vessels in which the ashes of the dead were placed amongst those nations who were accustomed to burn their dead. When the funeral pyre was burned down, the embers were extinguished with wine, and the bones and ashes of the dead collected by the nearest relatives, who sprinkled them with perfumes and placed them in an urn, which was then deposited in a niche of the *sepulcrum*, or family tomb. The urns were mostly made of baked clay, but also of stone and metal, and even, though rarely, of gold and silver. They were of various shapes, but commonly square or round.

Cinn'a, Lucius Cornelius, the leader of the Marian party during the absence of Sulla in the East. Though elected consul (B.C. 87) with the sanction of Sulla, his first act was to impeach him, and to take measures for bringing back the banished Marians to power. Defeated in the senate, he fled from the city, on which, however, he soon marched with an armed force, and invested it by land, while Marius, who had returned from his African exile, blockaded it by sea. They captured the city, massacred the friends of Sulla, and declared themselves consuls (B.C. 86). Marius died soon after. In his fourth consulate, Cn. Carbo being his colleague, C. collected an army at Brundisium to meet Sulla, who had returned to Italy to take vengeance on his foes, but he was slain while attempting to quell a mutiny that had broken out among his troops.

Cinn'abar, native mercuric sulphide, the most abundant ore, and chief source of the quicksilver or mercury of commerce. It occurs fibrous and amorphous, also crystallised in hexahedral prisms. In the mass it is dull-red coloured, opaque or translucent, with adamantine lustre. The most important mines are those of Idria in Carniola, Austria, of Almaden in Spain, and of New Almaden, New Idria, and Redington, in California. C., artificially prepared, constitutes the well-known colour Vermilion (q.v.).

Cinnam'ic Acid and the **Cinnamyl Group.** C. A. is a white crystalline substance, resembling benzoic acid in appearance, and is contained in Storax (q.v.), Tolu, and Peru balsams, in old oil of cinnamon, and in gum benzoin. C. A. is best obtained by boiling storax with a dilute solution of caustic soda, when soluble cinnamate of soda is formed. The aqueous solution of this salt is filtered from the undissolved portions of the storax, and mixed with excess of hydrochloric acid, when the C. A. is precipitated, and may be purified by recrystallisation from boiling water.

C. A. crystallises in rhombic prisms: it fuses at 133° C., and boils at 290° C., with partial decomposition. It rises in vapour at temperatures below its boiling-point, and may therefore be purified by sublimation. It is sparingly soluble in cold water, more readily in boiling water, but its best solvent is alcohol. C. A. is a monobasic acid, and forms crystalline salts with metals, and several interesting derivatives, the following being amongst the most important:—

Cinnamic Aldehyde, an oily liquid, which forms the chief constituent of the essential oils of cinnamon and cassia, and gives to them their characteristic odour. It may be prepared artificially by distilling a mixture of formiate and cinnamate of calcium.

Cinnamate of Cinnyl or Styracine, a crystalline substance contained, along with C. A., in storax, and may be obtained from the latter after the C. A. has been extracted by squeezing the remaining resin, when the styracine is forced out in oily drops, which crystallise on standing.

On distilling styracine with caustic potash, it is resolved into *Cinnamic Alcohol* and cinnamate of potassium. The cinnamic alcohol passes over as an oily liquid, which soon crystallises. It has a pleasant odour of hyacinths.

Styrol is another substance contained in storax. If the latter be distilled with water, styrol is carried over with the steam, and condenses in oily drops, which are readily separated from the water by decantation. It is a liquid body, which, when heated to 200° C., is converted into a solid crystalline substance called *meta-styrol*.

Cinnamon.

Cinn'amon, a bark much employed as a condiment, and in medicine as a stimulant, tonic, astringent, carminative, antispasmodic, &c., chiefly derived from the inner bark of *Cinnamomum Zeylanicum*, a tree belonging to the natural order *Lauraceæ* (q.v.). The best comes from Ceylon, but it is now naturalised in various tropical countries. The tree grows to the height of from 20 to 30 feet, and sometimes attains the thickness of 1½ foot. Its properties are owing to a volatile oil, the *oil of C.* It contains in addition a concrete fatty substance, obtained from the ripe fruits, and known in Ceylon as *C.-suet;* this is believed to be the *Comacum* of Theophrastes. From the leaves a volatile oil, having the odour and taste of oil of cloves, is also distilled. The tree itself has been long known: in the Bible, for example, it is frequently referred to under the name *kinnemon* or *kinman*. There are various other species in addition to the one mentioned. Aromatic C. yields the Cassia Bark of commerce (q.v.), and C. buds—also, however, obtained from other kinds of C. This tree is the *kiddah* or *cassia* of the Bible. C. bark is frequently used to adulterate C. Indian Clove Bark (q.v.) is obtained from *C. Culilwan*, Sintoc bark from *C. sintoc*, while *C. nitidum* (*eucalyptoides*) and *C. Tamala* were the sources of the *folia Palabathri*, in such repute among the old pharmacologists as stomachics and sudorifics. The 'Nepal sassafras' is the root of *C. parthenoxylon* and *C. glandulifera* (Bentley).

C. is obtained by stripping the bark off the branches, when it rolls up into 'quills.' The smaller of these are introduced within the larger, and then dried in the sun, and the whole tied up in bundles, each of about 88 lbs. weight. The thinner bark is accounted the finest flavoured. About 500,000 lbs. are annually imported into London.

Medicinally C. is valued as a stomachic and carminative. Its uses by cooks and confectioners are too well known to require description. There are, besides, bastard C., black C., Isle of France C., Santa Fé C., wild C., &c.

Cin'que Cento (Ital. 'five hundred'), an art term for the 'fifteen hundred period,' *i.e.*, the 16th c., especially the early part—the second period of the revival of the arts in Italy—and for the style of art then prevalent.

Cinquefoil, or **Quintfoil,** in heraldry, a flower of five foils or leaves, which are usually depicted as issuing from a ball as a centre point. In architecture, the name is applied to an ornamental foliation in five compartments—often represented in a circular form—five points or cusps marking off spaces between each pair, which are called the leaves. The C. is to be observed in the tracery of windows and panellings.

Cinque Ports were originally Dover, Sandwich, Romney, Hythe, and Hastings, and to them were afterwards added Winchelsea and Rye. They are under the government of a Lord Warden, whose office was formerly an adjunct of the premiership. The C. P. have various privileges as to pilotage, issuing of writs, and other judicial matters. They are supposed to have been incorporated previous to the Conquest, by Edward the Confessor. Their ancient organisation has, however, been broken up by the Municipal Reform Act, and assimilated to that of English municipalities in general. The jurisdiction of the Lord Warden has been curtailed by Acts of the present reign, and the office has become one of mere honorary dignity, without any emoluments, saving the right to live in Walmer Castle. The present holder is the Marquess of Salisbury, who succeeded the Marquess of Dufferin and Ava in the autumn of 1895.

Cin'tra, an old town in the province of Estremadura, Portugal, near the base of Sierra de C., 15 miles W.N.W. of Lisbon. It has two royal residences, one originally a Moorish palace, the other formerly the convent of La Penna. There is also a ruined castle, and many handsome private buildings. Pop. town-dist. 22,842. The well-known *Convention of C.*, concluded between Sir Hew Dalrymple and Marshal Junot, was signed here, 22nd August, 1808. By this treaty, the French, who had retreated from Lisbon after the defeat at Vimiera, were allowed to return to France with all the honours of war. A storm of indignation was roused in England by this event, and the generals concerned were subsequently tried by court-martial, but acquitted of blame. Wellington sided in opinion with the generals. A severe comment is made by Byron on 'that martial synod' in the first canto of his *Childe Harold*.

La Penna Convent, Cintra.

Ci'otat, La, a town in the department of Bouches-du-Rhône, France, on the Gulf of Lèques, 15 miles S.E. of Marseille. It has a good harbour, has Government shipbuilding yards and valuable fisheries, and is surrounded by plantations of the olive, orange, and pomegranate. Pop. 12,223. C., the ancient *Citharista*, a Massilian colony, was destroyed by the Teutonic invaders of Gaul, but rose to importance through the Levant trade in the 16th c. It was ruined a second time by the revocation of the Edict of Nantes, and has only begun to recover its prosperity in the present century.

Ci'pher (Fr. *chiffre*, Low Lat. *cifra*, from Arab. *çifr*, 'empty'), in arithmetic, properly denotes the character 0, used to fill an empty space, but is now loosely applied to any of the nine figures. In metaphorical language, however, it retains its primary sense—*e.g.*, 'he is a mere C.,' *i.e.*, a non-entity, a person who counts for nothing. Another use of the word is to designate the interweaving of the initials of a name, an arrangement which renders them a private mark. This usage has long been especially affected. Lastly, and perhaps from the preceding practice, the word has also come to be a name for secret writing—*e.g.*, 'the despatch was in C.,' *i.e.*, in an arrangement of letters or marks the meaning of which was only known to the initiated. See CRYPTOGRAPHY.

Cipria'ni, Giovanni Battista, painter and engraver, born at Florence in 1732, travelled to Rome when nineteen years of age, and devoted himself to the study of Correggio. He removed to England in 1754, and settled in London, where he died in 1785. His drawing is correct, and his painting is marked by harmony of colour and sweetness of style. His best plates are his composition named the 'Mother and Daughter,' the 'Death of Cleopatra,' after Benvenuto Cellini, and his 'Descent of the Holy Spirit,' after Domenico Gabbiani. C. furnished the design for the diploma of the Royal Academy, of which he was one of the original members.

Circæ'a, a genus of Herbaceous plants of the natural order *Onograceæ*, of which there are various species in the Himalayas, Europe, &c. *C. Lutetiana*, the 'enchanter's nightshade,' is a native of Britain. It has no relation to the nightshades, and probably the name has, through some mistake, been transferred from the Mandrake (q.v.) to this plant (*Prior*); while the term 'enchanter' has been given it from the sorceress-goddess Circe (q.v.), after whom the genus was named. The Alpine C. is not unfrequent in Scotland and the N. of England. Beyond a little astringency, the plants possess no notable properties.

Circass'ia, formerly an independent country, now incorporated in the Caucasian provinces of Russia, occupies the N. and part of the S. declivity of the Caucasus (q.v.).

Circass'ians. Under this name may be included all the tribes of the Caucasus, but the C. proper held only the north-western slope of that range, excepting the country of the Abasians, between the lower Kuban and the Black Sea. The C. are called by the Turks *Tcherkas* (*i.e.*, robbers), but call themselves Adighé. They numbered about 300,000, and comprised fifteen tribes. They do not belong to the Aryan race—of which, from their fine physique, they were once regarded as a high type—but to the Semitic or Turanian variety. Their peculiar language seems akin to the Turanian tongues. They were brave, strong, and handsome, and the beauty of the Circassian women was famous throughout the East. Their social state was rude and unprogressive. They were predatory and warlike; and their most stringent customs were to respect age, to revenge a kinsman's death, and to observe a law of hospitality called *kunadi*. Almost none of them except their bards, who were much respected, could write. They were governed by a kind of feudal oligarchy, and were divided into five castes—the chiefs, the nobles, the ordinary freemen, who formed the mass of the people, the vassals, who tilled the soil and followed the nobles to war, and the slaves, either prisoners of war or descendants of such prisoners. Their religion was a mixture of Christianity, Mohammedanism, and Paganism. Christianity was introduced among them in the 11th and 12th centuries, but ultimately Mohammedanism, which was the creed of the chiefs and nobles, prevailed. During the Middle Ages they were subject to the Arabs and Georgians. After throwing off the Georgian yoke in 1425 they fell under the power of the Khans of the Crimea, but during the 18th c. they became free from Tartar influence. The Russians, after annexing Anapa on the Black Sea in 1807, made repeated efforts to subdue the C., who, by the treaty of Adrianople in 1830, were ceded to Russia by Turkey, but, under Schamyl, resisted Russia until Prince Orbelliani defeated them in 1857, and captured Schamyl in 1859. A large number of the C. then sought refuge in Turkish territory, many of whom perished by starvation. Their country was thoroughly conquered, and the bold spirit of the mountaineers finally quelled. See Spencer's *Travels in Circassia*, and Haxthausen's *Tribes of Caucasus*.

Cir'ce (lit. 'the she-hawk'), a mythic sorceress, 'the daughter of the sun,' who dwelt in the island of Ææa, on the W. coast of Africa. Her 'charmed cup' had the power of changing those that tasted it into swine. When Ulysses, in the course of his wanderings, came to her isle, this fate befell twenty-two of his companions, but the hero himself escaped it by the aid of Hermes, and remained in safety with the enamoured witch for a whole year. The story is told in the 10th and 12th books of the Odyssey. The Latin poets make great use of the story of C., particularly Ovid in the 14th Book of the Metamorphoses.

Cir'cle, according to Euclid, is a plain figure contained by one line called the *circumference*, and is such that all straight lines drawn from a certain point within the figure to the circumference are equal to one another; this point is the *centre*. It is perhaps easiest conceived of as the path described by either extremity of a rod which rotates in a given plane round a given *fixed* point in the rod. This definition suggests at once a practical method for its description. For the fundamental properties of the C. see Euclid's *Elements*, Book III. The great problem among the ancient geometers with regard to the C. was its *quadrature*—*i.e.*, the construction by rigid mathematical methods of a square equal in area to the C. This area was soon shown to be equal to the product of the radius and the semi-circumference; and accordingly the problem was reduced to that of rectifying the curve and of finding the ratio of the circumference to the diameter. This ratio is the same for all circles; but it is undiscoverable by the geometry of C. and straight line, the constituents being incommensurable. The incommensurability seems to have been suspected by Euclid, whose most wonderful and complete book is perhaps his 10th, dealing with the investigation and classification of incommensurable quantities. The ratio, then, of the circumference to the diameter, invariably represented in mathematics by the Greek letter π, can only be approximately expressed as a number. The first approximation (22 : 7) was given by Archimedes. Another, and nearer, and very convenient value, is 355 : 113. Vieta calculated it to the 10th decimal place, Van Ceulen to the 36th, Sharp to the 72nd, De Lagny to the 128th, and Clausen to the 250th. The value of π to the first 15 decimal places is 3·14159,26535,89793.

In modern geometry the C. is classed among the quadrics or curves of the second order, to which the ellipse, parabola, and hyperbola also belong. Many of the properties of the C. can be extended to the sphere by the substitution of planes for straight lines; and this similarity is recognisable at once from their *quaternion* equations, which are identical, there being merely the further condition, in the case of the C., that it lies in one plane. See QUATERNIONS.

The *Curvature* (q.v.) of a C. is the same wherever you take it. Hence the curvature of a curve at any point is determined by drawing through this point the C. which has the same tangent, and the same ultimate deflection from the tangent, that the original curve has, since there is no other C. that can have a more perfect and higher degree of contact. This C. is called the *C. of curvature*, and its radius the *radius of curvature*; in practical life, the unit angle or *Degree* (q.v.) is that angle which is subtended by an arc, equal in length to the 1-360th part of the circumference of a C. of unit radius.

Circle, Magic, the charmed limits within which magicians and sorcerers, according to popular belief, were safe from the fury of the evil spirits whom their spells had raised. Described on a space of 9 sq. feet—7 was the number in the E.—there was an outer and an inner C., and the spaces between them, as well as in the angles of the square outside the larger one, were filled ‘with all the holy names of God,’ and other symbols, in which lay the potency of the charm.

Cir'cuits. England and Wales, except Middlesex, are for judicial purposes divided into seven C. Each of these districts is visited by one judge at least (or by two when an extra judge is required and can be obtained from London), twice every year, or more frequently whenever the circuit work necessitates it. Both criminal and civil cases are tried before these judges. The criminal charges for the county of Middlesex and city of London, and certain parts of Essex, Kent, and Surrey, are adjudged at sessions held monthly at the Central Criminal Court (see CRIMINAL COURT, CENTRAL). In 1865 the civil cases, which had formerly been tried at the Guildhall, were removed to the Royal Courts. In 1883 the civil cases were directed to be always thereafter tried at the Royal Courts of Justice, but in 1891, by statute 54 Vict. c. 14, provision was made for holding such civil courts in the City of London, and two judges were appointed for the purpose. The circuit districts are seven—the Midland, the Oxford, the North-Eastern, the South-Eastern, the Northern, the Western, and the N. Wales and S. Wales. In Ireland they are the N.E., the N.W., the Home, the Leinster, the Connaught, and the Munster. The Act of 1672 divided Scotland into three districts, in which C. are to be made by the justiciary judges. This regulation is affected by different statutes. The circuit courts are now held every year six times at Glasgow, four times at Perth, Dundee, and Aberdeen, and twice at Ayr, Dumfries, Jedburgh, Stirling, Inveraray, and Inverness. Special sittings may take place at any convenient town. A single judge sits except when the court is one of review or an important case has to be tried. All the Lords of Council and Session are judges of these courts.

Circular Notes are a kind of bank-notes, which the chief banking-houses of the United Kingdom supply for the convenience of travellers abroad. They are of the value of ten pounds and upwards. No charge is usually made by the bank for commission, as it makes its profit on the interest arising on the purchase-money between the time of purchase and the date at which the bank is called on to cash the C. N. A French *Lettre d'Indication,* addressed to a long list of foreign bankers, is given along with the notes, which must be presented on discounting any of them. The traveller should sign this letter at once on receiving it, and put it in one repository and the notes in another; thus, if his notes are lost or stolen, they cannot be cashed if he retain the letter, and even though both letter and notes come into the possession of a dishonest person, the former being signed, there will be the difficulty of endorsing the notes with a sufficiently good imitation of the signature to the letter.

Circular Numbers are those whose powers all end in the same figure—that is, every number whose final figure is 1, 5, 6, or 0.

Circular Parts, the name given to two rules, invented by Napier, which facilitate the solution of right-angled spherical triangles. They may be found in any treatise on spherical trigonometry.

Cir'culating Library, a library of books lent on hire. In the Middle Ages the stationers of Paris were compelled to lend books to students at rates of charge fixed by the university. The first C. L. in England was established about 1740 by Samuel Fancourt, a Salisbury clergyman, and in 1748 there was a large C. L. in Crane Court, London. Allan Ramsay opened a C. L. in Edinburgh about 1725. The *London Library* was founded in 1841, and is now a very valuable institution. Circulating libraries are now common throughout the country. The largest in England are those of Mudie, New Oxford Street, which was founded in 1842, and W. H. Smith and Son.

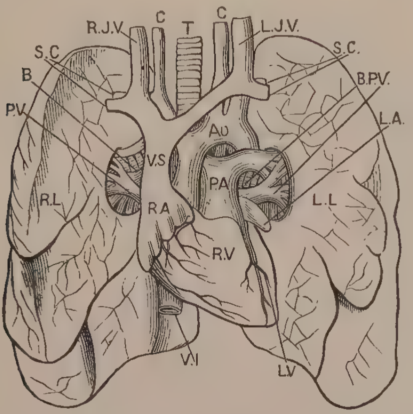
Circula'tion of the Blood. The blood is formed (1) from the chyle poured into it by the thoracic duct, (2) from the fluid and soluble matters absorbed by the blood-vessels of the alimentary canal, and (3) from the matter collected by the absorbents from all parts of the body, and elaborated by the lymphatic glands, called the *lymph.* (See BLOOD.) This fluid contains in it all the materials necessary for nourishing the various textures of the body; and, consequently, for the purposes of nutrition, and also for the purposes of respiration and excretion, it must be distributed throughout the body. It is in a state of constant movement in a definite direction, and the name given to this movement is the *C. of the B.*

A description of the C. of the B., or nutritive fluid, in the different great groups of the animal kingdom, will be found under such headings as AMPHIBIA, ANNULOSA, ANNULOIDA, CRUSTACEA, FISHES, MOLLUSCA, PROTOZOA, REPTILIA, and what will be detailed here will be the function as manifested in man, the mammalia, and birds.

History of the Discovery of C. of the B.—Hippocrates confounded veins and arteries under the general name of *phlebes*, the term *arteria*, artery, being applied by him only to the windpipe. Aristotle distinguished between arteries and veins, but supposed that the latter alone contained blood, which they carried outwards. The arteries were believed by him to be filled with air. Galen demonstrated that the arteries did not contain air, but blood. He thought, however, that there was a communication between the two sides of the heart through the septum. Vesalius pointed out that there was no such communication. Servetus showed that before the blood could pass from the right to the left side of the heart it must pass through the lungs. It was still thought, however, that blood passed from the heart outwards into the body by both arteries and veins. Fabricius ab Aquapendente showed that there were valves in many of the veins, so placed that the blood could only pass through these vessels *towards* the heart, not *from* it. At last the celebrated William Harvey appeared, and in 1628 he published his great work, *De Motu Cordis et Sanguinis,* which finally established our knowledge of the C. of the B., and which has always been regarded as one of the finest examples of purely experimental research and of inductive reasoning. He based his discovery, the greatest ever made in physiology, on the following considerations and facts:—(1) the continuity of the connections between heart, arteries, and veins; (2) that on dividing an artery blood spurted out from the end still connected with the heart, while on dividing a vein, blood flowed from the end further from the heart; (3) that when he applied a ligature to a vein, the vessel became swollen on the side of the ligature further from the heart; (4) on the arrangement of the valves in the heart and veins being such that it could flow only in a certain direction; and (5) that on calculating the amount of blood sent out from the heart along the arteries in a given time, it was found to be so great as to prove that a large proportion of it must return to the heart in that time, as there was not sufficient time either for the complete consumption of the old, or for the formation of new blood, to keep up the supply. Still Harvey did not understand how the blood passed from the extremities of the arteries into the commencement of the veins. The capillaries were not then known. In 1661 Malpighi showed, by means of the simple microscope, the circulation in the web of the frog's foot. Thus it was shown that the blood passed from arteries to veins by the capillaries or intermediate vessels, and the discovery of the course of the circulation was complete.

The Organs of the Circulation.—These are the heart, arteries, veins, and capillaries. A description of the structure of the last three will be found under their respective headings, but in order to understand the C. of the B., it is necessary here to describe the heart.

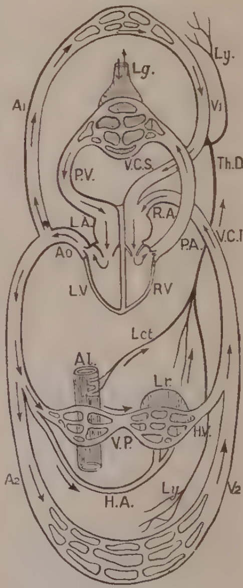
The Heart.—This is an organ placed somewhat obliquely in the thorax. It is of a conical shape. The base is directed upwards, to the right, and somewhat backwards, and corresponds to the middle of the back. The apex is situated a little to the left of the breastbone, opposite the space between the fifth and sixth ribs, a little below the left nipple. The organ, in the human being, is about the size of the clenched fist, and in the male it weighs from 10 to 12 ounces, while in the average female it is somewhat lighter. The heart is divided into four cavities, two corresponding to the base, called the *auricles*, RA, LA, and two to the body and apex, known as the *ventricles*, RV, LV. The auricular part is separated from the ventricular by a transverse groove, called the *auriculo-ventricular* groove, in which lie the nutrient vessels of the organ. Two longitudinal furrows are also seen, one on the anterior, the other on the posterior surface of the heart, and indicating a division of the organ into a right and left half, each consisting of an auricle and a ventricle. When the thorax is opened, the right side is the part chiefly seen, the left resting on the diaphragm. The auricles are called *right* and *left auricles*, RA, LA, the ventricles, *right* and *left ventricles*, RV, LV. Into the right auricle two great vessels open, namely, the superior and inferior *venæ cavæ*, VS, VI, the former of which returns the blood from the head, neck, and upper extremities, while the latter does the same office for the abdominal and pelvic portions of the body, and the lower extremities. Into this cavity there are also numerous apertures of small veins belonging to the heart. The blood then passes into the right ventricle by an opening called the *right auriculo-ventricular* aperture, which is guarded by a valve called the *tricuspid*. The right ventricle is shut off from the left by a strong partition between the cavities. From the right ventricle there issues a large vessel, termed the *pulmonary artery*, PA, which conveys the blood to the lungs. At the orifice of this vessel there is a valve, termed *semilunar*, from its shape. After the blood has passed through the lungs (see RESPIRATION), it is returned to the left auricle of the heart by four pulmonary veins, PV. From the left auricle it then passes to the left ventricle. The left ventricle is longer than the right, and has much thicker walls. At the left of the base of this cavity is the oval opening from the left auricle known as the *left auriculo-ventricular* opening. In front, and to the right of this, there is a round aperture, the mouth of the aorta, Ao, the great trunk artery of the body. The left auriculo-ventricular opening has a valve known as the *mitral*, so termed from its fancied resemblance to a bishop's mitre, and the orifice of the aorta has a semilunar valve, resembling that seen in the pulmonary artery.



The Heart, Great Vessels, and Lungs. (Front view.)

The cavities of the heart are lined by a serous membrane, called the *endocardium*, which is continuous with the lining membrane of the vascular system. The substance of the heart is composed of muscular fibres, which are remarkable for being striated, whilst they belong functionally to the class of involuntary muscles. (See MUSCLES.) They are arranged in a series of layers. According to Pettigrew, who has chiefly dissected the hearts of ruminants, seven layers enter into the composition of the walls of both ventricles—three external, three internal, and one intermediate between these two groups. He has also shown that certain fibres of the external layers are continuous with corresponding internal layers, thus forming a series of loops. This continuity occurs around the auriculo-ventricular orifices, and upon the septum, and at the apex of the ventricles. The fibres of the first or external layer are continuous with the deepest, those of the second with the sixth, those of the third with the fifth, while the fibres of the middle or fourth layers return as it were upon themselves. Again, he has shown that some fibres pass round both ventricles. The direction of the fibres changes as we proceed from without inwards; the external layer is very oblique, and in the right or left ventricle passes from right to left, from base to apex, of the heart; the next two layers are less oblique; the fourth layer is transverse; and in the three innermost layers the obliquity becomes greater as we pass inwards, and the direction is changed, so that the fibres pass from right to left, but now upwards, from apex to base.

Mode of Action of the Heart.—The right auricle, RA, receives the blood from the body by the inferior and superior venæ cavæ, VCI, VCS, and the left, LA, receives it from the lungs by the pulmonary veins, PV. When both auricles are full of blood, they contract and expel the blood from their cavities through the auriculo-ventricular orifices into the ventricles. The blood is prevented from passing backwards into venæ cavæ, or pulmonary veins, by the pressure of the blood filling the lungs and venous system. The two auricles contract simultaneously. After the ventricles have filled completely, they also contract simultaneously, and force the blood from the right into the pulmonary artery, PA, and that from the left into the aorta, Ao. To prevent the blood from regurgitating into the auricles, the auriculo-ventricular orifices are guarded by valves already alluded to. The right possesses the tricuspid, while the left has the mitral. It is necessary to understand the mechanism of these valves, which is identical in both. Take, for example, the tricuspid. As its name indicates, it consists of three cusps. These are of a somewhat triangular shape, the base of the triangle being attached to a fibrous ring surrounding the auriculo-ventricular opening, while the margins are free. When these three cusps have their edges in opposition, the orifice is nearly closed. They are brought into opposition when the ventricle contracts by the blood behind them lifting them up, but when the ventricles are dilated, the cusps hang downwards into the cavity of the ventricles. It is evident that some provision must be made for preventing the cusps from being forced backwards into the auricle. This is accomplished as follows: To the ventricular surface of the cusps a number of delicate tendinous cords (*chordæ tendiniæ*) are attached. These are in continuation with small muscular papillæ (*musculi papillares*) springing from the wall of the ventricle. When the ventricular wall contracts, these papillæ also contract, and pull upon the cusps, when these are forced upwards in the manner already described, so as to keep them tense, and thus prevent the possibility of their being forced backwards into the auricles.



Course of the Circulation. (Back view.)

We have now to consider how the blood is prevented from flowing backwards into the ventricles, during their relaxation, from the aorta, Ao, and pulmonary artery, PA. This is effected by the action of the semilunar valves placed in these vessels, near their junction with the ventricles, RV, LV. These valves are each composed of three semilunar segments, attached by their convex margins to the sides of the vessel, but free at their borders, which, during the flow of blood past them, are turned upwards in the direction of the vessel. In the middle of the free border there is a small fibrous nodule, the *corpus aurantii*, and by the apposition of the three *corpora aurantii*, the irregularly triangular space, which would be left when the margins of the segments are brought into the same plane, is completely filled up. Behind each segment a small dilatation or pouch is seen, termed the *sinus of Valsalva*, most distinct in the pulmonary artery. The mechanism of these valves is extremely simple. After the complete contraction of the ventricle by which it forces the blood into the vessel, it dilates. The walls of the vessels, being highly elastic, when relieved from the propelling or distending force (*vis a tergo*), recover themselves, and tend to push part of the blood backwards into the ventricles. But as it passes behind the segments of the semilunar valves, and fills the sinuses of Valsalva, the segments are pushed downwards as far as they will go, thus closing the lumen of the vessel and preventing regurgitation into the ventricles.

Cycle of the Actions of the Heart.—A complete action of the heart consists (1) of contraction of the auricles, (2) of a short pause, during which the auricles have begun slowly to dilate, (3) of contraction of the ventricles, and (4) of a long pause, during which the ventricles relax and become filled with blood which is flowing into them from the auricles. After the auricles have filled they again contract, and another cycle of actions is begun. It has been found that the time occupied by the contraction of the auricles is about equal to that of the short pause, and the time of the contraction of the ventricles to that of the long pause. If so, it is evident that in each cardiac cycle the muscular walls of the heart are relaxing as long as they are contracting; or, in other words, there are brief periods of rest equal to brief periods during which energy is being expended.

Sounds of the Heart.—When we listen over the cardiac region of the chest of a healthy person, we feel an impulse, and we hear two sounds like those occasioned by pronouncing in a medium pitch of voice the words *lupp dupp*. The first sound is dull, deep, prolonged, immediately precedes the pulse at the wrist, and is heard most distinctly over the apex of the heart. It is called the *first* or *systolic* or *inferior* sound, and it coincides with the contraction of the ventricles. It is due, or at all events coincident with, the combined effect of the four following actions:—(1) the contraction of the ventricles; (2) the rush of blood through the aortic and pulmonary orifices; (3) the flapping together of the auriculo-ventricular valves; and (4) the movement of the apex of the heart against the wall of the chest, caused by the change of form of the ventricular portion of the heart during its contraction. The second sound is sharp, short, superficial, and is heard with greatest distinctness over the base of the heart. It has been experimentally ascertained to be entirely due to the sudden closure of the semilunar valves in the way already described.

Forces carrying on the Circulation.—1. The chief of these is the heart. 2. The next usually mentioned is the elasticity of the larger arteries, which effects (1) the gradual conversion of the pulsatile or wave-like movement into a uniform flow, and (2) diminishes the resistance the ventricle has to overcome. But it can scarcely be said that the elasticity of the vessels is a new force, as the amount of recoil, supposing the arteries to be perfectly elastic, will be exactly equal to the amount of distension caused by the action of the ventricles. The elasticity of the ventricles modifies the character of the flow of the blood rather than adds to the force for propelling it forwards. 3. By some it is contended that the attractive influence of the tissues in the meshes of the capillary system forms one of the forces of the circulation (*vis a fronte*). 4. The blood is propelled along the veins towards the heart by muscular pressure on their walls forcing the blood onwards, as it cannot pass backwards, on account of the pressure of the valves in these vessels, which open *towards* the heart. 5. Lastly, Burdon Sanderson and others have shown experimentally that inspiration, by diminishing pressure on the venæ cavæ, favours the flow of blood to the heart, and thereby increases the vigour of the succeeding contractions. See RESPIRATION.

Arterial and Cardiac Pressure.—By this is understood the force or pressure of the fluid on the inner surface of the heart or arteries during a contraction of the heart. It is measured by an apparatus termed a *kymograph* (see KYMOGRAPH), and it has been estimated in the human subject to be about 4 lbs. 4 oz. on the sq. inch. Now, if we assume the superficial area of the inner surface of the left ventricle, which has to propel the blood through the whole body, to be 13 inches, as has been determined to be the mean, it follows that when the walls of this cavity contract they do so with a force equal to about 52 lbs.

Rapidity of the Circulation.—There is no accurate method of measuring this. According to Vierordt, the blood flows in the carotid, an artery of the neck, at the rate of about $10\frac{1}{2}$ inches in a second. In smaller arteries he estimated the speed as being much slower. Volkmann found in the carotid of the horse the rapidity to be 20·28 inches per second. According to Valentine and Weber, in the capillaries the rate is 1 inch per minute. All of these measurements are vague and unsatisfactory, and this most difficult problem is still unsolved.

Circumcis'ion is a religious rite which has prevailed among various nations all over the world. It is probably a relic of nature-worship, and points back to the practice of offering human sacrifices to the God of Increase.

The idea long prevalent among Christians was that C. is and was exclusively a Jewish rite, and that it was given to Abraham as a token and seal of the covenant, the institution of which is described in Gen. xvii. This idea may now be considered to be abandoned; for it is capable of absolute demonstration that C. was practised among people well advanced in civilisation—*e.g.*, the Phœnicians and Egyptians—long before the ancestors of the Hebrews had left Mesopotamia. But Scripture does not say that C. was first made known to Abraham. In fact, it implies exactly the reverse. The passage in Genesis assumes a knowledge of the practice, and only represents it as transformed for the first time into a religious rite, and acquiring a symbolic meaning.

Circumduc'tion of the Term, in Scotch law, is the sentence of a judge declaring the time elapsed for leading proof in a case, after which no further evidence can be adduced.

Circum'ference, or **Periphery,** the curved boundary of a plane figure: when the boundary is made up more or less of straight lines, it is usually termed *perimeter*.

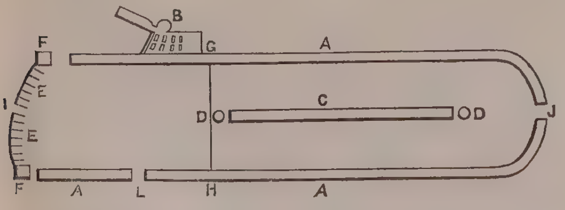
Circumnaviga'tion, the act of sailing round the world. This feat was performed first by Magalhæns (q.v.) in 1519. Drake (q.v.) accomplished it in 1577; and Captain Cook (q.v.) between the years 1768 and 1779 circumnavigated the globe no less than three times. In the present day it is frequently done, but not in the same way, nor in the same vessel. A traveller may now pass round the world in ten weeks. His starting point being London, he will take the train to Dover, cross over to Calais, and proceed to Brindisi. There he will catch the P. and O. steamer bound for Calcutta *viâ* Suez Canal, Red Sea, and Colombo. At Colombo he will change steamers and embark on that from Bombay to China *viâ* Singapore. From China he will proceed by the Empress Line of steamers to Vancouver *viâ* Japan. At Vancouver he will enter the train on the Canadian Pacific Railway, which will convey him to Quebec *viâ* Selkirk Range, Stephen, Regina, Brandon, Winnipeg, North Bay, Ottawa, and Montreal. From Quebec he will take steamer to Liverpool, and thence go on by train to London. Under favourable conditions he might traverse the distance in eight weeks, but as a rule some time is always spent in waiting for a steamer either in China, or at Quebec, or at both places.

Circumstan'tial Evidence is evidence which—assuming it to be true—does not directly prove a question at issue, but indirectly tends to prove it. Thus if A swear that he saw B stab C, the evidence is direct; and if we believe A, the question of whether or not B stabbed C is disposed of. But if A swear that he saw B and C quarrelling on the day when C was stabbed, belief in A does not satisfy us of B's guilt; but it is C. E. of more or less weight. And if we have an accumulation of such items of evidence, they may, though there be no direct evidence, amount to conclusive proof of guilt. But if any one item of circumstantial proof depend on another, the two must only have the weight of one. Thus A swears that he sold to B the knife which D swears that he found blood-stained near the murdered C. Here we have not two but only one item of proof, since if either A or D is swearing falsely, the testimony of the other is valueless against B. C. E. is in this better than direct evidence, that the witnesses to it can hardly combine to swear falsely without being detected. It is plainly impossible that any concatenation of circumstances should ever prove the innocence of one accused to be impossible. When the probability of innocence bears an appreciable ratio to that of guilt, according to the just principle of our law, the prisoner must be acquitted.

Circumvalla'tion (Lat. *circum*, 'about,' and *vallum*, 'a rampart'), in fortification, is a line of entrenchment thrown up by the besieging party round a place under siege, but facing outwards so as to resist attacks from the field.

Circumven'tion means in Scotch law deceit or fraud in making a bargain, or in procuring the making or execution of a deed. Either may be set aside by law if proved to have been entered into or done through C. It will not, however, be sufficient to prove that the act sought to be annulled is hurtful to the doer, or irrational on his part; for the law will not protect a man from the consequences of his own folly. It must be shown that deception was used towards him. If, however, the granter of a deed or maker of a will be of weak mind, a very slender circumstance or fraud may lead the law to set the deed or will aside.

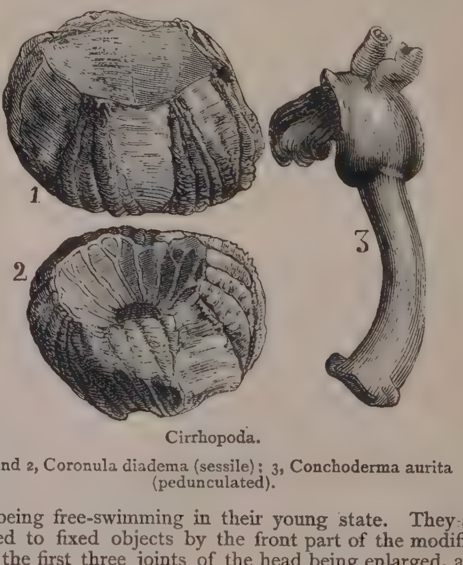
Cir'cus, The, of ancient Rome, was a place in which chariot-races and other games were exhibited. The Circensian Games were believed by the later Romans to have been first instituted by Romulus, and were named *Consuales*, in honour of the god Consus. To Tarquinius Priscus was ascribed the construction in the Murcian Valley, between the Palatine and Aventine, of a building for such exhibitions, which was known by way of eminence as the *C. Maximus*. It was frequently repaired and extended, and was reconstructed by Julius Cæsar, in whose time it was three stadia (about 600 yards) long, one stadium wide, and the surrounding buildings half a stadium deep. At different periods of its history, it was computed to contain 150,000, 260,000, and 385,000 persons. Scarcely a vestige of it now remains; but an excellent idea of an ancient C. may be obtained from the remains of the Circus of Caracalla, the ground-plan of which is shown in the annexed woodcut. Around the lines A A were placed the seats, as in a theatre, the lowest being separated from the ground by a parapet or balcony. At B was probably the station of the emperor. Down the middle of the area ran a dwarf wall C, called the *spina*, decorated with emblematic devices, and terminating at either end in three wooden cylinders DD of a conical shape, called *metæ*, round which the rival chariots were driven. At the end EE were placed the stalls for the horses and chariots, called *carceres*, the usual number of which was twelve. The whole of this side of the C. was called *oppidum*, from its gates and towers, FF. From G to H stretched a chalked rope (*alba linea*), for the purpose of securing a fair start, by bringing all the horses abreast at the entrance of the course. There were in all five gates, of which the chief were the *Porta Pompæ* (I), through which the opening procession entered; the *Porta Triumphalis* (J), through which the victors departed; and the *Porta Libitensis* (L), through which the bodies of those killed in the games were carried out. The *Euripus* in the C. Maximus was a canal 10 feet wide round the bottom of the front balcony, formed by Julius Cæsar to protect the spectators during the wild-beast hunts. The shows exhibited in the C. were the races, of which the Romans were passionately fond at every period of their history; the *Ludus Trojæ*, a sort of sham-fight, by young men of rank on horseback; the *pugna*, the representation of a battle; gymnastic contests in running, leaping, &c.; the *venatio*, a fight of wild beasts with one another or with men; and the *naumachia*, or representation of a sea-fight. In the races four chariots usually entered, drawn by two or four horses. The extent of the course was seven times round the *spina*, and twenty-five races were run in each day.



Circus of Caracalla.

Ciren'cester, or **Cic'ester,** a town of Gloucestershire, on the Churn, and on the Thames and Severn Canal, 17 miles S.E. of Gloucester, has some manufactures of woollens, carpets, and cutlery. It possesses a fine old church (St. John's), and in the vicinity there is an agricultural college, founded in 1846. C., according to Henry of Huntingdon, was originally a British city, called *Caer-corin* ('camp on the Corin,' mod. Churn). It became the *Corinium* or *Corinum* of the Romans, and stood at the junction of five Roman roads. The English invaders added *ceaster*, to mark that it had been a military station; and the modern name is only a corruption of *Corinium-ceaster*. Canute held a council here in 1020. C. once possessed a fine abbey, founded by Henry I., but no remains are extant. The town was attacked by Rupert in 1642-43, and was afterwards captured by Essex. Traces of a fortified wall have been discovered, as also various Roman remains. The C. division of Gloucestershire returns one member to Parliament. Pop. parl. div. of county 53,341; reg. subdist. 12,073; civ. and ecc. par. 7521.

Cirrhop'oda, or **Cirrip'edia,** an order of lower Crustacea represented by the Barnacles and Sea-acorns. These forms are distinguished by the fact that when adult they are fixed, being free-swimming in their young state. They are attached to fixed objects by the front part of the modified head; the first three joints of the head being enlarged, and



Cirrhopoda.

1 and 2, Coronula diadema (sessile); 3, Conchoderma aurita (pedunculated).

enclosing the rest of the body. The larva or embryo fixes itself by means of a peculiar *cement* furnished by special glands, which consist of modified parts of the ovaries. The hinder part of the animal, with its twelve feet converted into *cirri* or tentacular organs (hence the name *Cirripedia*), can be protruded from within the shell with which it is provided, and the cirri subserve respiration and nutrition. The mouth is provided with mandibles and maxillæ, and a complete digestive system exists. No distinct heart is developed. The larva is a free-swimming body known as a *nauplius*, provided with antennæ, a single eye, and a dorsal carapace or shield. Subsequently twelve limbs are developed on the abdomen, and the antennæ become prehensile organs, whilst a pair of eyes now exist. The antennæ are next fixed to some rock or stone by the cement, the carapace becomes calcified to form the adult 'shell,' and the feet become the cirri of the fully grown and metamorphosed animal, which loses the eyes of the larval stage. The Barnacles (q.v.) are stalked and possess peduncles, at the free end of which the body of the animal, contained within a shell, composed of calcareous plates, is found. The Balani or sea-acorns are sessile or unstalked, and fix themselves directly to rocks, their bodies being enclosed within shells, composed each of six segments or pieces, and having the twelve divided cirri, capable of being protruded from or retracted at will within the aperture of the shell, which is closed by an *operculum*.

Cirr'hus, or **Tendril**, is the name applied to the thread-like twining organs by which plants climb around others or up any support. They may be formed by various modifications of the leaves, as in the Pea tribe, various species of *Clematis*, &c. In other cases they may be thread-like leafless branches capable of coiling spirally. Some tendrils hook their tops round supporting objects, while others expand their tops into a flat disk, which clings to objects, and enables the plant to climb up in the same way as do the accessory rootlets of the Virginian creeper. The term C. is applied in zoology to any curled filament, and also to the modified feet of the *Cirripedia*.

Cis, a Latin preposition, meaning 'on this side,' the opposite of *ultra* and *trans*, and prefixed to names of mountains and rivers to form adjectives of place: Cisalpine, 'on this side of the Alps,' the opposite of Transalpine, 'beyond the Alps'; Cismontane, 'on this side of the mountain'; Ultramontane, 'on the further side of the mountain'; Cisrhenane, 'on this side of the Rhine'; Transrhenane, 'beyond the Rhine,' &c. It must be noted that the standpoint of those who first used the term was Rome, or some place within the bounds of the Roman dominion.

Cisal'pine Republic, The, formed out of the Cispadane and Transpadane republics, was proclaimed by General Bonaparte, 28th June, 1797, and recognised by Austria as an independent state at the peace of Campo-Formio. It comprehended Lombardy, Mantua, Bergamo, Brescia, Cremona, Verona, Rovigo, Modena, Massa, and Carrara, Bologna, Ferrara, and Mesola. On the 22nd October of the same year it received an accession of territory, and was divided into ten departments, with an area of 16,384 sq. miles, and a pop. of 3,500,000. The victories gained by the Russians and Austrians in 1799 produced a temporary dissolution of the republic, but it was re-established by Bonaparte after the decisive battle of Marengo. On 25th January, 1802, it assumed the name of the Italian Republic, and was divided into thirteen departments, with Bonaparte for its president, a title exchanged in 1805 for that of King of Italy, held by him till 1814, when the so-called Kingdom of Italy was dissolved.

Cissampelos (Gr. 'ivy-vine'), a genus of plants of the natural order *Menispermaceæ*. The root of *C. Pareira*, the 'velvet leaf' of the W. Indies, Central America, and India, yields the '*Pareira brava*,' or 'Butua root' of the shops, extensively and beneficially used in diseases of the bladder, &c.; other species are used as tonics. The root of *C. obtecta* is used for making an intoxicating drink, while *C. glaberuma* and *C. ebracteata* may be classed among that category of plants which have been reputed as remedies for serpent-bites. The root contains an alkaloid, *Cissampelin*, to which it owes its active properties.

Ciss'oid (Gr. *kissos*, 'ivy,' and *eidos*, 'a shape') **of Diocles,** a curve invented by Diocles (a Greek geometrician of unknown date) for the solution of the duplication of the cube, and the insertion of two mean proportionals between two given straight lines. If, from the extremity of a diameter of a circle as origin, lines be drawn to meet the tangent at the other extremity, that point on each line whose distance from the origin is equal to the distance between the intersections of the line with the circle and tangent, lies on the C. It has a cusp at the origin, and a point of inflection at infinity. The space between the curve and its asymptote (the tangent of the circle) is triple the area of the circle. Newton, in his *Universal Arithmetic*, gives a mechanical method of describing this curve.

Cister'cians, an order of monks founded in 1098 by Robert, abbot of the Benedictine monastery of Molesme in Burgundy, who retired with twenty companions to Citeaux (Lat. *Cistercium*), and there established the fraternity of C. The C., after degenerating, were reformed in the beginning of the 11th c. by St. Bernard of Clairvaux, who founded ninety-two monasteries, and from whom the C. in France were known as Bernardines. After St. Bernard's death, the C. shook off episcopal control and became very influential through Europe. They wore a white robe with a black scapulary. Their rule was austere. At first they shunned luxury, ate no flesh, slept on straw, and walked unshod. Among the various offshoots from the C. were the Recollets in Spain, the Feuillans or Bare-footed monks in France, and the Trappists of La Trappe in Normandy, who in the 16th c. sank into dissolute banditti. In England and Scotland the C. were very numerous. In the reign of Henry VIII. there were in the former country seventy-five Cistercian abbeys, among which were Woburn, Tintern, Furness, Kirkstall, and Rievaux. The Scotch abbeys of Melrose, Dundrennan, Culross, Deer, &c., belonged to this order. In France the Cistercian convent of Port Royal became famous in the Jansenist controversy. Since the French Revolution the C. have had few convents in Europe.

Cis'tern, a vessel for storing water or other liquid, with apparatus for regulating its supply and discharge. The kind most extensively in use is of wood lined inside with lead soldered at the angles. Cast-iron in one piece for small cisterns, and for large, in plates joined with flanges and bolts, and made water-tight with cement, is also employed, notably for water-tanks at railway stations. Very efficient and cheap cisterns are likewise made of slate slabs.

Cis'tus, or **Rock-Rose,** a genus of Dicotyledonous plants, belonging to the natural order *Cistaceæ*, to which it gives its name, shrubs, natives of Southern and Western Europe, N. Africa, and the Canary Islands. From the leaves and branches of *C. Creticus* exudes the ladanum or labdanum gum of Crete. In that island it is collected by means of a kind of rake 'with a double row of long leathern straps,' employed in the heat of the day when not a breath of wind is stirring. Seven or eight country fellows, in their shirts and drawers, whip the plants with these straps, which, by rubbing against the leaves, lick off a sort of odoriferous glue sticking to the foliage. At one time, it is said that it was gathered from the beards of goats who had been browsing on the foliage. It is now used as a perfume, but it was formerly esteemed as a stimulant and expectorant in the cure of the plague, and as a constituent in plasters. The ladanum of Spain and Portugal is chiefly derived from *C. ladaniferus*, and is said to be obtained by boiling in water the summits of the branches. It has somewhat similar properties to the former, but is not in such high repute. Many of the species of C. are cultivated in our gardens, *e.g.*, *C. ladaniferus*, *C. cyprius* (often confounded with the former), *C. virginatus* of Teneriffe, &c. Altogether there are about 200 species known, a number of which are figured in Sweet's '*Cistineæ*.' *Helianthemum vulgare*, the 'rock-rose,' a common little plant on dry ground, and remarkable for the irritability of the stamens, is the only species of the genus found as far N. as Scotland.

Cit′adel (Fr. *citadelle*, from Ital. *cittadella*, 'a little city'), a fort serving the double purpose of keeping in subjection the inhabitants of the town or city in or near which it stands, and, in case of a siege, of forming a stronghold to shelter the defenders after the rest of the town has been taken. The C. is always built in a space clear of buildings, and commands the entire fortifications of the city or town.

Cita′tion is the act of calling upon a party to appear in court to answer to an action, to give evidence, or to perform some other act before, or in obedience to, the Court. In England the term is chiefly used in the probate, matrimonial, and spiritual court. In Scotland C. is done by an officer of the court, or by a Messenger-at-Arms (q.v.) under warrant. When a party is not in Scotland, but under the jurisdiction of the Court of Session, he is cited edictally; formerly this was by a citation published at the market-cross of Edinburgh and on the shore and pier of Leith; but now it is done by leaving a copy at the office of the keeper of Edictal Citations. Lists of citations are printed and published. In criminal cases it is not sufficient that the party appear voluntarily. He *must* be brought into court in regular form, and he can plead any omission of form, even though he has consented to it. Prescription, positive or negative, in a process may be interrupted by C.

Cithara.

Cithara, a musical instrument, in shape like a guitar, which the player struck either with his finger or with a plectrum. Both the Greeks and the Egyptians used it.

Cities of Refuge were six Levitical cities—namely, Kedesh, Shechem, and Hebron on the W. side of Jordan, and Bezer, Ramoth, and Golan, on the E. side—appointed as a refuge to which the manslayer might flee from the Avenger of Blood (q.v.), and where he was protected till he could be tried by the authorities of his own city. If it was found on his trial that the deed had been involuntary, he was taken back to the C. of R., and on the death of the high priest, could return in safety to his home. The right of sanctuary was also possessed by many Greek and Roman cities, especially Ephesus, and by many churches in the Middle Ages—a privilege which was often too much abused, by letting real criminals escape.

Cit′izen (Old Eng. *citezaine* and *cyteseyne*, from the Old French form of *citozen*, and that from Low Lat. *civitadanus*, a derivative from *civitas*). Neither *C.* nor *city* is a word of definite meaning in modern Britain. The *civitas* of the Romans, which was a central corporation governing inferior ones of a like kind, was unknown here. Some burghs were called cities because they were royal residences, others because a bishop's cathedral stood there. Thus St. Andrews and Glasgow in Scotland, though mere burghs of barony, were called cities, and their inhabitants citizens. In Athens, citizens had the privilege of receiving a *theoricon*, or two oboli to each, as entrance money to the theatres; each C. who attended the ecclesia or public assembly received three oboli about fifty days in every year; every member of the *boulè* or senate, a drachma a day about 300 days in every year; besides, the freemen who served as jurymen or dicasts in the courts of justice received daily pay from the public treasury. The resident aliens were compelled to pay a capitation tax of twelve drachms and to choose patrons; and there was a large body of slaves. Such state donations were, however, rare. At Rome we find *civitas* along with *libertas* and *familia* making up the notion of *status*. Freemen were divided into *cives* and *peregrini*. The rights of cives were—(1) the *jus suffragii*, electoral and legislative power; (2) *jus honorum*, capacity for office; (3) *jus commercii*, or full rights in property; and (4) *jus connubii*, full rights in marriage. Aliens enjoyed only numbers (3) and (4), and these only in a limited way. An intermediate class, Latini, enjoyed number (3) fully. These rights were liable to be lost by the various modes of degradation (*capitis minutio*), and the political rights *suffragium* and *honores* were forfeited by infamy (*infamia*) or loss of civic honour (*existimatio*). Although the imperial revenue consisted to a great extent of provincial tributes, Roman citizens had, after the time of Augustus, to pay customs on most imported articles, an excise not exceeding 1 per cent. on all articles sold in the home markets, a tax of 5 per cent. on legacies and successions. Caracalla did not exempt from tribute where a subject became a C., and citizenship thus became a burden instead of a privilege. The Roman army felt insulted when addressed as 'citizens.' All political significance had, of course, left the term, and the state at last supported its citizens by distributions of corn and largesse, and by giving gratuitous spectacles. The Italian cities were generally administered by a *curia* or municipal senate elected by the people, and *duumvirs*, or annual consuls. In the 9th c. these cities began to rebuild their walls; and after the War of Investiture many were able to recover a jurisdiction and corporate life independent of their feudal surroundings. They had the parliament or general meeting of citizens for election; their *gonfaloniere* and *barroccio* of the town militia; the secret financial council, or *consilio di credenza*; the *signorias*, or municipal magistrates. The feudal lord frequently became a burgess. These free Italian cities formed a league against Barbarossa, and by the treaty of Constance (1183) all their previous privileges and immunities were confirmed, although the Emperor reserved a full right of sovereignty over most of them. Charters of immunity and franchise began to be granted in France in the reign of Louis le Gros. These were distinct from the early charters freeing serfs and fixing their feudal payments; they made careful provision for security of the person and property of citizens, on the principle of a common responsibility and of joint contribution to the expenses of defence and justice. The term C. was used universally during the French Revolution to express the complete political equality of all Frenchmen. In the municipal constitution of Brissot the electoral right was confined to the *citoyens actifs—i.e.*, those paying a *marc d'argent*, or yearly tax equal to three days' labour. In America the term has been used with a similar connotation.

Cit′ric Acid is a colourless crystalline compound contained in the juice of lemons, oranges, gooseberries, tamarinds, and in most acidulous fruits, and was first isolated by Scheele in 1784. C. A. is usually prepared from lemon-juice. The juice is allowed to remain for some time undisturbed, when fermentation sets in and mucilaginous substances separate: the clear liquid is decanted from these, neutralised with chalk, and then boiled with lime, when insoluble citrate of calcium is deposited; this is washed with cold water, decomposed by the proper quantity of sulphuric acid, and the solution of C. A. which results, after being syphoned off from the insoluble sulphate of lime, is evaporated to the proper concentration and allowed to crystallise. C. A. crystallises with one molecule of water of crystallisation. It has a pleasant acid taste, readily dissolves in water and in alcohol, and forms salts in which one, two, or three atoms of its hydrogen are replaced by metals; it is therefore a tribasic acid. C. A. is used by the calico-printer to discharge the mordant from cloth, and in the manufacture of bright colouring matters from cochineal and safflower. It is also used in medicine. Lime-juice is always given on board ship to sailors as an antiscorbutic. C. A. is also employed in the manufacture of effervescing powders, lemonade, &c.

Cit′ron, a tree cultivated in Southern Europe, but a native of the N. of India, belonging to the natural order *Aurantiaceæ* (the Orange family). By some botanists it is looked upon as a variety, or even as the type of the various plants which we now distinguish by the names of orange, lemon, shaddock, and lime, an opinion which Dr. Lindley was inclined to adopt (*Journ. Horticultural Society*, ix. 171). It has, however, been cultivated in Europe since the earliest period of the Christian era, or even before that time, and is now naturalised in most countries the climate of which is suitable for its growth. There are many cultivated varieties, distinguished by the shape, &c., of the fruits. In China, the variety known as the 'five-fingered C.' has the lobes separated into finger-like divisions. The pulp of the C. is cooling, but it is for the rind, which is made into a preserve, that the fruit is chiefly valued, and it may be said that it is used for the same purposes as the fruit of the lemon. From the *cedrate* variety of the C., oil of cedrate, greatly valued by the perfumers, is obtained. C. is frequently cultivated in Great Britain. It is believed that the word which the translators of the Bible have rendered 'apple' would in most places be more appropriately translated C.

Citron.

Citros'ma, a genus of trees of the natural order *Monimiaceæ*, containing about fifty species, all natives of tropical S. America. The leaves are covered with glands, which secrete an oil with a citron-like odour; hence some of the species are called *Lemoncillo*, or 'little lemons,' the fruit being only about the size of a pea when ripe.

Cit'rus, a genus of plants of the natural order *Aurantiaceæ*, consisting of trees and shrubs, natives of India and of the warmer parts of Asia, though also extensively cultivated in America, Southern Europe, and other warm regions, for the sake of their fruits. The flowers are very fragrant, and, like the leaves and rind of the fruit, abound in a volatile oil. Among the best-known fruits referred to the genus C. are the Citron, Orange, Lemon, Lime, Bergamot, Shaddock, Pompelmoose, Forbidden Fruit.

Citta', the Italian form of *city*, enters into the composition of many names of places in Italy, of which may be noted :—

CITTADELLA ('little town'), a walled town in the province of Venezia, N. Italy, on the Brentella, 14 miles N.E. of Vicenza; has woollen-cloth and paper mills. Pop. 9368.

CITTA DI CASTELLO ('castle town'), the *Tiphernum Tiberinum* of the Romans, a town in the province of Perugia, Central Italy, on the Tiber, 12 miles N. of Arezzo; has some manufactures of silk-twist, &c. It is chiefly notable in connection with Raphael, who painted many of his earlier pictures here. The town has many rare Gothic churches and other fine buildings. Pop. 24,688.

Others will be found under CIVITA.

Cit'y, a term introduced about the time of the Norman conquest. The word is derived from the Latin *civitas*, and is not limited in its application to episcopal towns. It is applicable to all towns of eminence, signifying that they are subject to municipal government. Long after the Conquest, C, is used synonymously with *burgh*, as appears in the charter of Leicester, it being called *Civitas Burgus*, which shows that it is an error to suppose the term to be only applicable to a town which 'either is or has been the see of a bishop.' On this point Woodeson, who was Vinerian Professor, adduced a decisive authority. It is that of Ingulphus, who relates that at the great council assembled in 1072 to settle the claims of two archbishops, it was decreed that bishops' sees should be transferred from *towns* to *cities*. In London, when 'the C.' is spoken of, it denotes the mercantile quarter of the town E. of Temple Bar. In America, the term is applied to all incorporated towns governed by a mayor and aldermen.

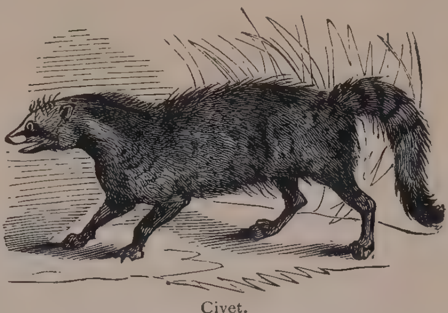
Ciudad', the Spanish form of the Lat. *civitas*, enters into the composition of many names of places both in Spain and her colonies. The most important are :—

CIUDADE'LA, a walled town of Minorca, on the N.W. coast of the island, 30 miles N.E. of Port Mahon, has some woollen manufactures, and a trade in agricultural produce. Its cathedral is an imposing structure. Pop. 8447.

CIUDAD REAL' ('the royal city'), the capital of a province of the same name, Spain, between the rivers Jabalon and Guadiana, 100 miles S. of Madrid, with which it is connected by railway. It has several famous Gothic churches, a public square of 150 by 75 paces, some manufactures of woollens, leather, tablecloths, &c., and a trade in wine, oil, fruits, and mules. Pop. 14,702.—The *province* of C. R. occupies the S. of New Castile, and has an area of 7840 sq. miles, and a pop. of 292,291.

CIUDAD ROD'RIGO ('city of Rodrigo'), a strongly fortified town in the province of Salamanca, Spain, overlooks the Agueda, 50 miles S.W. of Salamanca, has a citadel, a cathedral, part of which was erected in the 12th c., and several fine churches. In the Plaza Mayor are three Roman columns bearing inscriptions. The river is here spanned by a magnificent bridge. As a key to the W. of Spain, C. R. was a place of great importance during the Peninsular War. The French captured it in 1810, and the British besieged it for eleven days, and eventually carried it by storm in one of their most brilliant actions, 20th January, 1812. Pop. 8330.

Civ'et, a genus of Carnivorous mammalia included in the family *Viverridæ*, which, from their applying part of the sole of the foot to the ground in walking, have been named *Semiplantigrada*. They are of moderate size. The muzzle is sharp and the tail long. The flesh-tooth has a cutting edge, and the canines are sharp, long, and pointed. The tongue is roughened with numerous sharp papillæ. The claws can be partly retracted. The pupils of the eyes can contract very markedly on being exposed to light. The C.-cat of N. Africa is the most familiar species. It is nocturnal in habits, and supplies the C. of commerce, in the form of a pomade-like secretion, elaborated by a double pouch present in both sexes. This substance is used in the manufacture of perfumes, and is removed periodically from the secreting glands. Another C., called the genette, inhabits N. Africa and S. Europe, and may be domesticated like a cat. The food consists of raw flesh of various kinds. The common C. attains an average length of about 10 inches, and is coloured a brownish grey with black markings. The last-mentioned species does not afford 'C.'



Civet.

Civid'ale ('the little town'), the ancient *Forum Julii*, a walled town of Udine, N. Italy, on the Natisone, 8 miles E.N.E. of Udine. The cathedral of Santa Maria, built in the 8th c., has several fine paintings and a beautiful altar-screen. Its museum of antiquities and the municipal archives are rich in old and valuable MSS. C. carries on silk, cotton, and linen manufactures. Pop. 8448.

Civ'il Death occurs when a person alive, or possibly alive, is adjudged dead by the law. Those attainted of treason or felony are, with exceptions, held to be civilly dead. In former times, they who entered a monastery or abjured the realm were also held to be civilly dead. A presumption exists in favour of life for a reasonable number of years, so as to throw the *onus probandi* on the party alleging death. But this presumption may be overcome by a counter presumption of death arising from circumstances. No general rule can be given on this point. Neither forfeiture nor escheat is permitted by statute 33 and 34 Vict. c. 23 to follow upon civil death.

Civil Engineer, strictly every engineer not connected with the army—every engineer, that is, not a military engineer—but in common usage a man who makes or designs railways, docks, roads, canals, &c., as distinct from a *mechanical engineer*, a man who makes engines, boilers, and machinery in general. See ENGINEER.

Civil Establishments. Certain public departments of civil organisation, but provided for by the army estimates, are so called.

Civil'ian. This word has three meanings, two of which are legal. In the law, it may denote one versed in the principles and rules which form the basis of civil rights, or it may denote one who has specially studied these principles and rules as they appeared in the laws and government of ancient Rome. In a popular sense, a C. is one whose vocation is neither clerical nor military.

Civil List. Previous to the Restoration in 1660, the civil and military expenses of the state in England were paid out of what was called the royal revenue. This arose from crown lands, and from forced loans, or taxation by the will of the sovereign. (See BENEVOLENCE, SHIP-MONEY, TONNAGE AND POUNDAGE.) At the Restoration the expenditure was divided into two branches, the military and the extraordinary, and the ordinary for maintaining the civil establishments of the country; the revenues appropriated to the latter being called the hereditary or C. L. revenues. They were derived from the crown lands, and from taxes voted by Parliament at the beginning of each reign. In the reign of William III. the C. L. amounted to £680,000 a year. It went on increasing during the reigns of the Georges. In 1812 it amounted to £1,080,000 independent of annuities to members of the royal family paid out of the Consolidated Fund (q.v.). In the reign of William IV. the C. L. charges were confined to the expenses of the King's household, secret-service money, and pensions. These were fixed at £510,000 a year, including a pension list of £75,000. At the beginning of the present reign a C. L. was settled upon Her Majesty for life of £385,000 a year, of which £60,000 is for the privy purse, £131,260 for salaries of the Royal Household, £172,500 for the expenses of the Household, and £13,200 for the Royal Bounty, &c. In return for this grant, it was provided that the hereditary revenue should be carried to the Consolidated Fund. By the C. L. Act, 1 and 2 Vict. c. 2, Her Majesty is empowered to grant new pensions to the amount of £1200 a year, chargeable on the C. L. revenues, to those having fair claims on the royal beneficence, or who, by service or discovery, have earned the gratitude of their country. At the present time the amount so distributed is £24,592.

Civil Service. The paid service of the state which is not military or naval is called the C. S. Appointments in it were formerly under patronage, but now situations in the C. S. are (1) open to competition under regulations framed in pursuance of Clause v. of the Order in Council of 4th June, 1870, by the Civil Service Commissioners, with the approval of the Lords of the Treasury, or (2) open to competition independently of this clause and not subject to the 'General Regulations,' or (3) filled by 'limited competition' among candidates nominated by the heads of the Departments to which they belong, or (4) filled by nomination, subject to a qualifying examination only (sometimes there may be a competition at the discretion of the head of the Department which has the right of nomination), or (5) filled by candidates to whom the Commissioners have granted certificates with or without examination (Clause vii. of the Order in Council). Success in examination is not in itself a guarantee for permanent employment. A six months' probation is necessary, and should the candidate during this time not satisfy the chief of the department in which he has been placed, the appointment will be cancelled. The C. S. Commissioners hold examinations in London, Edinburgh, Dublin, and the provinces, on days which are previously advertised in the principal newspapers. Persons wishing to become candidates must apply to the C. S. Commissioners by letter in their own handwriting, addressed to the office in Cannon Row, Westminster, for permission to attend the preliminary examination, at least ten days before the day named. On receipt of this application, requisite instructions are supplied. Before being allowed to compete, candidates must satisfy the Commissioners that they are natural-born subjects of the Queen, and that, for the first-class examinations, they are not less than twenty-two or more than twenty-four years of age on the first day of the competitive examination. For the second-class examinations the limits of age are seventeen and twenty. Candidates must produce certificates of good health and character. They may compete without reference to any special office vacant, or the competition may be for a special office. Appointments may now be obtained by successful candidates in the Treasury, Privy Council Office, Colonial Office, India Office, War Office, Admiralty, Board of Agriculture, Foreign Office, Local Government Board, Board of Trade, Poor-Law Board, Customs, Inland Revenue, General Post-Office, and a great many other Government offices. There are also competitive examinations for the posts of Abstractor (20-25 years of age), Boy Clerk (15-17), Temporary Boy-Copyist (14-18), Temporary Boy-Messenger (13-15), and Female Typist (18-30). The most important and lucrative department of the C. S. open to competition is that of the C. S. of India, where the candidate must be between 21 and 23 years of age on the 1st April of the year in which the competition takes place. In this the successful candidate will at once, on arrival in India, receive a salary of 3000 rupees or £300 a year; his promotion, with good conduct and practical capability on his part, will probably be rapid, the salaries rising not by tens or twenties, but by hundreds of pounds per annum, until they reach the maximum. In February, 1892, the following return was laid on the table of the House of Commons:—

No. of Officers.	Yearly Salary.	Held by Europeans.	Held by Eurasians and Natives.
27	£5,000 and upwards.	26	1
50	£4,000—£5,000	47	3
125	£3,000—£4,000	125	—
351	£2,000—£3,000	346	5
1,003	£1,000—£2,000	951	52
2,635	£500—£1,000	2,078	557
3,526	£250—£500	1,334	2,192
10,975	£100—£250	2,097	8,878

These figures speak for themselves, and show how lucrative are the appointments which are open to members of the Indian C. S. The salaries of the judges of the Sudder Courts are £5000 a year. In the Forest Service of India there are also valuable appointments open to public competition. The India Public Works Department is one of the most important branches of the Indian C. S. The civilian officers are passed students of Government Civil Engineering Colleges in England and India, and civil engineers in practice of approved qualifications appointed direct by the Secretary of State or Government of India. The Indian Civil Engineering College at Cooper's Hill, Surrey, was established in 1870 for the education of civil engineers for this department. Admission to the college is obtained by competitive examination. In the Colonies also there are valuable

C. S. appointments open to public competition. The more important departments of the C. S. of the United Kingdom, India, and the Colonies are described under their titles in this work. For a description of the nature of the competitive examinations, see article Examinations for the C. S. See *Guide to Employment in the C. S.*, by J. D. Morell, LL.D., London.

Civil Service Estimates include all the ordinary expenses of the state, except those included in the estimates for the army and navy, and the interest on the National Debt. They came to £18,688,219 for the year 1894-5, as against £18,143,561 for the preceding year. Public Works and Buildings absorb £1,737,720. Law and justice cost £3,754,962. The sum of £9,642,180 is spent on Education, Science, and Art. The salaries, &c., of the Civil Departments take £2,039,993; while Foreign and Colonial Services cost the country £635,473. The C. S. E. are voted by the House of Commons in Committee.

Civ'ita, an older and fuller form of Citta (q.v.), and similarly used. The most important towns of whose names it forms part are:—

Civ'ita Castella'na ('the castled town'), a town in the province of Roma, Central Italy, 28 miles N. of Rome, on the site of the ancient *Falerium Vetus*, and containing numerous Etruscan remains. It is built on a steep hill near the Rio Maggiore, here crossed by a bridge 150 feet in height, and has a cathedral (1210) with beautiful mosaics, a very remarkable crypt, and wonderful altar figures of the 15th c., a college, and a citadel, which has been converted into a state prison. Pop. 4521.

Civita de Penn'e ('the city of the summit or pen'), the ancient *Pinna Vestina* (the chief city of the Vestini), a town in the province of Teramo, Central Italy, 29 miles E. by N. of Aquila. The cathedral and diocesan seminary are handsome edifices, but the town is in general ill-built. C. has a manufactory of silk-flowers, a dyework, and a tannery.

Civitano'va Marche ('new town'), a commercial town of Central Italy, province of Macerata, in what was formerly designated the Marches, 12 miles W. of Macerata, with a commodious harbour on the Adriatic, at a short distance from the town. Vines and olives are produced abundantly in the neighbourhood, which also possesses rich pastures. Pop. of town and port, 9988.

Civita, or Citta, San-Angel'o, a town in the province of Teramo, Central Italy, 25 miles S.E. of Teramo, and near the Adriatic. It has considerable trade, and a pop. of 7044.

Civita Vec'chia, a city, fortress, and free port in the Italian province of Roma, on the Mediterranean, 38 miles N.W. of Rome, with which it is connected by railway. Its harbour, which is strongly fortified, is formed by two semicircular moles and an exterior breakwater, has at its southern extremity a lighthouse 74 feet above the sea level, and has depth of water for vessels of 400 and 500 tons. The streets, narrow but regular, are well built. C. V. is the seat of a bishop, has an arsenal, shipyards, and magazines, and a large prison for convicts. It has communication by steam with Marseille, Genoa, Leghorn, Naples, Messina, Malta, Greece, Egypt, and Turkey. Pop. 11,938. C. V. is the ancient *Centumcellæ*. It was enlarged by Trajan, in honour of whom it was called *Portus Trajani*. In the reign of Justinian it became a bone of contention between Greeks and Ostrogoths. Often plundered and destroyed, it always rose again from its ruins. The place obtained its present name ('the old city') after its destruction by the Saracens in 812, when the inhabitants withdrew into the interior and founded a 'new city.'

Civitell'a del Tronto ('a little town of the Tronto'), a strongly fortified town in the province of Teramo, Central Italy, 9 miles N. of Teramo, situated on a rock on an affluent of the Tronto. It is noted historically for two events: the defeat of the forces of Pope Leo IX. and the Emperor Heinrich III. by the Norman Guiscard in 1053, and its successful defence against the Duke of Guise at the head of a French and Papal army in 1557.

Clackmann'an (Gael. *clach* or *clachan Mannan*, 'the stone circle or village of Mannan,' an ancient district of Scotland), the capital of Clackmannanshire, on the Devon, near its junction with the Forth, 29 miles N.W. of Edinburgh. It was formerly a royal burgh, and in 1330 was the residence of King David Bruce. Many objects in the neighbourhood bear testimony to this fact, as 'the King's stone,' &c. Though C. is the county town, the courts are held at Alloa. Pop. 1779.

Clackmann'anshire, the smallest county in Scotland, 16 miles long from E. to W., and 8 broad from N. to S., bounded N. and W. by Perthshire, E. by Perthshire and Fifeshire, and S. by the Forth. The Ochil Hills occupy the N. part of the county, but the remainder, consisting principally of the valley of the N. Devon, is very fertile and produces heavy crops. The Ochils, which are composed principally of trap, rise in Bencleugh to 2352 feet. Wheat and barley are cultivated in nearly equal proportions, in each case to about the third of the quantity of oats sown. Beans are a heavy and favourite crop. The minerals are iron, limestone, and coal, which is found in abundance. The chief manufactures are woollens, especially tartans and tweeds, glass, earthenware, and bricks. The most important town in the county is Alloa (q.v.); but the village of Dollar (q.v.) is also widely known in Scotland as a seat of education. C., which is divided into four parishes, returns one member to Parliament in conjunction with Kinross-shire. Area of C. is 48 sq. miles, and pop. of civ. county is 28,432.

Clad'ium (Gr. *klados*, 'a branch or twig'), a genus of plants of the order *Caperaceæ*. One species (*C. mariscus*) is common on the bogs and marshes of some parts of Britain; for example, Cambridgeshire, where hundreds of acres are covered with it. It is used for thatching and lighting fires. It is the most northerly of its genus, the twenty-one species described (Steudel's *Plantæ Cyperaceæ*) having an extended geographical distribution, though the majority are natives of Australia.

Cladodystrop'ia (Gr. *klados*, 'a branch,' and *dustrophos*, 'hard to rear'), a disease of aged oaks and other trees growing in a light soil, in which the upper branches are more imperfectly nourished than the lower, and therefore sooner decay —in other words, become what is called 'stag-headed.' It has been supposed that this is in consequence of the decay of the tap root, possibly from the attacks of fungi, but Berkley considers this mere conjecture.

Cladopto'sis (Gr. 'a falling away of the twig'), a disease of oaks, willows, and other forest trees, in which the small branches snap off with a regular circular fissure, leaving a cup-shaped scar, somewhat similar to that which takes place when a leaf or fruit separates at the stalk. It appears to be somewhat similar to the disease to which vine branches are subject after a cold summer, and which is known as *Phriganoptosis*. The branches fall off, 'a process facilitated by the peculiar formation of the stem, there being a transverse layer of cellular tissue at each bud' (Berkley).

Claim, in law, is a demand of right in something which is not possessed by the claimant.

Claim of Liberty is a petition to the Queen in the Exchequer Division for confirmation of liberties and franchises. See Liberty, Franchise.

Claim on a Bankrupt Estate.—Every creditor having a claim on such an estate must prove his debt, as soon as may be after the making of the receiving order, by delivering or sending through the post in a prepaid letter to the official receiver or to the trustee, if one has been appointed, an affidavit verifying the debt and stating whether the creditor is secured or not and describing the vouchers, if any, in respect of the debt. Notice from the official receiver or trustee of a payment of dividend is sufficient acknowledgment of proof of debt. To enable a Scotch creditor to prove under a fiat issued against an English trader, he must forward to his agent in England an affidavit setting forth fully the nature of his debt, accompanied by the securities, if any, held by the creditor, and a copy of the account, if any, between the parties. To rank under a Scotch sequestration, the claimant must describe distinctly the ground of his debt, accompanying his C. with an oath of verity, specifying every security which the claimant holds for the debt.

Clair, St., a lake, 30 miles long by 12 broad, between Lakes Huron and Erie, with the former of which it is united by the river St. Clair, which is merely the outlet of Lake Huron.

Clairac′, a town in the department of Lot-et-Garonne, France, on the Lot, 16 miles N.W. of Agen, has some manufactures of paper and leather, and a trade in wine and fruits. C. accepted the Reformation doctrines as early as 1527, and suffered greatly during the religious wars, more especially in the year 1621. Pop. 3562.

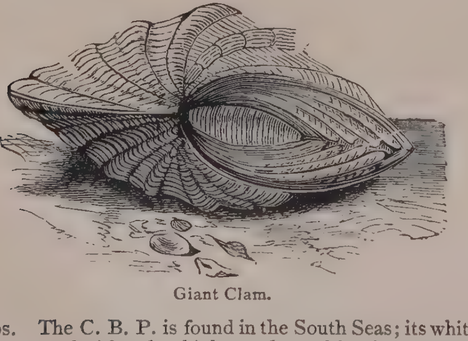
Clairaut, Alexis Claude, a distinguished French mathematician, was born 7th May, 1713, at Paris, where he died 17th May, 1765. At the early age of eighteen he was admitted to the Academy of Sciences, to the scientific journal of which he contributed many elaborate and original papers. His most famous works are his *Théorie sur la Figure de la Terre* (1743), his *Théorie de la Lune* (1752), and his *Théorie du Mouvement des Comètes* (1760). His *Problème des Trois Corps* is to this day one of the most profound specimens of analysis in existence.

Clairvaux′ (Lat. *Clara Vallis*, 'bright valley'), a small village of France, in the department of Aube, on the left bank of the river Aube, 7 miles E. of Bar-sur-Aube, derives its origin and its name from the celebrated Cistercian abbey founded here by St. Bernard in 1115. The abbey had at one time an annual revenue of 120,000 livres. It was suppressed at the Revolution, and its extensive buildings are now used as a house of correction and workhouse.

Clairvoy′ance (Fr. 'clear-seeing') is a term applied to a faculty supposed by some to be possessed by certain parties, in virtue of which they can see in the dark, describe objects they may never have seen with the naked eye, but which they are conjectured to see mentally, and by which also they can describe objects separated from them by any opaque substance or enclosed in a box. It is said to be possessed by spiritual 'mediums,' and by people under mesmeric influences. Of such a faculty there is no scientific proof, for in all cases the pretensions of the clairvoyant break down when submitted to searching inquiry by men who are acquainted with all probable sources of fallacy, and who bring to bear upon them the acumen and caution with which a successful lawyer investigates a case. C. is cleverly imitated by conjurors by means of a language of signs known only to the conjuror and the reputed clairvoyant. See MESMERISM.

Clam, in heraldry, an escalop or cockleshell, indicating that the bearer has been a crusader or has made long voyages at sea.

Clamshell and **Clam Bear's Paw,** the names applied to various genera of Lamellibranchiate molluscs, included in the family *Chamidæ*. (See CHAMA.) The Giant C. attains gigantic dimensions, and in some cases the shell alone may weigh 500 lbs. The C. B. P. is found in the South Seas; its whitish colour, spotted with red or high purple, and its ribbed and triangular form, placing it in high favour for beauty among conchologists.



Giant Clam.

Clan. This Gaelic word, meaning 'children,' inferentially descendants of a common ancestor, has come to be applied almost exclusively to the communities of the Scottish Highlands, as these are divided topographically, and by distinctive surnames. The peculiarities of clanship are well described in a book written about the year 1730, entitled *Letters from an Officer of Engineers to his Friend in London.* 'The Highlanders,' it says, 'are divided into tribes or clans, under chiefs or chieftains, and each C. is again divided into branches from the main stock, who have chieftains over them. These are subdivided into smaller branches of fifty or sixty men, who deduce their origin from their particular chiefs, and rely upon them as their more immediate protectors and defenders. The ordinary Highlanders esteem it a most sublime degree of virtue to love their chief and pay him a blind obedience. . . . Next to this love of their chief is that of the particular branch whence they sprang, and in the third degree to those of the whole C. or name, whom they will assist, right or wrong, against those of any other tribe with whom they are at variance. . . . Lastly, they have an adherence to one another as Highlanders, in opposition to the people of the Low Country, whom they despise as inferior to them in courage, and believe that they have a right to plunder them whenever it is in their power. This last arises from a tradition that the Lowlands in old times were the possessions of their ancestors. The chief exercises an arbitrary authority over his vassals, determines all differences and disputes that happen among them, and levies taxes upon extraordinary occasions. . . . Some of the chiefs have not only personal dislikes and enmity to each other, but there are also hereditary feuds between C. and C., which have been handed down from one generation to another for several ages. These quarrels descend to the meanest vassals, and thus sometimes an innocent person suffers for crimes committed by his tribe at a vast distance of time before his being began.' This description conveys a clear idea of clanship as it existed in the Highlands early in the 18th c., when the system was in full force. It shows a curious mixture of patriarchal and of feudal government, and the customs and feelings of the people tended to keep it unimpaired amid the improvements and diffusion of knowledge which was taking place in other parts of the country. The distinction between the Highland and the feudal chief was, that the former was the hereditary lord of his C., wherever they dwelt or whatever land they occupied, while the latter was entitled to the military service of all who held lands under him. The one dignity was personal, the other territorial; the rights of the chief were inherent, those of the baron were accessory; the one might lose or forfeit his possessions, but could not thereby be divested of his hereditary character and privileges; the other, when divested of his fee, ceased to have any title or claim to the service of those who occupied the lands. It thus often happened in the Highlands that the head of the C. was one man, and the feudal owner of the land which it occupied was another. The following is General Wade's list of the Highland clans and their numbers that fought for King James in 1715:—Islands and clans of Lord Seaforth, 3000; M'Donalds of Slate, 1000; M'Donalds of Glengarry, 800; M'Donalds of Moidart, 800; M'Donalds of Keppoch, 220; Camerons of Lochiel, 800; M'Leods, in all, 1000; Duke of Gordon's men, 1000; Stewarts of Appin, 400; Robertsons of Strowan, 800; M'Intoshes and Farquharsons, 800; M'Ewen in Skye, 150; the Chisholms of Strathglass, 150; M'Phersons, 220; the Atholl men, 2000, and the Breadalbane men, joined without their superiors—total for King James, 14,140. The following, with a total of 8000, supported George I.:—Duke of Argyll, Lords Sutherland and Strathnaven, Lord Lovat's Frasers, the Grants, Rosses, and Munroes, Forbes of Culloden, Rose of Kilravock, and Campbell of Clunes. See *History of the Highlands and Highland Clans*, by John S. Keltie.

Clandestine Mortgage. In England, if any one mortgage his estate a second time, without previously informing the postponed mortgagee in writing of the prior mortgage, or of any judgment or incumbrance he has voluntarily brought upon the estate, the postponed mortgagee is entitled to hold the estate as an absolute purchaser, free from the equity of redemption of the mortgager. In Scotland, C. M. is impossible.

Clan Macduff, Law of. This was a barbarous privilege which formerly belonged to those related within the ninth degree to Macduff, Earl of Fife. If one having the privilege was found guilty of homicide, he was absolved by coming to Macduff's Cross, between Fife and Strathearn, and giving nine *kye* (cows) and a *colpindash*, a young cow.

Clap-Net, a ground-net used by birdcatchers in the S. of England, consisting of two equal sides or parts, each about 12 yards long by 2½ wide, and having a slight frame. The parts are placed parallel to each other about 4 yards apart, and are closed upon one another by the pulling of a string, so as to cover the space between them. Call-birds are used as decoys for the wild birds the netters wish to catch.

Clapp'erton, Hugh, an African traveller, was born at Annan, in Dumfriesshire, in 1788, was sent to sea at the age of thirteen, and entering the navy, rose to the rank of lieutenant in 1814. He accompanied Denham and Oudney (1822) on a Government expedition to Central Africa, with the view of ascertaining the length and course of the Niger. Oudney died at an early stage of this enterprise, which only resulted in determining the exact position of Bornu, Houssa, and Mandara. In 1825 C., along with Pearce, Morrison, and Dickson, again set out for the same purpose. The party started from the Bight of Benin, but were almost immediately attacked by severe illness, which C. alone survived. Pushing into the interior, he reached Sakkatu, where he was detained by the Sultan Bello. Here his health gave way, and he died at the village of Changary, 4 miles from Sakkatu, 13th April, 1827. See *Narrative of Travels and Discoveries in N. and Central Africa in* 1822-24, *by Denham, C., and Oudney* (Lond. 1826), *Journal of a Second Expedition into the Interior of Africa, &c.* (Lond. 1829), and Lander's *Record of C.'s Last Expedition to Africa* (Lond. 1830).

Claque (Fr. 'a clap or slap with the hand'). A theatrical C., a distinct and acknowledged feature of the Paris theatres, is a body of individuals retained at a salary to applaud a special actor, and thus, so far, to secure the success of his engagement.

Cla'ra, Santa, or **St. Claire,** was born at Assisi, in the Duchy of Spoleto, Italy, about 1193. At the age of eighteen she left the house of her father, a wealthy nobleman, and betook herself to the convent of Portioncula, under the auspices of St. Francis of Assisi. She founded the order which bears her name in 1212, and was soon after joined by her sister Agnes, her mother, and several other ladies of high rank. After twenty-nine years of infirm health, occasioned by her excessive austerities, C. died, 11th August, 1253, and was canonised, two years after her death, by Pope Alexander IV. The *Order of St. C.* is divided into 'Urbanists,' those that follow the mitigated rule drawn up by Pope Urban IV. in 1264, and 'Damianists,' a severer sect of the sisterhood. The convents of the order are numerous in Catholic Europe and in America.

Clare, a western maritime county of Ireland, in the province of Munster, N. of the estuary of the Shannon. It is hilly in the E. and W., but an extensive and fertile plain occupies the centre, while on the mountain-sides and river-banks there are fine pastures or 'corcasses.' Besides the Shannon, which bounds it on the S. and E., C. is watered by the Fergus, with its great estuary, the Ardsallas, Graney, Forsett, Dumbeg, &c., and has as many as 100 miniature lakes. The loftiest mountains are in the Slieve Baughta and Barnagh ranges, which reach a height of 1312 and 1758 feet respectively. C. has a wild and precipitous sea-line of over 100 miles. Where the Shannon merges in the Atlantic, the land runs out into the long tapering promontory of Loop Head. C. is mostly formed of carboniferous limestone, and there are mines of coal, lead, manganese, copper pyrites, &c., and quarries of slate, flag, and black marble. The chief crops are oats, potatoes, wheat, and barley, and the manufactures include coarse linens, flannels, and friezes. There is a good coasting trade and active fisheries. Ennis is the capital, and communicates with Limerick by railway. A local line, 10 miles long, also connects Kilrush and Kilkee. C. has round towers, cromlechs, and other antiquities. Area 1294 sq. miles; pop. 124,483, or 12·0 per cent. less than in 1881. There are 48,066 acres under tillage, 7,294 acres under plantations, 90,525 acres under meadow and clover, and 463,061 under pasture. Turf, bog, marsh, and barren mountain occupy 16·5 per cent. of the area. C. is divided into two parl. districts, each of which returns one member—East C. 61,196; and West C. 63,287.

Clare College, Cambridge, founded in 1326 by Elizabeth, sister and coheir of Gilbert, Earl of Clare. Its buildings, which are in the style of the Renaissance, are much admired. The chapel was built in 1535. The college contains eight senior and seven junior fellows, who elect the 'master.' The fellowships are open to Bachelors of Arts, or persons of a higher degree, without restriction as to marriage. C. C. has thirty-two scholarships, 12 at £60 per annum, 4 at £50, 8 at £40, and 8 at £20. There are six minor scholarships at £80 to £40 per annum (classics, mathematics, and science), and seven exhibitions, 2 at £50, 1 at £40, and 4 at £20. The college is patron of 17 livings. In 1894 the number of undergraduates was 170.

Clare Constat, Precept of, in Scotch law, is a deed executed by a subject-superior to complete the title of his vassal's heir to the lands held by the deceased vassal under the granter of the precept. As no heir can be declared an heir by such or any private authority, a P. of C. C. cannot bar the true heir from entering after twenty years as an entry, authorised by the law, would have done. Of course a P. of C. C. holds good against the grantor and his heirs and successors.

Clare Island, at the entrance to Clew Bay, forms part of County Mayo, Ireland. It is 4½ miles long and 2 broad, and supports a lofty lighthouse. Area 8⅔ sq. miles; pop. 557.

Clar'encieux, one of the three kings-of-arms of the Heralds' College of England—Garter, C., and Norroy. The two latter are provincial, and C. ranks first. His jurisdiction embraces all England S. of the Trent, and his duty is to survey all the coat-armour within his province, to register descents and marriages, and to marshal the funerals of all his subjects who are not under Garter (q.v.). C. also grants arms within his province, subject to the approval of the Earl Marshal (q.v.).

Clar'endon, Constitutions of, is the name given to the concordat between Church and state in England, drawn up at a council of nobility and clergy held at the village of Clarendon, in Wiltshire, in 1164, in the reign of Henry II. These constitutions or laws were sixteen in number, and their main object was to restrict the power of the Church in England, and to give the crown the right to interfere in the election to all vacant offices in the Church. 'Many of the clauses,' says Green (*Short History of the English People*, p. 103), 'were simply a re-enactment of the system established by the Conqueror.' This is no doubt true, but it is impossible to doubt that the sharp separation between the civil and ecclesiastical jurisdictions introduced into England by William was the real cause of the conflict between the two. Although the primate, Thomas à Becket, signed them, they were rejected by the Pope of the period, Alexander III., and Becket himself vehemently retracted his consent. This led to his assassination, and subsequently to the penance of Henry II.; but in spite of the latter event, the C. of C. remained on the statute book, and may be regarded as the germ of the ecclesiastical revolution accomplished in the reign of Henry VIII. In Professor Stubbs's *Select Charters Illustrative of English Constitutional History*, the reader will find (pp. 137-140) the C. of C. 'in probably the exact form in which they were reported to the King, and confirmed by the bishops and barons.'

Clarendon, Edward Hyde, Earl of, an English politician and historian, was the son of a private gentleman, and was born at Dinton, in the county of Wilts, 18th February, 1608. He studied first at Oxford and then at the Middle Temple. Entering Parliament in 1640 as member for Wootton Bassett, he took the side of those who insisted on a redress of grievances, but was at no time a Puritan—always strenuously upholding the cause both of the Church and the crown. When the civil war broke out, he left the House, joined the King at York, was made Chancellor of the Exchequer, and received the honour of knighthood. When fortune deserted the royal cause, he accompanied Prince Charles to Jersey, where he began to write his *History of the Rebellion*. Called to Paris in 1648, he was sent to Spain in the following year to solicit help from the Spanish court, but returned without success in 1651. He then went to Antwerp; was made 'High Chancellor of England' in 1657 by his exiled monarch, and was confirmed in the office at the Restoration. He was also created Baron Hyde, and subsequently Viscount Cornbury and Earl of C., and, in fact, was for a time Premier. Court intrigues, however, and popular indignation at the failure of the war with Holland and the selling of Dunkirk to France, brought about his fall; he was deprived of his employments (1667), and retired to France. He died at Rouen, 9th December, 1674. He was buried in Westminster Abbey. C. was a well-intentioned and virtuous man, and an honest and moderate politician, though lacking in firmness of purpose. His *History*, marred though it is by numerous inaccuracies and prejudices—one may even go further, and say, with deliberate perversions of fact—is still, from a literary point of view, an admirable work. Its 'portraits' are superbly executed, even when the likeness is not true. C. wrote several other works, of which the most interesting is an account of his own life. His state papers have been published in three folio volumes. C.'s daughter, Anne Hyde, married the Duke of York, afterwards James II., and was the mother of Queens Mary and Anne. His son, **Henry, Earl of C.** (1638-1709), was for a time Lord-Lieutenant of Ireland under James II., and wrote a *History of the Irish Rebellion*. His state letters and diary were published at Oxford in 2 vols., 1763.

Clarendon, George William Frederick Villiers, Earl of, an English statesman and diplomatist, was born 12th January, 1800. He was descended from Thomas Villiers, who married the heiress of the last Earl of C. of the Hyde family and was made Earl of C. himself in 1776. From early life C. was trained to be a diplomatist, being appointed ambassador at Madrid in the year 1833, in which office he helped to establish the Spanish Government on a constitutional basis. Succeeding to the earldom on the death of his uncle (1838), he took his place in the House of Peers as a Whig, and supported Sir Robert Peel in his free-trade policy. After being Keeper of the Great Seal, he was, under Lord Russell's premiership in 1846, made first President of the Board of Trade, and subsequently Lord-Lieutenant of Ireland. In the subsequent Liberal administrations of Lord Aberdeen, Lord Palmerston, and Mr. Gladstone, C. held the office of Foreign Secretary, and few British statesmen have been more respected on the Continent. He died June, 1870.

Clar'et. The red varieties of French wines imported into this country pass under the general name of C. They vary extremely in their qualities and value, the bulk being cheap light wines. Others, such as Château Lafitte, are of a very high class, and held in great repute.

Clarifica'tion, the process of removing suspended matters from liquids, accomplished either by filtration, by allowing the matter to deposit, or by adding albumen or a similar substance, whereby the suspended body is mechanically dragged down. It is a process of great importance in many departments of manufacturing chemistry.

Clar'inet, or **Clar'ionet,** a wooden reed instrument which occupies the place in military bands that the violin has in orchestras. The peculiar quality of its tone is caused both by its shape and by the nature of the reed through which—held between the performer's lips—the air is blown into it. Its compass is about three octaves, but as it cannot be played conveniently in keys very distant from its natural key, each performer has always three instruments, of which the natural keys are A, B♭, and C, so that he may be able to play easily the varied keys of orchestral music. In military bands some higher clarionets are often used, and in orchestras occasionally a bass and a contra-bass C.

Clar'ion, a form of trumpet of high pitch, not now used. It is also the name of a four-feet reed organ-stop.

Clark, Sir James, M.D., Bart., a British physician, was born at Cullen, Banffshire, 14th December, 1788. Educated at the grammar-school of Fordyce and at King's College, Aberdeen, he studied medicine at Edinburgh and London, held for some years the position of navy surgeon, took the degree of M.D. at Edinburgh in 1817, and after travelling on the Continent, and practising as a physician for eight years in Rome, he settled in London in 1826. He soon acquired a high reputation, became physician to the Duchess of Kent, and, on the accession of Queen Victoria, her physician in ordinary. C. was made a baronet in 1838. He died 29th June, 1870. Among his many contributions to medical science deserving of notice is his *Treatise on Pulmonary Consumption*, which he considered might be arrested by proper regulation of food, air, and exercise. He was a zealous advocate of the study, at an early age, of the laws of health.

Clarke, Adam, a Wesleyan divine, was born at Magherafelt, in the N. of Ireland, in 1760. He became a 'circuit' preacher in Wiltshire in 1782, but settled in London in 1805; was appointed a sub-commissioner of the public records in 1807, and after a laborious literary life, died at Bayswater, 26th August, 1832. The chief fruits of his studies are his *Biographical Dictionary*, published in 1802, and his edition of the Bible in English (8 vols. 1810-26), illustrated with a commentary and critical notes. For his attainments in Oriental literature and biblical knowledge, the University of St. Andrews conferred upon him the degree of LL.D.

Clarke, Edward Daniel, a traveller and savant, was born 5th June, 1769, at Willingdon in Sussex. He studied at Jesus College, Cambridge, and acted as travelling tutor and companion to a number of noblemen and gentlemen, including Mr. Hill (afterwards Lord Berwick) and Mr. Cripps. His tour with the latter lasted from 1799 to 1802, and embraced the whole of Scandinavia, Russia, Circassia, Turkey, Asia Minor, Syria, Palestine, Egypt, and Greece. His travels were a source of great profit to his university and to his country. For the library of the former he secured a number of valuable marbles and MSS., and the colossal statue of the Eleusinian Ceres; and for the latter the celebrated sarcophagus of Alexander, now in the British Museum, and upon which he published a dissertation. Cambridge University conferred upon C., who had been instituted to the rectory of Harlton, the degree of LL.D., and a professorship of mineralogy was in 1808 created for him. His *Travels*, published during his life in 5 vols. (1810-19), and after his death in 11 (1819-24), were received with much favour, and his experiments with the oxyhydrogen blowpipe have been productive of valuable scientific results. After his death, which took place 9th March, 1822, his university purchased his Greek and Oriental MSS., including a Codex of Plato, discovered by him in the island of Patmos.

Clarke, Dr. Samuel, a distinguished scholar, philosopher, and theologian, was the son of an alderman at Norwich, where he was born 11th October, 1675. Educated at Caius College, Cambridge, he there pursued with special zeal philosophical studies, and became an adherent of the system of Newton. C. filled various posts in the Church, and was ultimately made one of Queen Anne's chaplains and rector of St. James's. Although his views on the Trinity (in his *Scripture Doctrine of the Trinity*, 1712) were considered semi-Arian, and censured by Convocation, he was a keen assailant of the freethinkers of his time, and among the best-known of his works is his *Demonstration of the Being and Attributes of God* (Boyle Lecture, 1704). The basis of his ethical system is the famous 'eternal fitness of things,' or the relations of things established from eternity by God. Among the proofs of his scholarship are his editions of Cæsar (1712) and of Homer (1729-32), the latter of which was finished by his son. C. was offered the mastership of the Mint on the death of his friend Newton, but declined it. He died 17th May, 1729. C. was a man of amiable disposition and irreproachable character. A collected edition of his philosophical works, among the most interesting of which are his letters to Leibnitz on Space and Time, was published in 4 vols. 1738-42.

Clarkson, Thomas, one of the most eminent of English philanthropists, was born at Wisbech, Cambridgeshire, 28th March, 1760, and studied at St. John's College, Cambridge. He is said to have been led into the agitation against slavery in Africa by writing a prize essay on the question 'Is it right to make slaves of others against their will?' After this he became the leader in, and devoted himself to, the agitation, secured the co-operation in Parliament of Wilberforce, wrote pamphlets innumerable on the subject, and, after the bill for suppressing the slave trade was passed in 1807, wrote a history of it (2 vols. 1808). C. lived to see the abolition of slavery in the W. Indies in 1833. He died at Playford, Suffolk, 26th September, 1846, having spent the last years of his life in promoting various benevolent schemes. See Thomas Taylor's *Biographical Sketch of T. C.* in the *Gentleman's Magazine.*

Clar'y, a plant, a native of Italy, and the S. of Europe generally, but long cultivated in our gardens for the sake of its aromatic and medicinal properties. It is antispasmodic and stimulant, and is used for flavouring soups and confectionery with its characteristic odour of the balsam of Tolu. Its flowers are used in making a fermented wine. Wild C. and Hormenium C. are members of the same family, but Wild C. is a name also applied to the Indian Heliotrope.

Class'ics. The name *classici* was applied to the highest of the six classes into which Servius Tullius divided the Roman citizens; and hence authors of pre-eminent worth have been termed *classic authors;* thus Aulus Gellius says—'Classicus scriptor non proletarius.' At the Renaissance, scholars, struck with the superiority of Greek and Latin to contemporary literature, distinguished the ancient from the modern writers by the word *C.*, but this restricted signification is no longer maintained. The Germans, and afterwards the French and English, extended the word to modern as well as ancient writers of eminence; and by the *C.* of a nation we now understand its leading authors, whose merits have been sufficiently proved by time and criticism to assure them of a permanent place in its literature. 'I call the classic,' said Goethe, 'the healthy. The *Nibelungen* is as classic as the *Iliad*, for both are healthy. The antique is classic, not because it is old, but because it is strong, fresh, joyous, and healthy.' The word is, however, still used in the narrower sense of the Greek and Latin authors; a *classical* education refers to the study of Greek and Latin writers alone, not to the study of the more recent authors of other nations, whose beauties of thought and form have entitled them to the epithet *classic*, which was formerly monopolised by the ancients, as almost the sole examples of established fame and perfection of style in literature. 'Classic' and 'Romantic' are occasionally used to distinguish Southern Romantic from Northern Teutonic art; and again they are frequently opposed in regard to French writers—'Classic' being applied to the school of Racine, and 'Romantic' to that of Hugo. But these partisan uses of the word are only the perversions of prejudice.

Classifica'tion of Animals. Two principles may be employed in classifying animals. One of these, forming the *artificial* method, has for its essential feature that of founding its characters upon resemblances between animals of a more or less external and superficial kind. Thus the savage employs an artificial method of classification when he classifies together fishes and whales from their outward appearance, or birds and bats because both fly. In opposition to this artificial method, which characterised the earlier history of zoology, we have the *natural* method. By means of this latter we group together only animals that are like in the *details of their structure*, and this method, therefore, is the expression of a true structural relationship between the organisms which it brings together. It is, in other words, a convenient expression of the facts and laws of morphology and physiology. The whale would, therefore, in this classification, be placed among the mammals, from a consideration of its structure, and not with the fishes, which it somewhat resembles in outward appearance. The animal kingdom is divided through the consideration of the morphological *type*, or broad features of structure, into five or six sub-kingdoms, which, beginning with the highest, are named respectively *Vertebrata* (q.v.), *Mollusca* (q.v.), *Annulosa* (q.v.), *Annuloida* (q.v.), *Echinozoa* (q.v.), *Cœlenterata* (q.v.), and *Protozoa* (q.v.). Each sub-kingdom admits of division into *classes*, the classes are divided into *orders*, the latter into *families* and *genera*, and the genera into *species*. See also SPECIES, &c.

Claude, St., a town in the department of Jura, France, 25 miles S. of Lons-le-Saulnier, at the confluence of the Bienne and Tacon. It owes its origin to a Benedictine abbey, founded here in the 5th c. St. C. has tanneries, potteries, and paperworks, and manufactures of turnery-ware on a large scale, consisting of articles in ivory, bone, horn, shell, boxwood, &c. Pop. 9782.

Claude Gelée, usually called **Claude Lorraine,** was born of humble parentage at Champagne, in Lorraine, in 1600, went in youth to Rome, in company with some adventurers of his district, and entered into the service of Tassi, a painter, for whom he acted as cook, groom, and colourman, and by whom he was taught the principles of art. He was an earnest and conscientious student of nature, and delighted in observing the varying phases of light and colour under which the same view presents itself at different seasons. This constant habit, together with his unwearying practice at the easel, raised him to the highest rank as a landscape painter. He settled finally at Rome in 1627, painted assiduously, and, after enjoying the patronage of Popes Urban VIII., Clement IX., and Alexander VII., died at Rome, 1678. C.'s works are to be found in every great gallery in Europe. England is particularly rich in specimens—Waagen counting fifty-four in all. The picture which C. himself considered his best is the 'Villa Madama.' Four exquisite pieces, 'Morning,' 'Noon,' 'Evening,' and 'Twilight,' are in the St. Petersburg Gallery. C.'s landscapes combine beauty of scene with truth in the highest degree. No painter has rendered the foliage of trees, and the character of their different species, with greater fidelity combined with high picturesque effect. It was the wish of Turner to be considered his rival, and the greatest of landscape-painters presented one of his finest works to the English nation on the condition that it should hang in the National Gallery side by side with one of the acknowledged masterpieces of the greatest landscape-painter born in France.

Claudia'nus, Clau'dius, born at Alexandria, flourished at the close of the 4th c. and the commencement of the 5th. He wrote at first in Greek, but the success of his panegyric on the consulate of Probinus and Olybrius in Latin verse induced him to abandon the language in which he had been educated. C.'s extant works consist chiefly of idylls and epigrams, and of panegyrics on the Emperor Honorius and his powerful minister Stilicho, the patron of C., and 'the perpetual theme' of his verse and of invectives against their enemies. The most important of his works is the very fragmentary epic poem the *Rape of Proserpine.* C.'s poetry is characterised by an 'absolute command of the Latin language,' splendid powers of description, and a brilliant, if somewhat ill-regulated, fancy.

Clau'dius I., more fully **Tibe'rius Clau'dius Dru'sus Nero,** Roman Emperor, was born 1st August, B.C. 10, at Lyon, in Gaul. He was the son of Drusus, step-son of Augustus, and succeeded to the purple on the murder of his uncle Caligula, in A.D. 41. C. in early life suffered much ill-treatment and neglect, being considered by his family little better than an imbecile. His natural stupidity, however, was strangely combined with an eager desire for knowledge, which led him to study with secret industry both science and literature; but his cowardice and weakness of character unfitted him for a public career. He was fifty years of age when proclaimed Emperor by the Prætorian Guards, who found him hiding in terror in a corner of the palace. Though he set an evil precedent by granting a donation to the Prætorians, C. began his reign with a just and moderate policy, but speedily fell under the dominion of others, who abused the imperial power. He was uxorious and fond of favourites; so that his wife Messalina, and his freedmen Narcissus and Pallas, found it easy to govern or plunder and torture in his name. The union of C. with his niece Agrippina, after the execution of his former consort (A.D. 48), was not more fortunate; for, having persuaded him to adopt her son Nero, she afterwards poisoned him (A.D. 54) in order to secure the succession. C. was endowed with abilities which might have gained him eminence in an obscurer sphere; he composed several historical works, among them a *History of Etruria*. The wars of his reign were, on the whole, victorious. C. himself undertook an expedition to Britain, and Mauritania was made a Roman province. Several public works, on a large scale and of great utility, were executed by C. Among these were the *Aqua Claudia*, the vast aqueduct which supplied Rome with water all through the Middle Ages; the port of Ostia, and the canal between Lake Fucinus and the river Liris.

Clause of a Deed is, in law, one of its subdivisions.

Clause of Pre-emption, in Scotch law, is a clause sometimes inserted in a feu-right, stipulating that the vassal shall not sell the lands without first offering them to the superior, or that the superior shall have the lands at a certain price fixed in the clause.

Clause of Devolution, in a Scotch deed, is a clause devolving some office or duty on some one on a stated event.

Clause of Return, in a Scotch deed, is a clause by which the grantor of a right makes a particular destination of it, and provides that in a certain event it shall return to himself. Of course, when the right is granted, as a bond for borrowed money, the creditor may defeat the C. of R. even gratuitously, because the presumption is in favour of the fact that the clause is dependent upon his, the creditor's, good will.

Clauses, Irritant and Resolutive, in a Scotch deed. These are two clauses which limit the right of an otherwise absolute proprietor, and which make the conditions imposed—without these clauses only a personal obligation—effective against creditors and singular successors. See SINGULAR SUCCESSOR.

Claus′el, Ber′trand, a French marshal, was the son of Jean-Baptiste C., a French Revolutionist of some mark, and was born at Mirepoix, in the department of the Ariège, 12th December, 1772. Entering the army at an early age, he distinguished himself in Holland, Italy, Austria, and Spain. After the defeat of Marmont at Salamanca, 22nd July, 1812, he obtained the command of the French army, and conducted its retreat into Portugal with much ability. On the restoration of the Bourbons C. was declared a traitor, and even condemned to death, but he was ultimately allowed to return from America, whither he had escaped. In 1830 he was appointed to the command of an expedition to Algiers, and being successful, was made a marshal of France. In 1835 he was appointed governor-general of Algeria, but being blamed for the disasters that befell the French army under the walls of Constantine in the following year he returned to France. C. died at Secourrieu (Haute Garonne), 21st April, 1842.

Clavagell′a, or **Clubshell,** a genus of Lamellibranchiate mollusca, belonging to the family *Gastrochænidæ*. The shell in C. is club-shaped and oblong, and one of the valves or halves of the shell is free, whilst the other is attached to an elongated tube, frequently divided by a longitudinal partition. This tube terminates like that of Aspergillum, or the 'Watering-pot Shell,' which belongs to the same family as C. *C. aperta* and *C. lata* are familiar species. *C. cretacea* occurs as a fossil in the Chalk rocks, and the genus commences as a fossil state in the Upper Greensand. Several living species exist as above named.

Clavi′chord, or **Clav′ecin,** one of the older forms of the piano, used frequently until about a century ago. Its strings were struck by pins attached to the ends of the keys, and were damped by pieces of cloth so as to produce a very soft sound.

Clav′icle. This is a bone familiarly known as the collar-bone. It passes from the summit of the breastbone, or sternum to the acromion process of the scapula, and it connects the superior extremity with the trunk. It has a curved form. To it are attached various muscles of the neck, trunk, and arms, and it acts as a fulcrum for the action of these muscles. It is absent in all pachydermata, ruminants, and solidungula, because in these animals there is no lateral movement of the fore extremity. In birds the two clavicles are very large, and unite to form a single bone known as the furculum, or 'merry-thought.' This arrangement in birds is probably for preventing the powerful pectoral muscles from approximating the shoulders. The C. is the first bone in the body to ossify. The first ossific nucleus makes its appearance about the sixth week. Two other nuclei make their appearance; that of the sternal end joins the body of the bone from the 18th to the 25th year. See SKELETON.

Dislocations of Clavicle.—Either end of the C. may be dislocated. Surgeons describe three dislocations of the *sternal* end of this bone—*forwards*, *upwards*, and *backwards*—according to the position of the displaced end. Of these three, the dislocation *forwards*, though a rare injury, is the most common. This dislocation is easily recognised by feeling the displaced end of the bone projecting in front of the upper part of the Sternum (q.v.). There is also depression of the shoulder.

The dislocation *upwards* is very rare. It is easily recognised by the end of the bone being felt to be elevated into the neck, with depression of the shoulder.

The dislocation *backwards* is very rare, and is generally caused by direct violence to the parts. It has also been caused by curvature of the spine. When due to this latter cause little relief can be obtained. In this dislocation the shoulder is elevated, and there is generally more or less interference with the circulation and respiration, on account of the displaced end of the bone pressing on the nerves and blood-vessels of the neck.

When the *acromial* end of the C. is displaced (which is not uncommon), it is generally, if not always, *upwards*, and is the result of a fall on the shoulder. This dislocation is easily recognised by the end of the C. being felt to be projecting upwards whilst the shoulder is depressed. The bone is easily replaced, but some little care is necessary afterwards to retain it in position.

Fracture of Clavicle.—Fracture of the C. is much more frequent than dislocation. It is generally due to violence; the fracture is oblique, and occurs most frequently near the middle of the bone. The shoulder is depressed and drawn forwards.

Clavicor′nes, the name given to a tribe of Beetles, distinguished by the clubbed tips of their antennæ or feelers, which exceed the palpi of the maxillæ (or lesser pair of jaws) in length. Of this group the Burying Beetles (q.v.) form typical examples, and the genus of Bacon Beetles also present a familiar group.

Clavig′ero, Francesco Severio, a historian of Mexico, was born about 1720, and sent by the Jesuits as a missionary to the Mexican Indians, among whom he laboured for thirty-six years. While thus engaged, he collected materials for the history of the country, both before and after its conquest by the Spaniards. On the suppression of his order in 1767, he withdrew to Cesena, in Italy, where, in 1780-81, he published his history of Mexico. C. died at Cesena, October, 1793.

Clavija, a genus of *Myrsinaceous* plants, of tropical S. America, named in honour of J. Clavijo Faxardo, a Spanish botanist. The fruits of some of them are eatable, and the roots of others are emetic.

Clay (Old Eng. *clæg*, the 'g' is still retained in the Lowland Sc. 'clag' and 'claggy'), a natural earthy compound, in a state of minute division, which with water acquires plasticity, and may be kneaded or moulded into a particular form, and hardened by heat. Typical or pure C. is composed of silica, alumina, and water, forming, in chemical language, a hydrous-silicate of alumina; but as natural clays are the result of the disintegration of primary rocks, they are never absolutely free from the admixture of other substances, such as lime, sand, magnesia, mica, and oxide of iron. The impurities give different colours to the numerous varieties of C., and so it occurs of all shades, from white, when nearly pure, to grey, red, blue, brown, and even deep black, from the presence of carbon. The purest clays are the most plastic, and as they burn white in the kiln, they are highly valued for the manufacture of fine earthenware, and are known by the names of Kaolin or China-C., Potter's-C., and Pipe-C. (q.v.). Fire-Clays (q.v.), of which *Stourbridge C.* is the most famous, contain much silica, and are very infusible. Common C. or loam is abundantly distributed over the earth's surface, and is largely employed in the manufacture of bricks, tiles, and coarse earthenware, which assume a red colour on firing, because of the oxide of iron present in the C. Brick-C. should contain much sand and little potash, soda, lime, or iron; indeed, any C. that is to be exposed to a high temperature should be almost free from the alkaline earths, as they give fusibility. C. constitutes an important part of all fertile soils, and possesses the highest agricultural value on account of its absorbent action on moisture, ammonia, and other fertilising agents. C. soil is difficult to work; still the excellence and luxuriance of the crops, which it produces, amply repays the extra labour entailed.

Clay, Cassius Marcellus, a Southern Abolitionist, was born in Kentucky, 19th October, 1810, and graduated at Yale College in 1832. He early entered the field of politics, and gained much *éclat* by taking what in his state was the unpopular side of 'abolitionism,' and displaying in his speeches considerable audacity. He supported Lincoln, and was sent as U.S. minister to Russia in 1862, where he remained. After his return, he took a prominent part in politics. A volume of his *Speeches* was published in 1848. C. permitted himself to use very strong expressions regarding England.

Clay, Henry, an eloquent American orator and statesman, was born in Hanover county, Virginia, 12th April, 1777. He studied law, was licensed in 1797, and commenced in Lexington, Kentucky, where he soon gained a lucrative practice. In 1806 he was elected to Congress, and in 1811 was chosen speaker of the House of Representatives. C. strongly repudiated the British claim to 'right of search' at sea, advocated the war of 1812, and was sent to Ghent in 1814 as U.S. commissioner to sign the treaty of peace. On his return he espoused the cause of South American independence, and also introduced what he called 'the American system,' which was a heavy protective tariff to promote home manufactures. C. laboured for the compromises with slavery in 1820 and 1850, and was three times a candidate for the presidency, but was defeated each time; yet he was undoubtedly one of the most popular leaders that America has ever had. He died at Washington, 29th June, 1852. See Colton's *H. C., Life, Letters, and Speeches.*

Claymore' (Gael. *claidheamh-mor;* lit. 'big sword'), a formidable weapon used by the Scottish Highlander. It was double-edged and two-handed; the length of its blade was sometimes nearly 4 feet.

Clazom'enæ, one of the cities of Ionia, on the S. side of the Hermæan Gulf (mod. Bay of Smyrna), at first built on the mainland, from which the people, through fear of the Persians, passed over to an adjacent island, which Alexander made a peninsula by uniting it to the mainland. Its site is now occupied by Vurla.

Clean'thes, a Greek philosopher, born at Assos, in the Troad, about 300 B.C., came to Athens in his manhood, and received instruction from Zeno for fifteen years. Poverty obliged him to draw water for a gardener during the night, and to write his lecture-notes on bits of potsherd and ox-bones. He nevertheless refused the proffered gift of the Areopagus (10 *minæ*). Slow in apprehension, he was at first called the Ass, but latterly the second Hercules. In 263 C. succeeded Zeno in the Stoa. There he taught the immortality of the soul, varying in intensity with the soul's life here. He repeated that man's duty was to live harmoniously with universal nature, *i.e.*, with the Divine Reason, which impresses laws upon passive matter. In metaphysics he maintained that in sense-perception the soul was affected as wax by a seal, but that the soul could distinguish the cataleptic phantasm, or true perception, from the acataleptic, or perception produced by dreams or insanity. His morality resulted in the starvation of all bodily desires, and his death proves his consistent faith, for it was either occasioned or accelerated by voluntary abstinence from food. Only a few fragments of C.'s works (of which Diogenes Laertius gives a list) have reached us—the finest being a *Hymn to Zeus* preserved in Stobæus.

Clear'ance, a term of the mercantile marine, denoting the custom-house or emigration-office licence for a ship to leave the port. All dues must be paid and all proper formalities observed before the C. can be got. A foreign vessel must be certified by the consul of the nation to which she belongs.

Clear, Cape, on an island (pop. 584) of the same name, forming part of County Cork, is the extremest S.W. point of Ireland. It is a lofty headland, 400 feet high, with a lighthouse and revolving light, 455 feet above the sea.

Clear Days, an English law term. In a lawsuit there are several steps in the proceedings which must be taken within a specified number of C. D. In reckoning these, the day on which the process is served and the day of hearing are not counted.

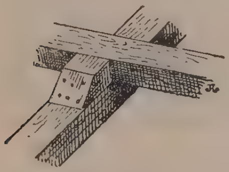
Clear'ing-House, in banking. Formerly the London bankers used to exchange cheques and settle accounts by a daily meeting of their clerks at one of the banks. But in 1775 a building, now called the C.-H., in Lombard Street, was acquired for the purpose. The arrangements are directed by a committee appointed by the banks. During the day each house transmits the cheques and bills which it receives on the others, and keeps a note of the obligations coming against itself. Accounts are closed at four o'clock. Three-quarters of an hour is allowed for the banks to consider drafts upon it, and to decide whether they are to be honoured. Meanwhile the bills and cheques have been classified at the C.-H., and by half-past five accounts are adjusted, each bank paying or receiving the balance due by or to it; the settlement being made not as formerly between the banks themselves, but with the C.-H., which is a depositor with the Bank of England. In addition to the London C.-H., there are also Clearing-Houses in England, at Birmingham, Leeds, Leicester, Liverpool, Manchester, and Newcastle-on-Tyne; in Scotland, at Aberdeen, Dundee, Edinburgh, Glasgow, Greenock, Inverness, Leith, and Paisley; and, in Ireland, at Dublin. In 1890, £7,801,048,000 passed through the London C.H.; in 1892, £6,481,562,000; and in 1893, £6,478,000,000.

Clearing-House, The Railway.—This is an ingeniously devised institution for regulating the complicated accounting between the railways of Great Britain. Plainly the equitable adjustment of the expense and receipts of the *through* traffic must be a work of much labour and difficulty; nevertheless, by means of the staff of the C.-H., these tangled accounts are, month by month, unravelled and a balance struck. The office of the institution is in London, near the Euston Station. It is regulated by the 'Railway Clearing Act, 1850' (13 and 14 Vict. c. 33, local and personal). There is a similar institution in Ireland, having its office in Dublin. The expenses are defrayed rateably by the companies forming the association, each company appointing a member to sit on the committee, which manages the C.-H., and whose decision is final in respect of any dispute between the companies which belong to the association. Officials of the C.-H. attend at each railway junction. They note the number of each carriage, van, waggon, or other vehicle which quits the original line. They also take a note of damaged stock. They make weekly returns to headquarters; these, with the collected passenger tickets, supply dates which form the basis of the accounting. A balance due by one railway to another on passenger or stock traffic, must be paid within five days after the date of the

C.-H. advice. Balances arising otherwise are payable within twenty-three days. Interest is charged on over-due balances. Cases of disputed liability are considered and decided by the committee.

Clearing-Nut, an Indian name for the nut of *Strychnos potatorum*, a plant belonging to the same genus as that which yields *Nux Vomica* (q.v.). It is commonly sold in the Indian bazaars for the purpose of clearing water. If the seeds are rubbed on the inside of a vessel, muddy water put into it soon becomes clear by the deposition of impurities. Their efficacy is due 'to the presence of albumen and casein, which act as fining agents, in a similar manner to analogous agents employed for beer and wine.' The seeds are also emetic, but devoid of poisonous qualities, while the pulp of the fruit is eatable. It may be also noted that this is likewise true of *S. Pseudo-Quina*, and that birds eat greedily of that of *S. Nux Vomica*, which yields strychnine (Roxburgh).

Clear-Story, or **Clere-Story,** is the name given to the upper story or wall of a church immediately above the roof of the side aisle, pierced with windows, through which light is admitted to the centre aisle. It is so called in opposition to the blind story or Triforium, which, opening from the centre aisle into the space covered in by the roof of the side aisle, is consequently blind or dark. C.-S. windows are to be found in the Basilicas, and in all the various periods of Gothic architecture; and till about the middle of the 14th c. they were generally small in size and wide apart. About this time they began to be greatly enlarged, in many instances the masonry being reduced to a minimum consistent with strength. A narrow passage is often found in the thickness of the wall at the C.-S. level, and leading all round the church, thus giving access to close the shutters or louvres when required, as well as for repairs.



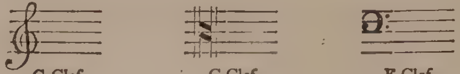
Cleat.

Cleats, on ship-board, are projecting pieces of wood or iron, formed so that ropes may be secured to them. C., in architecture, are small pieces of wood nailed to rafters in a roof to act as supports to the horizontal beams on which the common rafters rest. See *Art. Dict.*

Cleav'age, the name given in geological science to that condition or state of rock-particles, in virtue of which a rock can be readily split up into thin *laminæ* or plates, independently of any original lamination (or division into layers) which may have existed in the rocks. C.—'transverse' or 'slaty C.,' as it is termed—is best seen in *clay-slates*, but also occurs in sandstones and limestones, and in some trap rocks. It is best seen in purely-grained rocks, and splits such into very thin plates, lying smooth and parallel to each other. Of the origin of C., theories of *compression* are those most in vogue to explain the phenomena. Tyndall has shown that, if clay or white wax be subjected to pressure, allowing of expansion in directions at right angles to the pressure, slaty C. may be thus produced in these substances. This 'C.' of slate gives to that deposit valuable features in rendering it useful, in the form of thin plates, for many industrial purposes. C. tends to alter or destroy the presence of fossils in rocks, and its action is therefore to be taken into important account by the palæontologist.

Cleav'ers, or **Cliv'ers,** a species of Bedstraw (q.v.) very common in hedgerows and similar situations in Britain, &c., so called from clinging to clothing coming in contact with the leaves, which are covered with reflexed stiff-pointed hairs or bristles. At one time it was believed to be a specific in many cutaneous diseases, but its efficacy in these affections has not yet been fully determined.

Clef, in music, a sign placed upon the staff to indicate the absolute pitch of all the notes upon one particular line or space, and thus to fix indirectly the absolute pitch of all the other notes upon the same staff. Clefs are used, the forms of which are shown below, to indicate the positions of G, C, and F respectively in the staff.



G Clef. C Clef. F Clef.

The G (or soprano) C. is in modern music invariably placed, as in the figure, upon the second line; the C C. is generally, but not always, upon the middle line, and the F (or bass) C., always upon the fourth line.

Cleg, a popular name applied to some Flies belonging to the family *Tabanidæ*, or to that of the Breeze and Gad-flies. The English C. averages one-third of an inch in length, and is coloured black with yellow abdominal markings. The eyes are large. The C. of Scotland is a smaller species, and is known as 'Stout' in England. These flies possess a mouth adapted for piercing the skin of animals, and annoy horses, cattle, and domestic animals in summer especially, whilst they also attack man.

Clem'atis, a large genus of twining shrubs belonging to the natural order *Ranunculaceæ*, and easily distinguished by the long feathery style attached to their one-seeded carpels. There is only one English species, *C. vitalba*, the Virgin's Bower, the Traveller's Joy, or the Old Man's Beard. *C. flammula* is a sweet-scented species, a native of Southern Europe and Northern Africa, now common in our gardens. *C. florida* is accounted one of the most beautiful of all the species, and is that which remains longest in bloom; but *C. azurea*, *C. lanuginosa* (a fine blue-flowered Japanese species), and *C. tubulosa*, in addition to numerous hybrids such as *C. Jackmanni*, must also be classed among the favourite cultivated species of C.

Clematis (Virgin's Bower).

Clem'ens, Samuel Langhorne, better known by his *nom de plume* of 'Mark Twain,' an American humourist, was born in Florida, Missouri, U.S., 30th November, 1835. He worked first as a printer, but afterwards, in Nevada, as a journalist, when he developed a fresh phase of American humour, extravagant, surprising, and grotesque. In 1867 C. published *The Jumping Frog*, and in 1869, as the results of his travels in Egypt and the Holy Land, *The Innocents Abroad*, an amusing travesty of lofty and serious things—*e.g.*, in his weeping over the tomb of Adam, his blood-relation, in the church of the Holy Sepulchre. Among his other works are his *Autobiography* (1871), *Roughing It* (1872), *The Gilded Age* (1873). His best work, *A Yankee at the Court of King Arthur*, was published in 1890.

Clemens, Titus Flavius, surnamed *Alexandrinus*, in distinction from *C. Romanus*, a philosopher and theologian of the 2nd and 3rd centuries, was born either at Alexandria or Athens. Versed in all the science of the Greeks, at the age of manhood he convinced himself, by free inquiry, of the truth of Christianity. He now travelled over Greece, Italy, Egypt, Palestine, and the East in search of instruction from the great exponents of the new religion; but the only one whom he expressly names is Pantænus, the catechist or head of the Christian school at Alexandria. C. finally settled there, succeeded Pantænus as catechist and bishop (180), and died between 212 and 220. His peculiarity was that he did not cast aside his philosophy when he became a Christian, but held the eclectic system, afterwards called Neo-Platonism, and always sought to illustrate his teaching by the light which could be thrown on the doctrines of the Church from heathen antiquities. C.'s three great works are *The Exhortation to the Heathen*, *The Instructor* or *Pædagogus*, and the *Stromata* or *Miscellanies*. The object of the first is to win over heathens to Christianity; of the second, to build up converts in righteousness; of the third, to furnish the materials for a true gnosis on the basis of Christian faith. See Clarke's *Ante-Nicene Library*.

Clemens, surnamed *Romanus*, and, according to the ancient Church, the fellow-labourer of Paul (Phil. iv. 3), was one of the earliest Bishops of Rome, and is one of the 'Apostolic Fathers.' His (First) Epistle to the Corinthians is of dogmatic importance in relation to the doctrine of the Resurrection. The other writings attributed to him, a Second Epistle to the Corinthians, Two Letters on Virginity, the Apostolic Constitutions, the Apostolic Canons, and the Clementines, are unquestionably spurious. The two Epistles of C. to the Corinthians were found at the end of the *Codex Alexandrinus*. Both were defective; a leaf had been torn out of the first, and the end of the second was wanting. No other MS. of these was known to exist until Philotheos Bryennios, Metropolitan of Serræ in Macedonia, discovered one in the library of the Holy Sepulchre at Constantinople, and published an edition of them in 1875. His MS. contains both of the Epistles in a complete form.

Clem'ent is the name of seventeen Popes, of whom the most notable are—**Clement VII.** (Giulio de' Medici), who, as cardinal under Popes Leo X. and Adrian VI., had devoted himself to the Spanish cause in Naples and Milan. On his election as Pope in 1523, however, C. attempted to organise a national Italian party against Karl V., whose increasing power he dreaded. This led to the capture of Rome in 1527 by 'Bourbon's black banditti.' The growth of the Reformation after the Diet of Spires and the peace of Kadan were equally alarming to C., who sought the help of François I. and Henry VIII. He died in 1534, having by a secular policy reduced the influence of the Church to the lowest point. He founded the 'Monte della Fede,' or system of public credit, in which the creditors were associated in the management (*dogana*).—**Clement VIII.** (Cardinal Ippolito Aldobrandini) was elected 20th January, 1592. Although belonging to the Ecclesiastico-Spanish party, he is chiefly remembered in connection with the return of Henri IV. to the Church (which enabled C. to wrest Ferrara from Cesare d'Este), the readmission of the Jesuits to France, and the peace of Vervins. He died in 1605.—**Clement XI.** (Cardinal Gian Francesco Albani), was elected 16th November, 1700. At first a warm supporter of the French claim to the Spanish succession, he was compelled after the victories of Marlborough to acknowledge Charles III. as the Catholic King. By the peace of Utrecht, Sicily and Sardinia, which C. regarded as his own fief, were bestowed on the House of Savoy, with whom he soon had a bitter dispute as to *Di Monarchi* (a Sicilian tribunal which encroached on Papal privileges). In 1713 C. published the Bull 'Unigenitus,' condemning the 101 propositions in Father Quesnel's book; this irritated the French Jansenists and Nationalist clergy against Rome. C. was also connected with the great Jesuit missionary movement in China, the Stuart rebellion of 1715, and the expedition of Prince Eugène against the Turks in 1716. He died in March, 1721.—**Clement XII.** (1758-69). His rule is marked by the suppression of the Jesuits by Choiseul in France, Wall and Squillace in Spain, Fanuci in Naples, and Carvalho in Portugal. C. refused to abolish the order, and thus lost nearly all influence in Europe.—**Clement XIV.** (Cardinal Giovanni Vincenzo Antonio Ganganelli), was elected through Bourbon influence, 19th May, 1769. He was of a mild, religious disposition, and anxious to establish peace in the Church. The Curia was then divided into the *Zelanti*, or upholders of the ancient privileges of the Church, and the *Regulisti*, or party of concession to the crowned heads. C. belonged to the latter. He discontinued the reading of the Bull *In Cæna Domini*, allowed the claims of Sardinia and Parma, and on 21st July, 1733, abolished 'the Society of Jesus, its offices, houses, and institutions.' This act greatly assisted the Cismontane movement in Austria under Maria Theresa and Joseph II. C. died 22nd September, 1774.

Clemen'ti, Mu'zio, one of the earliest composers and performers of the modern pianoforte school, was born at Rome in 1752. He came to England as a boy, and for some time devoted himself to composing and teaching, but later on took up a music-publishing and pianoforte-making business, which he carried on successfully until his death, 10th March, 1832. Most of his compositions (over 600 in number) are for the pianoforte. Two of his works are considered authorities, *Practical Harmony*, and the *Gradus ad Parnassum*.

Cleome, a genus of plants of the order *Capparidaceæ*, found in the tropical regions of America. Most of the species are annuals—one, *C. pungens*, attaining the height of 4 or 5 feet. Among other species may be mentioned *C. spinosa* and *C. speciossima*, one of the handsomest of the genus, several of which are cultivated for the sake of their beautiful flowers.

Cleome'des, an ancient Greek astronomer, of whose life absolutely nothing is known. His treatise, *The Circular Theory of the Heavenly Bodies*, is a work in which truth is strangely mixed up with error. He held that the earth was spherical, and was a mere point in relation to the stellar sphere; that the moon rotated on its axis; that the fixed stars were as large, if not larger than the sun, and he also discussed the refraction of light. The two latest editions of this work are by Bake and Schmidt.

Cle'on, a famous popular leader of the Athenians, the son of Cleænetus, was brought up as a tanner. Even before the death of Pericles, however, he had achieved success in the more profitable trade of demagogue. In 427 B.C. he urged the Athenians to put to death all the adult males in Mitylene (about 6000), and to sell the women and children into slavery, and he so far attained his object. In 425 he succeeded, along with Demosthenes, in taking captive the Spartans who garrisoned the island of Sphacteria. In 422 he took the field against Brasidas, the famous Spartan general, in Chalcidice. He captured Torone, but in an attack on Amphipolis, the Athenians were defeated, and C. fled and fell. Thucydides and Aristophanes represent C. as the impersonation of violence, dishonesty, rapacity, and venality. Apart from the inconsistencies involved in this representation of his character, Grote forcibly argues in proof of its extravagance, that C. had proposed the banishment of Thucydides, and that Aristophanes himself admits that he had a grudge against him.

Cleopat'ra, the beautiful and accomplished, but ambitious and voluptuous Queen of Egypt, the last of the dynasty of the Ptolemies, was born B.C. 69. By the will of her father, Ptolemy Auletes, C. succeeded to the kingdom, along with her brother Ptolemy, but was expelled by him, B.C. 49. She was, however, reinstated by Cæsar, who was conquered by her charms, and to whom she bore a son, named Cæsarion, afterwards put to death by Augustus. In the war that ensued, young Ptolemy was killed, but a younger brother of the same name, whom she eventually poisoned, was associated with her in the government. On Cæsar's return to Rome, C. followed him, and there lived in his house, and received from him many gifts. On his death, B.C. 44, she fled to Egypt, and materially aided the triumvirate against the murderers of Cæsar. After the battle of Philippi, Antony summoned her to attend him at Tarsus, and her beauty so completely bewitched the Roman, that he remained her slave through life, and returned to her even after his marriage with Octavia, sister of Augustus. The infatuation of Antony in paying extravagant honours to C., and in assigning extensive territories to her and her children, so incensed and disgusted the Romans, that they declared war against her, and the great victory of Actium, B.C. 31, decided the fate of Antony and C. Augustus pursued them to Alexandria, where Antony, misled by a false rumour of C.'s death, fell on his sword. C., after vainly endeavouring to captivate Augustus, put an end to her life by the poison of an asp, B.C. 30.

Clepsyd'ra (Gr. *klepto*, 'I conceal,' and *hudōr*, 'water'), a kind of organ, used by the ancient Greeks, and described by Athenæus. The air was forced through the pipes by the action of water, giving rise to a soft musical sound.

Clepsydra, also an instrument used, before the discovery of the pendulum, for measuring intervals of time by means of the flow of water through a small orifice. The rate of flow varied with the temperature, barometric pressure, and generally with the height of the column of water above the orifice. This last source of variation is of the greatest importance, and is sometimes got rid of by keeping the vessel always full. In order that the rate may be the same at whatever height the surface of the fluid is, the vessel must be the surface of revolution of a cubical parabola.

Clerc, Jean le, a French theologian, was born at Geneva, 29th March, 1657. Having adopted the tenets of the Arminians, he settled in Holland in 1683, joined the Remonstrants in Amsterdam, and being interdicted by the Walloon ministers from preaching, was elected Professor of Hebrew, Philosophy, Classical Literature, and afterwards of Church History in the Arminian College there, a post which he held till his death, 8th January, 1736. Besides an extraordinary number of other works, he wrote commentaries on the whole of the books of the Old Testament, of which those on the historical books, especially the Pentateuch, have a permanent value. They may be regarded as the early dawn of the Rationalistic movement. C. is perhaps most likely to be remembered by his *Bibliothèque Universelle et Historique*, his *Bibliothèque Choisie* and his *Bibliothèque Ancienne et Moderne*.

Clergy (Gr. *klērikoi*, from *klēros*, 'a lot'), were so called, according to an early Christian writer, 'either because they are the heritage of the Lord, or because the Lord is their heritage.' The name was applied first to the three orders of bishops, priests, and deacons, but in the 3rd c. also to the inferior orders which were then introduced—sub-deacons, readers, acolytes, exorcists, doorkeepers. In the New Testament all Christians are God's heritage (*klēros*, 1 Pet. v. 3). The idea of a sacerdotal caste, a class of persons peculiarly consecrated to God, employed on the affairs of religion to the exclusion of all worldly concerns, and to be supported by the laity, was imported from the Jewish Church with its priests and Levites. Many privileges were claimed by and conceded to the C., especially during the Middle Ages. At the present day the C. cannot be summoned to serve as jurymen, cannot be arrested while officiating, may not farm more than 80 acres unless the bishop of their diocese permits it, and are not allowed to trade. In the Church of Rome, 'secular' C. are those whose duty lies in the outer world, *e.g.*, the parish priests, and those who do not belong to any religious order, like the 'regular' C., so called from Lat. *regula*, a monastic 'rule.'

Clerical Error is, in law, an error accidentally committed in the transcription of a deed or other instrument. Where the error is not *in substantialibus* it is not fatal to validity.

Clerk, is strictly a person in holy orders; but the term is now generally applied to any one whose chief occupation is writing as a subordinate. In English law, a C. is regarded as a superior servant.

Clerk, Parish.—An official of the Church of England. Formerly he led the responses, and otherwise assisted in the service of public worship, but now his duties no longer lie in that direction. He ranks next to the clergy in connection with the church to which he is attached. In many churches he is the officer who looks after the letting and rents of the pews. The incumbent generally appoints him, though in some places a custom prevails by which the parishioners choose their own clerk. He is paid according to the custom of the parish and can be removed or suspended by the archdeacon only. The City of London possesses a company of P. Clerks; but it has no privileges and no livery. In cathedrals and collegiate churches there are several clerks, sometimes forming a corporate body.

Clerk of the Assize is he that records all things judicially done by the judges of the circuits.

Clerk of the Crown is an officer in the Lord Chancellor's office, whose function it is to attend on the Lord Chancellor. He makes out writs for the election of members of Parliament. All returns are made to him. These he cannot alter, except by order of the House, under a penalty of £500—*toties quoties*.

Clerk of the Parliament Rolls is the name of an officer in each House of Parliament, who recorded the proceedings, and engrossed them on rolls for preservation. There are now a Clerk of Parliaments in the House of Peers, and a Clerk of the House of Commons; a large and competent staff of officers, including a Clerk of the Journals, is under each clerk.

Clerk of the Peace is an officer belonging to the Sessions (q.v.), whose duty it is to read the indictments, enrol the proceedings, draw the processes, and transact other business incident to the Sessions.

Clerk of Session.—The clerks of the Court of Session (see COURT OF SESSION) in Scotland are so called. There are two principal clerks and five depute clerks; besides these, there are two Inner House deputes and five assistants. The duty of these officers is to attend upon and assist the Lord President, the Lord Justice Clerk, and the eleven other Lords of the Session; five of these form the Outer House. No fees are allowed to the clerical staff, but each of the principal clerks receives £1000 per annum; each of the depute clerks, £550; each of the Inner House deputes £1425; and each assistant, £475.

Clerk to the Court of Teinds.—There are one principal and one depute C. of the Teind Court in Scotland.

Clerk of Justiciary.—There are one principal clerk (£700) and four deputes attached to the High Court of Justiciary.

Clerks to the Signet. See WRITER TO THE SIGNET.

Every court of law has necessarily a C. or Registrar, whose duty it is to write out the judgments and extract the decrees of the court.

Clerk, John, of Eldin, Mid-Lothian, Scotland, the sixth son of Sir John Clerk of Penicuik, obtained for himself, in 1779, a considerable reputation by the invention of the modern naval tactics of 'breaking the enemy's line'—an invention all the more remarkable that C. was not in any sense a naval man. This invention, being communicated to various naval officers, was adopted by Admiral Lord Rodney, 12th April, 1782, when he obtained his great victory over De Grasse in the W. Indies, and subsequently the manœuvre was systematically employed by the other great British admirals, such as Howe and Nelson. C. published various editions of his *Essay on Naval Tactics*—the latest and most complete in 1804. An unsuccessful attempt was made by General Sir Howard Douglas, son of the captain who, under Rodney, tried the manœuvre, to prove that it was suggested to his father, not by C., but merely by the chance position of the British and French Fleets. C. died 10th May, 1812.—His son, **John Clerk**, born in 1757, was educated for the law, passed advocate in 1785, and soon obtained the largest practice of his time. He was raised to the bench in 1823, taking the title of Lord Eldin. C. died in 1832. He is still remembered in Edinburgh society for his social qualities and his quaint, coarse humour.

Cler'mont (the *Clarus Mons* or *Clarimontium* of the Middle Ages), the name of several towns in France, the most important of which is **C.-Ferrand** (the *Augustonemetum* of Ptolemy), the capital of the department of Puy-de-Dôme, on an affluent of the Allier, and connected with Paris and Lyon by railway. It is beautifully situated at the foot of a range of extinct volcanoes, surmounted by the Puy-de-Dôme. The principal buildings are the cathedral (1248), the Romanesque church of Notre Dame du Port, said to date from 853, the Hôtel de Ville, Hôtel Dieu, linen-market, grain-market, the hospital, the theatre, and Palace of Justice. C. has a valuable public library, museums of natural history and antiquities, and a college. It has iron-foundries and machine-works, considerable traffic in grain, wine, oil, and cheese, and a large transit trade. In the suburb of St. Alyre is a fine mineral spring. Pop. 50,119. Pope Urban II. presided here in 1095 at the council in which the first Crusade was resolved on. Pascal was a native of C., and a statue has been erected in his honour. Other distinguished natives were Gregory of Tours and General Desaix.—**C.-l'Hérault,** a town in the department of Hérault, France, on an affluent of the Lergue, 23 miles N. of Agde by railway. It has manufactures of woollens, linens, verdigris, candles, &c., and an active trade in cattle and millstones. Pop. 5079.

Cathedral, Clermont.

Cleroden'dron, a genus of plants of the natural order *Verbenaceæ*, one of which *C. Thomsoni*, of W. Africa, is cultivated for the beauty of its flowers. *C. infortunatum*, an Indian species, is bitter and sub-astringent, and possesses tonic properties. These plants are chiefly natives of tropical Asia, but they are also found in Africa and America.

Cler'us, a Beetle genus, included in the Pentamerous section of the *Coleoptera*, and in the family *Serricornes*. *C. apiarus* is common on the continent of Europe, and is found in a larval state on the young of the hive-bee. It averages about half an inch in length, and is of green colour, the *elytræ* or wing-covers being red with purple markings. The adult beetles inhabit flowers, and particularly umbelliferous plants.

Cleve'land ('the Forest City'), in Ohio, U.S., on Lake Erie, at the mouth of the Cuyahoga river. It stands on a bluff 80 feet above the lake, and is beautiful and well laid out; the streets adorned with shady trees and fine public buildings. C. has a good harbour, and carries on an extensive trade with the lakes and with the mineral fields of Pennsylvania, especially in coal, iron, and copper. It has also communication with the Ohio river by the Ohio Canal, besides having railways to all parts of the country. Shipbuilding, copper-smelting, iron-rolling, and oil-refining are large and important industries. Iron and steel work—foundry and machine shop—products are annually valued at 30 millions of dollars, while petroleum refining is put at 10½ millions, meat slaughtering, packing, &c., at 4⅘ millions, and shipbuilding reaches close on 3 millions. The city is supplied with water from Lake Erie by works which cost $400,000. C. was founded in 1796, but in 1830 was only a village of 1100 inhabitants. In 1850 its population had risen to 17,034; in 1870 to 92,829; and in 1890 to 261,353.

Cleves, the French spelling of KLEVE or CLEVE (q.v.).

Clew, in ships, the lower corner of a sail. *C.-lines* are the ropes by which the C. is worked.

Clew Bay, an inlet on the coast of Mayo county in the W. of Ireland, 15 miles deep, with an average breadth of 8 miles, containing numerous indentations which form excellent harbours, and having at its upper end an archipelago of 300 fertile islets. It has valuable fishings. Clare Island lies at the mouth of the bay.

Cli'ché (Fr.), a process by which a sharp impression is obtained from a medal die. A quantity of semi-fused metallic-alloy is placed in a box under the die, which then descends forcibly upon it, causing the metal to take the finest lines of the die, which from its coldness, immediately solidifies the whole impression. 'C.' is also applied to the formation of stereotype plates.

Cli'chy, a town in the department of Seine, France, on a plain near the right bank of the Seine, and 4 miles N.W. of Paris, of which it forms a suburb. It has manufactures of white lead, chemical products, glue, and varnish. The parish church was erected in 1612 by Vincent de Paul, who was then curate of C. Pop. 30,698.

Click-Beetles, a popular name given to beetles belonging to the family *Elateridæ*, the larvæ of some species of which are the destructive 'Wire-Worms' (q.v.) of the agriculturist. The name 'C. B.' is derived from the noise they make on regaining their natural position after being laid on their backs; a spine arising from the front of the body, by means of a spring-action, enabling these insects to execute leaps, and to make the peculiar sound referred to. One familiar species of C. B. is the *Elater* or *Agriotes lineatus*—the striped species—found in hedges in summer, the larva of which is destructive to turnips and other plants.

Cliffor'tia, a genus of S. African bushes, belonging to the natural order *Rosaceæ*. The holly-like leaves of *C. illicifolia* are used by the Cape Boers (farmers) as an emollient and expectorant in coughs. The name *Cliffortiaceæ* is sometimes given to the *Rosaceæ* proper (including *Sanguisorbeæ*, as distinguished from *Amygdaleæ* and *Pomaceæ*).

Clif'ton, a suburb, and part of the parliamentary and municipal borough of Bristol, is built on the sides and summit of lofty cliffs (hence its name) of carboniferous limestone overhanging the Avon, and rising in St. Vincent's Rocks to the height of 308 feet. The river, which is here navigable, is spanned by a suspension bridge 702 feet in length, and having an elevation above low water of 275 feet. Its mineral springs and the beauty of its scenery made it, as early as the beginning of the 18th c., a favourite watering-place, which it continues to be, though its spa has declined in favour. C. has some fine public buildings, is a favourite residence of wealthy Bristowans, and has a proprietary grammar-school, *C. College*, which at present ranks among the foremost educational institutions in England. Traces of a large Roman camp are visible on C. Down. Pop. reg. sub-dist. and civ. par. (each) 29,345.

Climac'teric Year, a period of human life superstitiously supposed to be a turning-point in health or fortune, and thought to recur at the years produced by multiplying 7 by the odd numbers 1, 3, 5, 7, 9—to which some added the 81st year. The 63rd year was called the *grand C.*, and was supposed to be well-nigh impassable by most men, being the product of the two largest odd numbers, 7 and 9.

Cli'mate, in meteorology, is the sum of all the atmospheric variations at the locality under consideration, viewed especially in their relation to, and effect upon, animal and vegetable life. It depends first and chiefly upon the latitude and the mean annual temperature of the latitude, receiving from this consideration its usual subdivision into tropical, subtropical, temperate, and polar climates. Now, as a rule, the higher the latitude the lower the temperature, because the sun's rays, striking more obliquely on the surface, supply the same heat to a larger area, and therefore less to each unit of area. There are many conditions, however, which go to modify this general fact, but most, if not all of these, are due to the particular configuration of the land and sea. Thus, in the southern hemisphere, the *isothermal* lines, or lines drawn through localities whose mean annual temperatures are the same, approximate more or less to the parallels of latitude having their greatest contortions where the presence of land interferes most with the homogeneity of the surface. In the northern hemisphere, again, where the configuration of land and sea is much more irregular, the isotherms are extremely contorted. For instance, the isotherm representing a mean annual temperature of 0° C. corresponds, S. of the equator, almost exactly with the 60th parallel of latitude, suffering a slight disturbance just S. of Cape Horn; while, N. of the equator, it is traceable from the Aleutian Islands E. and S.E. over the American continent to the southerly extremity of the Labrador coast, then N.E. to Cape Farewell and to the North Cape, touching the N.W. of Iceland in its passage, then doubling southwards to the northern end of the Baltic, continuing E. and S.E. through the northern coasts of Russia and the southern districts of Siberia, undergoing a slightly northward flexure as it leaves Japan, and finally cutting through the S. of Kamchatka and across the N. Pacific.

All influences which are commonly enumerated as modifying C. may be said to depend on these four fundamental conditions: (1) the solar heat, (2) the earth's annual and diurnal motions, (3) the configuration of land and water, and (4) the character (physical and geological) of the country. It may be desirable to consider briefly the more important of these influences. The presence of aqueous vapour especially has a marked effect; for on account of its high specific heat, it tends to lower the temperature in summer and raise it in winter, thus equalising the C. Ocean currents, originating in the equatorial regions, and flowing towards higher latitudes, have the same equalising effect, as is well shown in the case of N.W. Europe, whose C., under the ameliorating action of the Gulf Stream, is much more equable than that of the corresponding latitudes on the American continent. In this connection also may be mentioned the similar influence of vegetation, and more particularly of forests. The elevation above the sea level is another important element in the adjustment of the C.—places situated in equatorial regions (*e.g.*, Quito, the capital of Ecuador, in S. America) enjoying a fine temperate, or even, as shown by the snow-capped peaks of the Andes and Himalayas, a veritable polar C. The nature of the soil too has a very significant influence—a damp clayey soil being very much colder, because a much better conductor of heat than a dry, sandy one. By more thorough drainage in various parts of England the mean annual temperature has been raised by several degrees, and statistics show a corresponding decrease in the death-rate arising from consumption, ague, rheumatism, and other maladies depending chiefly upon damp for their prevalence. Again, the slope and position of the land with reference to the sun and surrounding hills, and the consequent protection from certain winds, must also be taken into account. The more equable a C. is, the better, as a rule, is it suited for life; and the character of a C. is perhaps best judged of from a knowledge of the fauna and flora which flourish under its influence. From fossil testimony, we gather that in former geological epochs the C. of Europe was very different from what it is now. The rocks of the Tertiary formations indicate a sub-tropical development, even as far N. as Iceland; while the absence of organic remains in certain Post-tertiary deposits, and the occurrence of ice-markings, are unmistakable signs that Britain and France were then visited with a C. as bleak and polar as that of Greenland at the present day. In all works of any consequence on Physical Geography, Meteorology, and Geology, the conditions on which C. depends are fully discussed, and to these the reader is referred, as well as to articles GLACIERS, RAIN, SEASONS, &c., which, as parts of the Science of Meteorology, all bear to a greater or less extent upon this subject.

Cli'max (Gr. 'a ladder,' from *klino*, 'I bend,' because a ladder leans aslant), a figure in rhetoric denoting that artifice by which objects or propositions are, for the sake of impressiveness, presented to the mind of the hearer or reader in a gradually ascending series from weaker to stronger. The corresponding Latin term is *gradatio*. The converse figure is *anti-C.*, in which the ideas gradually or suddenly sink. It forms the main element in what is known as *Bathos* (q.v.).

Climb'ing Perch, the name given to a peculiar species of Teleostean fishes belonging to the family *Anabatidæ*, inhabiting the Ganges and other fresh waters in the E. Indies, and which have the power of leaving the water for considerable periods, and of making their way on the land, supporting themselves on their stiff spiny fins. The dorsal fin is single and elongated. The upper pharyngeal bones are divided into a number of curious labyrinthine chambers, in which moisture can be retained, for the purpose of keeping the gills moist, and of enabling them to breathe in their overland journeys. They migrate overland from their pools, when these are being dried up, in search of a fresh water supply. The name 'C. P.' has been given to this species of fish from the assertion that it is able to climb trees—the Tamil name of the creature being *Paneiri* or 'Climber of trees.' But this latter statement has not been satisfactorily determined, although there is no doubt of its land-loving habits, and of its ability to live out of water for days together. Another species allied to the C. P. is the Gourami of China. C. P. is on the average 6 inches in length. These fish are allied to the Mullets.

Climbing Plants, or **Climbers.** Some plants have such weak stems that, in order to rise from the ground, they must twine round other plants, or seek support for the same purpose from other objects. They may be divided, according to the means by which they attach themselves to the objects around which they twine, into:—(1) those which specially twine around a support; (2) those which ascend by the movement of the petiole or by the tops of their leaves; (3) those which ascend by true tendrils; (4) those which are furnished with hooks; and (5) those which are furnished with rootlets. Some twine round the support from right to left (*sinuirorsal*), as in the case of the hop and honeysuckle; while in others, as in the case of the Chinese yam, the haricot bean, the great hedge bearbine, &c., the twisting is from left to right (*dextrorsal*). The first form of twining is expressed in systematic works by the sign ☾, the latter by the sign ☽. Since the observations of Darwin, Unger, and others have called attention to the remarkable phenomena displayed by C. P., facts have been noted in regard to them which would almost incline us to designate some of these movements by a higher term than the mere phrase 'vegetable irritability' would denote. For a full account of these curious 'instincts' of plants, see Darwin *On the Movements and Habits of C. P.*; also *Journ. Linnean Society*; and Brown's *Manual*, pp. 78, 79, 579-583.

Clin'ic Baptism (Gr. *klinikos*, from *klinē*, 'a couch'), in the early Church was private baptism administered to the sick. It was done by sprinkling instead of immersion, which was the regular mode when done in the Baptistery (q.v.).

Clink'er, a firm mass of ash and other matters which is apt to form upon the bars of a furnace in which strongly caking coal is burnt, and which in this case, by impeding the access of air to the fuel, impairs the combustion, and allows the bars to be destroyed.

Clinker or **Clincher-Built,** a term applied to boats so made that each strake of planking overlaps at its edge the strake next below it, like the slates of a roof. If the planking be made flush throughout, the boat is said to be *carvel-built*.

Clink'stone, or **Phon'olite,** a compact felspathic rock, greenish-grey in colour, and somewhat slaty in texture, which emits a clear metallic sound when struck with a hammer.

Clinom'eter (Gr. *klinein* 'to incline,' and *métron*, 'a measure'), a small instrument used by surveyors for finding the slope of ground, and by geologists and others for finding the dip and strike of strata. There are various kinds of clinometers. Some depend upon the movements of a spirit level, while in others the swing of a pocket compass indicates the vertical line. Another kind of C. is used by French mariners to determine the exact inclination of the keel of their ship, and they are accordingly enabled to trim the vessel to suit its sailing powers.

Clinton, De Witt, son of James Clinton, U.S. general, was born in Orange county, New York, 2nd March, 1769. After his admission to the bar he was appointed secretary to his uncle, General George Clinton, and signalised himself as a political rival of Aaron Burr (q.v.). In 1802 he was appointed U.S. senator, and in 1803 Mayor of New York city. He was several times elected by the Democrats as Mayor of New York; and was Governor of the state from 1817 to 1822, and again in 1824. C. founded many valuable institutions; but his greatest work was the Erie Canal, connecting the waters of the lakes with the Hudson. He suggested the idea, and was mainly instrumental in carrying the work to its completion. He died 11th February, 1828. See Hosack's *Life of C.*, and Renwick's *Life of C.*

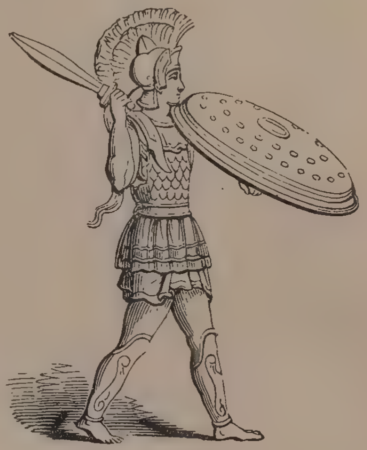
Clinton, Henry Fynes, a most distinguished classical scholar, was born in 1781, and educated at Westminster School, and Christ Church, Oxford. He inherited a large fortune, and for twenty years (1806-26) sat in Parliament for Aldborough. His great works are his *Fasti Hellenici* and *Fasti Romani*, containing respectively a most learned and exhaustive account of the chronology of ancient Greece and Rome. Both of these works were epitomised by the author. C. died at Welwyn, Hertfordshire, 24th October, 1852.

Cli'o (Gr. *Kleiō*, the 'proclaimer' or 'fame-giver'), in the Greek mythology, is the daughter of Zeus and Mnemosyne. She is the Muse of History, and is represented in a sitting attitude, wearing a laurel wreath, holding in her left hand a half-open inscribed roll of parchment, and beside her an open cylindrical chest, containing more rolls of manuscript. Sometimes she has a parchment roll in one hand and a stylus in the other. See MUSES.

Clio.

Clio, a genus of Pteropodous mollusca, the familiar species of which is named 'Whales' Food,' from the fact that the cetaceans of the Arctic seas feed chiefly upon the immense myriads of these minute forms, which they draw into their mouths. W. F. averages about three-quarters of an inch in length. No mantle or shell is developed. A distinct head exists, and the gills are rudimentary. The fins by which it swims are attached to the sides of the neck. The head bears numerous tentacles. Another species is found in the S. Seas. These animals are nocturnal in habits.

Clipeus, a circular shield used by Greek and Roman foot soldiers. It was made of wicker-work covered with ox-hides or of wrought bronze, and was large enough to protect the whole trunk of the warrior.



Clipeus.

Clipp'er, a term applied generally to any sailing ship built with the object of attaining considerable speed.

Clith'eroe (formerly *Cliderhow*; perhaps the Cymric *Cleddwr*, 'the rock by the water,' to which has been added the Old Eng. *hou*, 'a hill'), a manufacturing town in the W. of Lancashire, on the Ribble, 28 miles N. of Manchester by railway. It lies at the base of Pendle Hill, which rises to a height of 1803 feet, and in the vicinity is the famous Pendle Forest, a favourite haunt of the Lancashire witches. C. has extensive cotton and print industries. Its castle (now a ruin) was founded by the Lacys in the 12th c. Up to 1885 C. returned one member to Parliament. About 5 miles W. of C. is situated the Jesuit College of Stonyhurst. Pop. parl. div. of county, 89,450; reg. sub-dist. 13,709; mun. bor. and civ. par. (each) 10,815.

Clito'ria, a large genus of plants of the order *Leguminosæ* (sub-order *Papilionaceæ*), widely distributed over tropical Asia, Africa, and America, but more particularly in the latter country on the eastern side of the Andes. *C. Ternatea* is originally from the island of Ternata, one of the Moluccas, but now common in most tropical countries and in European conservatories. The corollas of the blue variety yield a dye which is used in Cochin-China, though it is not permanent, and in Amboyna it is employed to colour boiled rice. The butterfly-pea, another C., is found in the southern American states and Mexico, and in the Khassia Hills in India, without being found in any intermediate place.

Clive, Robert, Lord, born near Market Drayton, Shropshire, 29th September, 1725, was the eldest son of a lawyer of very ancient family. After a turbulent and idle boyhood, he obtained, at the age of eighteen, a writership in the East India Company's service at Madras. C. was disgusted with mercantile employment, and twice attempted suicide while in the 'Writers' Buildings.' He obtained means of study in the the Governor's library. When Labourdonnais, the French Governor of Mauritius, captured Madras, C. escaped to Fort St. David and obtained an ensign's commission in the Company's army. Two years later the French Governor of Pondicherry, Dupleix, took advantage of the disputed claims to the viceroyalty of the Deccan and the rule of the Carnatic to get himself recognised as Governor of India from the river Kristna to Cape Comorin, and the war between the English and French Companies began. It was then that C., now a commissary with the rank of captain, raised the siege of Trichinopoly by the capture of Arcot (1751), the capital of the Carnatic, which he defended for fifty days with a handful of English and Sepoys against the large army of Rajah Sahib, who was not only compelled to raise the siege with great loss, but was twice defeated in open field. Under the command of Major Lawrence, C. added to these triumphs the storming of Covelong and Chingleput. He then married Miss Martelyne and returned in 1752 to England, where he was a good deal lionised. In 1755 he was appointed by the Company Governor of Fort St. George, with a commission as lieutenant-colonel in the British army. Surajah Dowlah, the viceroy in Bengal of the court of Delhi, had just, on a frivolous pretext, attacked the English factory of Fort William, the modern Calcutta. The tragedy of the Black Hole (q.v.) roused the Madras settlement to fury, and C. was despatched with 2400 men to Bengal. Hoogly and Calcutta rapidly fell, and, assisted by Admiral Watson, C., distrusting the proposals of the Rajah, stormed the French factory of Chandernagore. A conspiracy against Dowlah, which C. carried on with the grossest deceptions, was played out on the field of Plassey, where an army of 55,000 well-appointed natives was dispersed, only 500 being slain. C. accepted from the new viceroy, Meer Jaffier, between £200,000 and £300,000. Although the act was much blamed, he was appointed by the Company Governor of the Bengal settlements, which he greatly strengthened by the defeat at Patna of Shah Alum, a prince of the Delhi family, who was threatening Bengal. The grateful Meer Jaffier gave C. the rent paid by the Company for the Bengal settlements; but soon commenced an intrigue with the Dutch factory of Chinsurah. This was promptly suppressed by the defeat of the Dutch fleet on the Hoogly, and the imposition of conditions on the Dutch factory. In 1760 C. returned to England, where he received an Irish peerage, and entered the House of Commons, where he attached himself to the Grenville party. His chief interest was still in Indian affairs; he opposed Sullivan in the Court of Proprietors, and was obliged to take his former employers into Chancery, as they had rescinded Meer Jaffier's grant of rent. Frequent revolutions and the corrupt administration of the Company's servants led to C.'s return to Calcutta in May, 1765. In less than two years he succeeded in abolishing the private trade of the Company's servants, and in prohibiting the receipt of presents. Their salaries he supplemented out of the Government monopoly of salt. Equally important reforms were carried out in the army, although a conspiracy of 200 officers was formed to oppose them. C. also obtained from the court at Delhi a recognition of the Company's supremacy and right to collect the revenues in Bengal, Orissa, and Behar. For a short time, however, the fiction of a native viceroy at Murshidabad was continued. C. set an example of self-denial to his fellow-countrymen. The only large present he accepted (£60,000) he formed into a fund for the invalided servants of the Company. On his final return to England in 1767, his great services seemed to be forgotten in the general dislike with which the 'nabob' class were at that time regarded. The sufferings of the Bengal population from famine were contrasted with the splendour in which C. lived at Berkeley Square and Claremont. At length in 1772, the financial position of the Company having become serious, a parliamentary committee was appointed to inquire into its recent history. Chiefly owing to the eloquence of Wedderburne, the House of Commons, while affirming the general illegality of the private appropriation of military acquisitions, passed no censure on C. His health, however, gave way soon after: he became addicted to opium, and committed suicide on 22nd November, 1774. There are Lives of C. by Malcolm, Greig, and others.

Cloa'ca (Lat. 'a sink') is a cavity at the extremity of the alimentary canal of birds, reptiles, and amphibians, into which the great intestine, &c., open. In the *Ornithodelphia*, a group containing the two genera *Echidna* and *Ornithorynchus*, there is a spurious C. In the *Didelphia*, or Marsupials, there is a shallow C.

Cloaca Max'ima, a celebrated subterranean vault, the construction of which is ascribed in Roman legend to Tarquinius Priscus, by which the filth of ancient Rome was conveyed to the Tiber. It was formed by three arches, one within the other, the innermost being a semicircular vault about 14 feet in diameter, the blocks of which were united without lime. It was large enough to allow the passage of a cart loaded with hay, and Agrippa passed through it in a boat on an occasion when it was cleansed. The original C. M. extended only from the Forum to the river, but was ultimately extended as far up as the Subura, and of this extension vestiges were discovered in 1742. The expenses of cleaning the common sewers at Rome were defrayed partly by the treasury and partly by an impost called *cloacarium.* The censors were intrusted with the administration of the sewers under the Republic, but under the Empire this was vested in special officers, with the title of *cloacarum curatores* —'curators of the sewers.' The sewers at Rome were constantly flushed by the superfluous waters of the aqueducts.

Clock Bell-Metal is an alloy of copper, into which tin, lead, and zinc in variable proportions enter. Small quantities of antimony and bismuth are sometimes introduced, to give a crystalline grain and a certain tone to the bell-metal.

Clocks and Watches. See HOROLOGY.

Clog Al'manac, Rim Stock, or **Prime Staff,** an almanac or calendar of days, made generally of wood, but sometimes of horn, bone, or brass. When four-sided it contained three months on each of the edges; the days were marked by notches, every seventh by a larger notch. On the sides symbols, each linked to the proper notch by a line, indicated the Golden Number, a cycle of the moon, and festivals of saints. Some were perfect, containing the Dominical Letter (q.v.), the Prime (q.v.), and marks for all the feasts; others were imperfect, having only the prime and immovable feasts engraved on them. There were the family C. A., hanging like a modern clock or weatherglass, and the smaller one, carried in the pocket as watches or handy compasses now are. This instrument was much used in England and Denmark; but in the latter country it was generally flat, each side being divided into six columns; even six-sided ones were not uncommon, two months being notched on each edge. There also it was called a *Runic staff*, after the Runic characters used for notation. Specimens of the C. A. are to be seen in the British Museum, London; the Bodleian Library, Oxford; and St. John's College, Cambridge; and a few other places.

Clogheen' (Irish Gael. *cloichin*, dim. of *cloch*, 'a stone'), a town in the county of Tipperary, Ireland, 14 miles S.W. of Clonmel, on the river Tar, at the crossing of the roads from Dublin to Cork and from Cahir to Lismore. It has extensive flourmills, as the limestone soil of Tar Vale produces rich crops of wheat. Pop. 3176.

Clog'her (Irish Gael. *clochar*, 'stony land'), a decayed episcopal city in the county of Tyrone, Ireland. It is 15 miles S.S.E. of Omagh, and 98 N.N.W. of Dublin, on the Launy, a tributary of the Blackwater. St. Patrick is said to have been, in A.D. 444, the first bishop of the see, which is now united to that of Armagh. Pop. town, 273; parish, 8611.

Cloister.

Clois'ters (Lat. *claustra*, 'enclosed places'), vaulted passages connected with cathedrals and collegiate or monastic institutions, generally situated on the S. side of the church. They enclose on four sides a large area, called the cloister garth, and give covered access to the church, and to the various offices of the establishment ranged round the three remaining sides. The side-walls of the C. are in Northern Gothic generally of a design similar to the aisle-walls of a church, having windows sometimes glazed, with tracery and buttresses between; while in warmer countries the C. are generally open pillared arcades of the most graceful and beautiful design. A stone seat is often continued along one side of the C., and many of them have stalls or carrols, where the monks were in the habit of studying and copying books; and at certain hours of the day the C. formed a common place of meeting for conversation and recreation, as well as for processions to and from the church. Certain orders used the C. for interments. The prototype of the C. is to be found in the colonnade surrounding the court in front of the Basilican churches.

Clonakil'ty (Irish Gael. *Clough-na-Kiltey*, 'the stone-house of the O'Keelys'), a town in the county of Cork, Ireland, 26 miles S.W. of Cork. It stands at the head of a small inlet from C. Bay, and exports grain. Pop. 3221.

Clo'nes (Irish Gael. *Cluain-Eois*, 'Eos's meadow'), a market-town in the county of Monaghan, Ireland, on the high-road between Monaghan and Belturbet, 12 miles W. of the former town, and near the Ulster Canal. C. has large cornmills, a brewery, and some manufactures of crochet-lace. Near the town are the ruins of an ancient monastery, which is said to date from the 6th c., a round tower, and some very old earthworks, probably of heathen origin. Pop. 2032.

Clonmel' (Irish Gael. *Cluain-meala*, 'the honey-meadow,' so called from the abundance there in old times of wild bees' nests), a municipal borough in Tipperary, Ireland, with a small portion in the adjoining county of Waterford. It is situated in a beautiful valley on the Suir, here crossed by a bridge of twenty arches, is a well-built town, and has a considerable trade in corn, cattle, bacon, and butter. In the neighbourhood are extensive cornmills, breweries, and a distillery. C. returned one member to Parliament up to 1885. The town was the birthplace of Sterne, and the scene of Smith O'Brien's 'insurrection' in 1848. Pop. mun. bor. 8480; area 331 acres.

Clontarf' (Irish Gael. *Cluain-tarbh*, 'the meadow of the bulls'), a town in the county of Dublin, Ireland, 3 miles E.N.E. of Dublin, a favourite sea-bathing place, and famous in ancient Irish history as the scene of the defeat of the Danes by Brian Boroimhe in 1014. C. had a 'priory' as early as 550, which afterwards came into the hands of the Knights Templars, and is now a Carmelite monastery. C. Castle, not long ago burnt, is said to have been one of the finest specimens of antiquity in the British Isles. Pop. 2396.

Cloots or **Clootz, Jean Baptiste,** born at Val-de-Grace, near Cleves, 24th June, 1755, and educated at Paris, conceived the idea of making that city the metropolis of the universe, and abolishing national distinctions. Under the assumed name, Anacharsis, he traversed Europe, announcing his doctrine, and losing great part of his inherited wealth. Returning to Paris, he renounced his rank (of baron) in the Prussian nobility, and assumed the title of 'orator of the human race,' in which capacity he assisted at the absurd ceremony of introducing fictitious delegates from all foreign nations to the Assembly. After the September massacres he was elected a deputy, and in the interests of his universal republic he savagely called for the death of the King. A treatise of his in support of Mohammedanism was gravely approved of by the Assembly. At last Robespierre, feeling that the Hébertist party was threatening not only the Jacobins but the Republic, denounced C. as too rich, a foreigner, and an atheist. C. was executed 23rd March, 1794. His writings are, like himself, curious, but of no consequence.

Close, a term used in heraldry in connection with birds addicted to flight, as the eagle and falcon, indicating that the wings are not expanded, or *disclosed*, which is the technical term. C. applies also, in the same art, to barnacles or bits for horses, when they are not extended.

Close-Hauled, in navigation, is the manner in which a ship's sails are arranged when she is wanted to sail as nearly in the teeth of the wind as possible.

Clos'et, in heraldry, a diminutive of the Bar (q.v.)—one-half of its width.

Clotaire, the French form of the name of several Frankish kings of the Merwing or Merovingian dynasty. See MERWINGS.

Clothes-Moth (*Tinea*), the name given to various species of Lepidopterous moths, the young or larvæ of which destroy cloths, furs, and other fabrics, by biting them and otherwise destroying them, for the purpose or forming cocoons or pupæ-cases from the materials. Of this genus of moths (included in the sub-order *Heterocera*, and in the family *Tineina*), the *T. destructor*, *T. tapezana* of woollen fabrics, and the *T. pellionella* of furs, are familiar species; whilst *T. granella* or the Corn Moth (q.v.) is found in granaries and libraries also. *T. destructor* is of a buff colour; *T. tapezana* has the front wings black at their roots and the rest of the wings white; whilst in *T. sarcitella*, another common species, the colour is a silky grey, the head and chest being white. The antennæ are filiform, and the larvæ or caterpillars have eight or ten pro-legs. By means of their sharp jaws the larvæ nip out the fabrics in which they live, and amid which the female moth has deposited her eggs. Exposure to air, and saturation with the odour of camphor or spirit of turpentine, are the most effectual means for destroying these forms. But free exposure to currents of air and cleanliness are the surest preventives from their attack.

Clo'thing, Army, is a department of the British military system. Formerly the colonel of the regiment was paid so much a year for clothing it. This system, as was to be expected, led to gross abuse. The colonel contracted with a tailor for a wholesale supply at lowest possible price; the officer making a profit, it used to be calculated, of fully fifteen shillings per man. The disasters of the early part of the Crimean war gave rise to a national demand for reform in the system. Under the royal warrant of 21st June, 1855, the troops are clothed at the direct expense of the state, the colonels receiving compensation for the loss of their former perquisite. The A. C. Department is in Grosvenor Road, London, and chief officers of the staff of superintendence are director and assistant-director of clothing, storekeeper, medical officer, and inspector of colours. The cost of a uniform for a private in the W. India regiment is £2 10s. 2d., and for one in the line £2 16s. 5d.; for a Life-Guardsman it is £7 4s. 5d., for a Foot-Guardsman £4 13s. 10d., for a kilted Highlander £3 17s. 3d., and for one trewed £3 5s. 3d. The vote for 1894-95 was £789,600.

Clothing, Navy. On joining the royal navy every man receives £2 10s., which is paid to him to cover the expense of his outfit. Afterwards he has to clothe himself. An officer inspects his clothes once a week and makes an order for any raw material which the sailor may require, and for which he has to pay—the paymaster pays, and deducts the amount from the man's pay, except for blankets and bedding. The net estimates for 1894-95 for the victualling and clothing of the navy are £1,402,100, being an increase of £141,400 on those for 1893-94.

Clo'tho, in ancient mythology, one of the three Fates or *Parcæ* (q.v.)

Clotho, a genus of Spiders (q.v.), inhabiting the S. of Europe and N. of Africa, which construct a curious tent-like habitation of conical shape, fastened to rocks and in crevices; egress and ingress being obtained through a curious doorway. The exterior of the tent is purposely stained for concealment, and it is fastened securely by cord-like structures to its basis of attachment. *C. quinquemaculata* is a familiar species, about half an inch long, and coloured black on the abdomen. Another is *C. Durandii*.

Cloud, St., a town in the department of Seine-et-Oise, France, on the slope of a hill on the left bank of the Seine, 6 miles S.W. of Paris. The name C. is a corruption of Hlodoald, a grandson of Clovis (Hlodowig), who, forced to become a monk, took up his residence at *Novigentum*, the modern St. C., and was afterwards canonised. Its principal attraction was its splendid château, built by Mazarin, long the residence of the Dukes of Orleans, and the scene of many memorable historical events. Bonaparte was here named First Consul in 1799, and here Charles X. signed the famous ordinances of July, 1830. It was the headquarters of the Allies from 7th April to 3rd June, 1814, and also of Blucher in 1815 during the siege of Paris. It was almost wholly destroyed by the fire of the French artillery, 13th October, 1870, as it was believed to be the headquarters of the German staff. Pop. 5660.

Cloudberry, a plant of the natural order *Rosaceæ*, allied to the bramble, raspberry, &c., bearing an agreeably flavoured fruit, greatly used for preserves in Norway and Sweden, where it is common. It is also found, though not so plentifully, in high situations in Britain. The Antarctic representative of it is *Rubus geoides* of Tierra del Fuego and the Falkland Islands.

Clouds. Moisture is always being evaporated from all points on the surface of land and sea; its rate of evaporation being in direct ratio to the dryness of the atmosphere, and in inverse ratio to its density. The amount of moisture is shown by the wet-bulb thermometer, which gives the temperature of evaporation. 186,240 cubic miles of vapour are annually raised from the surface of the globe. Although the southern hemisphere possesses three times as much water as the northern, yet partly by the direction of the trade-winds, partly from the superior condensation-power in the N., more rain and fog occur there. There is absolutely less vapour in the atmosphere in January than in any other month; while in July, on account of the heat, the evaporation is greatest. The chief effect of moisture in the air is to obstruct the passage of the sun's heat; there is also considerable absorption of heat on evaporation. In the region of C., which is stated by Kämptz to be from 1300 to 21,320 feet, but which balloon observations extend to an elevation of perhaps 10 miles for light cirrus, the cloud-air is dry, the moisture being condensed by the colder air into C.; these C. prevent the free radiation of heat, and thus obstruct the formation of dew on the earth. The quantity of C. manufactured out of the invisible vapour depends on the differences of the air currents in temperature, moisture, and velocity. In Britain, the heavy E. wind, or polar current, forces upwards and transforms into dense black C. the light and moist S.W. wind. In the balloon observations at Kew, the temperature of the cloud-stratum, varying from 2000 to 3000 feet in thickness, was found to be the same at the top and at the bottom. As a general rule, the cloud-stratum is higher over land than over water, and increases in height with the oxygen of the air, *i.e.*, distance from the sea. In intense cold, C. often consist not of vapour, but of small crystals of ice. The appearance of a cloud depends on its being connected with an ascending current of vapour; when this ceases, the cloud is formed, and immediately begins to dissolve. C. also, if near the earth, imitate the depressions and elevations which they extend over. There is no radical difference between C. and fog, the latter being always close to the ground, which is then generally moister and warmer than the atmosphere. The *cirrus*, or cat's-tail is the highest cloud; it consists of long white silver horizontal bands, perhaps containing snow or ice. Travelling in the direction of its length, it seems stationary. The parallelism of these bands has been assigned to electrical conditions. The *aurora* is supposed to be connected with them; it is in this region that halos and parhelia are formed. The *cumulus* is the rounded, dense, white, mountainous cloud of the daytime. *Cumuli* move in currents near the earth, and are in fact formed from the ascending air which has been heated on the earth's surface. In the evening they often mass themselves and deepen in colour. Still lower is the *stratus* or horizontal band which forms at sunset and disappears in the morning. It includes the white and grey mists formed in valleys and over marshes. There are four subordinate forms of C.—the *cirro-stratus*, a compact structure of filaments, resembling in outline and position the *cirrus*; the *cumulo-stratus*, a mass of C., having at sunrise a black or bluish tint on the horizon, and passing into the *nimbus*, or rain and thunder cloud, which has a uniform grey tint, fringed at the edges; and the *cirro-cumulus*, which is a combination, of course in endless variety, of the *cumulus* and the *cirro-stratus*. C. move much faster than the wind at the surface of the earth; the rate of 109 miles an hour has been observed at Edinburgh, and the rate of 72 miles when the wind was blowing at 42 miles an hour. See Somerville's *Physical Geography*, and Buchan's *Meteorology*.

Cirrus.

Cumulus.

Clough, Arthur Hugh, an English scholar and poet, was born at Liverpool, 1st January, 1819, educated at Rugby under Arnold, passed to Balliol College, Oxford, and was elected a fellow of Oriel in 1842. The theological *fever* was strong at the time, and for a moment it seemed as if C. would catch it; but his spirit was too exquisitely susceptible of living impressions, and his mind too speculative, or rather too critical, to be long enthralled by 'archæological formulas.' The result was that he went the other way, and his brief career was mainly shaped by his antagonism to the 'form of thought which Oxford exacted of her children.' In 1848 he resigned his fellowship, and in the same year, a little earlier, published the *Bothie of Tober-na-Vuolich*, a 'true long vacation pastoral,' in classical hexameters, instinct with the finest aroma of elegant culture, the bright joys of college friendship, the humour, sympathy, sarcasm, and luminous talk of youth, relieved by picturesque descriptions of Highland scenery and delineations of Highland character. The work is imperfect in art, and is now beginning to fade from the memory; but at the time it was thought to indicate a new poet. Next year (1840) appeared his *Ambarvalia*. After leaving Oxford, C. travelled in France, Italy, and America, was appointed an examiner in the Education Department of the Privy Council in 1853, and in 1856 secretary to the Commission of Report on Military Education. His health now gave way; after visits to Greece and Constantinople, and a short return to England, he was again ordered to the Continent; but was carried off by malaria fever at Florence, 13th November, 1861. C.'s nature was singularly pure, tender, and strong, and his talent incomparably greater than his fame is likely to be. See *Poems by A. H. C., with a Memoir*, by F. T. Palgrave.

Clouted or **Clotted Cream,** prepared by boiling milk on which the cream has risen, and skimming off the cream, in which a quantity of coagulated casein becomes entangled by boiling. The S.W. of England, Devonshire and Cornwall, is noted for its C. C.

Clove, or **Culilawan Bark,** is a name also applied to the bark of *Myrtus caryophyllata*, a native of Ceylon and the Mascarene Islands.

Clove Gilliflower, the aromatic scented double-flowered varieties of *Dianthus Caryophyllus*.

Clove Nutmeg, the fruit of *Agathophyllum aromaticum*, one of the *Lauraceæ*, which is aromatic, though the kernel which it encloses is of an acrid caustic taste. The leaves are used in Madagascar as a condiment.

Clo'ver, or **Trefoil,** a genus of plants belonging to the order *Leguminosæ* (sub-order *Papilionaceæ*). There are from fifteen to twenty British species of C.; about one half are pasture plants, the rest mere weeds, of no economic importance. The cultivated species of C. are—The red C., the zigzag C., the carnation C. All the above have red flowers. The following species have pinkish or white flowers:—The Alsike C., and the white or Dutch C.; while the hop or procumbent Trefoil has yellow flowers.

The red C. is much employed as a 'shifting' crop, either by itself or in the mixtures known to the farmer as 'seeds.' It is now so much a cultivated plant that it is found difficult to make it stick to lands as perfectly as it once did: such soils are described as 'C. sick.'

The zigzag C., so called from the angular bends at each joint of the stalk, is a lover of sandy soil, and is probably only a variety of the red or broad-leaved C. It is usually known by the seedsmen as the 'cow grass,' though it is rare to find two seedsmen supplying the same plant under that name. The carnation or Italian C. is an introduction from the Continent, and is used on upland soils upon the white-crop stubble sown in the autumn. There are several varieties of it.

The Alsike C. is also a Continental form. From possessing characters intermediate between the red and the Dutch C. it is also called hybrid, though its hybridity is not admitted by botanists. It is a good pasture grass. The Dutch C. is a valuable feeding plant in dry and thin soils. The hop or procumbent Trefoil is a different plant from the hop trefoil of the farmer (which is *Medicago lupulina*). Bokhara C. is *Melilotus leucantha;* bush C. and Japan C., American names for *Lespedeza;* prairie C., an American name for *Petalostemon;* Soola C. and Maltese C., *Hedysarum coronarium;* sweet C., an American name for *Melilotus*. See MEDICK, MELILOT, and SHAMROCK.

Clover Weevil, a genus of Beetles of the section *Pentamera* and family *Rhynchophora*. This insect has, therefore, the head prolonged to form a *rostrum* or *beak*, and derives its name from its feeding on the leaves of the clover, the larvæ eating into the clover flowers. The African C. W. infests the red, and the yellow-footed C. W. attacks the white clover. The former is about a twelfth of an inch or little more in length, and is coloured of a dark-blue or blackish-blue tint.

Cloves. See CARYOPHYLLUS.

Clo'vis, the Latinised form of the name of the Frankish King *Hlodowig* (q.v.)

Cloyne (Irish Gael. *Cluain-uamha*, 'the meadow of the cave'), a town in the county of Cork, Ireland, 15 miles E. by S. of Cork. Its cathedral dates from the 13th c. C. was once a separate bishop's see, but was re-united in 1835 with that of Cork, from which it had been disjoined in 1678. The famous Berkeley was Bishop of C. There is little or no trade. St. Colman Maclenin founded a monastery here in 604, and the cave from which the place is named is still to be seen. Pop. of town 995.

Club (which has been conjecturally derived from the Old Eng. *cleofian*, 'to cleave,' and Welsh *clapiaw*, 'to form into a lump'), may be applied to any voluntary unincorporated society possessing a common fund, derived from the contributions of its members, and generally managed by a committee, who are not entitled to make their constituents liable for any expenses beyond the purposes for which the C. was formed. Clubs for dinner in common were popular in Athens, and eating in common was a prominent feature in the early religious or social *gilds* (a word connected with the Welsh *gwyl*, Breton *goel*, and Gaelic *feill*, 'a feast or holiday'). Thus the gild of Abbotsbury had a yearly banquet, to which the poor were admitted, the members being obliged to furnish so much bread 'well boueted and thoroughly baked.' Support and nursing of sick gild brothers, burial of the dead, and performance of religious services, were also objects of the early gilds. This common meal has been derived from the old Teutonic sacrificial banquet, and has been compared to the Greek *eranoi* (see Bekker's *Charicles*, ii. 239) and the banquets of the Roman *collegia*. These fraternities were spread all over Catholic Europe in the Middle Ages, there being eighty in Cologne and one hundred in Hamburg. One of their ceremonies is curiously preserved in 'the march of the members of the English benefit societies to morning service in their church before the midday dinner, the cricket-match and games of the afternoon, and the evening dance.' As the later frith-gilds, gilds merchant, and trade-unions all in their time acquired a corporate existence, they seem hardly to fall under the term C. It would, of course, be impossible to mention the objects, charitable, political, convivial, and religious, for which clubs have been formed. Among others, we may note the 'Mermaid' of Shakespeare; the 'King's Head and Green Ribbon C.' of the Shaftesbury clique; the 'C.' of Presbyterian and Tory Jacobites, which organised in Penston's Tavern the opposition to the Revolution settlement in the Scots Parliament of 1689-90. Specimens of the fantastic club are the 'Calf's-Head C.,' which (as late as 1735) used to dine off calf's-head, in contempt of the memory of Charles I., solemnly burning the *Ikon Basiliké*, and swearing republicanism over Milton's *Defensio Populi Anglicani;* and the 'Ugly C.,' celebrated by the *Spectator*, of which the qualifications of members were defined by an 'Act of Deformity.' Early in the 18th c. the Hell-Fire Clubs, which used Tartarëan names, and burned sulphur at their blasphemous meetings, were denounced by an Order of Council (28th April, 1721). In the latter half of the same century the celebrated convivial clubs of 'The Society of Bucks' and 'John Shaw's Punch-House' were formed at Liverpool and Manchester respectively. The 'Scramble C.,' and the 'Oyster and Parched-Pea C.' of Preston (which included among its office-bearers an Oystericus and a Clerk of the Peas), belonged to the same period. Among the political clubs of the period of the French Revolution may be mentioned the *C. des Enragés*, Breton C., *Société Publicole*. The 'Breton' developed into the 'C. of Friends of the Constitution,' and, after it met in the hall of the Jacobin Convent, the 'Jacobins,' who, known as the *Société Mère*, had 300 affiliated clubs in France. Barnave, Mirabeau, and Robespierre belonged to it. Still more violent were the 'Cordéliers,' among whom were Desmoulins and Danton. Lafayette's C. was the *Feuillans*, or 'Club of 1789, Friends of the Monarchic Constitution.' Of the same complexion was the *C. des Monarchiens*. It was the 'Electoral C.' which, meeting at the Hôtel de Ville, constituted itself a provisional municipality, and, as the affair of the Bastille approached, a permanent committee for arms.

Clubs for amusements, such as horse-racing, trotting, pigeon-shooting, polo, golf, skating, driving, athletics, football, gaming, cricket, boating, chess, debating, are now common. There are clubs, political and social, in every city, town, and district. Clubs for men only, clubs for women only, and clubs, of which the members are both men and women. In France, Italy, Switzerland, and England, Alpine clubs have existed for many years; their *Transactions* contain much interesting description and some scientific observation. Their chief advantage lies in the certainty of reliable guides and experienced companions. In 1812 the 'Roxburghe C.,' for the printing or reprinting of a limited number of copies of rare and interesting books or documents, was formed on the occasion of the public sale of the Duke of Roxburghe's library; it was followed by the Maitland, Spalding, and Bannatyne clubs in Scotland.

Among the great London clubs ought to be mentioned the 'Rota Coffee C.' in New Palace Yard, to which Milton, Marvell, and Harrington belonged; the 'October and March C.,' consisting of Tories under Harley and St. John; the 'Kit-Kat C.' in Shire Lane, to which Halifax, Marlborough, Walpole, and other Whigs belonged; 'Almack's (originally Brooke's) Chocolate C.,' founded in Pall Mall in 1764; 'White's,' removed to St. James's Street in 1736, to which Chesterfield, Cibber, and Bubb Doddington belonged; 'Turk's Head C.,' to which in 1763 Reynolds, Johnson, Burke, and Goldsmith belonged, removed to Thatched House, and now the 'T. H. C.;' 'Cocoa-Tree C.,' where Smollett did his election bribing; 'Beefsteak C.,' founded, with the motto 'Steaks and Liberty,' by Lord Peterborough in honour of Peg Woffington, to which Colman and Garrick belonged, and from which Wilkes was expelled for his *Essay on Woman*, 'Will's C,' where Dryden talked; and 'Button's C.,' frequented by Addison.

Clubb'ing, a disease affecting the roots of cabbages and allied plants, the result of which is that the whole force of vegetation is carried upwards to the leaf and stem, causing the destruction of those parts. It is a local disease, and probably depends upon peculiar conditions of the soil. Berkley recommends, as the most effectual preventive of it in districts subject to the disease, to put a small quantity of wood ashes into the hole in which the root of each plant is placed.

Club-Foot, or **Tal'ipes,** may be due to the contraction of certain muscles, or to the paralysis of others. It is generally congenital, but is sometimes the result of disease or destitution. Four kinds are usually described by surgeons. 1. *Talipes equinus.* The muscles of the calf are contracted, the patient walks on the front of the foot, and the heel is raised from the ground. This kind is usually a result of teething. 2. *T. varus*, the most common form of C.-F. The patient walks on the outer edge of the foot. 3. *T. vagus*, a rare form, compelling the person to walk on the *inner* aspect of the foot. 4. *T. calcaneus*, in which the person walks on the heel. Sometimes we find several of these forms in the same foot. The proper treatment consists in dividing the tendons of the contracted muscles by a thin knife underneath the skin, and applying means to keep the limb in position. In children C.-F. is always curable.

Club-foot.

Club-Grass, a common name for *Corynephorous*, a grass belonging to the oat tribe. Though rare in England, it is generally diffused throughout the continent of Europe.

Club-Houses, in London, Law Regarding. It is now settled (Fleming *v.* Hector) that these have no legal character similar to commercial partnerships or joint-stock companies, and that the members are not liable for the debts incurred by their secretaries, stewards, or committees.

Clupei'dæ, a family of Teleostean fishes belonging to the sub-order *Malacopteri*, and including the herrings, pilchards, sprats, sardines, anchovies, &c. It is distinguished by its members possessing scales of large size, by the wide mouth, into the formation of which both maxillary and inter-maxillary bones enter; by the single dorsal fin, and by the absence of a second soft or *adipose* fin. Most of the C. possess numerous *pyloric cœca*, or appendages to the stomach. The ventral fins are abdominal in position (*Abdominalia*). The Air-Bladder (q.v.) communicates with the throat by a duct. Sometimes the belly is rendered serrate by the presence of irregular scales.

Clupesoc'idæ, a family of Teleostean fishes, included in the Malacopterous sub-order, and allied to the Herring family, and to the Pikes. The members of this group are both marine and fresh water in habits. None are found in British waters.

Clu'sia, a large genus of tropical American trees or shrubs, the type of the natural order *Clusiaceæ* or *Guttiferæ*, so named from Charles de l'Ecluse or Clusius, a famous botanist of the 16th c. *C. grandiflora*, with its large leaves, from 7 inches to a foot in length, and white flowers 5 or 6 inches in diameter, is one of the beautiful trees of the tropics. *C. insignis*, or wax-flower, is a Brazilian and Demerara species, whose flowers excrete a quantity of resin, which, when rubbed with the butter of the chocolate-nut, is used by the Brazilian women to alleviate pain. A similar resin, yielded by *C. alba*, *C. rosea*, and *C. flava*, of the W. Indies, is used by the Caribs for painting the bottom of their canoes. *C. Galactodendron* is one of the Palo de Vaca, or 'cow trees' of Venezuela and other portions of S. America, so called from the milky juice, which exudes from incisions made in the bark, being used as a substitute for milk. It is affirmed by the credulous that the 'milk' flows more fully just before the full of the moon; one tree will yield a quart in an hour. The milk is nourishing, though the use of it leaves a sensation of astringency on the lips and palate. *C. Duca* yields the duca resin of Colombia, which is burnt for the sake of its agreeable odour. Many of the species are epiphytes—*i.e.*, parasites on the stems of other trees. Altogether about thirty species are described.

Clusia'ceæ, or **Guttif'eræ,** a natural order of trees or shrubs belonging to the Dicotyledons (division *Thalamifloræ*), natives of the humid tropics of S. America. There are thirty-two genera, and about 150 species described. Most of the plants have acrid properties, and yield a yellow resin. Among the chief and common plants of the order are Gamboge (q.v.), Mangosteen fruit-tree, the American Mammee apple-tree, bitter or Weandee oil-tree, the butter-tree of Sierra Leone, &c.

Cluso'ne, a town in the province of Bergamo, N. Italy, near the Serio, 17 miles N.E. of Bergamo, has linen manufactures, and a trade in iron, copper, vitriol, corn, &c. C. is also the name of a small river of N. Italy, which joins the Po some 18 miles S. of Turin. Pop. 3985.

Clus'tered Col'umns, or **Compound Piers,** one of the richest features in Gothic ecclesiastical architecture, when the shafts or columns are attached to each other sometimes for their whole length, at other times only at the base and capital. C. C. are susceptible of very effective adornment, as with floriated fillets.

Clu'tha, or **Mol'yneux,** the largest river in New Zealand, issues from Lake Wanaka, in the province of Otago, in 44° 35′ S. lat., 169° 20′ E. long., and after a S.E. course of 200 miles, falls into the S. Pacific in 46° 18′ S. lat., 169° 38′ E. long. Its principal tributaries are the Kawarau (draining Lake Wakatipu), Manuherikia, and Pomahaka. The C. is a very deep and rapid river, and was computed by Balfour, colonial marine engineer, to discharge 1,690,000 cubic feet of water per minute.

Cluy'tia, a genus of Euphorbiaceous plants, natives of Africa, and found in great abundance at the Cape of Good Hope. *C. lanceolata* is said to be used in Abyssinia as a cure for dysentery in cattle.

Clwyd, a Celtic word found both in the Cymric and Gaelic tongues, and derived from an adjective meaning 'strong.' This adjective is seen in the names of several rivers in Scotland and Wales—*e.g.*, the 'Clyde' in Lanarkshire, and the 'Cluden' near Dumfries; the 'C,' 'Cloyd,' and 'Clydach,' in Wales, which were probably so named from the strength or rapidity of their current. By far the largest and most important is the Scottish river, the Clyde (q.v.). The only other requiring notice is the C. of N. Wales, which rises in the Bronbanog Hills, in the S.W. of Denbighshire, flows in a northerly direction past Ruthin, St. Asaph, and Rhyddlan, and falls into the Irish Sea between the shires of Denbigh and Flint, after a course of 30 miles.

Clyde, a river of Scotland, rises in an amphitheatre of the Lowther Hills, in the extreme S.E. angle of Lanarkshire, near the sources of the Tweed and the Annan. It has its origin in the Daer Water and several other mountain streams, of repute among anglers. After flowing N. for some 20 miles, and sweeping round the E. base of Tinto Hill, it has a sinuous course in a north-westerly direction through the picturesque Dale of C. or Clydesdale, till it expands into a broad estuary, and eventually into a firth of the same name. Its only considerable tributaries are the Douglas, Avon, Calder, and Leven, and the principal towns it passes are Glasgow, Lanark, Hamilton, Renfrew, Dumbarton, Helensburgh, Greenock, and Gourock. The Vale of C. is famous alike for its orchards, its coal and iron, and its horses. By far the most singular feature of the upper C. itself is its series of romantic falls near Lanark, where the bed of sandstone and shale has been ploughed into deep gorges and gloomy defiles, through which the river descends some 230 feet in less than 6 miles. The falls, which are beautifully flanked with savage cliffs and wooded slopes, are four in number—(1) Bonniton Linn, consisting of a single leap of 30 feet; (2) Corra Linn, the most magnificent of the four, having one cataract of 90 feet, and a total descent of 120; (3) Dundaff Linn, a miniature cascade of 10 feet; and (4) Stonebyres, forming three successive falls, like Corra Linn, of 70 feet. At Glasgow the C. becomes navigable for large vessels, and begins to assume the appearance of a great trading and shipbuilding river. Its estuary rapidly widens below Dumbarton, until between Greenock and Helensburgh it has a width of 4 miles; but the promontory of Roseneath here hinders its further extension, standing well out into the channel, and separating the Gare Loch from Loch Long, both arms of the estuary stretching in a northerly direction. After sending off Loch Long to the N. and Holy Loch to the W., the main stream turns abruptly S., opens into the Kyles of Bute, but continues along the coast of Renfrew and Ayr, until it merges in the Irish Channel at Ailsa Craig. Its length to Glasgow is 75 miles, and its further course is 48 to Cantire, where it is considered that the Firth of C. begins. The river has a basin of 1500 sq. miles. In 1859 a fort (Mathilda) was erected about a mile to the W. of Greenock for the defence of the C.

Clydesdale Horse, a breed which originally belonged to Lanarkshire and Ayrshire, but whose great strength, fine action, noble form, and substance have made it much appreciated in England, on the Continent, in America and Australia.

Clytæmnes'tra, according to Homer, a daughter of Tyndareus and Leda, and half-sister of Helen, became the wife of Agamemnon, to whom she bore Orestes, Iphigenia, and Electra. On Agamemnon's return from Troy she murdered him in the bath; a crime for which, seven years afterwards, her own son Orestes took her life.

Cnidos'colus, a genus of *Euphorbiaceæ*, consisting of shrubs or herbaceous plants belonging to Africa. *C. stimulans*—a native of the Southern States of America—on account of the lacerated segments of the leaves, which are covered with spreading hair, stinging the naked feet of the negroes, is well known as 'Tread Softly.' Its tuberous roots are eaten like those of cassava. *C. quinquelobus* stings even more terribly, and on this account is shunned as a cultivated plant. In some cases the persons so stung will fall down, and remain quite unconscious for some time. In every case an excruciating pain is experienced, which, according to Black, from whom we take this account, 'lasts for some days, and the parts swell, and sometimes continue swollen, accompanied by an itching sensation, for months.'

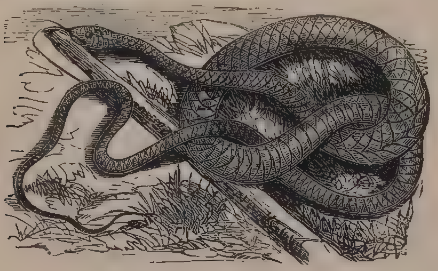
Cni'dus, or **Gni'dus,** anciently a city of Caria, Asia Minor, on the W. extremity of the peninsula of Triopion (now Cape Krio), which formed the S. side of the Ceramic Bay. A Lacedæmonian colony, and a member of the Dorian Hexapolis, it soon acquired wealth, and patronised art—one of its temples being adorned by the famous Venus of Praxiteles. The larger of its two ports was formed by transverse moles carried out into the sea, one of which is still almost entire. Eudoxus, the mathematician and friend of Plato, was a native of C.

Coach. The word is said by Taylor to be an English form of the Ger. *kutsche*, which itself comes from the Magyar *kotezy*, while that again has been formed from *Kottsee*, the name of a town in Hungary. The C. is a box-like carriage, with four wheels, mounted on springs or suspended on leathers. Carriages were employed by the ancients in travelling. The *carpentum* of the Romans was a richly decorated two-wheeled vehicle, covered with an awning, and chiefly used for the conveyance of Roman matrons in the days of the Republic, and during the Empire a four-wheeled carriage, called *carruca*, was invented; but there is no reason to suppose that either of these was suspended on leathers. Towards the end of the 13th c., the Queen of Charles of Anjou entered Naples in a *caretta*, a small highly adorned car; which, according to Beckman, is the first instance of the use of a C. in Europe. In the 16th c. coaches commonly appeared in European state ceremonies, particularly in Germany; and in 1588 they had become so general that the Duke of Brunswick forbade his vassels to use them, in so far as they discouraged the more manly and skilful exercise of horsemanship. The first coach made in England was built for the Earl of Rutland by Walter Quippen in 1555. In 1556 he built one for Queen Mary, and in 1564 a state-coach for Queen Elizabeth, which on account of its jolting she discarded for a Dutch coach imported for her in 1570. Within the next fifty years German coaches came into extensive use in England. Private coaches were not uncommon at the end of the 16th c., and at this period it appears that carriages were divided into two classes, coaches and *caroches*, the latter being larger and heavier, though considered more stately and more appropriate for court pageantry than the former, which were relegated to the country. Carriages were quite common throughout Europe generally in the two succeeding centuries. Hogarth has represented in his pictures the appearance of the sumptuously carved and gilt carriages of his time, and they certainly look ill-adapted for rapid motion, highly perched as the body is on slim supports between the two widely-separated pairs of wheels. An example of English coachmaking of the 17th c., still in a condition for use, exists in the 'Speaker's C.' It is made of elaborately carved oak with richly painted and gilt panels, and measures 14 feet from axle to axle, the total length being 19 feet. The royal state C. was constructed for the coronation of George III. in 1761. Its frame is composed of eight palm-trees whose branches support the roof, which is surmounted by a crown, borne by boys emblematical of the three kingdoms. Various figures support the body and the coachman's box, his footboard being a scallop-shell, and the whole structure is adorned with carved trophies, painted allegorical and mythological designs, &c. Its length is 24 feet, breadth 8½ feet, and height 12 feet.

Hackney Coaches first appeared in the streets of London in 1695. They do not derive their name from Hackney in London, as is commonly supposed, but from the French *haquenée*, a cob-horse, the vehicle to which the animal was harnessed being called *coche-à-haquenée*. The *hansom* was patented in 1834 by the inventor whose name was Hansom, but since then many improvements have been effected on the original design. About the same time a four-wheeled vehicle was introduced into London, and usurped the name *cab*, which previously belonged to the two-wheeled *cabriolet* imported from Paris about 1820. It is said that Lord Brougham was so fascinated with the general appearance of the 'cab,' that he ordered a better finished C. of the same shape, which has since borne his name, and become the national carriage of England. Carriage-building is carried to greater perfection in England than in any other country, and of the numerous varieties of pleasure carriages, the *brougham*, *landau*, and *barouche* need only be mentioned for their symmetry and elegant form, and combination of strength with lightness.

The chief kinds of wood employed in carriage-building are ash for framework of bodies, Honduras mahogany for panelling, and white pine for seat-boards and under-part of bodies; the wheel spokes are formed of sapling oak or hickory. Canadian black walnut wood has been found to be an excellent substitute for most of these woods. The painting of a carriage is a most tedious process, and the beautiful glossy colour is only acquired by a great number of successive coats of paint and varnish, each layer after drying being smoothed and polished before another is applied. See Thrupp's *History of Coaches*, and article CARRIAGE.

Coach-Whip Snake, so called on account of the whip-like appearance of its tail, the scales of which, both in arrangement and colour, very much resemble the thong of an ordinary whip. It occurs in Florida, S. Carolina, and Georgia, U.S. of America, and is said to be harmless to man, although when attacked it shows considerable courage and dexterity in defence. The head and body are long, narrow, and of black colour, while the tail is thin and of a tawny brown. The C.-W. S. measures from 5 to 7 feet in length, has great power of speed, and feeds on birds and the smaller vermin.



Coach-whip Snake.

Coadju'tor, a subordinate fellow-worker. In ecclesiastical law the word is specially applied to the assistant to a bishop.

Coagula'tion. There are many substances which exist in a soluble and insoluble condition. The act of passing from the soluble to the insoluble state is termed *C.* The spontaneous C. of the fibrine contained in blood—the clotting, as it is termed—the C. of albumen by heat, as in the case of the boiling of an egg, and of caseine by rennet in the manufacture of cheese, are familiar examples of this phenomenon.

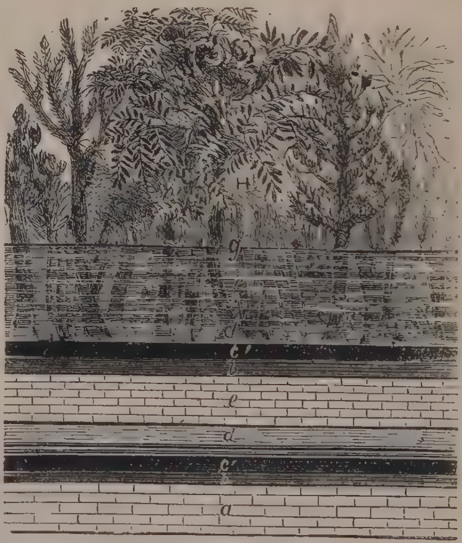
Coagulation of the Blood.—The change which occurs in blood usually after removing it from the body by which it separates into solid and fluid portions. See BLOOD.

Coa'ita, or **Qua'ta,** a species of Platyrhine, S. American monkeys, belonging to the genus *Ateles* (q.v.), or spider-monkeys. The C. measures about a foot long in the body, the tail itself, which is very elongated, measuring 2 feet. The face is dark coloured. This monkey is not to be confounded with the *Coaiti* (q.v.), or Coaiti-Moudi, a carnivorous mammal.

Coai'ti, a genus of Carnivorous mammalia, included in the Bear family, and belonging solely to the New World, being found in Surinam and Brazil. In this genus the molar teeth are small, and the canines compressed and sharp. The muzzle is very elongated, proboscis-like, and extremely mobile. The claws are long, and of curved, compressed shape, and the tail is also of considerable length. The red C., or C.-Moudi, has a fur of reddish-chestnut colour, the ears and legs being black, the tail banded with maroon colour, and the lower jaw white. It is fond of climbing trees. The brown C., or *Narica,* has a brown-coloured fur, which is sometimes mottled with black, and tinted with chestnut. The under parts are coloured grey. The fur is thick and coarse. The C. feed on both animal and vegetable matters, and although shy, may yet be domesticated with success.

Coaiti.

Coal (Old Eng. *col,* Dutch, *kool,* Fr. *koal,* Ger. *kohle,* a word found indeed in all the Teutonic languages, and having its congeners in Latin), is the name given to a substance which it is much easier to recognise than to define, and the question, What is C.? has at once baffled the law courts and scientific men to answer. Dr. Percy (*Fuel*) has thus attempted to distinguish it from all other bodies. 'C. is a solid, stratified, mineral, combustible substance, varying in colour from dark-brown to black, opaque, except in extremely thin slices, brittle, not fusible without decomposition, not sensibly soluble in ether, chloroform, benzole, or oil of turpentine, not containing sufficient earthy matter to render it incapable of being applied with advantage as a source of heat in ordinary fireplaces or in furnaces.' There is no doubt that C. is vegetable matter which has undergone great changes from the length of time it has been stored up within the earth, and the various influences to which it has there been subjected. A gradation in physical as well as chemical characteristics can be traced, leading from wood and peat at one extremity, up to anthracite, which is the ultimate



The Process of Coal Formation.

a, limestone; *b*, shale; *c' c'*, coal-beds formed; *d*, slate; *d''*, coal-bed in course of formation; *e*, sandstone; *f*, water; *g*, surface of water, and petroleum or hydrocarbon oils; *H*, foliage of coal plants rooted in *c'*.

product of these changes recognised as C. Liebig explains the chemical changes necessary to produce C. from wood or peat by the theory of the elimination of a compound of hydrogen and carbon as marsh gas, of carbon and oxygen as carbonic acid, and of hydrogen and oxygen in the form of water. As regards physical characteristics, certain varieties of peat are hard, black, and lustrous like C., and some lignites or brown coals retain so much woody appearance and structure that boxes have actually been made from them.

The varieties of C. are usually classified as—(1) Anthracite, (2) Bituminous C., and (3) Lignite or brown C.; but it is not possible to strictly limit any class, and each contains within itself many minor variations. Anthracite or stone-C. is usually of a brilliant black lustre; it has a conchoidal fracture, and it does not soil the fingers on handling. It is often called Blind C., on account of the difficulty with which it is ignited and burns. It includes such coals as contain the highest proportion of carbon, its range being from 90 to 95 per cent. Enormous deposits of anthracite exist in the eastern division of the great Pennsylvanian C.-field in the U.S. Bituminous C. includes the greater proportion of C. in common use, and nearly all the deposits in British C.-fields come under this head. It contains generally from about 73 to 90 per cent. of carbon, leaving out of account the ash or earthy matter always present in variable proportions. Several varieties of bituminous C. are distinguished according to their mode of burning, which depends chiefly on the relative proportions of carbon, oxygen, and hydrogen they contain. Steam-C. approaches anthracite in its properties; dry or non-caking C. does not possess the valuable property of agglutinating during burning which characterises caking or household C. and makes it so valuable for domestic use. Cannel or parrot C. differs considerably in appearance from ordinary bituminous C., being of a dull, lustreless, black colour, not splitting into thin layers, and generally devoid of vegetable structure under the microscope. Cannel-C. contains a comparatively large percentage of oxygen and hydrogen, and it is therefore of value for the manufacture of C.-gas or paraffin oil. It is only distinguished from the bituminous shales now extensively used for paraffin and gas by the much larger proportion of ash which the latter contain. Lignite or brown C. is a name generally restricted to such deposits as are of more recent origin than the carboniferous epoch to which the great C.-fields at present worked belong. Lignites vary in colour from a light earthy brown to a deep lustrous black, which last is undistinguishable from ordinary bituminous C., and they contain from 50 to 70 per cent. of carbon, leaving out of account the ash they contain. They also usually have a large percentage of water. Deposits of lignite of great industrial value occur in Germany, and some of them yield on distillation a very large proportion of paraffin. Taking 100 parts of carbon as a standard of comparison, the following may be regarded as showing the average composition of these leading varieties of C.:—

	Carbon.	Hydrogen.	Oxygen.
Anthracite .	100	2·84	1·74
Bituminous C. .	100	6·21	21·23
Lignite . .	100	8·37	42·42

Although the greater proportion of the C. in Europe and America belongs to the deposits of what is known as the carboniferous epoch, it must not be concluded that C. is on that account a product peculiar to that period. In Great Britain workable seams of C. are found in oolitic deposits at Brora in Sutherlandshire, and C. of a similar age is also found in Yorkshire, while at Bovey Tracey, in Devonshire, a lignite has been worked which belongs to a period so comparatively recent as the Miocene age. The brown C. deposits of N. Germany are not older than the Wealden of England, and the enormous C.-fields of India and China are supposed to have been formed during the Permian epoch.

C.-fields are very widely and generally distributed throughout the world, and the total quantity of C. known to exist within available depths is at present great beyond compute. The output of coal in several countries is given in the subjoined table, according to the latest returns. Some coal-producing countries, such as China, &c., are not included, as either the statistics given are not reliable or no statistics are forthcoming at all.

Year.	Country.	Output in Tons.	Value in £.
1893	Austria-Hungary .	21,610,233	6,759,882
"	Belgium . .	19,411,000	7,256,240
"	Canada . .	3,719,170	1,728,317
1891	France . . .	30,050,000	15,212,000
1893	Germany . .	95,476,200	—
"	Great Britain .	164,325,795	55,809,808
1892	India . . .	2,537,696	55,711
1893	Italy . . .	317,249	81,883

"	Queensland . .	264,403	125,340
"	Russia . . .	7,418,000	—
1892	Sweden . . .	199,380	—
"	United States .	160,088,295	42,608,881

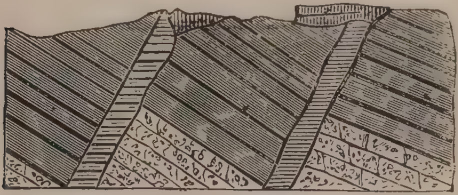
The extraordinary rapidity with which the annual output of C. from British mines has increased in recent times, led some years ago to a species of panic regarding the possible early exhaustion of our mineral wealth, and in consequence a Royal Commission was appointed to 'inquire into the several matters relating to C. in the United Kingdom.' As a result of the labours of that commission, we have the most accurate and reliable statistics attainable regarding the limits of the various British fields, their available contents, and the rate at which they are being worked out. We may perceive from the following statistics how the demand upon our C.-fields has increased, it being estimated that the consumption, at the beginning of the century, was about 10,000,000 tons:—

1855, 64,453,070 | 1865, 98,150,587 | 1873, 127,016,747
1893, 164,325,795

The whole available C. in ascertained C.-fields, according to the report of the commissioners in 1871, including only such as exists within 4000 feet of the surface, and seams of not less than one foot in thickness, amounted to 90,207 millions of tons. To this amount they added as existing under Permian and recent rocks, but still within the 4000 feet limit, 56,273 millions of tons as the probable contents of fields yet unexplored, making an aggregate attainable amount of C. of 146,480 millions of tons. Lying at a depth ranging from 4000 to 10,000 feet, in all the fields included in the above estimate, it is calculated there is an additional quantity of more than 48,465 millions of tons. But as the internal temperature of the earth increases at the rate of 1° Fahr. for

Coal Plants.

each 60 feet downwards from the surface, and as there is good reason to believe that it rises in much more rapid proportion as we penetrate inwards, it is not supposed to be possible, under any conditions at present known, to work at a depth of more than 4000 feet, while at the depth of 10,000 feet the heat must be much greater than that of boiling water, and the shaft of the pit reaching to that depth would be nearly 2 miles long. The total available deposit of workable C. is, after deductions, for the present 143,392 millions of tons, and of that amount Scotland possesses 9400 millions of tons, of which 1800 millions lie under the Firth of Forth. Ireland possesses only the insignificant total of 130 millions of tons, not as much as the output of the United Kingdom for one year. In judging of the possible exhaustion of British C.-fields, three methods of viewing the subject may be adopted. Judged by the annual output at which we have now arrived, it is easy to say we have C. which will furnish our present rate of supply for about eight hundred and seventy years. Taking the alarmist view of the rapid development of C.-mining during the past quarter of a century, and supposing the demand to continue progressive in the same ratio, we must, according to Price Williams and others, exhaust our C.-fields in 360 years. Neither of these views take into account the conditions under which the demand for C. has increased so rapidly, nor the probable future of the industry. 'On the one hand,' say the commissioners, 'the rate of consumption may be thrown back to any extent by adverse causes affecting our national prosperity, and on the other hand, new discoveries and developments in new directions may arise to produce a contrary effect upon the consumption of C.' They also point out that long before the period of total exhaustion a time of scarcity and dearness would be first reached; that naturally the best and most accessible seams are first exhausted, leaving only such as are more difficult to win, and of less value. Gradually thus we would lose the easy industrial supremacy we now possess through C., and instead of exporting, as we do at present, it would become cheaper to import C. from America or other fields than to work out the remnants of our own. Other considerations might be adduced pointing towards the improbability of the consumption of British C. continuing to increase at the rate of recent experience. Continental, Eastern, Australasian, and American fields are being rapidly opened up, and worked more in proportion to their size than hitherto; improved scientific processes and machinery are yearly extracting much larger proportions of calorific effect from C. than heretofore, and there is much less waste in the mining processes. The introduction of improved processes in metallurgy, such as the hot blast and the Bessemer process, has already been the means of effecting enormous economies, and in almost all directions involving the burning of C., great room for other like improvements yet exists.



Trap Dikes. English Coal Fields.

The industrial applications of C. do not end with its great value as a calorific agent. Distilled at a low temperature, it yields paraffin and paraffin oils used for illuminating and lubricating, and by applying a higher temperature, C.-gas is produced. The residual gas-tar and liquor of these processes are also of great value, being the sources of ammoniacal salts in the case of the liquor, while the tar yields aniline, whence the C.-tar dyes are produced, the disinfectant carbolic acid, pitch for artificial asphalt and other useful products.

For mining of C. and the regulations of C.-mines, &c., see under MINING.

Coal'brook Dale, a valley and hamlet in Shropshire, on the Severn, which is here crossed by a cast-iron bridge of more than 100 feet span, and 40 feet high. The dale has a valuable coal-field, the group of strata enclosing the beds having a thickness of from 700 to 800 feet, and also extensive ironworks. The inhabitants are mainly employed in the foundries and collieries. Pop. ecc. par. 1502.

Coal'fish, a Teleostean fish included in the Cod family, the fry or young of which are known as *Podleys*, whilst the adult form is also known by the name of *Saithe.* The length varies from 10 inches to 1 or 1½ feet; the upper parts are of a deep bluish-black colour; in shape and form it resembles the Whiting (q.v.) very closely. The flesh is coarse, but is eaten salted in the northern parts and islands of Scotland. The C. occurs also on the American coasts and in the N. seas. It is voracious in habits, following many kinds of bait.

Coalition is a term applied in English politics to the union of two parties or portions of parties for the attainment of a common end. A notable C. in British history is that of 1782, when Lord North and Charles James Fox, the leaders of opposing parties, took office in the same cabinet. More recently (1853) the C. of the Whigs and Peelites in the Aberdeen cabinet is memorable in connection with the Crimean war. The C. of the Conservatives and Liberal Unionists in 1895 took place in opposition to the policy of the Separatist Liberals under Lord Rosebery and Sir W. V. Harcourt, who advocated the construction of an Irish Parliament at Dublin whose business should be to legislate for Ireland in matters, purely Irish and not Imperial, while the Irish representation should still be continued in the Imperial Parliament. This question had remained entirely outside the range of practical politics until Mr. Gladstone in 1886 adopted that Home Rule scheme which was understood to meet with the approval of the Irish National party.

Coal-Mines, Law as to. A coal-mine is legally part of the lands within which it is situated, but it may form a separate estate. A proprietor may sell the surface of the land, reserving the coal and other minerals, or he may sell the latter and reserve the former.

Coal-Mines Regulation Act, 50 and 51 Vict. c. 58, which re-enacted and amended the Act of 1872, was passed to carry out proper regulation and inspection of mines.

Under the Act, no boy or girl under twelve years old can be employed under, or above, ground, and no woman or girl of any age, is to be employed in any mine to which the Act applies below ground. Boys of 12 and upwards may not work below ground more than 54 hours per week. A register must be kept of the boys, girls, and women employed. Wages are not to be paid at public-houses. Single shafts are prohibited. A daily inspection by a competent person of every mine is directed, and a great number of regulations are made with the view of promoting healthfulness and safety in the coal-mines. Mines of shale, fire-clay, and stratified ironstone also come under this Act.

Coam'ings of ships are frames of wood or iron placed round hatchways and other openings in the deck to keep out water.

Coan'za, Cuan'za, or **Quan'za,** after the Congo (q.v.) the most important river of Lower Guinea, Africa, rises in the plateau of the interior, and, after a course of 600 miles marked by numerous cataracts, enters the sea 38 miles S. of San Paulo de Loando. It forms several islands near its mouth, has numerous tributaries, and is navigable for large boats as far up as the lowest cataract, about 110 miles.

Coast-Guard, a body of seamen formerly employed by customs department exclusively to keep a look-out for smugglers, but since 1856 under the control of the Admiralty, and liable to be called to serve as regular sailors on board ships of war. The force may be augmented to the number of 10,000 at the utmost, but the number for 1894-5 was 4200.

The coasts of the United Kingdom are divided into eleven districts: Hull, Harwich, Newhaven (East and West), Weymouth (East and West), Holyhead, Leith and Clyde, Limerick, and Kingston (2), at each of which there is a district gunship stationed, while there are also 9 steam cruisers and 16 sailing cruisers attached to nine of the districts. Able-bodied seamen employed in the service are divided into three classes—boatmen, commissioned boatmen, and chief-boatmen; they receive high sea-pay, free house rent, and medical attendance, and 1s. 4d. a day besides in place of provisions. They are drilled in the serving of land-batteries, gunboat exercise, and naval gunnery. The pay of the C.-G. is estimated, for 1894-5, at £208,941, and contingencies at £54,623, showing an increase of £290.

Coast Volunteers, or **Royal Naval Artillery Volunteers,** an attempt, which has not been very successful, to organise seafaring men and others, in connection with the Coast-Guard (q.v.), but separate from it, specially for the defence of the coasts of the United Kingdom. On 5th August, 1873, an Act of Parliament was passed authorising the formation of a Royal Naval Volunteer Force, and the regiment of Royal Naval Artillery Volunteers was duly formed, and 126 officers were appointed to command the men. The regiment was, however, disbanded on 1st April, 1892.

Coast'ing Trade is the maritime commerce between ports of the same country. Formerly, by statute 12 and 13 Vict. c. 29, entitled 'an Act to amend the laws in force for the encouragement of *British* shipping and navigation,' no goods or passengers could be lawfully carried coastwise from one part of the United Kingdom or Channel Islands to another except in British ships. The same restriction existed in reference to the coasting trade in any of our possessions in Asia, Africa, or America. But by statute 17 and 18 Vict. c. 5, the restrictions were repealed and *Foreign ships* in the coasting trade were placed on the same footing as *British* ships and made subject to the same regulations. The Queen was also granted retaliatory powers, as in the statute of the preceding year (c. 107). Statute 18 and 19 Vict. c. 96 specially directed that *Foreign* ships engaged in the coasting trade around the United Kingdom and the Channel Islands should be subject to the same regulations as to stores for the use of the crew and in all other respects as British ships.

Coatbridge', a town in the parish of Old Monkland, Lanarkshire, 8 miles E. of Glasgow. It stands in the centre of a district rich in minerals, and is near the great ironworks of Gartsherrie, Summerlee, Dundyvan, Calder, and Langloan. In the immediate neighbourhood are upwards of fifty smelting furnaces. C. is one of the most thriving towns in Scotland, the population having increased from 1599 in 1841, to 13,624 in 1871. The pop. of mun. bor. is now 16,328.

Coat of Arms, a garment worn in the knightly exercises and actual battles of the Middle Ages, embroidered with the armorial insignia of the wearer. It was made of velvet, fur, cloth of silver or of gold, and descended to the knee. The phrase is applied in modern heraldry to the insignia alone, on whatever field they are emblazoned. See HERALDRY, SHIELD.

Coat of Mail, a suit of armour made of plates or scales of metal, or of linked rings, which was worn in the Middle Ages.

Co'balt is a steel-grey metal, occurring in small quantities in the free state in Meteoric Iron (q.v.), in combination with arsenic as *tin-white C.*, with arsenic and sulphur as *C. glance*, and with arsenic and oxygen as *C. bloom;* it is also present in many copper ores. Before the discovery by Scheurer, in 1540, of the beautiful blue colour which oxide of C. imparts to glass when fused with it, compounds of the metal possessed no value, and their presence in the mines was attributed by the superstitious German miners to a malevolent demon, or *kobold*, who was supposed to have placed them there instead of the useful ores which they resemble in appearance; it is from this curious superstition that C. derives its name. Metallic C. was isolated by Brand in 1773. It may be obtained by strongly igniting oxalate of C. It is hard, very infusible, and magnetic, and in its chemical properties and compounds resembles iron. Its atomic weight is 59, and the symbol for its atom Co. Chloride of C. is a red salt, obtained by dissolving oxide of C. in hydrochloric acid; its solution is employed as a *Sympathetic Ink* (q.v.); nitrate of C. is prepared in a similar manner. C. has two oxides, the protoxide and the sesqui-oxide; the latter is used for staining glass and porcelain, and is obtained as a black powder by precipitating chloride of C. by a solution of bleaching powder. When C. ores, which have been previously roasted, are fused with sand and pearl ash, the oxide of C. produced by roasting the ore dissolves in the glass formed by the pearl ash and sand, with a magnificent blue colour, whilst nickel, copper, iron, &c., also present in the ore, collect at the bottom of the vessel in which the fusion has been made in a metallic mass called *speiss*. The blue glass when finely levigated forms *smalt* or *C. ultramarine*, whilst from the speiss, nickel is extracted. *Zaffre* is an impure oxide of C., obtained by roasting C. ores with sand. *Thenard's blue* is prepared by igniting a mixture of freshly-precipitated alumina and carbonate of C., or of the phosphate of alumina and C. *Rinman's green* is obtained by evaporating a mixed solution of nitrate of C. and nitrate of zinc to dryness, and calcining the residue.

Coban', a town of Guatemala, Central America, on the Rio Dolce, 55 miles N. of Guatemala. It lies in a region rich in sugar-cane plantations and in tropical fruits. Pop. 27,820.

Cobbett, William, an English political writer, born 9th March, 1762, at Farnham, in Surrey, was bred to work on his father's farm. In 1783 he enlisted in the 54th Foot and went to Nova Scotia; while there he taught himself constantly, and rose to the rank of sergeant-major. Discharged in 1791, C., after spending a few months in Paris, settled in Philadelphia as bookseller and pamphleteer. He wrote in the bitterest manner against freethought, free institutions, &c., and was twice fined for libel. His *nom de plume* was Peter Porcupine: latterly his publication became periodical, and was called the *Political Censor*. Returning to London in 1800, where he was received with considerable attention by public men of Pitt's party, he started first a daily paper called the *Porcupine*, and then the *Weekly Register*. His influence may be inferred from the fact that Windham stated in the House of Commons that C. deserved a statue of gold. By his discussion of the treaty of Amiens he contributed to the rupture with France. In 1803 he suddenly went over to the Radical side of politics, either because he was slighted by Pitt or from conviction. This led to more than one Tory prosecution followed by fine and imprisonment. In 1817 his *Twopenny Tract* alarmed the Government into passing the 'Six Acts,' and C. retired for two years to America, where he studied agriculture, and drew certain conclusions on 'cottage and farm economy,' which, on his return to England, he tried unsuccessfully to realise on two farms. In 1825 appeared his *History of the Reformation in England and Ireland*, which, with his *Legacy to Parsons*, expresses his opinion that the transactions in Church property at the Reformation were fraudulent, and that the original Catholic endowments should be restored to educational and charitable objects. C. was now a popular leader on social and economic, as well as political, questions, as may be seen in his *Advice to Young Men and Women, Poor Man's Friend, Rural Rides, Emigrant's Guide*. As the Reform Bill drew near, the political interest became predominant. C. was once more prosecuted for some intemperate language, in which, in the *Register*, he had defended the burning of threshing-machines by the distressed labourers (Luddites) as leading to the reduction of tithes. Returned to the House of Commons for Oldham in 1832, he sat there for three years. He died at his farm of Ash, near Farnham, 18th June, 1835. The rugged independence and energy of C.'s character was somewhat marred by an inordinate vanity, which led him to regard himself as one of the leading men in Europe of his time, and by the superficial knowledge of social and political institutions, which is so often the bane of self-educated men. He is acknowledged to be a master of plain, forcible prose; and the warmth of his public and private affections and his substantial honesty have not been seriously questioned. C. is seen at his worst in his conceited *History of George IV.* See an admirable essay by Professor Thorold Rogers. His son, **John Morgan C.,** published a complete collection of his *Political Works.*

Cobden, Richard, an English politician, born at Dunford, near Midhurst, 3rd June, 1804, was the son of a small gentleman farmer. In 1838 he abandoned his career as a calico-printer in Manchester (which had been rapidly successful) that he might devote himself and his fortune to the Anti-Corn Law agitation. He seconded J. B. Smith's celebrated motion before the Manchester Chamber of Commerce, and for nearly six years attended the Inner Council of the League, which met twice a day at Newall's Buildings, Market Street, Manchester. It was C. who gained over many of the Chartists and the clergy, and who founded the Anti-Corn-Law Conference, which sat in the Palace Yard to watch the Free-trade motions in Parliament. At Drury Lane and Covent Garden, and at the great centres of Protectionism through the country, C. and Bright, during the memorable year of 1843, seemed to carry everything before them, until the *Times* itself declared (18th November) that the 'League was a great fact.' In the meantime C. had been, in August, 1841, returned to Parliament for Stockport, and took part in the debates on Villiers' annual motion, 'that all duties payable on the importation of corn, grain, meal, and flour do now cease.' In 1844 he brought his motion for a select committee to inquire into the effects of protective duties on imports in the interest of the tenant farmers and farm labourers of the country. He was replied to by Gladstone. After the triumph of his principles in 1846 (a triumph which Sir R. Peel stated in Parliament to be mainly due to C.'s efforts), he was returned unopposed for the W. Riding of York, which he represented till 1857, when he was rejected by his constituency for having offered what was considered at the time a factious opposition to Lord Palmerston. In 1859 C. was chosen by Rochdale. In 1860 he carried through the Commercial Treaty with France, was offered a baronetcy and a seat in the Privy Council, but declined these honours; soon after fell into bad health, and withdrew from political life. He died 2nd April, 1865. C. was an ardent advocate of free trade in land, viz., the abolition of primogeniture, strict settlements, &c.; of financial reform, in which he included the substitution of direct for indirect taxation, and the consequent throwing open of all ports; of reduction in the votes for the services, as involved in his principle of non-intervention; of national, in the sense of undenominational, education. He spoke against the confiscation of the unarmed vessels belonging to subjects of a hostile belligerent, and against the practice of public loans being negotiated without inquiry for purposes of tyranny and oppression. Although there was no rhetorical art or epigram in C.'s speeches, they were marked by unaffected grace and simplicity, by keen logic, and by an abundance of well-chosen and accurately stated facts. His *Political Writings* were published in 2 vols.

Cobi'ja, or **Puerta la Mar,** the only seaport of Bolivia, and capital of the province of Atacama, 300 miles N. of Copiapo, has an insignificant trade. Pop. 2590.

Cob'le, or **Cobb'le,** a low, flat boat, with the stern square. It is much used by salmon-fishers.

Coblenz, or **Koblenz'** (the Roman *Confluentes*), the capital of Rheinland, Prussia, situated on the Rhine, at its confluence with the Moselle, is a fortified city of the first rank. It is connected, for purposes of defence, with the strongly fortified castle of Ehrenbreitstein (q.v.), on the opposite bank of the Rhine. The old town is irregularly built, with many of its streets narrow and ill-kept, but the new town is well built, and its streets airy and clean. The Church of St. Castor, founded early in the 9th c., stands on a tongue of land jutting out between the Rhine and the Moselle; other public buildings are the Government-house, the town-hall, the king's palace, and the old castle of the Electors of Treves. There are manufactures of linen, cotton, furniture, and japanware. Vine culture engages the industry of many of the inhabitants. C. is a free port, and carries on an extensive commerce, especially in corn, wine, and iron; it has also a trade in volcanic products for millstones and mineral waters. Pop. 36,250

Cob-Nut, a large cultivated variety of the Hazel (q.v.). The Jamaica C., or Hog-nut, is a tree of the natural order *Euphorbiaceæ.* Its white juice, which turns black in drying, is used in Guiana and other countries as ink. The nut is wholesome if the embryo is extracted; otherwise it is cathartic.

Cob'ra, a genus of Colubrine snakes belonging to the section *Venenosa*, and included in the family *Elapidæ.* The distinguishing features of the whole genus are the possession of one or two smooth teeth behind the poison fangs, and the power of distending the loose skin at the sides of the neck, so as to form a kind of movable hood. The Portuguese name of the C. (*C. da capello*) means 'hooded snake.' This snake is one of the most deadly and venomous of known serpents. It inhabits India, and receives the name of 'spectacle snake' from the spectacle-like mark which exists on the back of the neck—a mark wanting in the nearly-allied *Naja Haje* of Egypt. The C. attains a length of 3 or 4 feet, and is coloured of a pale brown on the upper parts, and a lighter tint below; whilst the colour is variously marked with black, and exhibits variations. Specimens destitute of the spectacle-mark come from the E. Indies. The poison proves fatal to man within a comparatively short period.

Cobra di Capello.

Co'burg, or **Koburg,** capital of the Duchy of Saxe-Coburg, Germany, and alternating with Gotha as the residence of the Grand Duke of Saxe-Coburg-Gotha, is situated on the left bank of the Itz. The town is mostly old, and not well-built. Of its churches, the most notable is the *Moritzkirche*, with a tower nearly 340 feet high. The old castle of the Dukes of C., in which Luther was concealed in 1530, stands on a height 500 feet above the town. The ducal palace was erected in 1549, and is the principal building. There is a library containing 13,000 volumes. C. has manufactures of cotton, linen, and woollen fabrics, artistic work in marquetry, gold, and silver, also bleaching and dye works, breweries, &c. Pop. 18,600. Near C. are the 'pleasure-castles' of Rosenau and Kallenberg.

Coburg Peninsula, in the N. of Australia, forms the N.W. extremity of Arnhem Land, to the W. of the Gulf of Carpentaria, and partly encloses Van Diemen Gulf. It is an irregular promontory, about 50 miles from E. to W., but slightly connected with the mainland, and separated from Melville Island by the narrow channel of the Dundas Strait.

Co'ca, or **Cu'ca,** a shrub of the natural order *Erythroxylaceæ*, the leaves of which are extensively chewed by miners and travellers in Peru, mixed with a little unslaked lime or the ashes of the Quinoa (q.v.) or of the trumpet-tree. They have an effect on the constitution analogous to that of wine, enabling those using them to bear up under great fatigue and hunger. Respiration, so difficult at high altitudes, no longer becomes a labour; the desire for sleep departs, and the spirits attain buoyancy unknown before. Taken habitually and in large quantities, C. occasions various stomachic disorders, and eventually ruins mind and body. Used to a great extent with tobacco, it produces a sort of intoxication. Such, at least, is the account given by the native Indians who have long been acquainted with its use, and by Spruce, Tschudi, Scherzer, and other travellers. Weddell does not, however, think so highly of it, affirming that it does not supply the place of food, but merely deadens the sense of hunger for a time. Its use is now rapidly spreading, not only among the Indians, but among the Europeans and other settlers in Peru. Some years ago it was calculated that 30,000,000 lbs. were annually gathered, and that the use of the drug was indulged in by 10,000,000 people. In Bolivia alone about 15,000,000 lbs. are produced annually. It is probable that C. owes its peculiar properties to an organic base, to which Weddell has applied the name of *cocaine*, which in many of its properties resembles *theine*. A tonic wine has been made from it, and this, as well as the leaves, may probably yet be used as a medicinal agent.

Coca.

Cocce'ji, Heinrich, Freiherr von, a very able and learned jurist, was born at Bremen, 25th March, 1644, went to Leyden to study law in 1667, and to England in 1670. Having acquired a profound acquaintance with the subject in all its branches, he was appointed Professor of the Law of Nations at Heidelberg in 1672, of Jurisprudence at Utrecht in 1688, and regular Professor of Law at Frankfurt on the Oder in 1690. C. was sent on a mission to the Hague by Friedrich I. in 1712, and after his return was created a baron of the empire and a privy councillor. He died 18th August, 1719. His chief work is his *Juris Publici Prudentia* (Frankf. 1695), which was long used as a text-book in German universities. Other productions of C. are *Anatomia Juris Gentium* (Frankf. 1718), and *Grotius illustratus* (3 vols. Bresl. 1744-48).—His son **Samuel,** born 1679, succeeded him as professor (1703), but devoting himself to a public career, rose to the highest legal position, dying (22nd October, 1755) High Chancellor of the Prussian state. He was the great reformer of the administration of justice in Prussia. His great professional work is the *Corpus Juris Fridericianum* (Berl. 1749-52).

Cocce'jus, Johann, whose original name was Koch, born at Bremen, 9th August, 1603, was first appointed Professor of Hebrew at Bremen (1629), then at Franeker (1636), afterwards Professor of Theology in the same place (1643), and finally Professor of Theology at Leyden (1650), where he died, 5th November, 1669. He established a peculiar theological system called the *federal* method, founded on the idea of a covenant between God and man, which again was twofold—the covenant before the fall (of works), and the covenant after the fall (of grace); the latter embracing a threefold economy—prior to the law, under the law, and of the gospel; and also a school of biblical interpretation, according to which the Old Testament history exhibited, as in a mirror, the history of Christ and of the Christian Church, and which carried on a great controversy in the Netherlands during the 17th c. with the opposite school of Grotius (q.v.). See Conybeare's *Bampton Lectures* (1824).

Coccin'ia, a climbing cucurbitaceous shrub, common in the hedges in India, the ripe fruits of which are used by the natives in their curries, and the leaves and other portions are also used medicinally.

Cocc'o, Co'coa Root, or **Eddoes,** a name applied to various species of *Colocasia* and *Caladium*, tropical and subtropical, closely allied genera of plants belonging to the natural order *Araceæ*, the underground root, or Corms (q.v.), of which are used as food, *e.g. C. antiquorum*, *C. esculenta*, *C. macrorhiza* (the Taro of the South Sea Islands—q.v.), *C. Himalensis*—the root of which, in addition to its nutritive properties, is, when fresh, stimulant, diaphoretic, and expectorant. The leaves of *C. antiquorum* when raw are acrid, but by boiling they lose their acridity, and are eaten as a substitute for spinach. The corms of *C. esculenta* are sometimes called Yams (q.v.) in the W. Indies, Madeira, &c. Lecoq has described curious spasmodic movements in its leaves, occurring spontaneously, at irregular intervals, and at different periods of the day and night. The quivering was sometimes of sufficient force to ring little bells attached to the leaves. Lecoq states that *C. esculenta* is quite destitute of Stomata (q.v.), and he attributes the phenomenon to the incessant pulsation of the imprisoned sap.

Coccosteus (Gr. 'berry-boned'), a genus of extinct *Ganoid* fishes, included in the sub-order *Ostracostei*, and having the head defended by a large ganoid shield, the plates of which were covered with small tubercles; the presence of these latter giving origin to the name 'berry-bone.' A ventral or sternal shield also existed, but this latter had probably no connection with the upper one. A lower jaw or mandible existed, and this carried teeth of small size. The Notochord (q.v.) was persistent, but the neural spines of the vertebræ, their hæmal spines, and the fin-rays were ossified. This genus of fishes is exclusively confined in Britain to the Devonian rocks. Barrande has, however, described one from the Silurian rocks of Bohemia.

Cocc'ulus, a genus of plants of the natural order *Menispermaceæ*. A decoction of the roots of *C. villosus*, an Indian species, is used in cases of rheumatism, &c., and the fruits supply a kind of vegetable ink.

Cocculus.

Cocculus Indicus, the fruit of the Anamirta Cocculus, a plant belonging to the natural order *Menispermaceæ*, a native of the E. Indies. The pericarp contains an alkaloid (*Menispermint*) which is not poisonous. The seeds are very poisonous, of the size of a large pea, and are very bitter. They owe their bitter and poisonous properties to Picrotoxin, a white, intensely bitter substance, crystallising in needles. C. I. has been used to give bitterness to beer, porter, and ale, but it is forbidden by law under very heavy penalties. It is sometimes used to destroy lice. In some countries it is employed to stupify fish, so as to render them easily caught.

Cocc'us, a genus of *Hemipterous* insects, belonging to the sub-order Hemoptera, and forming the type of a tribe named *Coccina*. From members of this genus the Cochineal (q.v.) and Kermes dyes are obtained. Many species infest our hot-houses under the general name of bugs, and do harm to our plants; but it is to the tropical members of the group that we owe our dyes and other commercial products—such as lac, wax, &c. They are all minute insects, the males being two-winged, and the females wingless, but possessing a rostrum or beaked process. The females infest plants, and suck nutriment from them by means of the rostrum. The abdomens of the males are usually provided with two elongated filaments. The *C. aceris* is a well-known British species. *C. cacti*, living in the Nopal or *Cactus opuntia* of Central America, furnishes Mexican cochineal. *C. lacca*, of the E. Indies, gives us lac. The females alone appear to yield the colouring matter. See COCHINEAL INSECT.

Coc'cyx is the the inferior or posterior terminal portion of the vertebral column. In man it consists commonly of four rudimentary vertebræ, sometimes of five, rarely of three. These unite together, and in advanced life the C. unites with the sacrum. See SKELETON and VERTEBRAL COLUMN.

Cochabam'ba, the second largest city of Bolivia, and capital of a department of the same name, on the Rio de la Rocha, is the see of a bishop, and has fifteen churches, manufactures of cottons, woollens, leather, saddles, starch, soap, &c., and an active trade in grain and fruits. Pop. 26,300. C. was founded in 1572, and played a conspicuous part in the Revolution of 1815.—The *department of C.* is rich in precious metals, and grows cotton, sugar, dyewoods, &c. Area 21,417 sq. miles; pop. 361,390.

Cochin (*Kochi-bandar*, 'small port,' or *Kochi*, 'a morass'), a native feudatory State in S. India, called after its former capital, which is now included within the Madras District of Malabar: area, 1362 sq. miles; pop. 722,906, of whom 501,544 are Hindus, 43,389 are Mohammedans, 173,831 are Christians, and 1142 are Jews. It lies between the Western Ghâts and the Arabian Sea, consisting for the most part of a strip of lowland, deeply intersected by a chain of lagoons. The staple crop is rice, and the soil is so fertile that three harvests are often taken off the same field. Oilseeds, cotton, indigo, sugarcane, tobacco, and ginger are also grown. The bordering hills of the Nelleampatti range yield coffee, cardamoms, and pepper. The coconut palm flourishes everywhere along the coast-line. Its many products—coir, oil, coprah, and nuts—supply the chief exports. Timber, such as teak, blackwood, and poon, is one of the most valuable products; the quality of the teak wood being excellent for shipbuilding purposes. The chief industries are salt evaporation, carving of ivory and sandalwood, and ornamental metal works. The majority of the Christians, who are mostly engaged in boating and fishing, belong to the Roman branch of the Syrian Church, established here in 1659; but there are also several congregations of Jacobite and Nestorian Christians of unknown antiquity. The Jews live in a suburb of C. town and are divided into two separate communities—the *white* Jews, as fair as Europeans; the *black* Jews, who are as dark as the native Hindus. They have a tradition that they are descended from certain fugitives from Jerusalem, when the city was destroyed by the Romans. They are unable to account for the difference of the colour of their skins, but it seems impossible to attribute it to intermixture of race, as the Jews are proverbially strict on that point. The capital is Ernakollam (pop. 7283), but the residence of the Rajah is at Tripunthora. The Portuguese first landed at the town of C. under Admiral Cabral, and here Vasco da Gama died in 1524. In 1662 the Portuguese were driven out by the Dutch, who, 100 years later, lost it to Travancore, from whose power it passed to Haidar Ali. In 1799 the British conquered Mysore and regularly took over C. The first treaty with the native Rajah dates from 1798. The *town* of C., situated on the left bank of the principal navigable backwater, has a population of 17,601, of whom 4716 are Hindus, 3090 are Mohammedans, 9768 are Christians, and 27 are Jews. It is a most interesting place, with colonies of many distinct creeds and races. Inscriptions prove that both Syrian Christians and Jews were settled here in the 8th century. The spacious, unadorned Church of St. Francis, with monuments dated 1546, is supposed to be the oldest European church in India. The Portuguese fort has entirely disappeared, but there are many quaint buildings of the Dutch period. The exports are chiefly coconut products, timber, coffee, pepper, and tobacco. A very large percentage of the Cochinese suffer from *Cochin leg*, already referred to in a previous article. See BARBADOS LEG.

Co'chin-Chi'na, the **Anamese' Empire,** occupies a long and narrow strip of territory on the E. coast of the Indo-Chinese Peninsula, and consists of the inland province of Anam, and the maritime provinces of Tonquin in the N. and C.-C. in the S. It is bounded on the N. by China, on the E. and S. by the Gulf of Tonquin, the China Sea, and Lower or French C.-C., and on the W. by Siam. Area, 27,020 sq. miles; pop. estimated at 4,600,000. A mountain range runs N. and S., separating the inland from the two maritime provinces. Spurs from this central chain occupy much of the area of Anam and C.-C., and numerous streams descending from it flow E. through the latter into the China Sea. Anam is watered by the Mekong. The province of Tonquin is flat, and is watered by the great and valuable river Song-koi, which, rising among the mountains of Yunnan, passes through rich alluvial plains in its lower course, and falls into the Gulf of Tonquin. The inhabitants are Mongols, Chinese, and Malays, engaged chiefly in the cultivation of rice, which is the principal article of food, and in working the tin and other valuable mines. The religion is Buddhism, the form of government is modelled upon that of China, and the capital is Hué, on a river of the same name in the province of C.-C.

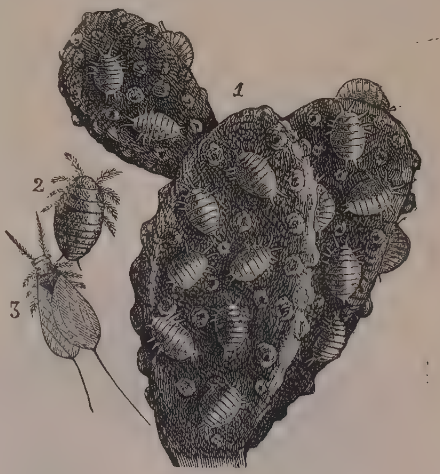
History.—The early history of Anam, by which name the empire is always spoken of by the natives, has been said to be 'either a wild fable or a revolting recital of internal war, anarchy, and bloodshed.' Little is known about it with certainty until 1624, when the Christian religion was introduced into the country by Portuguese Jesuits from Macao. In 1778 Warren Hastings, Governor-General of India, despatched a mission to Anam with the view of establishing commercial relations with the empire. A frightful civil war was then raging throughout the country. The envoy was inhospitably received, and was at last counselled to take refuge on his ship in the harbour of Hué, whence with difficulty he escaped with his life. A few years afterwards the French attempted with greater success to establish relations with Anam. A Franciscan friar, usually designated Bishop of Adrian, but whose real name was Pigneaux de Behaine, and who was of French birth, while prosecuting a Christian mission in the country, became intimate with the reigning sovereign, had an opportunity of affording him signal services which led to the extension of his sovereignty in Tonquin and Cambodja, and thus obtained an ascendency over his mind. The result was the ratification of an offensive and defensive alliance between the Anamese sovereign and Louis XVI. of France in 1787, or immediately thereafter. This treaty, however, led to no results till 1884, when the whole of Cochin-China, including Tonquin, was taken under the protectorate of France.

Cochin-China, Lower or **French** (*Basse Cochin-Chine*), a French colony in the extreme S. of the Indo-Chinese Peninsula, consisting of tracts of land on both sides of the lower course of the Mekong or Cambodja, bounded on the N.E. by C.-C., on the N.W. by the kingdom of Cambodja, and on the S. by the China Sea. Area, 23,082 sq. miles; pop. 2,034,453, most of whom are Anamites—the remainder being Cambodians, Chinese, Malays, &c. There are about 3050 French. The colony consists of the four provinces of Saigon, Mytho, Vinhlong, and Bassac. In the extreme N. and N.E. (the province of Bassac), the land is covered by spurs of the mountain range that runs N. through the Anamese empire, and by elevated uplands. This hilly district is productive in indigo, tobacco, cotton, sesamum, hemp, vegetables, earth-nuts, sugar-cane, betel, maize, mulberry-trees,

&c. Forests of valuable timber trees also occur. In the other provinces of the colony the surface is flat, the soil alluvial and rich, and covered by an intricate and widely extended network of rivers and *arroyos*, or channels scooped out partly by nature and partly by human labour. The chief river is the Mekong or Cambodja, 'which,' says Louis de Carné, 'will bear comparison with the noblest rivers of Asia.' It divides itself into three great branches in its passage through the inland districts, and these are again subdivided into many minor branches, forming a delta 40 miles wide by 60 miles. Other important streams are the Donnai and the river of Saigon. All the greater rivers are navigable for vessels of considerable draught, though the sandbars at their entrances, over which the water is seldom more than from 9 to 12 feet deep, are an obstacle to navigation. A vast tract of the area of the colony is in rice-fields, and rice is the chief product of the country. In 1893 the amount of rice exported from C.-C. was 695,515 tons, or more than double that exported in 1873. China, Singapore, and Europe received the greater part of it. Silk, cotton, hides, pepper, fish, and copra were also exported. The only great seaport, and the centre of commerce of the colony, is Saigon (q.v.). The climate is not considered healthy for Europeans. The rainy season, that of the S.W. monsoon, lasts from May to October, during which the temperature ranges from 68° to 86° Fahr. The hottest weather occurs in the months of February and March. The administration of government is in the hands of a governor and council, and the colony is represented by one deputy. There are now over 50 miles of railway and nearly 2000 miles of telegraph. The imports are estimated at £1,421,865 and the exports at £3,228,274.

History.—The connection between France and the Cochin-Chinese empire dates from the latter part of the 18th c., when, in 1787, the King of Anam, in return for services performed, engaged himself by treaty to cede the town and harbour of Touran or Kwang-han, with the territory belonging to it, to Louis XVI. The King failed to carry out his treaty by the stipulated transfer of territory, but he yielded so far as to treat the French representatives with respect, and he extended protection to the French missionaries. In the succeeding reign the Christians suffered severe persecution at the instigation of the King, and many of the French missionaries were murdered. Under Tien-fri, who ascended the throne in 1841, the persecutions of the Christians were recommenced, until, in 1847, Captain Rigault di Genouilly arrived on the shores with a demand for the fulfilment of the treaty of 1787. His demand being refused, he fired into and destroyed five Cochin-Chinese junks. The relations of the two powers remained, however, unaltered — the Anamese persecuting, the French protesting—till 1857, when the Anamese King, Tu-duc, fiercely assailed the Christians, and, among others, murdered a Spanish prelate. An alliance of France and Spain against Tu-duc was the result, and on the 30th August, 1858, a squadron of French and Spanish ships appeared before Touran, summoned the forts to surrender within a given time, and receiving no answer, fired and took possession of the town and forts on the following day. The town and surrounding territory of Saigon were taken by the French in 1859, Mytho in 1861, Vinhlong in 1862, and Bassac in 1893. By treaty, 1862, the King of Anam engaged to pay France an indemnity of 1,000,000 sterling, to cede to that power the provinces then known as Lower C.-C., and to guarantee toleration in religion and commerce. Having acquired these three provinces, the first care of the French governor of the new colony was to secure the peace of the frontiers. To attain this end was a matter of no small difficulty. The little kingdom of Cambodja, on the N.W. of the colony, had for years been ravaged by Siam on the W. and C.-C. or Anam on the E. It was evident to the French authorities that tranquillity was only to be secured by protecting Cambodja against her rapacious neighbours, and thus guaranteeing her independence. Accordingly, Rear-Admiral de la Grandière was despatched to the Viceroy of Cambodja (then under suzerainty to Siam), to inform that ruler that henceforth he was to consider himself a tributary to France, and a treaty giving validity to this arrangement was ratified between the two powers in August, 1863. This arrangement naturally and not unexpectedly led to complications. The French felt themselves called upon to suppress an insurrection of a section of Cambodians assisted by Anamites in 1867, and to prevent the recurrence of similar disturbances, the French governor wrested the southern provinces of Lower C.-C., and joined them to Vinhlong. Since this period the French have applied themselves to the object of developing their colony. In 1866 an expedition was organised to explore the course of the Mekong, and to open up a commercial highway by this river between the western provinces of China and the great seaports of the French colony. The river, obstructed by impracticable rapids, and with an irresistible current, was found to be quite unfit for navigation, and thus the dream of making Saigon the seaport of Yunnan and Szechuen vanished conclusively. But the resolution to extend French influence in Indo-China was not abandoned, and in furtherance of this aim the minutes of a treaty with Anam were signed on the 14th March, 1874, the chief conditions of which were—opening three ports in Tonquin; liberty for Europeans to reside therein; liberty to travel in the interior under passport from French consul; leave to pass Chinese productions through Tonquin; freedom in regard to Catholic (Roman) faith; obligation that French protection be called upon in case of internal disturbance. In 1883-84 the French Republic developed great activity in Cochin-China, and first took Anam under its protection, and subsequently drove Chinese troops out of Tonquin, resulting in warlike operations between France and China, which terminated in a treaty being signed in 1885. At the present time the arrangement is as follows:—Annexation of C.-C. by the French whose officials govern the country; Anam ruled by a King who resides at Hué with a French resident to take care of French interests; Cambodja ruled by a French resident in the name of the King of Cambodja; and Tonquin administered by a French resident in the name of the Regent of the country.

Coch'ineal Insect, a species of the Hemipterous genus *Coccus* (q.v.), which lives on the *Cactus Opuntia* or Nopal of Central America, and on other species of cacti as well—such as the *Cactus* or *Opuntia Tuna* of Peru, &c. The C. I. was first introduced into Europe in 1523 from Mexico, but cochineal is now produced in the E. Indies and Algiers, as well as in Europe. This insect is of small size, and of a deep red or mulberry colour. The insects scraped from the cacti are killed by immersion in boiling water and are dried in the sun. 70,000 of these small insects go to the pound of cochineal.



Cochineal.

1, Cochineal insects on cactus branch; 2, Female insect; 3, Male insect.

Coch'lea, a portion of the internal ear. See EAR.

Cochlosper'mum, a genus of small trees and shrubs indigenous to tropical India, Africa, America, and N. Australia, belonging to the natural order *Flacourtiaceæ* (*Brixineæ*). The stem of *C. Gossypium* of India yields kuteera gum, used as a substitute for gum and tragacanth. The cottony substance which adheres to the seeds is used to stuff pillows, &c. A decoction of the roots is used in Brazil as a cure for abscesses, and for pains which are the result of falls and other accidents. *C. Planchoni* is a native of Western Africa; its roots yield a yellow dye. *C. tinctorium* of Senegambia furnishes a yellow dye.

Cock, a name applied generally to the males of Rasorial or Gallinaceous birds, but sometimes restricted to denote the male of the common or Domestic Fowl (q.v.). In the C.-birds of most Rasores (q.v.) the ornaments displayed in the form of plumes, brilliant lustres, wattles, and epidermal appendages are seen to greatest perfection. The presence of these appendages is doubtless a mark of sexual difference and selection. See SEXUAL SELECTION.

Cockade′ (*cocarde*, Old Fr. *coquarde*, 'a cockscomb,' then a red device in the hat like a cockscomb), originally applied to the ribbon with which the loop of a cocked-hat was ornamented, is a term now used to signify a ribbon, a knot of ribbons, of leather, or something similar, worn on the hat as a badge of office or a party symbol. The badge of the Stuarts was a white rose, and a white C. became the symbol of their party after the Revolution, while that of Nassau was orange, and the Hanover C. black—the latter becoming common in this country after the accession of George I. It was in the 18th c. that these marks of distinction assumed military importance, a tuft of grass or corn being worn by the soldiers under Marlborough and Prince Eugene. In the War of Succession the French C. was white, that of Spain red; and the two colours were blended when the armies of these countries were subsequently combined. When in 1789 French citizens generally exhibited the 'red, white, and blue,' it was partly in defiance of an order issued in 1782, which forbade all who were not soldiers to wear the regulation white C. of France. The red and blue were added as being the colours of Paris. The tri-colour has been the badge of the French army since the Restoration, at the beginning of which an ineffectual attempt was made to establish the white of the monarchy as the sole colour. The Austrian C. is black and yellow; the German, black and white; the Belgian, black, yellow, and red—the shape on the Continent being generally a flat disk, and the material generally leather, but at times silk or other stuff. On the flat disk the colours are disposed concentrically. The adoption of the C. by European nations was only the systematising of ancient usage. The Plantagenet family was named after their sprig of broom—*Planta genista;* and the Wars of the Roses are so named after the badges of Lancaster and of York.

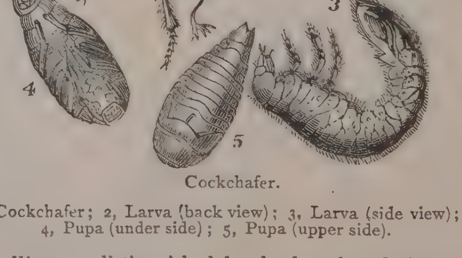
Cockatoo′, the name by which several distinct genera of Scansorial birds, included in the Parrot family, are distinguished. The sub-family *Cacatuinæ* is sometimes formed to include these birds, in which—the true cockatoos—the tail is broad and even, and the head adorned with an erectile crest. The bill is larger and less acutely curved than in the parrots. These birds are confined to Australia and the E. Archipelago. The food consists of fruits and seeds, and the nests are built in holes of trees. They may learn to speak, but not with the same distinctness or fluency as the parrots. The great sulphur-crested C., the lesser sulphur-crested C., the galeated C., the tricolour-crested C. (the crest of scarlet, yellow, and white) of Australia, the Goliath C., the long-billed C., and the Banksian C. of Australia are well-known forms. The genera *Microglossus* of New Guinea is also included in the C. family.

Tricolour-crested Cockatoo.

Cock′atrice, a fabulous monster, said to be hatched by a serpent from a cock's egg, and to inflict death by its breath and by its look. The word occurs four times in the authorised version of the Old Testament, where it evidently means a venomous serpent, and is probably identical with the reptile named by the Greeks *basiliskos*. See BASILISK.

Cockburn (pron. *Co′burn*), **Henry,** a notable Scottish advocate and judge, was born at Edinburgh, 26th October, 1779, educated at the High School and University of his native city, and was called to the bar in 1800. After seven years' waiting for briefs, he was appointed Advocate-Depute to the then Tory Lord Advocate; but having, through his long and intimate friendship with some of the chief Liberals of the time, Horner, Brougham, and above all Jeffrey, thrown aside the political principles hereditary in his family, he was dismissed from the office. C.'s very considerable ability, his shrewd common-sense, and his impressive and homely manner, began to win him a reputation and a practice—particularly after the introduction into Scotland of jury trial in civil causes. In 1831, under the Grey Ministry, he was made Solicitor-General for Scotland, and in 1834 became one of the judges of the Court of Session, when he took the title of Lord C. He died 26th April, 1854, at his residence of Bonaly, near Edinburgh. C. was not a voluminous author, although he wrote some articles for the *Edinburgh Review*, chiefly on law reform. His best-known works are his *Life of Jeffrey*, published in 1852, and the *Memorials of his Times*, published two years after his death, containing glimpses of the Edinburgh society of the time in which he lived. This was continued by the publication in 1874 of his *Journal*, in 2 vols., a work principally valuable for the news gathered by C. of the 'Disruption' of 1843, which ended in the formation of the Free Church, of the events which led up to it, and of the men who took part in it. A volume of C.'s correspondence has also been published.

Cock′chafer, the name given to a beetle of the tribe *Lammellicornes*, distinguished by the length and size of the leaves of which the terminal joint of the antennæ is composed.



Cockchafer.

1, Cockchafer; 2, Larva (back view); 3, Larva (side view); 4, Pupa (under side); 5, Pupa (upper side).

These leaves are largest in the male C., and fold up like a fan. The C. belongs to the *Phyllophaga*, or leaf-eaters. It is not common in Scotland, but occurs in England and Europe. The adult feeds on leaves, the larvæ feeding on the roots of corn and grasses. The C. is of a black colour, covered with a downy white substance, and is on an average an inch in length. It spends from three to four years in the grub or larval condition, but has not a long existence as the adult. The larvæ are very destructive to grasses, and occasionally immense hordes of these beetles appear in certain localities, and devastate the plant-surroundings. Such an invasion occurred in Galway in Ireland in 1688.

Cock'er, one of the spaniels, nearly allied to the Blenheim dog. Its colour is usually of a blackish tint. The C. is of small size, and is employed in pheasant-shooting. Its ears are pendent, but the tail is not of great length.

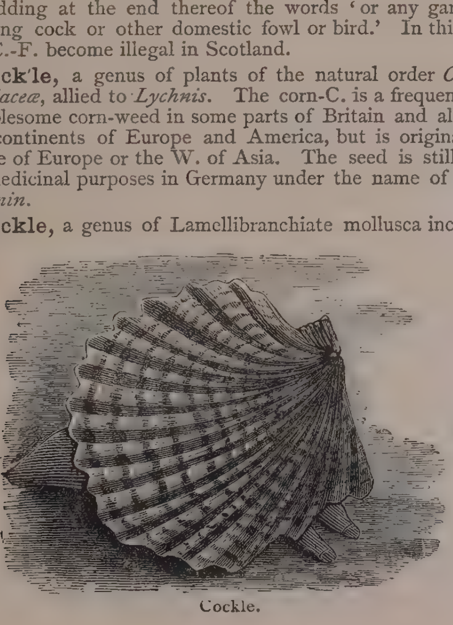
Cocker, Edward, an arithmetician and caligrapher, was born probably in 1631 at London, where he died about the year 1677. C. was a schoolmaster by profession. His famous *Arithmetic* was published shortly after his death by John Hawkins. C. was also the author of a small dictionary, and of a book of sentences for writing, called *C.'s Morals*.

Cock'ermouth, a municipal borough in Cumberland at the confluence of the Cocker and the Derwent, 25 miles S.W. of Carlisle. C. has considerable trade, manufactures of woollens, linens, cottons, hats, and hosiery, tanneries, breweries, and dyeworks. It returned one member to Parliament till 1885. The poet Wordsworth was a native of C. C., which is a place of considerable antiquity, has the ruins of a castle built soon after the Norman conquest. There is a fine promenade a mile long on the N. bank of the Derwent, with the old castle at one end and wooded cliffs at the other. Pop. parl. div. of county, 63,590; reg. sub-dist. 11,785; and civ. par. 5464.

Cock-Fighting is now prohibited by statute 12 and 13 Vict. c. 92, under which every person who shall in any manner encourage, aid, or assist at the fighting or baiting of any bull, bear, badger, dog, cock, or other animal, shall forfeit and pay a penalty not exceeding £5 for every such offence. In 1850 an Act entitled 'Cruelty to Animals (Scotland)' was passed, but the wording of the statute was found not to include *game or fighting cock*, and as the practice of C.-F. had become most common, and the law did not prohibit it, a short statute was passed on 30th May, 1895, whereby the definition of the word *animal* in the 11th section was amended by adding at the end thereof the words 'or any game or fighting cock or other domestic fowl or bird.' In this way has C.-F. become illegal in Scotland.

Cock'le, a genus of plants of the natural order *Caryophyllaceæ*, allied to *Lychnis*. The corn-C. is a frequent and troublesome corn-weed in some parts of Britain and all over the continents of Europe and America, but is originally a native of Europe or the W. of Asia. The seed is still sold for medicinal purposes in Germany under the name of *black cummin*.

Cockle, a genus of Lamellibranchiate mollusca included in the family of *Cardiadæ*, the members of which possess equivalve shells of heart shape, with radiating ribs: the mantle is open in front, and the syphons are short. The foot is large and sickle-shaped. The common C. is a well-known edible mollusc of our coasts. It is enabled to take leaps of considerable extent by straightening its foot suddenly, and leaping through the impetus thereby gained. By means of the foot also these molluscs burrow in the sandy coasts in which they are found. A great many species exist. Two adductor muscles exist for the purpose of closing the shell. A C. shell weighing 120 lbs. has been brought from the South Sea Islands, and is to be seen at Kenmare Castle. It has been used as a punch-bowl.



Cockle.

Cock'ney (from the Fr. *cocagne*—'*Pays de Cocagne*'—an imaginary land in mediæval mythology where the houses are made of cakes; perhaps formed from the Lat. *coquinus*, from *coquere*, 'to cook'), was a name given to the luxurious inhabitants of London, as opposed to the less effeminate denizens of the country. 'The King of Cockeney'—*i.e.*, of London—occurs in some verses ascribed to Hugh Bagot, Earl of Norfolk, in the time of Henry II. 'The Land of Cockaigne' is applied in a popular satire of the 13th c. to a Fool's Paradise for monks, in which the pleasures are all sensual.

Cock of the Plains, a species of grouse inhabiting N. America. It is the largest member of that family found in the New World; but is smaller than the Capercailzie (q.v.). The plumage is of a general yellowish-brown tint, the under parts being white, whilst generally it is mottled with dark tints. The males have bare sacs on the neck, which they can distend at will. C. occurs in California and Columbia. Its flesh is bitter, owing to the bird feeding on certain herbs (*Artemisia*, &c.).

Cock of the Rock, a Dentirostral (*Insessores*) bird, belonging to the Manakin family, and so named from its possessing a singular double crest of feathers rising from the sides of the head, whilst the upper tail-coverts give the bird the appearance of a cock-like tail. It inhabits Guiana. Its colour is a fine orange, with the wing-gills and tail black. Another species is found in Peru.

Cock'pit, a theatre in which gamecocks used to be exhibited fighting. The room in which the Judicial Committee of Her Majesty's Privy Council met at Westminster was so called, because it was built on the site of the C. of the palace at Whitehall. In *nautical language*, the term is applied to a place under the lower gun deck, containing the rooms of several junior officers; here the surgeon keeps his medicine-chest, and attends to the wounded.

Cock'roach, a genus of Orthopterous insects belonging to the Cursorial section of that order, and included in the family *Blattina*. All the legs are formed for running; the head is concealed beneath the thorax; the feelers are long and bristle-like; simple eyes or ocelli are generally wanting; wings may be wanting in the females only, or in both sexes; the hinder wings fold up fan-wise, the front wings forming elytra or wing-covers; spines exist on the tibiæ, and the tarsi are five-jointed. The body is flattened and ovate, and the abdomen is terminated by a pair of jointed appendages. *B. orientalis* is the common C. or black-beetle, found in great quantities in many houses. The wings in this species exist in the males only, and are rudimentary. These insects are supposed originally to have been imported from India. They occur also in ships, a second species, *B. Americana*, being found in the latter habitations. They are of nocturnal habits, devour animal and vegetable matters, and exhale a disagreeable smell. *B. gigantea* is a large W. Indian species, also named the *Drummer*, from its making a knocking noise in the night-time. The eggs are enclosed in horny cases, and are arranged therein in a double row, each egg being partitioned off from its neighbour. *B. Lapponica* occurs in Lapland.

Cocks'comb, a plant belonging to the natural order *Aurantiaceæ*, is a native of the E. Indies, and is now extensively cultivated in our conservatories, and in the open air in warm localities.

Cocksfoot Grass, a genus of grasses, of which one species, the common C., is generally distributed over the cooler portions of Europe, Asia, N. America, and the N. of Africa. In Britain it forms one of the best of our pasture grasses, growing well on most lands, particularly where the soil is loamy or chalky. It is also suitable for growing on boggy soils under course of reclamation. In America it is called the *orchard grass*. Twenty-nine species are described by Steudel.

Cock'swain, or **Coxwain** (pron. *coxon*), is the commander of a boat's crew, and steersman of the boat. The C.'s whistle brings his men together on the shortest notice. The word is formed from the Welsh *cwch*, 'a boat,' and '*swain*,' properly a servant, but here the petty officer in command.

Co'coa, Caca'o, or **Co'co,** a tree belonging to the order *Byttneriaceæ*, from the seeds of which the drinks called C. and chocolate are prepared. It is a native of Mexico, Demerara, and other portions of tropical America, but is now naturalised in various other tropical countries, such as Martinique, the W. Indies, Colombia, the Philippine Islands, Guiana, the Canaries, &c. About the year 1520 the seeds were introduced into Europe as a medicinal agent. The tree is much branched, and attains a height of from 16 to 20 feet on an average, though occasionally it grows to twice that height. It produces ovoid fruits, each of which contains from 13 to 40 seeds—the *C. beans* of commerce. After being shelled and bruised to pieces, they constitute *C. nibs*. The seeds are extracted from the fruits by their being allowed to ferment for some time, and then opened by hand, or by being buried in the earth until the pulp becomes rotten, after which the seeds are dried in the open air or by means of a fire. The last method of extracting the seeds produced the *Cacao terré* of the French manufacturers, and is by some considered as yielding the best C. In commerce there are two kinds of C., viz., Caraccas C. from Caraccas, and Island C. from Bourbon, Mauritius, the W. Indies, &c., which is less esteemed than the first-named quality. Most of the C. used in England comes from Guayaquil. It is very nutritious, chiefly owing to the soft, solid oil known as *C. butter*, which forms more than 50 per cent. of the shelled bean. The rest consists of starch, gum, mucilage, gluten, albumen, &c., and a crystallisable principle called *Theobromine* analogous to Caffeine (q.v.). It is prepared for use in various ways. First it may be prepared as Chocolate (q.v.), or by grinding up the roasted seeds with their outer shells or husks between hot cylinders into a paste, when it is then mixed with starch, sugar, &c. This forms *common C.*, *soluble C.*, &c., or the *C. nibs* already mentioned. This latter is the purest form of C. The husks are sometimes imported from Italy under the name of 'miserable,' and are used in Ireland and Italy for making a thin, though wholesome and agreeable, beverage in favour with the poorer classes of these countries.

Cocoa.

From the pulp which surrounds the seeds a kind of spirit is distilled. C., as a beverage, is nourishing and wholesome, and the *butter* is official in the English pharmacopœia. As an emollient, and as an ingredient for making 'suppositories,' it is valuable from not becoming rancid. C. mixed with rice, meal, starch, sugar, and flavoured with vanilla, constitutes the *Racahout* of the Arabs.

Co'co-Nut, a species of palm, a native of the Indian coasts and the South Sea Islands, but now naturalised in suitable situations in most tropical countries. It always prefers the vicinity of the sea-shore, though sometimes found at a considerable distance inland. It is one of the most graceful of its order, often rising to the height of from 60 to 100 feet, in a stem not over 2 feet in diameter. With the exception of the bamboo, there is perhaps no plant which is applied to so many and so varied uses as the C. From the husk surrounding the nut, coir or fibre is manufactured, and out of this mats, brushes, cables, &c., are made. In Southern India and other countries the fruits form one of the staples of life. The oil extracted from it is used in cookery when fresh. By pressure, stearine, used in making candles, can be extracted from it. The shells are made into spoons, drinking cups, lamps, &c.; when burnt furnish an excellent charcoal and lampblack. 'Toddy' is made out of the fresh sap, as already described in the case of other palms, and vinegar, arrack, and sugar are also some of the products of this juice. The leaves are used for thatching houses, making mats, baskets, hats, &c. The terminal leaf bud is boiled and eaten as a potherb. The hard wood is used for an infinite variety of purposes, and in this country is familiar under the name of 'porcupine wood,' out of which ornamental boxes, &c., are made. It is even considered that the flowers are potent as an astringent, the roots as a febrifuge, and the milk as a cure for ophthalmia. With this category of uses we have by no means exhausted the list of economic purposes to which the C. are applied, which are, indeed, almost endless. There are about a dozen other species of *Cocos*, one of the most interesting of which is *C. butyracea* of New Granada. From this tree toddy is also extracted, but the method adopted is somewhat different from that employed in other countries. The tree is cut down, and a long cavity excavated in the trunk near the top; at the end of about three days this cavity is found filled with the sap, which constitutes 'toddy.' *C. coronata*, a small Brazilian species, has a quantity of starch stored away in its loose pithy interior, which is used as food.

Coco-nut Palm. Tree, flower, and fruit.

The *Double C.*, the *Coco de Mer*, *Coco de Salomon*, *Coco des Maldives*, is *Lodoicea Sechellarum*.

Coco-Nut Beetle, a genus of *Longicorn* Coleoptera or beetles, the larvæ of which inhabit coco-nut trees and eat into the stems. The larvæ are eaten by the natives of the E. Indies, and are of large, soft conformation.

Cocoon', the shell or covering of fibrous material in which many species of insects are protected during their pupa or chrysalis condition. The cocoons of several species are of very great industrial importance, especially those of the moth *Bombyx mori*, or the silkworm, which is the source of all ordinary silk. Several other species of moths yield silky fibre used in textile manufactures, the most important of which is the Tusseh or Tussur moth of India, which spins a large grey-coloured C. from which a very strong silky fibre is derived. In addition, the Ailanthus moth has been introduced from

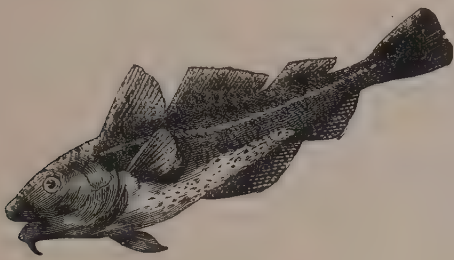
China for culture in France, and silk is obtained from a hybrid between it and the Arrnidy moth of Bengal. Among other valuable cocoons may be mentioned the Moonga of Assam, which forms one of the principal exports of that country; and the Mezankooree of the same region, from which much of the native dress of Assam is made; and the Yama-mai or oak silkworm of Japan, which has been introduced into Europe. There are, besides, numerous other species of moths, which yield useful silk both in the Old and New Worlds.

Co'cum Oil, a vegetable butter obtained from the seeds of an Indian tree belonging to the same genus as the mangosteen. It is of a pale greenish-yellow colour, and very friable. C. is exported to Britain, where it is used in the manufacture of pomatum.

Cocy'tus, a tributary of the Acheron, in Epirus, and supposed by the ancient Greeks to be connected with the lower world. In their mythology it was one of the rivers of Hades, and is mentioned in the Odyssey. Virgil also assigns it a place in Tartarus, as with the Pyriphlegethon flowing into Acheron. The name is derived from *kōkuein*, to shriek, to wail. Hence Milton's—

> 'Cocytus, named of lamentation loud
> Heard on the rueful stream.'

Cod, a genus of Teleostean fishes belonging to the suborder *Anacanthina*, and to the family *Gadidæ*, which also includes the haddocks, whitings, &c. The ventral fins are jugular in position, that is, exist on the throat beneath the pectoral fins. The body is spindle-shaped. The scales are soft and of small size. The median fins are large. The lower jaw is furnished with a *cirrhus* or barbule. Three dorsal and two hind fins exist. The fishery of the C. forms a source of industry, which gives employment to thousands of men on the coasts of the United Kingdom, Holland, Sweden, Norway, Iceland, Newfoundland, and elsewhere. The flesh is eaten both in a fresh and salted state. The air-bladder and roe are regarded as delicacies, and from the liver is obtained the cod-liver oil which, in tubercular and phthisical complaints, is so invaluable a remedy. The fishery is carried on by hand-lines chiefly, the bait being cuttlefishes, shellfishes, &c.



Cod.

Varieties of C. (rock and red C.) exist, and the Dorse (q.v.) is sometimes named 'Baltic C.' The average length of the C. is 2½ or 3 feet, and its weight from 10 to 12 lbs.

Co'da (Ital. 'tail,' Lat. *cauda*) is a name given to a phrase or passage sometimes added, like a peroration, at the end of a musical composition.

Coda'rium, a genus of plants of the order *Leguminosæ*. *C.* (*Dialium*) *acutifolium* and *C. obtusifolium* yield the Sierra Leone fruits known as brown and velvet tamarinds, the pulp of which has an agreeable flavour, and is very commonly eaten.

Code (Fr. *code*, Lat. *codex*, older form, *caudex*). A collection and chronological arrangement of the laws of a state is sometimes so named, but this is usually called a *Digest*; and by a C. we generally denote a legal system which, though it may adopt some existing laws and customs, is founded on principles fundamentally new, such, for instance, as are advocated in the *Fragment on Government* and other writings of Jeremy Bentham. Roman law was first reduced into a C. by order of the Emperor Theodosius, A.D. 438. This, under the name of the *Theodosian C.*, continued for some centuries to be the only authoritative compilation recognised in the western part of the empire. The *C. Justinian*, whose authority prevailed in the eastern division of the empire, was compiled and finished by Tribonian about the year 533. It consists of the *Institutes*, or elementary principles of Roman law; of the *Digest* or *Pandects* (q.v.), containing the opinions of eminent lawyers; of a new C. or collection of imperial *Constitutions*; of the *Novels*, or supplementary C. These form the *Corpus Juris Civilis*, as published about the time of Justinian. They are the foundation of the legal systems of most of the states of Europe.

The old laws of the French monarchy were founded partly on Roman law, partly on custom, and partly on ordinances of the kings. In 1800 Bonaparte appointed a commission to form a scheme of a civil C. This was promulgated in 1803-4 as the *C. Civil des Français*. Under the empire it was named the *C. Napoléon*, by which name it is still known. To judge of its value, we should read reports of the discussions in the French Council of State. The *C. de Procédure Civil* (1806) prescribes the forms of civil process, and the rules of the courts' practice. The *C. d'Instruction Criminelle* was promulgated in 1808, the *C. de Commerce* in 1808, the *C. Penal* in 1810. Regarding the last, Thibaudeau says:—'Napoleon was absent from its discussion. He said that the laws should be concise, and leave much to the judges and the government in imposing the penalty, because,' he said, 'men have feelings of compassion unknown to the law.' Under the head of *Violations des réglements relatifs aux manufactures, aux commerce et aux arts*, any coalition to lower wages is punishable by fine and imprisonment, and workmen combining to stop a manufactory are to be punished in the same way; leaders in both cases being subject to severer penalties.

Among mediæval codes the fullest and best was that of the *Gothic Law*. It was initiated by Alaric, King of the Visigoths, and enlarged by his successors. The second was the Burgundian; the third the Salic Law (q.v.), whose history is somewhat obscure. It dates from the exodus of the French from Germany. The fourth or Frisian law dates from the times of Pippin and Karl Martel. The *Asegabuch*, a set of Frisian laws, was composed about A.D. 1200. A complete collection of them was published by Richthofen. All these codes ultimately merged in the law of the feudal system.

Codification is the process of forming a C. of laws. It may be either done by public authority, as in the cases of the *Codex Theodosianus* and the *Codex Justinianus*, or it may be done by a private person, as were the codes Gregorianus and Hermogenianus. Many attempts have been made to procure the codification of the laws of England. Notwithstanding the earnest advocacy of Lord Brougham and other judges and lawyers since his time, these have hitherto been almost totally ineffectual. In British India and in those of our colonies which use the Indian Penal Code, the law has been codified to some extent; and also in Great Britain the law relating to partnerships, promissory notes, cheques, and bills of exchange has been codified; but in other directions the law may have been *consolidated* but not *codified*.

Co'deine is an Alkaloid (q.v.) present in opium, and was first extracted from that substance by Robiquet in 1832. It is a colourless crystalline body possessing a bitter taste and a powerfully alkaline reaction, combines with acids to form crystalline salts, and is a narcotic poison.

Codiæ'um, a genus of Spurgeworts (*Euphorbiaceæ*) indigenous to the Moluccas and islands to the N. of Australia. *C. pictum* of the Moluccas is often cultivated about houses in that country, and used for fences. The leaves are strewed on the ground on festive occasions, and are also used to decorate triumphal arches. When chewed, both bark and roots excite a burning sensation in the mouth.

Cod'icil (Lat. *codicillus*, a dim. of *codex*) is a supplement or addition made to a will by the testator, adding to, explaining, or altering some part of his former disposition. It may be written on the same paper as the will, or affixed to it, or written on separate paper and deposited in a different place from that in which the will is placed. In general the law relating to codicils is the same as that relating to wills, and the same guarantees of signature and attestation are required. A man may make as many codicils as he pleases, and the last is equally valid with the first, if not contradictory. See WILL.

Cod'lin, or **Codling,** a variety of apple, for boiling or roasting, and thence deriving its name, which is probably connected with *coddle* and *caudle*, the origin of which again is the Lat. *calidus*, 'warm.'

Codling Moth, belonging to the Tortricina tribe. The larvæ live in apples (hence its name), and destroy much fruit. The caterpillars have ten feet, and roll up leaves to form a cocoon. The wings are short but of broad conformation.

Cod'liver Oil is obtained from the liver of the cod, torsk, and other members of the Gadidæ (cods, haddocks, whitings, &c.) family of fishes, the chief centres of its production being Newfoundland and Norway. Three varieties are known in commerce by the names of 'white,' 'pale,' and 'brown,' the difference in colour arising from the various modes of preparation. A fourth and very impure variety, prepared in Norway, is largely used by curriers under the name of cod oil. In Newfoundland the process of preparation is very simple. The livers are taken, as fresh as possible, and well washed to remove traces of gall, &c.; they are then heated in a boiler with steam or boiling water till the oil rises to the surface, when it is removed, and excess of water driven off by heat. The oil is next strained through cloth bags of different degrees of fineness, an operation which effectually prevents the admixture of solid extraneous matter. C. O. thus prepared is almost devoid of smell, taste, or colour, and possesses valuable medicinal properties. In Newfoundland it is worth from 5s. to 6s. per gallon. The disagreeable taste and smell of ordinary C. O. are partly due to the putrefaction of very minute pieces of liver and other solid impurities not removed by filtration. Its proximate constituents are olein, palmitin, and stearin, with small quantities of butyric and acetic acids, and a peculiar substance called 'gaduin.' When taken internally, this oil supplies the system with nutritive fatty matter, and to this circumstance its efficacy in the treatment of pulmonary diseases is to be attributed.

Codogn'o, a town in the province of Milano, N. Italy, near the Po, 24 miles W. of Pavia, is a railway junction between Milan and Piacenza, has silkmills, and linen factories, and an active trade in agricultural produce. Pop. 11,659.

Cod'rington, Sir Edward, an eminent British admiral, was born in 1770, entered the navy in 1783, fought under Lord Howe, and at the battle of Trafalgar, in 1805, was captain of the *Orion*. In 1821 he was made vice-admiral, and in 1827 commanded the British, French, and Russian fleets which crushed those of Turkey and Egypt at the battle of Navarino. Although for political reasons he was re-called, C. continued to be honoured both at home and abroad, and in 1837 reached the dignity of Admiral of the Red. He sat for Devonport from 1832 to 1839, and died 28th April, 1851. C.'s son, **Sir William John Codrington,** was born 1800, and entered the army as an ensign in the Coldstream Guards. On the outbreak of the Crimean war, he was made commander of a brigade of the Light Division, took part in the battles of Alma and Inkerman, and on the resignation of General Simpson, was appointed commander-in-chief of the English forces. On his return to England he entered Parliament as member for Greenwich in 1857, but accepted the governorship of Gibraltar in 1859. He was made a G.C.B. in 1865, and received various foreign honours—French, Sardinian, and Turkish. He died in 1884.

Cod'rus, the last King of Athens, according to the Greek legend, reigned about 1068 B.C. The Dorians having invaded Attica, the oracle declared that their success depended on the life of C. being spared. The Attic King, learning this, entered the hostile camp in disguise, and quarrelling with the soldiers, was slain. On this the Dorians returned home. The kingly authority was henceforth abolished at Athens by the Eupatrids, and Medon succeeded his father as Archon for life.

Coëfficient (Lat. 'together-making'), in algebra, is one of two factors, simple or compound, which together make up an expression. Thus, in 4 ab^2c^3, 4 ab^2c^2 is the C. of c, 4 ab^2 of c^3, 4 ab of bc^3, abc of 4 bc^2, &c.

Cœhoorn, or **Cohorn, Menno, Baron Van,** a great military engineer, was born near Leeuwarden, in Friesland, in 1641, studied fortification under his uncle Bernardus Fullenius, Professor of Mathematics and Engineering at Franeker, entered the army at the age of sixteen, and after distinguishing himself in various battles and sieges, particularly those of Maestricht and Namur, rose to be lieutenant-general and chief director of Dutch fortifications, and the trusted engineer of William III. Of the towns he fortified, Bergen-op-Zoom is considered to be that which most unmistakably shows his genius. C., who has deservedly been called the Dutch Vauban, died at the Hague, 17th March, 1704. He wrote several books, of which the *Nieuwe Vestingbouw* ('New System of Fortification') is the best known. It was translated into many European languages.

Coe'horns, so called from the engineer of that name, are small howitzers or mortars, about 4½ inches calibre, which, being easily moved, and requiring but a small amount of powder, were at one time much used in sieges, especially in pouring shells into the outworks of a fortress.

Coel, or **Koil,** a town of British India, in the N.W. Provinces, district of Alighar, 2 miles S. of Alighar, and 80 S.E. of Delhi. Alighar is the administrative headquarters of the district, but C., with which town it is connected by a fine tree-shaded avenue, is the place where the general headquarters courts sit. The district of C. is a well-tilled plain watered by the Ganges Canal. Pop. 61,485.

Cœlelmin'tha, literally 'hollow worms,' the name formerly given to certain groups of parasitic worms or *Entozoa*, belonging to the sub-kingdom *Annuloida* or *Echinozoa*, and included in the order *Nematelmia* or 'round worms.' Owen gave this name to these groups, in allusion to their possessing a distinct body-cavity, and in contradistinction to the Tape Worms (q.v.), and others, which possess no alimentary canal or body-cavity. The *Ascaris* or round worm, *Strongylus*, and *Filaria* or the Guinea-worm, are illustrative examples of C.

Cœ'le-Syr'ia (Gr. 'Hollow Syria'), now known by the Arabic name *El-Bŭkâ'a* ('the deep plain') is properly defined by Strabo as the valley between Libanus and Antilibanus (about 100 miles long by 10 broad), but sometimes erroneously made to include the coast of the Mediterranean. The Lowland Scotch expression for districts similarly depressed is exactly the same, *e.g.*, 'The Howe of the Mearns,' and 'The Howe of Fife.'

Cœnæsthe'sis, a term designating undue susceptibility to external impressions. Some persons are susceptible of slight changes in the circumstances of their lives, while others are not so. To some individuals freedom from anxiety, good digestion, a bright sun and a dry bracing air, is the cause of cheerfulness, exhilaration, or even of joy; while some mental cause of depression, a slight disorder of digestion or of liver, or a dull day, may cause gloominess and even despair. (Carpenter's *Mental Physiology*.)

Cœ'nobites ('dwellers in a *cœnobium*,' from the Gr. *koinos*, 'common,' and *bios*, 'life'), the name given to monks in the 4th c. who lived together in the same dwelling under an abbot or head, as distinguished from those who lived alone or solitary, as 'monks' (in the original use of the word) or *anchorites*.

Cœ'rulein is a dye recently introduced for dyeing and calico-printing, and is obtained by treating Gallein (q.v.) with concentrated sulphuric acid at 200° C. (392° Fahr.). A beautiful green colour is produced by dissolving C. in an alkaline solution. In calico-printing this solution and the mordant alumina yield a rich green, while iron mordants produce a brown colour; both dyes are fast. On treating a hot aniline solution of C. with alcohol and acetic acid, an indigo-blue colour results, which may be communicated to wool.

Coff'ee, a genus of *Rubiaceæ* or *Cinchonaceæ* (for opinions differ), consisting of between fifty or sixty species, but only one of which produces the fruit from which by decoction can be made the beverage known as *C.* All are shrubs or small trees under 20 feet in height, natives of the tropics—the greater number of the species being found in the western hemisphere. The most important is *Coffea Arabica*, which grows to a height of about 20 feet, but when cultivated is seldom allowed to attain to more than 10 or 12 feet. Though now cultivated solely within the tropics, the native country of the C. shrub is the mountainous country at the extreme S.W. point of Abyssinia—the word *C.* being derived, according to some, from *Kaffa*, the name of one of the Abyssinian provinces; though it is more probably the Arabic *quahwah*, pronounced by the Turks *kahve*, whence the French *café*. From Abyssinia it was introduced into Arabia, and from Arabia into Batavia, about two centuries ago, by the Dutch. Whether it was the Dutch or French who first introduced C. into the western hemisphere is a disputed point, but at all events it is agreed on every hand that all the C. now imported from Brazil, Central America, the W. Indies, &c., is the progeny of a single plant, most probably derived from the Botanic Garden at Amsterdam, into which it was introduced from Batavia. Its use as a beverage soon spread among Eastern nations, though at first it was opposed by the priests, on the ground of its being one of those intoxicating beverages forbidden by the Koran. In 1652 the first C.-shop was established in London by a Greek named Pasquet, the servant of an English merchant of the name of Edwards, who had become acquainted with the beverage in the E., but who, to save himself from the annoyance of visitors anxious to taste the new drink, established his servant in a house where it could be bought. From this date the use of C. rapidly increased, and spread into the European continental countries, where it is now popular, and prepared to greater perfection than in Britain. The value of the coffee imported into the chief countries of Europe, Turkey, Egypt, and the United States of America is estimated at £52,168,755. The following table points out the distribution of the commodity, a large proportion of which arrives from India, Ceylon, Java, and Brazil. The duty paid to the British Revenue is about £166,000 annually.

Coffee.

Country.	Value of Coffee in £.
Austria-Hungary	3,324,833
Belgium	2,144,640
Bulgaria	89,880
Denmark	902,000
Egypt	301,058
France	5,826,920
Germany	10,691,650
Great Britain	3,997,406
Italy	1,261,920
Netherlands *	2,917,750
Norway	766,388
Portugal	122,175
Roumania	149,960
Russia	651,900
Spain	586,720
Sweden	1,500,666
Switzerland	680,640
Turkey *	879,541
United States of America	15,972,708

* Coffee, valued at £1,661,000, was also exported.

* Coffee, valued at £450,000, was also exported.

From this it will be seen that the United States of America and Germany are the chief customers of the C. planter. Next come France, Great Britain, Austria-Hungary, the Netherlands, and Belgium. Then follow Sweden and Italy. There is also a transit in some of the countries, notably Turkey and the Netherlands, where the value of the export is more than half that of the import.

After the coffee-berries are ripe they are gathered, and deprived of their outer pulp by machinery, then steeped in water to remove all mucilaginous matter, after which the parchment-like covering of the seeds is removed by means of a mill and a winnowing machine. They are now roasted, the heat not only reducing the berries to one-half their original bulk, but also causing the development of a volatile oil and a peculiar acid to which the flavour and aroma of the C. is due. In Sumatra and other of the Malay islands, an infusion of the roasted leaf is used, under the name of C.-tea. It is said to contain a large quantity of Caffeine (q.v.), which constitutes the active principle of the C., and it is probable that the use of the leaf may extend. In Central Africa Speke describes the natives as chewing the C.-beans instead of making a decoction of them. The physiological effect of C. is that it acts as a stimulant to the brain, causing sleeplessness, and is accordingly used as an antidote to narcotic poisons. According to the most widely received belief, it acts like tea as a soother to the vascular system, and by preventing waste of the tissues of the body, enables it to support life on a less quantity of food than would be otherwise required for the maintenance of animal existence. Cocoa (q.v.), Paraguay Tea (q.v.), and other beverages which have a similar effect on the system, also contain a principle analogous to caffeine, but neither Chicory (q.v.), nor any of the numerous substitutes for C. do so, or have any pretensions to act in a similar manner on the system, except that they supply to the palate a sensation not unlike that of C. For instance, what is called Swedish C. is the seeds of *Astragalus bœticus*.

Essence of C. is a very concentrated infusion or decoction, mixed with extract of chicory and burned sugar until it is of the consistency of molasses. A teaspoonful, mixed with boiling water, makes a useful substitute for the legitimate decoction of the ground C.-beans. The name Wild C. is given in the W. Indies to *Faramea odoratissima*, *Zuelania lætoides*, and *Eugenia disticha*.

Coffee-Bean-Tree, or **Coffee-Tree, Kentucky.** See GYMNOCLADUS.

Coffee-Bug, a genus of Hemiptera (*Homoptera*) belonging to the family *Coccidæ*, and so named from its destructive inroads on the coffee plantations. Ceylon has particularly suffered from its ravages. *Lecanium Ilicis* is an allied species which lives on the *Ilex* or evergreen oak of the Mediterranean coasts. The red ants are in turn destructive to the C.-B.

Coff'er (Fr. *coffre*, 'a chest;' Gr. *kophĭnos*, 'a basket') is the name given to a casket for keeping jewels and other valuable articles; the term being sometimes applied to a chest. In architecture, it denotes a deep panel in a ceiling, the same as a caisson; in fortification, a particular kind of *caponnière*.

Coffer-Dam, a water-tight enclosure within which the foundations for a bridge abutment, quay wall, or other such structure may be excavated and the masonry built. A C.-D. commonly consists of two continuous rows of wooden piles driven in the ground, and left sufficiently long to reach above high-water mark. The rows are several feet apart, and the space between them is filled with clay puddle, so as to make a thick wall impervious to water. The water is pumped from the enclosed space, so that excavation and erection can go on within it, without the use of divers, at all states of the tide. Of late years cast-iron has in a number of instances been used with success instead of the wooden piling. For illustration of C.-D. see Art. on Blasting.

Coffin, a chest or box in which a dead body is interred. The word is probably derived from *cophinus*, a Latinised form of the Greek *kophinos* ('a basket'), though it must be noted that no such use of *kophinos* was known to the ancients themselves. In the East at the present day a dead body is consigned to the earth wrapt merely in a cloth or 'winding-sheet,' which Mohammedans express by the Arabic word *kafan*, and it is probable that to it our English word is to be traced. In early times the bodies of persons of distinction were deposited in coffins, and when Joseph died, 'they embalmed him, and he was put in a C. in Egypt.' The Egyptians enclosed embalmed bodies in cases of cedar, which are still found in a state of almost perfect preservation, from the dryness of the rock tombs where they were deposited. Coffins of wood and burnt clay have been found at Athens; and while it was customary for the Greeks to burn dead bodies, recent investigations seem to prove that burial of unburnt corpses in coffins was equally frequent. Among the Romans, too, inhumation in coffins of wood and stone was practised. Pliny mentions that a kind of stone found near Assos in Troas, was made into coffins which speedily consumed the corpse. (See SARCOPHAGUS.) The kistvæn or C. of the ancient Britons was formed of rough slabs of stone; during the tenth and two following centuries, stone-coffins were in common use in England, and towards the end of that period they were employed in the interment of monks, whose bodies before that period were laid in the earth. Coffins both of lead and wood, belonging to the Old English and later periods, have also been discovered, those of the Templars found in the Temple Church in London being of the former material. The present mode of sepulture in closed coffins has recently been condemned on sanitary grounds, retarding, as it does, the resolution of the body into its component elements, and the question of adopting cremation has been openly discussed. As a compromise between the two modes, Seymour Haden has suggested the use of coffins of basketwork and other easily perishable materials of open construction, which will accelerate the dissolution of the body, by freely admitting air and moisture, and in cases of death from infectious disease, he has proposed to use a double basket case, the intermediate space being filled with charcoal powder.

Coffin also signifies the raised crust of a pie, and in this sense it is frequently used by Shakespeare; and the whole hoof of a horse's foot above the coronet is so named in veterinary practice.

Cogg'eshall, a market-town of Essex, consisting of Great C. and Little C., on the Blackwater, 40 miles N.E. of London, and 10 W. of Colchester. Great C. is connected with Little C. by a bridge across the river, and contains a beautiful church, St. Peter's, restored in 1868, a grammar-school, endowed by Sir Robert Hitcham, a mechanics' institute, a public library, &c. Its manufactures are chiefly silk, velvets, patent isinglass and gelatine. In 1142 King Stephen here founded a Cistercian abbey, part of the ground-plan of which was discovered in 1865. Pop. reg. sub-dist. 3906—Great C. civ. par. 2730; Little C. civ. par. 379.

Coggia's Comet, a large comet visible without telescopic aid to our earth, appeared in the summer months of 1874 in the northern hemisphere. The nucleus was bright and well-marked, and the tail could be traced for a considerable distance in the sky. Tietjen, Schulhof, and Geelmuyden have given calculations which all agree in assigning to it a great length of revolution, the period deduced by the last being 10,445 years.

Cogn'ac (Lat. *Cogniacum*, 'the corner of the water;' Fr. *coin*, Lat. *cuneus*), an old town in the department of Charente, France, on a height overlooking the plains of the Charente river, 20 miles W. of Angoulême. It gives name to the famous brandy, and has also large manufactures of leather, linseed oil, and pottery. There are two important fairs held here in May and November. C. is the birthplace of François I., and its only historical building is a ducal château, now converted into a store. Pop. 17,392.

Cog'nate. See AGNATE.

Cog'nition, or **Cog'niscing,** is a process in Scotch law for inquiring into the mental condition of any one suspected of being idiotic or insane.

Cognition and Sale is, in the law of Scotland, the name given to a process before the Court of Session, at the instance of a Pupil (q.v.) and his Tutors (q.v.), for obtaining a warrant to sell the whole or a part of the pupil's estate.

Cognitionis Causa.—In Scotland, when the creditor of a deceased proprietor brings an action against the heir to constitute the debt against him, and the heir renounces the succession, the court will give a decree for the debt. This is called a *decree C. C.*

Cognition and Sasine is, in the law of Scotland, the form of entering an heir in burgage property.

Cogn'izance, a name given rather indefinitely to a distinguishing mark in heraldry. See BADGE and CREST.

Cognoscen'ti (Ital. form of the Lat. *cognoscentes*, 'knowing ones'), critics in matters of art, whose *knowledge*, genuine or otherwise, is their title to the function they assume.

Cogno'vit Actio'nem, an English law-term, indicating the written confession of a defendant that the cause of action against him is just. Judgment may then proceed on the C. A., and execution follow according to the terms agreed to in the writing.

Cohabita'tion, in the law of Scotland, means the living together of a man and woman, as husband and wife, who are generally reputed to be such. It may constitute marriage as implying contract. See CONTRACT, MARRIAGE.

Co'heir or **Coheir'ess,** one of two or more persons to whom an inheritance descends. See SUCCESSION, COPARCENARY, COMMON TENANCY, &c.

Cohe'sion, that property of a homogeneous portion of matter on which depends its resistance to any straining or disrupting force. It is thus distinct from Adhesion (q.v.), which is a similar molecular attraction subsisting between two different portions of matter in contact. Both seem to be superficial attractions, independent of mass, and quite inappreciable at sensible distances. C. is most strongly marked in solids, and its experimental determination in the case of material used for purposes of construction, is of the greatest importance in practical engineering. Liquids possess the same property, though to a less extent, otherwise they could not hold together as drops. Further, all the curious phenomena of Capillarity (q.v.) are due to the simultaneous and mutual action of C. in the liquid, and adhesion between the liquid and some other kind or kinds of matter. The so-called C. and submersion figures of Tomlinson are also capillary phenomena, which are best noticed here, and are thus produced. When a drop of liquid is gently placed on the clean surface of a specifically heavier liquid, the former is observed to spread out according to a definite pattern, which is different for each pair of liquids, thus suggesting, as Tomlinson pointed out, a method of analysis. This is a C.-figure. Submersion-figures are formed by the gradual sinking of a liquid through a specifically lighter one; and some of these are extremely beautiful and regular, the vortex rings produced in many instances being singularly perfect. It is a common error in popular science to say that gases have no C., but even possess among the particles a repelling action. Such an hypothesis, however, is of absolutely no use in the molecular theory of gases, and adds a complexity which is not to be desired. C. acts between the particles *when they are sufficiently near*, but owing to their velocities at collisions, these particles rebound almost instantaneously, so that the cohesive forces act during a practically indefinitely short time, and are not sufficiently great to overcome the energy of motion of the particles.

When a solid is heated it generally expands, the molecules being driven further apart, and consequently the cohesive forces diminish in intensity. At length the solid melts, and the molecules acquire a certain freedom, the energy of heat being transformed into energy of motion; but the velocities are not sufficiently great to neutralise the effects of C., which is still apparent. By the application of more heat, however, the fluid expanding becomes more mobile, expands, and the molecules get more active, till at last their velocities become so great that the effects of C. are no longer evident—the liquid becomes a gas. Thus, though increase of temperature has a powerful effect upon cohesive forces, it seems to be only because the distances between the molecules and their velocities are increased; but it affords an argument in favour of the energy-nature of heat, placing it in the same category with motion.

Co'hort, a division of the legion, in the ancient Roman armies. There were always ten cohorts in a legion, and during the republic these were all equal to each other. Hence the strength of the C. varied with that of the legion, and ranged at different periods between 300 and 600. Under the empire the first C., which had charge of the eagle, was twice as strong as each of the other nine. The word was sometimes loosely used in the general sense of *battalion*.

Cohosh, the black snake-root, and plant of the order *Ranunculaceæ*. It grows to a height of 4 to 8 feet, and occurs in Florida and Canada, where it may be found in the woods. C. is a tonic when taken medicinally, and also produces a reduction of force and action of the pulse.

Cohosh.

Cohune' Oil, a valuable oil obtained from the kernels of a Brazilian palm, *Attalea cohune*.

Coif (Fr. *coiffe*, a headdress, from Lat. *cofea*, used by Fortunatus), a defensive hood which was worn as a portion of a soldier's armour in the Middle Ages. It was sometimes continuous with the hauberk, and sometimes separate. The name was also given to a covering for the head, especially of the tonsure, worn by Roman Catholic priests. In legal language, it was the cowl or covering of lawn worn by serjeants-at-law under their caps—a relic of the ecclesiastical character of lawyers. To become a serjeant-at-law was the same thing as to attain the *Degrees of the C.;* after which a barrister left the Inn of Court, which called him to the bar, to become a member of Serjeants' Inn.

Coimbatore' (*Kóyam-batúr* or *Koyampadi*), the chief town and administrative headquarters of the district of the same name, Madras, British India, on the left bank of the Noyel, a tributary of the Cauvery, 304 miles by rail S.W. from Madras; pop. 46,383. It is well built, with wide streets and a good water supply. Situated 1437 feet above sea-level, in a gorge of the Ghâts, it is exceptionally cool and healthy for Europeans. C. was a spot of much strategic importance, owing to its position; and was repeatedly passing from the hold of one power to that of another until it finally became British in 1799. The *district* of C. has an area of 7860 sq. miles; pop. 2,004,839, of whom 1,945,010 are Hindus; 43,947 are Mohammedans; 15,566 are Christians; and 213 are Buddhists. The staple crops are the 'dry grains' of *cholum*, *cumbu*, and *ragee*. Rice cannot be grown without artificial irrigation. Other crops are potatoes, oil-seeds, flax, cotton, tobacco, sugarcane, coco-nut, and areca-nut. The only manufacture is cotton-weaving, and the export of inferior cotton, tobacco, and grain, in exchange for salt is limited. Palladam is the chief centre of the cotton trade. Wild elephants, now preserved by law, are taken alive in the N. part of C. During the drought of 1876-7 this tract was saved by the railway from the extreme pressure of famine.

Coim'bra (anc. *Conembrica*), a city of Portugal, capital of the province of Beira, on the right bank of the Mondego, 110 miles N.N.E. of Lisbon, built on the slope of a hill in the form of an amphitheatre. The streets are steep, narrow, and ill-paved; but there are several fine buildings, including the cathedral and the university—the only one in Portugal—originally established in 1290, and transferred here a second time from Lisbon in 1537. There is a student attendance of 1166, and the subjects taught are theology, law, medicine, mathematics, and philosophy; law and philosophy appear to attract the majority of the undergraduates. George Buchanan (q.v.) was for some time a professor at C. Being accused of heresy, he was imprisoned in a monastery, where he commenced his Latin metrical version of the Psalms. The library of the university possesses 60,000 volumes. C. has manufactures of earthenware, linen, and woollen. Pop. town 51,226; district 316,624. Area of the latter is 1500 sq. miles.

Coin, Coining (Fr. *coin*, Lat. *cuneus*, the 'wedge' by which money was stamped). See MINT, MONEY, CURRENCY, NUMISMATICS.

Coin, Coining, Laws Regarding. On 6th August, 1861, the laws of the United Kingdom relative to the coinage were consolidated and amended by statute 24 and 25 Vict. c. 99. To counterfeit the gold or silver coinage, was constituted a felony in England and Ireland and a high crime and offence in Scotland, punishable at the discretion of the court by penal servitude for life or for not less than three years, or by imprisonment for any term not exceeding two years with or without hard labour and with or without solitary confinement. To diminish or lighten the gold or siver coinage became a felony in England and Ireland and a high crime and offence in Scotland, and the punishment was set at penal servitude for three to fourteen years, or imprisonment for two years with or without hard labour and with or without solitary confinement. Colouring counterfeit coin or any pieces of metal to make them pass for gold or silver coin, or colouring or altering a genuine coin to make it pass for a higher coin—felony, and high crime and offence; penal servitude for three years up to life or imprisonment up to two years, with or without hard labour and with or without solitary confinement. Unlawful possession of filings or clippings of gold or silver coin—felony, and high crime and offence, penal servitude for three to seven years or imprisonment up to two years, &c. Buying or selling counterfeit gold or silver coin for less than its nominal value, and importing counterfeit gold or silver coin—felony, and high crime and offence; penal servitude for three years up to life, or imprisonment up to two years, &c. Exporting counterfeit coin—misdemeanour, and crime and offence; imprisonment up to two years, &c. Uttering or tendering counterfeit coin, with knowledge of its being false or counterfeit—misdemeanour, and crime and offence; imprisonment up to one year, &c. Possession of three or more counterfeit gold or silver coins—misdemeanour, and crime and offence; penal servitude up to three years or imprisonment up to two years, &c. Defaced coin is no legal tender. Making, mending, or having possession of coining tools—felony, and high crime and offence; penal servitude from three years up to life, or imprisonment for two years, &c. Any person, to whom coin, suspected to be counterfeit or diminished otherwise than by reasonable wearing, is tendered, may cut, break, bend or deface any such coin, and he who tenders it must bear the loss provided there be no dispute, or, if dispute arise, provided the coin be declared counterfeit, or so diminished, by any Justice of the Peace after inquiry has been duly held before him. The Coinage Act of 1870 consolidates and amends the laws relating to the coinage and to the mint. Gold is a legal tender for any amount. Silver is a legal tender for any value not exceeding forty shillings, and bronze C. is so to the value of one shilling. The Act deals with the defacing of light C., and with the coining and purchase of bullion at the Mint. See MINT.

Coir, or **Coco-Nut Fibre,** is a material usefully employed in the manufacture of ropes, cords, mats, &c. It possesses in a high degree all the requisite qualities—strength, firmness, and elasticity. In the Laccadive Islands, cordage and rope-making form a considerable branch of industry, and in many of our prisons and industrial schools the imported fibre is used for making coco-nut mats.

Cojutepec′, a town of San Salvador, Central America, with a pop. of 8600. A few miles off there is a lake of the same name, which exhibits a remarkable phenomenon. After a gale its waters assume a dark greenish hue; and fish in considerable quantities are cast ashore dead.

Coke (lit. '*cooked*' or '*caked*' coal) is a substance 'which bears the same relation to coal that wood charcoal does to wood.' It is obtained by heating coal to a high temperature in a closed vessel, or its equivalent, and consists essentially of the fixed inorganic matter of the coal with a considerable part of its carbon. It is most commonly prepared in ovens called C.-ovens, which, when filled with coal, are closed up excepting an opening for the exit of gases, and some small holes for admitting air. The coal is ignited at the top, allowed to burn until no further visible smoke is emitted, and then cooled gradually. C. contains from 6 to 12 per cent. of incombustible matter (ash), but *exclusive* of this it is nearly pure carbon. It burns freely, without smoke, and without caking or clinkering (q.v.) upon the fire bars. It is also free from some of the impurities of the coal from which it has been made, and for these and other reasons, it forms in many cases a most useful fuel. It was at one time used exclusively for many purposes (*e.g.*, the smelting of iron), for which it is now found practicable to use the fuel in its natural state as coal. C. can only be made from that class of coals known as 'caking' coals, which tend to soften and clinker by heat, and which it is on that account difficult to use in ordinary furnaces without mixture with some non-caking fuel. In its conversion into C., coal loses from a quarter to nearly a half of its weight, this loss including the greater part of its hydrogen, nitrogen, and oxygen. The cause of the phenomenon of caking, or forming C., is not at present known. It has been connected with the proportion of oxygen in the coal, but although, in the average, caking coals contain much less oxygen than those which do not cake, yet analyses show that, in many instances, the ultimate composition of specimens of both kinds is almost identical. It is probable that this property of caking (as well as many other properties of coal) depends rather upon the proximate than upon the ultimate constitution of the fuel, and of this we have as yet scarcely any experimental knowledge.

Coke, Sir Edward, an eminent English judge and jurist, was born at Mileham, in Norfolk, 1st February, 1552. He was educated at the free grammar-school of Norwich, and at Trinity College, Cambridge, and, after a course of law study at Clifford's Inn and the Inner Temple, was called to the bar in 1578. His professional career was one of brilliant and rapid success. He filled in succession the posts of Recorder of Norwich, Recorder of London, Solicitor-General, Speaker of the House of Commons, and Attorney-General. Although the manner in which he conducted the prosecutions of Essex and Raleigh did not add to his reputation, he gained on the whole a high character as a judge. In 1606 he was appointed Chief Justice of the Common Pleas, as a reward for the way in which he conducted the prosecution of those concerned in the Gunpowder Plot; in 1613 he was made Chief Justice of the King's Bench, and refused to yield a jot of the judicial prerogatives to James I., for which, as well as for persistently opposing the court party in Parliament, he was both disgraced and imprisoned. Under Charles I., he continued an advocate of the popular cause, and in 1628, during the third Parliament of that monarch, took a leading part in the preparation of the celebrated Bill of Rights. He died 3rd September, 1633. C. has been well described by Green in his *Short History of the English People* as 'a narrow-minded and bitter-tempered man, but of the highest eminence as a lawyer, and with a reverence for the law that overrode his every other instinct.' His works, including his *Reports* and *Institutes*, the first of which is the famous *C. upon Littleton*, are among the most valuable of British law classics.

Col (Fr. a doublet of *cou*, 'neck,' from the Lat. *collum*, of the same signification), applied in Alpine geography to a mountain pass, as *C. du Géant*, *C. Cervin*, *C. Longet*, &c.

Co′la, Koll′a, or **Goora Nuts,** the seeds of *Cola* (*Sterculiaria*) *acumenata*, a tree belonging to the natural order *Sterculiaceæ*, inhabiting tropical Africa, and extensively used as a condiment by the natives of the western and central portions of that continent, and by the negroes of the West Indies and Brazil, into which countries it has been introduced. An extensive inter-tribal trade is carried on in this nut by the Africans. A small piece is chewed before each meal as an appetiser or aid to digestion, and to improve the flavour of any eatable or drinkable. It has an astringent taste. Bitter C. is obtained from Fernando Po, but its source is not yet ascertained, though it is believed to be derived from some species of *Guttiferæ*. There are also several varieties of the true C.-nut, all of which have, however, similar properties—among others, it is said, those of Cinchona Bark (q.v.).

Col′bert, the name of a French family which in the 17th c. produced several distinguished men, and was understood to be descended, according to a popular but now discredited tradition, from a Scottish house established in Champagne as early as the 13th c. The so-called 'tradition' cannot be traced beyond the rise of the great statesman's fortunes, and probably originated in a desire to find for him an ancient and aristocratic origin. Two branches of the C. family in the 17th c. are found pursuing commerce—one at Reims, the other at Troyes. To the former belonged **Jean Baptiste C.,** Marquis de Seignelay, the illustrious French minister, who was born at Reims, 29th August, 1619, and received a practical training from the Italian bankers of Cardinal Mazarin, who recommended him warmly to Louis XIV. When appointed Comptroller-General of Finances in 1661, he established a chamber of justice, which suppressed great frauds in the collection of the revenue. Minister of Marine in 1668, he gradually acquired authority over the kinds and rate of taxation, the public regulation of commerce, agriculture, and manufactures, in fact, the whole non-military administration of the revenue. On his industry (he worked sixteen hours a day) and his integrity depended much of the glory of the reign of the 'Grand Monarque.' He raised the revenue from 89,000,000 to 105,000,000 francs, and reduced the debt from 52,000,000 to 32,000,000; and yet, fearing the prodigality of his master, he steadily opposed all borrowing by the state. As Sully had favoured agriculture, C. paid special attention to the cloth, silk, and hat trades, &c. His regulations of manufactures, enforced by public inspectors, were no doubt intended as a great act of national technical education, but they hampered trade in the most disastrous manner down to the Revolution. Political ideas led him to prohibit corn exportation; but by the Languedoc Canal, the creation and repair of roads, and the diminution of certain feudal burdens, he benefited agriculture and the people generally. He also extended the French marine; Brest, Toulon, Rochefort, &c., dating their importance as naval stations from his rule. In 1663 and 1666 he founded the *Académie des Inscriptions et Belles-Lettres*, the *Académie des Sciences*, and the *Jardin des Plantes*, thus continuing the policy of Richelieu. He had also the happiness of assisting such men as Corneille, Molière, Racine, and Mézerai. Latterly the huge expenses of Louvois' military policy and of the court, and the suspicion the King had of C.'s ambition, oppressed him, and made his position difficult. At last an unjust accusation of jobbery in some fortifications compelled C. to retire, and he shortly afterwards died, 6th September, 1683. No man contributed so much to the glory of Louis XIV.'s reign. C.'s brother **Charles** was created Marquis de Croissy; his son, **Jean Baptiste,** who succeeded him in the Marquisate of Seignelay, had something of his father's greatness; another son, **Jacques Nicolas,** became a prelate of the Church; and in the 18th and even 19th c. the family had still some names of mark. See D'Aubigny's *Vie de C.* in the *Hommes Illustres de France*, and Pierre Clément's *Lettres, Instructions, et Mémoires de C.* (Par. 1862 *et seq.*), and his *Histoire de C. et de son Administration* (Par. 1875).

Col'chester, a parliamentary and municipal borough in Essex, on the S. bank of the Colne, 51 miles N.E. of London by railway. From its port and suburb, Hythe, the river is navigable to the sea, 15 miles distant, and corn, malt, and oysters are exported. The baize and silk manufactures have much declined. Among its notable public buildings are the Town-hall, the Corn Exchange, the Hospital, two ancient churches dating back to William I. and Edward II., and the ruins of an old castle, a Benedictine abbey, and St. Botolph's priory built in the 12th c. Its 'camp' is the second largest in England. C. returns one member to Parliament. C. is of great antiquity. It is the Roman *Camelodunum*, or *Colonia*; the *Colne-céaster* of the English conquerors, a favourite stronghold of the Danes, and a place of note in the times of Elizabeth and of the civil war. Roman remains are abundant in the neighbourhood. Pop. mun. bor. co-extensive with parl. bor. 34,559.

St. Botolph's Priory, Colchester.

Col'chicum, the meadow saffron or 'Autumn crocus,' falsely so called, a plant of the natural order *Melanthaceæ*. *C. autumnale* is found wild in many parts of England. The flower expands in the autumn, but the leaves are not fully developed until the ensuing spring. The dried bulbs and seeds are used for the cure or alleviation of gout, though it is only a dubious remedy. They contain a poisonous principle called *Colchicine*, and act upon all secreting organs as a sedative though rather acrid, and apt to create depression, and in large doses even death. Cattle are not unfrequently injured by eating it. It is believed to have been the basis of the empirical medicine for the gout long famous as *Eau medicinale*, and Royle is of belief that *C. variegatum*, or perhaps *C. bulbocodioides*, furnished the Arabian hermodactyls, at one time considered so potent for soothing pains in the joints.

Colchicum.

Col'chis, anciently a province of Asia Minor, bounded on the W. by the Pontus Euxinus or Black Sea, on the N. by the Caucasus, on the E. by Iberia, on the S. by Armenia, and coinciding nearly with the modern Russian province of Imerethia and the district of Mingrelia. C. was from the earliest times celebrated for its trade in linen. As the birthplace of Medea, and the scene of the adventures of the Argonauts in quest of the Golden Fleece, it had a dubious reputation among the ancient poets as a seat of sorceries and enchantments.

Cold Cream, a simple ointment, applied as a cooling emollient to inflamed surfaces. An excellent C. C. may be made by melting one part of white wax in four parts of sweet almond oil, then adding gradually three parts of rose water, and stirring the mixture constantly to render it homogeneous.

Coldstream, a town of Berwickshire, on the left bank of the Tweed, 15 miles S.W. of Berwick. It was the favourite ford for the passage of the invading English and Scottish armies during war. Later on, from its proximity to England, it became as 'famous' as Gretna Green for its irregular or clandestine marriages. Pop. 1535.

Coldstream Guards, after the 1st Foot the oldest corps in the British army, one of the three regiments of Foot Guards included in the Household Brigade, and so named from having been raised at Coldstream in 1660 by General Monk. It was at first named 'Monk's Regiment.' The following is a list of the battles and campaigns at which the regiment greatly distinguished itself:—Oudenarde, Malplaquet, Dettingen, Lincelles, Egypt (with the Sphinx), Talavera, Barrosa, Peninsula, Waterloo, Alma, Inkerman, Sevastopol, Egypt (1882), Tel-el-Kebir, Suakin (1885). From this it will appear that the C. G. have had a fair share of the fighting which has engaged the attention of the army during the last two centuries.

Cole'brooke, Henry Thomas, a great Orientalist, third son of Sir George C., was born at London, 15th June, 1765. After residing in France he was appointed, in 1782, to a writership in India, where he became a judge and President of the Board of Revenue. Following in the track of Sir William Jones, he devoted himself to Sanskrit, and in 1797 published a translation of a digest of Indian laws. He laboriously collected and studied ancient Sanskrit MSS., and contributed to the *Researches* of the Calcutta Asiatic Society learned and suggestive essays on the Hindu religion, the Sanskrit language and poetry, the Vedas, &c. He was appointed President of the Royal Asiatic Society of Great Britain in 1820, and died in London, 18th March, 1837. C. was a man of wide comprehension, keen critical insight, and deep research. He was one of the first scholars who revealed the riches of the Sanskrit literature to Europeans, and his edition of the *Amara Cosha* (1808) marks an epoch in Sanskrit-English lexicography. He advanced the study of philology not so much by original speculations as by collecting and elucidating Sanskrit works formerly inaccessible to Europeans, on which succeeding researches have been based. Among C.'s other works are a *Sanskrit Dictionary* and *Remarks on the Husbandry and Commerce of Bengal*, in which he advocated free trade with India. His *Miscellaneous Essays* were published in 1837 (later ed. with *Memoir* by his son, 1873).

Colen'so, The Right Rev. John William, D.D., Bishop of Natal, South Africa, was born 24th January, 1814; graduated as second wrangler at Cambridge in 1836; was from 1838 to 1842 assistant-master at Harrow; acted as tutor in St. John's College, Cambridge, from 1842 to 1846, and was rector of Forncett, St. Mary, Norfolk, until his appointment, in 1854, to the bishopric of Natal. For the first part of his *Pentateuch and Book of Joshua* (1862)—a microscopic investigation of Scripture, displaying extraordinary acuteness, combined with an almost morbid eagerness to discover contradictions in the narrative—C. was deposed from his see by the Bishop of Cape Town, but the deposition being declared illegal by the Privy Council, he was afterwards reinstated in his diocese. On revisiting England in 1874, he was forbidden to preach in their dioceses by the

Bishops of London, Oxford, and Lincoln. C.'s theological views have created much discussion in England and a schism among the Anglicans of the Cape. It cannot be said with justice that any adequate reply has yet been given to his destructive criticism. He died at Bishopstowe, S. Africa, 20th June, 1883. His works comprise *Miscellaneous Examples in Algebra* (1848); *Plane Trigonometry* (1851); *A Translation of the Epistle to the Romans* (1861); *A Zulu Grammar and Dictionary; A Zulu Translation of the New Testament; The New Bible Commentary by Bishops and other Clergy of the Anglican Church Critically Examined* (1871); six parts of his *Pentateuch and Book of Joshua* (1862-72), and *Lectures on the Pentateuch and the Moabite Stone* (1873).

Coleop′tera, an order of Holometabolic ('complete metamorphosis') insects, represented by the numerous kinds of Beetles, and so named from the front pair of wings being hard and horny, unfitted for flight, but forming *elytræ* or wing-cases for the protection of the hinder pair. The inner margins of the *elytræ* are generally straight, and form a suture when approximated. The mouth is eminently masticatory, and consists of a *labrum* or upper lip, two *mandibles* or biting jaws, two *maxillæ* or lesser jaws, a *labium* or lower lip, and *palpi* or organs of touch appended to the *maxillæ* and *labium*. The hinder wings fold transversely when at rest. Compound eyes are always present. The antennæ or feelers vary widely in form, and are composed generally of eleven joints. The chest consists of pro-, meso-, and metathorax—three distinct segments. The tarsus consists usually of not more than five joints, but fewer joints may be developed. The larvæ generally consist of thirteen joints, inclusive of the head. The body is soft, the head in the larvæ being horny. The pupa may be enclosed in a cocoon, but its parts are always to be recognised as they lie within the pupa-case. Many variations in the wings and wing-cases exist, and the body is generally invested by a hard covering of *chitinous* or horny material. The order is classified by the number of joints in the tarsi, by the shape and form of the antennæ, and by other salient features.

Coleorhiz′a (Gr. *koleos*, 'sheath,' *rhiza*, 'root') the cellular sheath which covers the radicle (and afterwards the fibrillæ) of Dicotyledons, as it pierces the lower part of the embryo. See ROOT.

Coleraine′ (Irish Gael. *Cuil-rathain*, 'the corner of the ferns,' alluding to an incident in the life of St. Patrick), a seaport, county of Londonderry, Ireland, on the right bank of the Bann, 4 miles above its mouth. The suburbs of Killowen and Waterside, on the opposite side of the river, are joined to C. by a handsome bridge. C. has manufactures of linen, cotton, soap, leather, and paper, and carries on a large trade in grain, pork, butter, whisky, &c. The salmon fishery on the Bann is one of the most valuable in Ireland. Although ships of 200 tons can discharge at the quay of C., the real port of the place is Portrush, 5 miles distant, which has steam communication with Glasgow and Liverpool. The Barony of C. is included partly in the North Derry parl. div. of the county, and partly in that of South Derry. Pop. of township 6845.

Coleridge, the name of an English family distinguished in literature and law.—**Samuel Taylor C.,** 'logician, metaphysician, bard,' but most memorable as bard, was born on 21st October, 1772, at Ottery St. Mary, in Devonshire. While yet a child he lost his father, who was vicar of the parish. His education began at Christ's Hospital, where Charles Lamb was his contemporary. He there became proficient in Greek, but, according to himself, preferred metaphysics and theology to history and poetry. The work of Bowles (q.v.), however, changed his ideas as regards the last of these. In 1791 C. entered Jesus College, Cambridge, where he devoted his mind to classics, but did not graduate. Debt, his academic failure, and a cross in love, led him to enlist in a dragoon regiment, from which unhappy position his friends procured his release in April, 1794, after four months of soldiering. Soon afterwards, at Bristol, he engaged with Southey in a visionary scheme to found a *Pantisocracy*, or ideal communistic settlement in America; but scarcity of funds fortunately arrested this at the outset. Here, also, a volume of poems was published, and in the next year (1795) C. married Miss Fricker, whose sister became the wife of Southey on the same day. He now lived at Nether Stowey, in Somersetshire, while Wordsworth resided at All-Foxden, a neighbouring village. Here C. remained for three years, during which some of his greatest works—*The Ancient Mariner*, *Christabel*, and *Remorse*—were composed. It was at this period that C. preached Unitarianism at Taunton. In 1798 the first edition of the *Lyrical Ballads* by Wordsworth and C. appeared, and in the same year the Wedgewoods gave him the means of visiting Germany. On his return he translated Schiller's *Wallenstein*, which appeared in 1800. C. now resided at Keswick. From 1804 to 1806 he travelled on the Continent, spending the first part of this period in Malta as secretary to the governor. In 1808 he lectured in London on poetry and the fine arts; but from this time till 1816 he was under the mastery of opium. In that year he made a heroic and happily successful effort to break off the habit; and coming then into contact with Gillman, lived in his house at Highgate until he died, after four years' confinement to a sick-room, on the 25th of July, 1834. During the latter part of his life C. was an orthodox Trinitarian.

C.'s genius was subtle, comprehensive, and eminently original. As a critic, he shows keen insight and exquisite taste. As a philosophic writer, though he embodied no definite scheme and founded no special school, and is at times misty and desultory, he is yet, by his enthusiasm and learning, by the vivifying influence which he exerted over reproductive minds, entitled to be considered, as John Mill said, one of our chief 'seminal' thinkers. His teaching was a strong check to the Benthamism of his day, and his marvellous conversational powers lent him a Socratic influence over many of his youthful contemporaries. Along with De Quincey, he may be regarded as the first interpreter of German thought to Englishmen. His chief prose works are *Statesman's Manual* (1816), *Biographical Sketches* (1817), *Biographia Literaria* (1817), *The Friend* (1818), *Aids to Reflection* (1825), *Constitution of Church and State* (1830). But it is as a poet that his fame is highest and will be most lasting. *The Ancient Mariner* and *Christabel*, in which he introduced the form of lyrical narrative adopted by Byron and Scott, are full of thrilling weirdness and enchanting melody. *Kubla Khan* is a bewitching extravaganza of delicious cadences and dreamy Oriental splendour. His *Odes to France, Love, Youth and Age*, and other shorter pieces, delight us by their tender sentiment, soft fanciful colour, and unsurpassably rich and sweet music. The *Hymn in the Vale of Chamouni* stands apart from his other works. It is marked by sustained and lofty imagination, by solemn and austere religious sentiment. His dramatic attempts are not part of his characteristic work; they neither add to nor lessen his fame. See C.'s *Biographia Literaria; Specimens of C.'s Table-Talk;* Cottle's *Early Recollections of S. T. C.;* and Gillman's *Life of S. T. C.*—**Hartley C.,** eldest son of S. T. C., was born in 1796, at Clevedon, near Bristol. His early years gave evidence of great talent, but through his irregular conduct at Oxford University he forfeited the Oriel Scholarship. After some profitless life in London he went to Ambleside, and there remained till his death, 6th January, 1849. C.'s sonnets, though admirable, are excelled by his prose works, of which the chief are *Lives of Northern Worthies* and *Life of Massinger*. See *Memoir of Hartley C.* by Derwent C.; also an article in *Macmillan's Magazine*, vol. v., by Lord (formerly Sir J. D.) C.—**The Rev. Derwent C.,** son of S. T. C., was born at Keswick, 14th September, 1800. He was educated at Cambridge, served as a tutor in Plymouth, and was from 1841 to 1864 Principal of St. Mark's College, Chelsea. He afterwards became rector of Hanwell, Middlesex. He is author of a *Memoir* of his brother, H. C., whose poems and prose remains he edited; of a work on *The Scriptural Character of the English Church*, and of a Life of Winthrop Mackworth Praed. In 1861 he addressed two letters on Education to his cousin the Right Hon. Sir John T. C.—**Henry Nelson C.,** son of S. T. C.'s brother, Colonel C., was born in 1800. He wrote a work entitled *Six Months in the*

West Indies, and an *Introduction of the Greek Classic Poets*, but is best known for his *Specimens of the Table-Talk of S. T. C.*, which he published in 1835. He contributed to various periodicals, and died 26th January, 1843.—**The Right Hon. Sir John Taylor C.**, nephew of S. T. C., was born at Tiverton, Devon, 9th July, 1790. He was educated at Oxford, where he became a fellow of Exeter College, was called to the bar at the Middle Temple in 1819, was appointed serjeant-at-law in 1832, judge of King's Bench in 1835, and privy councillor in 1858. He was made D.C.L. of Oxford in 1852, and was editor of the *Quarterly* after Gifford's death, published an edition of *Blackstone's Commentaries* in 1825, and a *Memoir of Keble* in 1869. He died 11th February, 1876.—**Lord C., The Right Hon. John Duke**, son of the above, was born 3rd December, 1820, educated at Eton and Oxford, and called to the bar at the Middle Temple in 1846. He was made Recorder of Portsmouth in 1858, and a Queen's Counsel in 1861. After contesting Exeter unsuccessfully in 1864, he was elected for that city in 1865; was made Solicitor-General in 1871, and in 1873 was appointed Lord Chief Justice, and raised to the peerage, with the title of Baron C. of Ottery St. Mary's, Devon. He was a man of fine literary as well as legal acquirements, and at one time contributed to various periodicals. Died 14th June, 1894.

Coleroon', a river of India, the northern branch of the Cauvery, in the Carnatic, and forming through the greater part of its course of 93 miles the boundary between the districts of Trichinopoly and Tanjore. It falls into the Bay of Bengal 120 miles S.S.W. of Madras. From the constant deepening of the bed of the C., and a corresponding rising of that of the Cauvery, the supply of water in the latter river had become inadequate to the proper irrigation of Tanjore. This was remedied by throwing two weirs, locally called *anicuts*, across the C. in 1856. The lower *anicut* is 1901 feet long, and cost £30,000, but the revenue in S. Arcot since the construction has increased £10,000 per annum.

Colet, John, an English scholar and patron of learning, the son of Sir Henry C., a city knight, who had been twice Lord Mayor of London, was born in 1466, studied at Magdalen College, Oxford, and after spending some time in Paris, went to Italy to learn Greek. In 1504 he became Doctor of Divinity, and in 1505 Dean of St. Paul's. The death of his father in 1510 gave him the possession of an ample fortune, with part of which he at once began to found St. Paul's School. After a generous and enthusiastic career, in which he laboured with equal zeal for the revival of learning and the reformation of religion, he died, 16th September, 1519. C. had a thoroughly modern mind. An intense scorn of those mediæval beliefs, which constitute the peculiarities of Roman Catholicism, animated all his preaching; the picture of Christ drawn by the Evangelists appeared to him the only thing worthy of absolute reverence. It is not surprising that his impatient eloquence alarmed the old-world party, and but for the help of the liberal Archbishop Wareham, he might have suffered persecution as a heretic. Later on, in Henry's reign, C. would certainly not have escaped trouble. Among his published works are a treatise on the sacraments of the Church, and two treatises on the Hierarchies of Dionysius; others exist in MS. at Oxford. See Seebohm's *Oxford Reformers of* 1498, and Green's *Short History of the English People* (1875).

Col'ic (Gr. *kōlikos*, from *kōlon*, 'the large intestine') is an internal disease, painfully affecting the stomach. The face has a peculiar anxious expression. Pain may be alleviated by pressure, and hence C. is distinguished from inflammation, in which pressure always aggravates the pain. C. may be due to indigestion, or to cold, &c., when opium, chloroform, ether, or belladonna gives relief. In all cases poultices or hot fomentations do good. Sometimes C. is caused by working amongst minerals, as copper or lead. Copper C. and lead C. are characterised by the severity of the pain and the length of the spasms; in the former there is a purple line round the gums; in the latter there is a blue line round the gums. In both cases Epsom salts should be given. Lead C. is often called painter's C., because painters are subject to it from working with lead paints.

Colicoden'dron, a tropical American genus of *Capparidaceæ*, all of which have acrid properties. *C. Yeo* of Brazil possesses the acrid principle to such an extent as to be dangerous to horses and mules (Von Martius).

Colign'i or **Colign'y**, the name of a French family, 'seigneurs' of Châtillon-sur-Loing in Burgundy, from whom have come several distinguished men.—**Gaspard de C.**, Marshal of France, was the first who entered the French service after the annexation of Burgundy by Louis XI. He accompanied Charles VIII. on his expedition to Naples, and Louis XII. in his conquest of the Milanese; was created marshal by François I. after the battle of Marignano, and received the governorship of Champagne and Picardy. By his marriage with Louise de Montmorency, daughter of the Constable of France, he greatly increased his influence. C. died 24th August, 1522. Of his two sons, one, **Odet de C.** (born 1515, died 1571), became a cardinal at the age of eighteen, but having embraced the doctrines of Calvin, was excommunicated by the Pope. He publicly espoused in his 'red robes' Elisabeth de Hauteville, who was sometimes called, in spite of the ecclesiastical curse, *Madame la Cardinale*. When the civil war broke out, Odet took part in all the strifes with the Guises, but was poisoned by his valet (at whose instigation is not known) after the peace of 1570.—A still more notable person is his younger brother, **Gaspard de C.**, admiral of France, a great soldier, and a leader of the Huguenots, who was born at Châtillon-sur-Loing, 16th February, 1517. Entering the army at an early age, he distinguished himself greatly during the reigns of François I. and Henri II. at Cerisales, Carignano, Rentri, and St. Quentin, and on other occasions. At first the colleague of Condé, and on his death his successor, in the leadership of the Huguenots, whose doctrines he had embraced from purely conscientious reasons, he fought bravely at the battles of Dreux, Jarnac, and Montcontour, and succeeded in securing an advantageous peace for his party in 1570. After an attempt had been made privately to assassinate him, on the instigation of the Guises, who were jealous of the influence which his powerful mind had acquired over Charles IX., C. perished in the Massacre of St. Bartholomew, 24th August, 1572. See De la Ponneraye's *Histoire de l'Amiral de C.* The family continued to be more or less conspicuous all through the 17th c.

Coli'ma, the capital of a state of the same name in Mexico,

Colima.

with a pop. estimated at 25,736. It is in a fertile plain near the volcano of C., which rises 12,003 feet above the level of the sea. Its port, of the same name, 40 miles S.S.W. from the city, has good anchorage, but is little frequented. The *state* of C., one of the Pacific states of Mexico, has an area of 2272 sq. miles and a pop. of 73,026. The coast-line extends 100 miles, and the land, which is in general of low elevation, yields excellent cotton and many tropical products.

Coll, one of the Inner Hebrides, N.W. of Mull, Argyllshire; length about 12½ miles; greatest breadth 3½ miles; highest summit 326 feet. Much of the soil is incapable of cultivation, but some spots are remarkably fertile. The inhabitants neglect the valuable ling fisheries on the coast, leaving them to be prosecuted by fishers from a distance. Pop. 522, showing a decrease of 121 since 1881.

Coll'ar-Beam, a piece of timber connecting horizontally opposite rafters, and placed above the level of the feet of the rafter. Also the straining piece of a queen-post truss.

Coll'aring, the neck or cylindrical part of a Doric or Tuscan column.

Collat'eral Se'curity is, in law, a security besides the main one for payment of a debt or for the discharge of an obligation. Such a security can never be available further than for securing the fulfilment of the principal obligation.

Collateral Success'ion is the succession of the brothers and sisters of the deceased. Formerly in Scotland no representation was allowed in succession to personal (moveable) estate; but now the issue of a predeceasing next of kin come in place of their parent in the succession to an intestate, and take the share to which the parent would have been entitled. See BROTHERS, LAW OF SUCCESSION AMONG, SUCCESSION.

Colla'tion, a term of Scotch law. The somewhat analogous one in English law is Hotch-pot (q.v.). C. is a provision of the law of Scotland by which the heritable and moveable (real and personal) succession of a deceased person may in certain circumstances be accumulated into one mass, and divided equally among the next of kin. C. may take place either between the heir in heritage and the executors, or amongst the younger children. If the heir accept the heritable (real) estate, he has no share in the moveable (personal) estate. But he may have his share in both by giving up his exclusive right to, that is collating, the heritage. C. may take place with regard to collaterals as well as to descendants.

Collation to a Benefice is, in England, the act by which a benefice is bestowed. C. comprises presentation and institution, so that where the bishop and patron are one, as he cannot present to himself, he confers the benefice by C.

Coll'e, a town in the province of Siena, Italy, 22 miles S.S.W. of Florence, on the Elsa. It is a bishop's see, has a cathedral and castle, several manufactories, especially paper-mills, and a trade in the corn, wine, oil, and silk produced in the neighbourhood. Pop. 8773.

Collec'tions at Churches. In England C. at C. are at the disposal of the incumbent and churchwardens. Should they disagree as to the distribution, they are to be disposed of as the ordinary shall appoint. (See OFFERTORY.) In Scotland money is still collected at the doors of churches. Formerly one-half of the sum collected by the Established churches was given in support of the poor, the other half was formed into a fund for the temporary relief of sudden distress. Collections at dissenting churches are the property of the congregation. By the present Poor Law Act it is provided that in all parishes in which poor's assessment is levied, the ordinary church collections shall belong to the kirk-sessions, to be applied to no other purposes than those to which they were legally applicable before the date of the Act.

Coll'ects are brief, comprehensive prayers found in all liturgies, and consisting of five parts: invocation, the reason on which the petition is founded, the petition itself, the benefit hoped for, and ascription of praise or mention of the Lord Jesus, or both. They were so called probably because they were originally concluding prayers offered up by the priest alone, in which the previous devotions were all *collected* or summed up, or because in the C. the voices of all the people were collected, as it were, into one, instead of its being said like litanies. See Blunt's *Dict. of Doctr. and Hist. Theology*.

Coll'ege (Lat. *collegium*, a number of persons united by the same office or calling, a corporation or fraternity), in ancient Rome was an association or corporation with a certain constitution, some of them resembling a modern guild, some being of a religious character, as of the pontiffs, the augurs, &c., and others concerned with government and administration. In modern times a C. is a court or council, as of cardinals, bishops, electors, &c.; a society or corporation banded together for a common object, and for mutual help in the preservation of their privileges, as a C. of physicians, surgeons, &c. C. also means a church inferior to a cathedral, which is served by clergy living in common. The commonest meaning of C., however, in England, is that of an academic establishment endowed with revenues, and connected with a university, whose students and teachers live together in particular buildings in a monastic way, and the president of which, with the other officers, teachers, and students, forms a corporation independent of the university. In Scotland C. is more nearly synonymous with university. It is so in the case of those of Glasgow and Edinburgh, and although there are two colleges in the University of Aberdeen, the two are simply united under the same government as one to form the university. In France the C. is a high-school of a superior kind, affiliated and subordinate to the university.

College of Arms. See HERALDS' COLLEGE.

College of Justice. This term has in Scotland been applied to the Court of Session or Supreme Civil Court, composed of Lords of Council and Session, and of the members and officers of court. The court receives the title of C. of J. in the Act of 1537, and the judges of it were in 1540 termed senators. By the Treaty of Union, no person can be appointed a judge of this court who has not served as an advocate or principal clerk of session for five years, or as a Writer to the Signet (q.v.) for ten years. The judge must be at least twenty-five years of age. The admission is made by the judges in virtue of a letter directed to them by the sovereign. There is a form of trial, but the court has no power to reject the presentee. See SESSION, COURT OF.

Colle'giate Churches were parish churches turned into capitular foundations to accommodate the overflow of canons from some of the cathedrals. They are thus inferior to cathedrals in not having a bishop's throne, although a bishop or even an archbishop was sometimes head of the chapter. See Walcott's *Sacred Archæology*.

Coll'ey, or **Collie,** the name given to a Scottish shepherd's dog. The origin of the name is not at all clear. Probably it comes from *colly*, 'grimy, black,' or it may have been called after the name of a person, C. its first breeder. The C. is one of the most sagacious of dogs. For shrewdness it is not excelled by the Newfoundland or the St. Bernard. It seems to combine the merits of both. It can take the water and retrieve like the former; it can gallop up precipices and descend into crevices after man or sheep with as sure a step, as keen a scent, as undaunted intrepidity and gentle carefulness for the lost, as the latter. The stories told about the acute and accurate knowledge of a C. dog are very numerous—indeed, they surpass those recorded of the St. Bernard. Hogg, the Ettrick Shepherd, says that at one time he had several hundred lambs, which he was taking to the fold. They scampered off over the hills in three separate divisions in different directions, defying all efforts to find them. Night came, and the search had to be given up. The dog remained at his task, and in the morning he was found in a gorge standing watch over the whole of the lambs. The C. is an ornamental as well as a useful dog. The general character of the head of the C. resembles that of a fox, the nose pointed the eye rather small, but full of intelligence, mingled with sagacious craft, the ears half prick, the tips falling over somewhat, neck long and taper, shoulders and brisket deep, back rather short, coat thick and long, tail long, full feathered, and curling well over the back. The backs of the fore-legs should be feathered, the hind ones bare from the hocks, the hips wide and prominent, and the hocks well separated. The colour varies from bluish-grey and tan to lightish grey, from black and white and fawn to black and tan. An absolute necessity to the shepherd, the C. makes also a capital watchdog. Its size varies from about 18 inches to 2 feet in height.

Coll'ier, Jeremy, a nonjuring divine and polemic, was born 23rd September, 1650, and studied at Cambridge University; was appointed rector of Ampton in 1679, and chosen lecturer at Gray's Inn in 1685. His life was one long controversy. He was strongly opposed to the Revolution of 1688, writing bitter pamphlets against the Government, and falling foul of Bishop Burnet. For this he was twice imprisoned. The latter portion of his life was occupied with a more useful strife, which he commenced with a pamphlet, entitled *A Short View of the Immorality and Profaneness of the English Stage* (1698). The wits of the day, including Congreve and Farquhar, endeavoured to meet C., but he beat them at their own weapon of satire, and he is generally credited with having aided much in purifying the stage. After a life spent in literary activity, he died, 26th April, 1726. Among his other works may be mentioned an *Ecclesiastical History of England*, and a translation of the *Meditations* of Marcus Aurelius, which has been praised by Matthew Arnold.

Collier, John Payne, born in London, 11th January, 1789, descended from the celebrated Jeremy C., and for a time law and parliamentary reporter on the staff of the *Morning Chronicle*, is known as one of the most able commentators on Shakspeare and Shakspeare's contemporaries. In 1831 he published a *History of English Dramatic Poetry to the Time of Shakspeare, and Annals of the Stage to the Restoration*. It was followed in 1835 by *New Facts regarding the Life of Shakspeare*. The work, however, which created the greatest sensation was a volume published in 1853, bearing the title *Notes and Emendations to the Text of Shakspeare's Plays, from Early Manuscript Corrections in a Copy of the Folio of* 1632, *in the Possession of J. P. C.* The publication of this book caused a prolonged, fierce, and somewhat painful controversy, but the bulk of C.'s emendations seem now to be accepted by Shaksperian editors. Among the later noteworthy works of C. are a *Bibliographical Account of Rare Books* (1865), a series of reprints of the productions of early British poets and pamphleteers, and an edition of Shakspeare, completed in 1875.

Colliers, Coal-bearers, and Salters. The workmen at coal-pits and salt-works in Scotland were formerly under servitude. They became bound, independent of agreement, merely by entering the works, to perpetual service there; and in the event of sale or alienation of the ground in which the works were, the right over the workmen passed to the purchaser without express grant. This slavery was abolished by Act of Parliament 15 Geo. III. c. 28; made more effectual by another Act passed in the thirty-ninth year of the reign of Geo. III. See COAL-MINES REGULATION ACTS.

Collimation, Line of, the straight line which passes through the centre of the object-glass of a telescope and the intersection of the wires placed at the focus. The difference between the actual line and the true axis of symmetry of the telescope is termed the *error of C.*

Coll'ine (Gr. *kolla*, 'glue'), a term applied to gelatine, isinglass, and glue.

Coll'ingwood, Cuthbert, Admiral Lord, an English naval commander, was born at Newcastle-upon-Tyne, 26th September, 1750. From the early age of eleven, at which he became a midshipman, he served in the navy, his thorough seamanship, coolness, and courage enabling him to rise rapidly in his profession. He distinguished himself in 1794, when Howe beat the French off Brest, and in the battle of Cape St. Vincent in 1797. Finally, at the battle of Trafalgar, in 1805, he broke the enemy's line, and completed the victory on the death of Nelson, whose devoted friend and admirer he had been throughout life. He was rewarded with a peerage. C. died at sea, 7th March, 1810, lamented by the country and his sailors, who called him their 'father.' His *Despatches and Correspondence* were published by his nephew (Lond. 1828).

Coll'ins, Anthony, a noted freethinker, born at Heston, Middlesex, 21st June, 1676, and educated at Eton and Cambridge. He produced various shrewd and acute works, and was the friend of Locke and Le Clerc. C., who led an upright and benevolent life, died 13th December, 1729. His chief work is a *Discourse on Freethinking*. He also wrote an *Essay concerning the Use of the Human Understanding* (1707), *an Inquiry concerning Liberty and Necessity* (1715), and a book on the *Grounds and Reasons of the Christian Religion* (1724), all of which provoked vehement controversies in their days.

Collins, William, one of the best English poets of the 18th century, was born 25th December, 1721, at Chichester, where his father was a hatter. He was educated at Winchester (where, according to Warton, he wrote his *Persian Eclogues* at the age of seventeen), and at Magdalen College, Oxford. On leaving the university he went to London as a literary adventurer, and passed twelve years in toiling and idling, starving and revelling, framing projects which were never realised, publishing poems which were not favourably received, until the death of an uncle raised him above urgent want. But his sufferings had unfitted him for intellectual effort; he became nervous and partially insane, and died 12th June, 1759, in his thirty-ninth year. Hazlitt declared that C. was the only one of the minor poets of whom it could not be said that he might not have done the greatest things. With the exception of Blake, he was the most purely poetic spirit of his century. His *Persian Eclogues* (first published in 1742, and again in 1757, under the title of *Oriental Eclogues*) won the praise of Goldsmith, but have not the glow and splendour of the East. His *Odes* (1746) awoke no response in the public, but they have always been favourites with poetic minds. Nothing more delicately imaginative, pensive, and musical, rich in colour and choice in diction, was produced in the 18th c. That on *The Passions* is unsurpassed for bold and vivid personification, and exquisite changes of melody; while the *Ode to Evening* is one of the sweetest, airiest pieces in the language. Every word is faultless, every tone is true. See Moy Thomas's Memoir, prefixed to the Aldine edition of C.'s works.

Collins, William, R.A., born in London, 18th September, 1787, first exhibited at the Royal Academy in 1807, and was elected Associate in 1814, and R.A. in 1820. After the death of his father in 1812 he found himself obliged to paint portraits, though the special branch of art in which, in the earlier part of his life, he took most delight, was landscape, with rustic or homely figures. In 1814, however, he commenced to paint coast scenery, and following this path, arrived at fame and fortune. C. died in London, 17th February, 1847. Among his works, which excel in truth of form, chiaroscuro, and colour, probably the best known are, 'Happy as a King' (1836), 'The Shrimpers—Evening' (1831), and the 'Fisherman's Widow' (1835). See his *Biography* (Lond. 1848), written by his son, **William Wilkie C.,** who attained high distinction as a novelist. He was born in London, January, 1824, and intended for a commercial career, but turned aside to literature, commencing with the biography of his father. Among his earlier fictions are *Antonina* (1850) and *Basil* (1852). C. became a fellow-worker with Dickens in *Household Words*, in which appeared *After Dark* (1856) and *The Dead Secret* (1857). An immense accession to C.'s popularity was given by his *Woman in White* (1859-60). Since then he may be considered to have held a leading place among English novelists. Later productions were *The Moonstone* (1868), *Man and Wife* (1870), *The New Magdalen* (1873), and *The Law and the Lady* (1875), &c. Several of these have been dramatised. All C.'s works are remarkable for vivid portraiture, startling incident, and a surprising intricacy of plot, which at once perplexes and captivates the reader. He died 23rd September, 1889.

Collis'ion of Vessels. To prevent collision of vessels, steering and sailing rules have been laid down by the Merchant and Shipping Amendment (1862) Act. In the Court of Admiralty it has been held that where loss arises from a tempest, or Act of God (q.v.), as it is termed, the loss falls where it lights; when there has probably been fault, but no one can say who has been chiefly to blame, the loss is divided equally, or in proportion to the respective value of the ships. If the fault be clearly on one side, the owners of the ship in fault are answerable for damage. The Common Law regarded the negligence of both parties contributing to the loss, neither could bring an action, but if either with ordinary care could have avoided the disaster then the loss must fall upon that party. The Judicature Act of 1873, however, provided that in this respect or in any other where the Common Law differed from the rule in the Admiralty Court, the latter should be followed. A steam-vessel is bound to keep out of the way of a sailing-vessel, and a sailing-vessel running before the wind is bound in all ordinary cases to give way to one beating up against the wind.

Collo'dion (formed from the Gr. *kollaō*, 'I cause to stick') is a solution of a particular kind of *gun-cotton* (see CELLULOSE and GUN-COTTON) in a mixture of alcohol and ether, and is largely employed in photography and surgery. C. was discovered by Maynard, a physician of Boston. The best kind of gun-cotton for C. is prepared by soaking 1 part of cotton-wool in a cooled mixture of 16 parts of nitre, 12 parts of fuming sulphuric acid (Nordhausen vitriol), and 12 parts of ordinary oil of vitriol. The wool should be stirred about in the mixture for five minutes, then washed for a long time in a current of cold water, squeezed, and allowed to dry in the air. To prepare C., 1 part of the gun-cotton is shaken in a bottle with 16 parts of ether; after some time 1-2 parts of absolute alcohol are added, and the mixture agitated till the wool disappears. The C. thus obtained should be filtered. C. is a clear, colourless, and more or less mucilaginous liquid. Its uses depend upon the fact that when spread over a surface and allowed to dry, a tenacious film is left, which adheres closely to the material on which the C. has been spread. Thus a wound or raw surface, if painted with C., becomes covered with an artificial skin, which completely protects it from the air. For surgical purposes *flexible C.* is employed. This consists of a mixture of 6 fluid ounces of C., 120 grains of Canada balsam, and 1 fluid drachm of castor oil. C. is also employed in making small balloons, and to protect caustic substances, &c., from the air.

Collodionised Paper Process, a photographic process, invented by Corbin, which consists in employing negative paper coated with gelatine as a support for the excited collodionised film, which is preserved by a thin layer of albumen and honey. To render the film sensitive it is immersed in a bath of aceto-nitrate of silver, after which it is washed and dried. Immersion in a solution of gallic acid to which a few drops of acetonitrate of silver have been added develops the picture.

Coll'ot d'Herbois, Jean Marie, one of the most sanguinary and ignoble characters of the French Revolution, was born at Paris in 1750. He was at first an actor and dramatist, but became prominent at the time of the Revolution, distinguishing himself as one of the most violent of the Jacobins. Sent (1793) by the Convention to Lyon after its surrender, he committed the most fearful atrocities, 1600 persons being, at his orders, destroyed by grapeshot or the guillotine. He contributed to the fall of Robespierre, but was nevertheless transported to Cayenne, where he died of fever, 8th January, 1796. The *Nouvelle Biographie Générale* gives a long list of C.'s comedies, which once, it seems, had some success, though they are now only remembered by the infamy of their author.

Collu'sion is a deceitful or fraudulent agreement between two or more persons to defraud someone of his right. When proved, it has the effect at common law of making void any transaction in which it occurs. Instances of C. frequently occur in arrangements between bankrupts and their creditors; and as the proof in such cases is often difficult, our bankrupt statutes have created certain legal presumptions of C. in cases of bankruptcy.

Col'man, George, the elder of two dramatists of the name (1733-94), was born at Florence. He was an industrious and successful writer, composing or adapting more than thirty plays, besides writing poems and publishing translations. He was for a time acting manager of Covent Garden Theatre, and subsequently purchased the Haymarket. Of his pieces, the *Jealous Wife* shows perhaps the most ability. His son, commonly known as 'the Younger' (1762-1836), educated at Westminster School, Christ Church, Oxford, and King's College, Aberdeen, was also an indefatigable writer of dramas, receiving large sums for many of them, one or two of which are still occasionally acted. He also managed the Haymarket Theatre, and for a time was Examiner of Plays. His latest work was a memoir of his life, which was published under the title of *Random Records* (Lond. 1830).

Col'mar, or **Kolmar,** formerly the capital of the French department of Haut-Rhin, fell to Germany in 1870, and is now the capital of Ober-Elsass. It stands on a plain at the confluence of the Lauch and the Fecht, about 2 miles from the foot of the Vosges Mountains. The most remarkable buildings are the cathedral (1363), Hôtel-de-Ville, and the college, which contains some pictures by Albert Dürer. It has a public library of 72,000 vols. Its chief manufactures are linens, calicoes, woollens, silks, paper, hosiery, and leather, and it is the entrepôt for cotton, iron, wine, and colonial produce for Switzerland. Under the Franks, C. was a royal court, called *Columbaria*, round which the town grew up. The Emperor Friedrich II. gave it municipal rights in 1226, and it was afterwards a free imperial city. Its fortifications, erected in 1552, were dismantled by Louis XIV. in 1673. The peace of Ryswick (1697) united it to France, in whose possession it remained till 1870. Pop. town 30,399, district 55,090.

Colne, a market-town in Lancashire, 32 miles N.E. of Manchester, on C. Water, a tributary of the Calder. Mousselines-de-laine and calicoes are manufactured, and in the vicinity, coal, slate, and lime abound. Archbishop Tillotson received the rudiments of his education at the grammar-school of C. Pop. reg. sub-dist. 53,369, and civ. par. 14,023.

Col'obus, a genus of Old World or Catarrhine monkeys, in which alone, of all the species, the thumbs are absent or at most very rudimentary. This genus is allied to *Semnopithecus*, and the *C. Ursinus*, *C. Satanas*, and *C. Guereza*, are familiar species. These monkeys exclusively inhabit Africa. See also MONKEY.

Colocolo, a large wild cat occurring in the N. of S. America. The back is grey, the belly white, and streaks of black are drawn along the body and legs. It feeds principally on monkeys. In size it is similar to the ocelot.

Colocolo.

Col'ocynth, a medicinal substance consisting of the dried pulp of the Bitter Cucumber, a plant which is a native of the S. of Europe, and bears some resemblance to the common water-melon. C. is a light spongy yellowish-white substance, intensely bitter, and about the size of a small orange. It is imported chiefly from Smyrna, Trieste, France, and Spain. Its active principle is *Colocynthin*.

Bitter Cucumber.

Cologne′, the French form of the German Köln (q.v.).

Cologne Yellow, used for lacquering, and generally as an oil or water colour, is a mixture of chromate and sulphate of lead with sulphate of calcium.

Colomba′no, San, a small town of N. Italy, province of Milano, in a hilly district, 9 miles S. of Lodi. In the vicinity are found felspar, red granite, and limestone.

Colom′bia, United States of, formerly **New Granada,** a federal republic of S. America, is bounded N. by the Caribbean Sea, S. by Ecuador and Brazil, E. by Venezuela, and W. by the Pacific. It is divided into nine states or departments, each of which has area, population, and capital town, as given in the following table:—

Departments.	Area in Sq. Miles.	Population.	Capital Town.
Antioquia . . .	22,316	466,200	Medellin
Bolivar . . .	21,345	286,060	Cartagena
Boyacá . . .	33,351	699,874	Tunja
Cauca . . .	257,462	623,480	Popayan
Cundinamarca . .	79,810	571,200	Bogotá
Magdalena . .	24,440	92,170	Santa Marta
Panama . . .	31,571	288,320	Panama
Santander . . .	16,409	571,000	Bucuramanga
Tolima . . .	18,069	309,220	Ibagué
Total . . .	504,773	3,907,524	

In the W. it is traversed by the great triple range of the Andes, alternating with lofty plateaux, while in the E. and S.E. it is spread out in magnificent *llanos*, covered with dense forests, and forming the basin of the upper waters of the Orinoco and Rio del Negro. Its great river is the Magdalena, which flows throughout the state from N. to S., receives the Cauca and many smaller tributaries, and enters the Caribbean Sea after a course of 900 miles. There is every variety of climate, from the tropical heat of the coasts to the intense cold of the region of perpetual snow. The soil is fertile, but, so far at present, only a small portion has been brought under cultivation; the chief products being vegetable ivory, rubber, dyewoods, tobacco (Ambalema and Palmira), sugar, coffee, mahogany, cinchona bark, ipecacuanha, &c. Its mineral wealth is more important, consisting of gold and silver, (£650,000 annually), platinum, copper, mercury, lead, cinnabar, manganese, iron, salt, and emeralds. The Muzo emerald mines alone yield about £20,000 worth of stones annually. The foreign trade of C. is mainly with Great Britain and the United States. England receives most of the precious metals, and Germany nearly all the tobacco. Besides the railway across the isthmus of Panama (q.v.), there is a short line between Sabanilla, on the coast, and Barranquilla, where the navigation of the Magdalena begins. The Magdalena is ascended by regular lines of steam-vessels for some 800 miles. Among the industries, which are all somewhat primitive, the chief are agriculture, cattle-breeding, and mining. The capital is Bogotá. The inhabitants of the interior are mostly Indians, while the total number of white men does not greatly exceed one million. The Colombians are Roman Catholics, but no form of religion is protected by law. In spite of the opposition of the Catholic clergy, a compulsory state system of education has been established, there being 1832 schools with 95,000 scholars. There are also a national university (1700 students), 4 departmental colleges (1100 students), and several public and private institutions for secondary education. The press is free, and Government has abolished the penalty of death for crime. Each state of the republic is no longer independent, but by the constitution of 1886 it has become simply a department of the republic and its president a governor appointed by the President of the Republic. Legislation is carried on by two Houses—Senate, consisting of three members from each department; the House of Representatives, having 66 members elected every 4 years, one representative for every 50,000 inhabitants. The President is elected for six years' tenure of office. The army consists of 5500, but all able-bodied men are liable to serve in case of war.

The country, originally occupied by a semi-civilised tribe, called *Chibchas* or *Muyscas*, was conquered by Ximenes de Quesado (1536-37), and in 1718 was formed into a Spanish viceroyalty, comprising the districts Panama, Bogotá, and Quito. In 1819 it became independent of Spain, and was formed into a republic along with Venezuela and Ecuador. This union was dissolved, however, in 1829-30, and C. was converted into a separate republic in 1833. After several 'revolutions,' the constitution was finally remodelled, and the country received its present name on the 8th May, 1863, instead of that of New Granada.

Colom′bo (a Portuguese corruption of *Kalambu*, itself an Arabic corruption of the Sinhalese *Kalan-totta*, the 'Kalany-ferry'), is the capital of Ceylon, on the S.W. coast of the island, near the mouth of the Kalany-ganga, on a spit of land protected by a fort. It is the residence of the English governor, the seat of a colonial bishop, and has a pop. of 126,825. Among the more notable buildings are the cathedral, and other Christian churches, Protestant and Catholic, a Mohammedan mosque, a military hospital, and an orphanage. The houses, both of the Europeans and natives, are so hidden in clumps of coco-palms and other tropical trees that the town presents the appearance of a forest. C. may be divided into the European or White Town in the neighbourhood of the fort, and the *Pettah* or Black Town, in which most of the magazines and warehouses are situated. The esplanade of Galle-Face forms the public park of the city. C. is the chief station for steamships in Ceylon, very few resorting to the southern port of Point-de-Galle. C. possesses a European society of considerable culture. There are a museum and a public library. C. is connected with Kandy, in the centre of the island, by a railway 75 miles long, and with other parts of the island.

Colonel (Fr. from the Ital. *colonnello*, a dim. of *colonna*, 'a column'; or, according to others, but with less probability, it is Lat. *coronalis*, from *corona*, 'a crown'), in the British army, is the highest officer attached to a regiment. Except in the Engineers and Artillery, the office is a sinecure, bestowed, presumably, as a reward for long service. Besides the regimental rank of C., there is the rank of brevet-C., through which every officer must pass before he becomes a general officer. See Brevet, General Officer.

Colo′nia do Santiss′imo Sacramen′to, a strong seaport of Uruguay (Banda Oriental), on the N. bank of the Plata, opposite Buenos-Ayres. In 1845 the combined English and French fleet retook it from Rosas, then Dictator of Buenos-Ayres, to keep the navigation of the upper part of the river free.

Colo′nial Corps were certain regiments forming part of the regular British army, but devoted to the service of the colonies. As the colonies became self-ruling, it came to be considered contrary to imperial interest to keep up forces not available for general imperial purposes. The C. C. have accordingly been disbanded, except the Malta Fencibles and two West Indian regiments.

Col′onies, Laws of England regarding. All persons charged in any colony with an offence committed on the sea, may be dealt with as if the offence had been committed within the jurisdiction of the colonial court, and shall receive the same punishment as would have followed on conviction in England. The term *colony* includes all possessions abroad in which there is a legislature, except the Channel Islands and the Isle of Man. Colonial law is void if contrary to Act of the Imperial Parliament made in respect of that colony, or if contrary to any order made under such Act; but mere inconsistency with instructions from the Home Government will not make it void. Statute 28 and 29 Vict. c. 63, provides for and defines generally all legislative powers of a colony.

Colonn′a, an illustrious Roman family, which takes its name from a small village on the Alban Hills in the old compartimento of Latium, now belonging to the Rospigliosi-Pallavicini family. It traces its origin to the Counts of Tusculum, who in the 10th and 11th centuries enjoyed the highest estimation at Rome, but it first came forward independently about the close of the 11th c., and from that time till far on in the 16th it played a part surpassed in distinction by no Roman family except its hereditary rival and foe—the Orsini. By numerous fortresses, built all along the Alban and Sabine Hills to the very borders of Naples, it became repeatedly a source of terror, both to the Popes and to the Roman people, while it was perpetually mixing itself up in the bloody feuds of the age. Usually the Colonni figure as the heads of the Ghibelline party, but occasionally they are also found on the side of the Guelphs. The sons of Giovanni C. (who about 1278 was a Roman senator, and in 1288 Marchese of Ancona), **Stefano** and **Agapito,** were the founders of the two still flourishing lines of the C. family, that of *Palestrina* (now represented by the branches of C. di Sciarra, and Barberini-C.), and that of *Paliano,* usually called the line of the Grand Constable, with which is joined the subordinate branch *C.-Stigliano* in Naples. Pope Martin V. (**Oddone C.**), with numerous cardinals, generals, statesmen, scholars, and authors, belong to it, whose names are conspicuous in the ecclesiastical, political, and literary history of Italy. We can only notice here **Vittoria C.,** the most famous poetess of Italy, who was the daughter of Fabrizio C., Grand Constable of Naples, and was born at Marino in 1490. In 1507 she was married to Ferrante d'Avalos, who soon after came to his father's title—Marchese de Pescara—and who died in 1525 of wounds received in the battle of Pavia. Overwhelmed with grief, the young widow sought consolation in solitude, in study, and in religion. She occupied herself with poetical composition, and her verse, which in her early widowhood musically bewailed her lost husband, drew its inspiration in later years from elevated religious feeling. Her poems, the best edition of which was published (with a memoir) at Rome (1840) by Ercole Visconti, are perhaps too faithfully modelled on the style of Petrarch, but evince an exquisite talent and genuine sentiment. Her beauty and talents, which are said to have attracted the affectionate regard of Michael Angelo, are celebrated by Ariosto in the 37th canto of his *Furioso.* It may here be noted that the C. Palace in Rome, at the base of the Quirinal, is world-celebrated for its gallery of art and its magnificent gardens. See Coppi's *Memorie Colonnesi.*

Colonna, Cape (anc. *Sunium Promontorium,* Byron's 'Sunium's marble steep'), a headland of Greece, the most southerly point of Attica, rising almost perpendicularly from the sea to the height of 269 feet. Sixteen columns of white marble, the remains of a temple of Minerva, crown the steep and give it its name.

Colonnade′, a series of columns, placed at intervals, and arranged according to the rules of art, and of the particular order to which they belong.

Col′onsay ('the island of Columba'), one of the Inner Hebrides, W. of Jura, between Mull on the N. and Islay on the S. Separated from it by a narrow channel to the S., of not more than 100 yards wide, and dry at low water, is the isle of Oronsay. Together they are 12 miles long, with a breadth of from 1 to 3 miles. Potatoes and barley are grown, and black cattle and sheep of a superior breed are fed on the pastures. Oronsay contains the fine ruins of a priory, founded by the Lord of the Isles. Pop. of C. 358; of O. 23.

Col′ony has been applied to a great variety of settlements. The limited space possessed by the states of ancient Greece suggested the Doric colonies of Italy and Sicily, and the Ionic and Æolic colonies of Asia Minor. This was voluntary emigration of persons who proposed to form themselves into a self-supporting society, and who therefore seldom retained any connection (except that of a common religion) with the mother country. Their origin was, however, frequently appealed to for a temporary political purpose, and they were liable to be involved in the wars between the democratic and the aristocratic parties in Greece. The Greek term *apoikia,* or 'departure from home,' is therefore different in meaning from the Latin *colonia,* 'plantation of tenant-farmers,' which was made necessary by the disuse of the agrarian law. The latter were chiefly in the conquered provinces of Italy; they were accompanied by the *augur* and the *agrimensor* (who overthrew the ancient and consecrated the new boundaries); they had duumvirs, quinquennials, and decurions, in imitation of the consuls, censors, and prætors of Rome; these magistrates regulated local affairs, but political sovereignty remained at Rome. The C. was regarded by the better class of plebeians as an exile, as a renunciation of the Roman for a municipal franchise, and the state regarded it as a nursery for soldiers. Fifty such colonies were founded in Central Italy before the second Punic War, and at least twenty more from 197 to 177 B.C. in Italian Gaul, Campania, Apulia, &c. Some of these colonies were purely military, and had an ensign on their coinage; others were purely civil, *Coloniæ togatæ,* and had a plough on their coinage. The Roman C. differed from the *municipium* in this, that the former was entirely governed by Roman, the latter frequently by local law and custom. Modern examples of the military C. are Gibraltar, Aden, Malta, and St. Helena. Carthage introduced a different system of colonisation in the commercial factories which she planted round the Mediterranean, and which were imitated in the French and Dutch settlements in the East. The modern policy, however, as in the Spanish colonies of S. America, and in the African and Eastern colonies of Portugal, was to conquer the native race, and keep them down by a strong government, the members of which were taken from the home country. After the Seven Years' War (1763), England gradually took the place of France in Eastern colonisation. The English C., *par excellence,* was, however, a private adventure, as in Raleigh's Virginia, or a movement of conscience, as when the Pilgrim Fathers sailed for New England. The question of the supreme power of the mother country, which had been speculatively raised by Molyneux with regard to the Irish woollen trade, was strikingly illustrated by the failure of the directors of the Indian and African Company to give coherence or permanence to the Darien expedition. That company had, by Act of Parliament, power to make colonies, to defend commerce, and to make reprisals when attacked. Nevertheless, it was found necessary to declare war against Spain, and, of course, the unassisted C. was destroyed. But the political doctrine of trade reciprocity was a stronger link between the colonies and the mother country than even the feeling of allegiance. It was held, even in the time of Adam Smith, that it was important to bind the colonies to buy the manufactures of the mother country, while the latter gave the colonies a preferential market for raw produce. This monopoly was no doubt advantageous to the colonial capitalist, who flourished at the expense of the British consumer. The practice of restraining manufactures in the colonies is curiously counterbalanced by the modern protectionism of colonies, who find it impossible to compete with the free trade of the mother country. At the present day there exist three kinds of British colonies:—(1) those possessing responsible government where the Crown appoints the Governor and retains its veto on legislation; (2) where representative government is in force, and the Crown has only its power of veto, but where the public officers are under the control of the Crown; and (3) the Crown colonies which are absolutely controlled by the Home Colonial Department. Appeals from the colonial courts are taken to the Judicial Committee of the Privy Council. The C. is, however, disabled from such acts of independent sovereignty as the initiative in war, alliances, and diplomacy generally. Colonists are British subjects, and are treated as such by British consuls. Great Britain expends about £2,000,000 annually, chiefly for military and naval purposes, on certain of her colonies, not including India, and in return obtains about £250,000 as contributions to the payment of this sum.

Col'ophon, anciently an Ionian city of Asia, on the river Hales, 8 miles N. of Ephesus, was of little historical note, though its trade in resin is mentioned by Pliny. Mimnermus, the elegiac poet, was a native of C., and it claimed to be the birthplace of Homer. The Greek proverb, 'He has put the C., *i.e.* the finishing stroke, to it,' has probably no reference to the city, though Strabo says it originated in the fact that victory was assured to the party on whose side the famed Colophonian cavalry charged. The C., or inscription at the end of old printed books, contained the printer's name and the date and place of printing.

Colora'do (Span. 'red'), the name of two rivers in the U.S.; one rises in the Rocky Mountains, and, after a course of 1200 miles, flows into the Gulf of California; the other rises in the interior of Texas, and, after a course of 800 miles, flows into the Gulf of Mexico.

Colora'do, one of the United States of N. America, is situated among the Rocky Mountains. It is bounded by Wyoming on the N., Kansas and Nebraska on the E., New Mexico on the S., and Utah on the W., and has an area of 103,645 sq. miles. The chief rivers are the Rio Grande del Norte and the Arkansas. Pike's Peak is 11,497 feet above the sea. The discovery of gold in 1857 led to its settlement. The mineral resources of C. are immense, including not only gold but silver mines of great value, also gypsum, coal, iron, and salt. The annual yield of minerals amounts to over 41 millions of dollars. The amount of gold and silver taken from the mines amounts to over 27½ millions of dollars annually. The total debt, less sinking fund, of C. is $7,811,176. C. was admitted as a 'state' in 1876. Pop. in 1870, 39,864, and now 412,198, of whom 7730 are described as coloured. The state capital is Denver; other towns are Golden City, Mountain City, and Central City.

Colora'do Bee'tle, a genus of beetles noted for effecting great destruction in potato-fields. It has committed great ravages in America. All efforts to check this pest have been unavailing, the plants speedily succumbing to the attack of these insects, which appear frequently in great numbers. See POTATO.

Colorim'eter, an apparatus of great value in the art of dyeing for ascertaining the strength of dye-stuffs. A known weight of the colouring matter to be tested is suitably dissolved, and the colour it produces compared with a standard solution. The colorimetric test is generally applied by the intensity of colour produced by an ascertained depth of the solutions in two different graduated test-tubes.

Coloss'æ, a city of ancient Phrygia, on the Lycos, now the *Ak-su*, a tributary of the Mæander. Its people were famed for their skill in dyeing wool, but what Strabo means by *Collossean-dyed* is now unknown. C. was one of the early churches of Asia, and to its members Paul addressed an epistle.

Coloss'us, a Greek word whose origin is not known, signified a statue larger than life, but was more frequently applied to those enormously large figures which were so famous in Egyptian, Greek, and Roman art. The most celebrated Egyptian C. was the vocal statue of Memnon, in the plain of Thebes. Among the colossi of Greece, the most celebrated was the bronze statue of the Sun, by Chares of Lindus, which all agree to have been upwards of 105 English feet high, and which stood at the entrance of the harbour of Rhodes, though there is no authority for the statement that it did 'bestride' the harbour mouth. This, like the statue of Memnon, mentioned above, was one of the Seven Wonders of the ancient world. Among the famous colossi of Phidias were the ivory and gold statues of Zeus at Olympia, and of Athene in the Parthenon, and the bronze statue of the latter on the Acropolis, the point of whose spear and the crest of whose helmet were seen by sailors from the promontory of Sunium. At Rome, the most famous colossi were the statue of Jupiter on the Capitol, the bronze statue of Apollo at the Palatine Library, and the statue of Nero, which gave the adjoining amphitheatre the name of *Colosseum.*

Colos'trum, the first milk of mammalia, distinguished from ordinary milk by its yellowish colour and greater thickness, due to a large proportion of fatty principles, casein, milk-sugar, and solid constituents. See MILK.

Colour, in art, means that combination or modification of tints which is specially suited to produce a particular and desired effect in painting. Among the old masters, the greatest colourists either belong to the Venetian school, founded by Giorgione at the close of the 15th c., or were the pupils and imitators of the leaders of that school. Titian, Correggio, Paul Veronese, and Rubens are recognised generally as the greatest colourists. The excellence of C. lies, in part at least, in the subtle harmony which is seen to exist between it and the action or suggested meaning of the picture. *Local Colours* are the natural hues of objects arranged in special localities of a picture for the purpose of producing a desired picturesque effect. *Positive Colours* are the natural views of objects unaffected by any modification, as that of distance, reflected light, or the neighbourhood of colours that weaken or otherwise affect them. *Neutral Colours* are those the natural force of which is modified or broken by the reflected colours of surrounding objects.

In June, 1895, a lecture was given by Wallace Rimington on the subject of the production of colours as an expression of emotion. The new art, as explained by the lecturer, presents colour in a way different from that in which nature and art have hitherto shown it, namely, as something formal and immobile. C. will now be subjected to the influences of time, rhythm, and immediate and boundless combination. A notation of colour must, of course, be compiled, which will inform the reader at a glance of the combinations of colours and tints, just as a sheet of music instructs the reader as to the combinations of sounds described thereon. In time, instruments will be invented for treating colour just as others have for centuries dealt with sound. Colour in itself is beautiful, quite apart from form, and there would appear to be no reason for doubting the possibility of affecting the emotions through the eye by combinations of colours as they have been, and are being, influenced through the ear by combinations of sound. A 'Colour Organ' has been invented, which casts combinations of colour upon a screen somewhat on the same principle as a musical organ discharges sounds. Its object is to practically illustrate the physical analogy between sound and colour, and to present to the eye the *colour interpretation* of existing music.

Colour-Blindness is a peculiar affection consisting of an inability to distinguish one colour from another. It is often termed *Daltonism,* after the celebrated philosopher Dalton, who was subject to this affection. The most common variety of it is that in which the person cannot distinguish red from green. Poppies among green corn, or ripe fruit on a cherry-tree, have to them the same hue. Others can only distinguish black, white, and grey (which is really a mixture of black and white), and to them nature presents neutral tints only. It is said to be more common in the male than in the female. A harmless defect in most persons, it may be very serious in others, as in pointsmen, railway-guards, engine-drivers, or sailors, who have to know the meaning of signals made by coloured lights. The cause of C.-B. is not known. Three theories have been advanced: (1) that it is a defect of the structure of the retina of the eye; (2) that it is a peculiarity in the absorptive power of some of the fluids or transparent media of the eye; and (3) that the defect is in the sensorial centre in the brain. According to Dr. MacGowan, who has spent many years in various parts of the world, there is a complete absence of C.-B. among the Chinese. The American Indians are said to be almost free from the affection. Among civilised nations between 3 and 4 per cent. of the males, and two-tenths of 1 per cent. of the females suffer from C.-B. See EYE.

Co'lours, Metals, and **Furs,** are the three tinctures in Heraldry (q.v.). The metals, which are *or*, gold, and *argent*, silver, represent yellow and white, and always take precedence of the C., unless the contrary is specified. The five C. are *azure*, blue; *gules*, red; *sable*, black; *vert*, green; and *purpure*, purple; their abbreviations being az., gu., sa., vert., purp. *Tenne* or *tawny*, an orange colour, and *murrey* or *sanguine*, a dark crimson, are sometimes used, but very seldom now, in English heraldry. In French heraldry vert is called *sinople*. C. and metals, when engraved, are represented by a very convenient system of dots and lines; *or*, by dots; *argent*, is left plain; *az.*, is indicated by horizontal lines; *gu.*, by vertical lines; *sa.*, by horizontal and vertical lines, like a small check; *vert*, by diagonal lines from dexter to sinister, or heraldic right to left; and *purp.*, the reverse of the latter. *Tenne* is represented by vertical lines down through those of *purp.*; and *murrey* or *sanguine* by diagonal lines from both dexter and sinister, crossing each other.

Colours, Military, are the standards and other flags carried by a regiment. They are sentimentally regarded as symbolical of the achievements and renown of the regiment, and as forming an important part of 'the pomp and circumstance of glorious war.' Their chief use is to serve as a rallying point to the troops who serve with them, or to show to the men, following in the rear, the direction taken by the commander or front ranks.

Colt, Samuel, inventor of the C. revolver, was born in Hartford, Connecticut, U.S., 19th July, 1814, and in early life was successively a sailor and a 'lecturer.' In 1835 he took out a patent for the invention which gave him fame and wealth. In 1837 his revolver was used successfully in the Florida war, and still later in the Mexican war. C. erected large works in Hartford, on the banks of the Connecticut river, reclaiming a great deal of waste land for this purpose. He died 10th January, 1862.

Colts'foot. (See TUSSILAGO.) Sweet C. is the American name for *Nardosma*. West Indian C. is *Pothomorpha*.

Colubri'na, one of the chief divisions of the order *Ophidia* (q.v.) or Serpents (q.v.), distinguished by the fact that all its members possess solid teeth in the upper jaw, in addition to the poison-fangs with which that jaw may be provided. The fangs, when present, are immovably fixed in the mouth, and they may be deeply grooved, but never form completely hollowed or 'canaliculated' organs. The head gradually tapers off into the neck, and is not markedly triangular. It is covered by large-sized scales or *scuta*. The C. are divided into the three sections, *Innocua*, or harmless snakes; *Suspecta*; and *Venenosa*, or venomous forms. The *Innocua* possess no fangs or poison-gland, solid teeth existing in both jaws. Of this group the Boas and Pythons (q.v.), and the genus *Coluber*, represented by the common ringed or British snake, afford good specimens. This latter snake, found in Britain and Europe, inhabits mossy places generally, averages 3 feet in length, and is coloured pale olive, spotted with black above and whitish beneath. The neck is spotted yellow. The *Coluber Elaphis* of S. Europe, the Æsculapian snake of Italy, the black snake of America, are also examples of the same genus. The section *Suspecta* includes snakes with fangs placed far back in the upper jaw, and having solid teeth *in front* of them. These are all Old World snakes (*Homolopsidæ*), &c., and but little is known of their habits. The Colubrina *Venenosa* have fangs in front of the upper jaw, with solid teeth *behind* them. To this group belong the Cobras (q.v.), the water-snakes of the E. Indies, and many others. As implied by the name *Venenosa*, they are all particularly venomous.

Colum'ba, St., the apostle of the Scottish Highlands, was born at Gartan in Donegal, on the 7th December, 521. Fedhlimidh, his father, was of the Cinel Connal, a branch of whom, the Hy Neills, gave several kings to the N. of Ireland. His mother, Eithne (*Aine*), was of the royal race of Leinster. He thus possessed the advantage, especially valuable among a Celtic people, of royal lineage. His uncle was king of Ulster, and he was related to the kings of Dalriada in Argyllshire, his adopted country. He was baptised *Colum*, and was subsequently, from his Christian zeal, called *Colum Cille*—*i.e.*, 'Colum of the Church.' He began his education at Movile (*Magh-bile*, 'the plain of the large tree'), under the celebrated bishop St. Finnian, who ordained him as deacon. After studying some time in Leinster under an aged bard, Gemman, he entered the monasteries of Clonard and of Glasnaoidhein (Glas Nevin) near Dublin, whence he returned to the N. When twenty-five years of age he founded the Church of Derry in Ulster (*Daire*, 'oak copse,' the foundation of the since famous Londonderry), and about seven years later founded the monastery of Durrow (*Daire-magh*, 'the oak copse of the plain or field'). He planted various other churches from this period to the year 561, when an event occurred which was the great crisis in his life. Various accounts are given of the matter, but the following is the best authenticated:—C. copied a psalter belonging to Finnian without asking the owner's permission. (This transcript afterwards became famous as the *Cathach*, and is said to be still preserved by the O'Donnels as a very valuable relic.) Finnian claimed the copy as his property, C. refused to give it up, and the matter was referred to Diarmat, King of Connaught, who, on the principle that every *cowie* (calf) belongs to its cow (or mother), ruled that every *son-book* (copy) belongs to its book (the original). Far from yielding to this decision, C. raised a number of his clansmen, attacked and routed King Diarmat, slaying several of his followers. For this affray, which was called the battle of Culdrevny, C. is said to have been excommunicated and banished for ever from Ireland by a synod of Irish bishops. This is improbable, as it is certain that he afterwards revisited Ireland, and exerted great political and ecclesiastical influence there. The battle of Culdrevny, however, seems to have induced him to leave Ireland, and to enter on his missionary labours. In 563, C., then in his forty-second year, accompanied by twelve attendants or friends, some of them relatives, set sail for the W. of Scotland. Tradition states that he first landed at Salen, in the island of Mull, but finding the water unhealthy, he crossed to the other side of the island, and fixed his abode on Iona (q.v.). This small island has, from his day, been called *I Challum Cille* ('the isle of Colum of the Church'). The name Iona is shown by Reeves to have arisen from the mere carelessness of a transcriber, and has nothing to do either with Hebrew or with the Latin C. Scotland was at this period mainly peopled by the Southern Picts, occupying Wigtownshire, &c., the Strathclyde Britons or Cymri, whose capital was Dumbarton, the Northern Picts, who occupied the country N. of Athole along with the Hebrides, and the Scots, who ruled in Argyllshire. Connal, C.'s near relative, reigned in Argyll, and gave him whatever right he himself had over Iona. His people had embraced Christianity in Ireland. St. Ninian had ministered among the Southern Picts; St. Mungo was at that time labouring in the kingdom of Strathclyde; but the most numerous people of the whole, the Northern Picts, were still heathen. St. Adamnan tells of C.'s reaching the dwelling of the Pictish king, Brude, near Inverness, and after being for some time refused an interview, at length converting that monarch. He also relates that Brochan, King Brude's chief Druid, had a slave whom C. ordered him to release. He refused, but falling dangerously ill, he besought C.'s intercession for his recovery, which was promised, but on the condition of the slave's release. This was granted, and along with similar incidents, must have greatly advanced C.'s moral influence. In the *Book of Deer*, written in the 11th or 12th century, we read that he and his pupil Drostan came to *Abedoboir* (Aberdour) in the district of Buchan, where the Mormaor (high steward) Bede, a Pict, gave him in perpetuity that town, and that the town of Deer (*Deur*, tear) was conferred on him owing to the recovery of the Mormaor's son through the prayers of the Christians. We hear of C. also in Skye, and it is probable that he visited the Orkneys, while some of his successors took up their abode in Iceland. His biographer gives neither a minute nor a consecutive account of his travels, but merely fragmentary details.

We learn that in the year 573 his friend Connal, King of Dalriada, died, and the selection of his successor seems to have been mainly left to the decision of C. He chose Aidan, who proved himself the most talented of all his race. Next year we find him and King Aidan at the celebrated convention of Drumceat in Ireland, where, through his influence, various disputes between Argyll and Ulster were settled, and Argyll was made a free and independent kingdom. At this convention a sentence of death was passed on the bards for their rapacity and scurrility; but C. generously pleaded their cause, and procured a reversal of the decree, consenting, however, to a great reduction in their number. He visited his churches and monasteries in Ireland, and speedily returned to his beloved Iona. Here he passed peacefully away very early in the morning of the 9th June, 597, at the age of seventy-six.

Many interesting questions must be briefly passed over. We read of his conversing with his Pictish cousins, yet needing an interpreter in preaching. This seems to prove that the old Pictish language was a middle dialect between the Gaelic and the Cymric, possessing words common to both, but in several respects differing from either.

His establishment in Iona was simple and primitive, but not so rude as is often supposed. There was a most methodical arrangement of outhouses—or farm-offices, in modern language—among others, a byre, showing the error of the common notion that C. permitted no cows on the island. We also have mention alike of a kitchen and a cook, a baker and a butler.

As to the Church constitution established at Iona, while it is clear that C. himself was a mere presbyter, yet since Bede affirms that the province, and even the bishops, were subject to the Abbot of Iona, we must conclude that something like apostolic authority was exercised by the great missionary, and descended to his successors, though there is no evidence that any definite 'system' of ecclesiastical government was ever adopted by them. He greatly advanced religion in Ireland, and his successors carried the gospel to the N. of England. C. was a man of great energy and determination, but liable to outbursts of violence. He seems to have possessed an athletic frame, and Adamnan describes him as being of 'angelic beauty.' His biography, written by St. Adamnan (q.v.), has been issued, with notes and illustrations of the highest value, by Reeves. See also *Historians of Scotland*.

Col'umban or **Columba'nus, St.,** a native of Ireland, was born in Leinster about the middle of the 6th c. The Christian religion at this period flourished in Ireland as it did in no other country, and Irish missionaries went out far and wide to propagate it. C. was among the most famous of these. After a training at the monastery of Bangor—whose abbot was then Congall, the friend of Columba—C. departed for France in 589 along with twelve companions, the customary number in such cases. Here he established religious houses at Fontaine, Annegray, Luxeuil in Burgundy. His reproofs, however, offended King Theodoric, and this, together with a dispute as to the celebration of Easter, compelled the Irish monks to leave the country in 610. After travelling through Switzerland, C. founded in 612 the celebrated monastery of Bobbio among the Apennines, on the river Trebbia, where he died three years later, having by his work aided much in advancing Western Christianity. His writings, which are in Latin, comprise twelve sermons, a monastic rule famed for its brevity and simplicity, some poems, and ecclesiastical treatises. M. Guizot has praised his sermons for their eloquence and power. C.'s works are contained in the *Collectanea Sacra* of Flemming (Louv. 1667), and his Life was written by Abbot Jonas, a successor in the abbacy of Bobbio. C.'s name is preserved in the Lombard town of San Colombano.

Columba'rium (Lat.), a dove-cot. The term was also applied to a sepulchral chamber fitted up with niches resembling the holes of a pigeon-house, for the reception of funeral urns, called *ollæ*, and formed of baked clay. In these the ashes of the freedmen and slaves of great families were frequently deposited. A very perfect C. was discovered at the Villa Rufini near Rome in 1822.

Colum'bia, or **Or'egon,** originally a vast region of N. America, on the Pacific slope, extending from California to Alaska. It was claimed both by Spain and England, and was for some time a cause of dispute between the U.S. and England. By the treaty of 12th June, 1846, the present boundary—49° and the Strait of Fuca—was agreed upon, and the original region is now divided into British C. (a province of Canada), the state of Oregon, and the territory of Washington.

Columbia, British, a province of the Dominion of Canada, is bounded E. by the Rocky Mountains, W. by the Pacific Ocean, S. by Washington Territory, and N. by the rivers Simpson and Peace. It includes Vancouver's Island (q.v.), and has an area of 382,300 sq. miles, and a pop. of 98,173. The province has a rugged coast-line of some 700 miles, along which are scattered numerous islands, the largest after Vancouver being Queen Charlotte Island, Pitt Island, and Prince Royal Island. The mainland is traversed from N. to S. by two westerly ranges of the Rocky Mountains, and is watered by the Fraser, with its tributary the Thomson, and by the Simpson, the Columbia, and the Skeena. The climate varies greatly, according to the altitude and distance from the sea, but in the most populous parts it is temperate and equable, the temperature ranging from 75° F. in summer to 22° in winter. There are occasional tracts of rich arable land, and the hills and plains everywhere afford excellent bunch-grass pasture. Immense forests of cedar, pine, oak, maple, &c., offer inexhaustible supplies to a rapidly growing timber trade. Sea-otters, black, red, and silver foxes, fur seals, martens, beavers, &c., yield costly furs, while there are also buffaloes, bears, deer, goats, and grouse and other game in abundance. The fish found on the coasts and in the rivers include whales, seals, sturgeon, salmon, cod, halibut, anchovies, &c. The Fraser is specially famed for its salmon and its small oily 'oulachans.' The fish produce for 1893 was valued at £888,972. But the importance of the province is mainly owing to its vast mineral resources. The mountains are composed chiefly of granite or mica-schist, with here and there masses of sandstone, limestone, and intruded trap, interbedded with clay-slate, containing auriferous quartz. To the N. coal-beds and iron pyrites occur, the latter in great quantities. Gold is found everywhere, and among the other minerals are silver, iron, and copper. Steam-vessels are now plying on the rivers, and the Pacific Canadian Railway with its terminus in Vancouver's Island, after passing through the province, was completed in 1885. The capital is Victoria, at which the imports in 1893 were valued at £636,546, and the exports at £410,821; and the other important places are New Westminster, Fort Alexander and Fort George. B. C. became a member of the Dominion of Canada in 1871. It sends six representatives to the Parliament at Ottawa, and has a local Legislature, consisting of 33 members, an Executive Council, and is presided over by a Lieutenant-Governor, appointed by the Governor-General. There are 150 schools of the higher grade, with 10,780 pupils under 230 teachers, and 282 public schools. The schools are entirely supported by Government. The revenue is estimated at £205,000, and the expenditure at £287,000, the net amount of public debt being over £339,000.

Columbia College, New York city, was founded in 1754, and is the fifth in regard to age in the U.S. It is controlled by the Episcopalians. C. C. has a law school, and a flourishing 'School of Mines.' In 1888 it was opened to women.

Columbia, District of, is the seat of the Federal Government of the United States. It lies on the left bank of the Potomac, at the head of sloop-navigation, and originally belonged to the state of Maryland. When it was found necessary to establish the general Government in a district free from any local state jurisdiction, Maryland and Virginia gave up for this purpose a piece of land 100 sq. miles. The part on the right bank of the Potomac was afterwards given back to Virginia, and the D. of C. is now 60 sq. miles. It is governed municipally by three commissioners appointed by the President, is not represented in Congress, and has no municipal legislative body. The citizens do not vote on national or municipal concerns. It is co-extensive with the city of Washington. Pop. of district is 230,392, of whom about one-third are coloured.

Columbia River, or **Oregon** (the latter is the Indian name), the largest river on the W. side of N. America, rises in the Rocky Mountains. It pursues a winding course, and with its large and numerous tributaries drains an extensive region. Latterly it flows almost due W., near the N. boundary of the state of Oregon, and after a course of 1000 miles, enters the Pacific between Cape Disappointment and Point Adams. It furnishes the only harbour on the Pacific slope between San Francisco and Port Discovery, but although the mouth is 5 miles wide, there are only 4 or 5 fathoms of water at the bar. Navigation is open both to English and Americans, but vessels can only ascend about 100 miles. The river was discovered by Captain Gray of Boston in 1792, who gave the name of his vessel, C., to it.

Colum'bidæ, a group of birds usually included among the sub-orders of the Insessores or Perchers, but occasionally considered a separate order of the class *Aves*. The C. are represented by the various groups of doves and pigeons. They perch on trees, a habit which ordinary Rasores do not exhibit. The upper mandible is horny, and arched at its apex, whilst it is also arched at its base, where the nostrils, covered by a cartilaginous plate, are situated. This plate is usually covered by a soft vascular membrane, which may appear in the form of a wart-like process. The wings of the C. are more powerful than those of ordinary Rasores. The hinder toe is as well developed as the three front toes, and is placed on the same level as the latter digits. These birds are all monogamous, and generally pair for life. Their young are born in a naked, helpless state, and thus differ from the young of Rasores. The crop is double, and of large size. The C. inhabit both warm and temperate climates, and from their susceptibility of domestication present innumerable varieties. The rock-dove is the progenitor of our domestic breeds. See also CARRIER PIGEON, DOVE, FRUIT PIGEON, GOURA, GROUND PIGEON OR DOVE, PASSENGER PIGEON, &c.

Rock-Dove.

Col'umbine, a genus of plants of the natural order *Ranunculaceæ*. There are various so-called species—many no doubt only varieties of each other—of which the best known is the common C., long a favourite garden flower, and at one time esteemed in medicine as a diuretic and aperient. Most of the species of it are natives of the temperate and colder regions of the northern hemisphere.

Colum'bium, or **Nio'bium,** a rare metal, discovered in 1801 in *Columbite* from Massachusetts, and since then in a few other minerals. C. is identical with Rose's niobium, and not with tantalum, as supposed by Wollaston.

Colum'bus (the Latinised form of the Ital. *Colombo*, Span. *Colon*), **Christopher,** born at Genoa in 1436, was the son of a woolcomber, and was sent at an early age to school at Pavia, where he showed a taste for geography, geometry, and astronomy. At the age of fourteen he went to sea, and after having made a number of voyages in the Mediterranean, he made the bolder venture of a voyage to Iceland in 1467. About 1470 he settled in Lisbon, and married Phillipa Palestrello, the daughter of an Italian navigator, who, dying soon afterwards, left to his son-in-law all his charts, maps, journals, instruments, &c. These C. turned to account by constructing globes and maps for sale to support his family. About this time also he joined several successful expeditions to Guinea. At what period he at first conceived the idea of a passage westward to the shores of India it would be difficult to determine. His expeditions, however, to Iceland (where he *may* have read the record or heard the story of the earlier Norse discovery), to Madeira, the Canaries, the Azores, and the Portuguese settlements of Africa, suggested to him the possibility of crossing the Atlantic. His magnanimous spirit rose to the conception of the sea-passage to India, and he proposed his plans for the discovery of this W. passage successively to the states of Genoa, Portugal, Venice, France, England, and Spain. His project was regarded for many years as the hallucination of a visionary; but amid all his disappointments the magnificence of his scheme, and his firm conviction that he was the destined instrument of Heaven to carry the banner of the cross to all the ends of the earth, comforted and fortified his spirit. Years spent in pressing a disregarded suit, however, exhausted his means; and when, in 1480, he was travelling with his little son, Diego, in Andalusia, resolved to turn his back on Spain and appeal to France, he found himself destitute of the bare means of subsistence. Stopping before the convent of La Rabida, he begged for bread and water for his child. This act of paternal solicitude directly opened up the hitherto closed path to success, to the most splendid discovery in the annals of the race, to never-dying fame. Attracted by C.'s distinguished appearance, the superior of the convent entered into conversation with him, discussed his scheme for crossing the Atlantic, and furnished him with means and credentials to the court of Spain. Queen Isabella, after some time spent in hesitation and reflection, declared herself 'ready to assume the undertaking.' The arrangements between C. and the Spanish sovereigns were concluded 17th April, 1492. Appointed admiral, viceroy, and governor-general of all such lands as he should discover, C. set sail with three vessels—two of them barques—and 120 men from Saltes, near Palos, on the 3rd August, 1492, and after a voyage of seventy days (during one-third of which he was detained refitting at the Canaries), he discovered the New World on the 12th October. The land first seen was one of the Bahama Islands, upon which C. landed, and with tears of joy and devout thanksgiving he solemnly planted the cross upon it, and named it San Salvador. He also discovered the islands of Cuba, Santo Domingo, &c., after which he set sail for Spain, and arrived there 15th March, 1493. After this time C. made three successive voyages, discovering the Caribee Islands, Puerto Rico, Jamaica, Trinidad, and the N.E. coasts of S. America. The victim of misrepresentations, and driven by his officers and crews to abandon his legitimate object of discovery for the search for gold, and for the illusory El Dorado, the latter years of C.'s life were wasted; he lost the favour of King Ferdinand, and on 20th May, 1506, he died at Valladolid in poverty and neglect. His remains were buried with great pomp at the King's expense, and over his grave a superb monument was raised.

A short but interesting biography of C. by his son, Don Fernando Colon, is printed in Barcia's *Historiadores primitivos* (Madr. 1749). The diary of C. on his voyage of discovery is to be found in Navarrete's *Viages de los Españoles* (Madr. 1825-37), and has been translated into French, with annotations and additions, by Rémusat, Balbi, Cuvier, &c., under the title *Relations des quatre Voyages enterpris par C., suivies de divers Lettres et Pièces inédites, &c.* (Par. 1828). Latterly (Lyon, 1864) Torre prepared a *Raccolta completa* of C.'s writings. We may also note the biographies of C. by Bossi (Mil. 1818), Irving (Lond. 1828), Sanguinetti (Gen. 1846), Reta (Tur. 1846); and the discussion of disputed points in Humboldt's *Cosmos*, and *Examen Critique de l'Histoire de la Géographie, &c.*

Columell'a, L., Ju'nius Modera'tus, the most copious and best-informed writer among the Romans on rural affairs, was born at Cadiz, and flourished in the early part of the 1st c. Any knowledge that we possess respecting him is derived from casual notices scattered through his writings. He died, probably at Tarentum, about A.D. 42. C.'s great work, *De Re Rustica*, in twelve books, is a systematic treatise on agriculture. He also wrote *De Arboribus*, in one book. The most complete edition of C. is that of J. G. Schneider (Leipz. 1794-97), in the *Scriptores Rei Rusticæ*, containing an account of the various MSS. and of the gradual emendation of the text. Translations of C. exist in English, French, German, and other tongues.

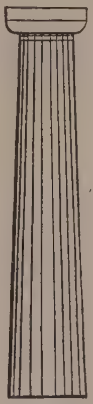
Columellia'ceæ, a small order of Dicotyledonous plants, consisting of *Columella*, a genus of plants from the Andes, comprising two or three species. It is most nearly allied to the *Saxifragaceæ*, among which it may probably in time be allowed to take its place.

Col'umn (Lat. *columna*), a pillar of various materials, either standing alone, or supporting a superincumbent mass of building, or itself merely an architectural decoration. The solitary C., set up in memory of some person or event, is a structure of great antiquity. Jacob set up a pillar on Rachel's grave, and Absalom in his lifetime reared one for himself, because he had no son to keep his name in remembrance. It was not uncommon for the kings of the ancient East to inscribe their deeds on a pillar of stone, the latest discovered and most important of these being the Moabite Stone (q.v.), above 3 feet high, and about 2 feet in breadth as well as in thickness. As famous specimens of the solitary C., Pompey's Pillar, near Alexandria in Egypt, the columns of Trajan and Antonine in Rome, the London Monument, the Alexander monument in St. Petersburg, and, latest and grandest, the C. of Victory erected at Berlin in 1873, may be mentioned.

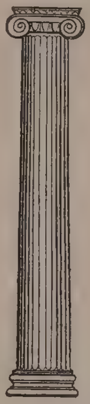
The C. in architecture which supports a roof or entablature presents a special aspect of the civilisation of every country which has ever found time to enjoy and cultivate the arts of peace. In the architectural monuments of ancient *Egypt*, the C. is always found forming a portico inside the building, has no fixed proportion between the diameter of the shaft and its height, and frequently resembles the trunk of a palm-tree. The shaft of the *Assyrian* C. was tall and slender, and the capital sometimes terminated in two half bulls placed back to back. Rawlinson, in his *Five Great Monarchies*, gives an engraving of two capitals, one of which is very like the Ionic, and the other rather resembles the Corinthian style. The C. of the historical remains of India, has a massive shaft surcharged with ornamentation; the capital is sometimes spheroidal, at other times it exhibits a sculpture of the lion, the bull, the elephant, or some fantastic animal. The kind of C., however, to which our attention must mainly be directed, is that which originated in Greece, and which with modifications has been reproduced in all countries to which Greece transmitted its civilisation and its arts. The Greek C. may be described as a pillar of wood, stone, or iron, circular on the plan, and rarely polygonal; either a truncated cone—that is, with the diameter of the shaft diminishing upwards, but having a slight swelling, called the *entasis*, about a third of its height from the base; or cylindrical—that is, with the diameter of the shaft the same from base to capital. It is divided into three principal points, the *base*, *shaft*, and *capital*—respectively its foot, body, and head.

There are three styles or orders of the Greek C.—the *Doric*, the *Ionic*, and the *Corinthian*; and to these the Romans added two other orders—the *Tuscan*, which is only a modification of the Doric, and the *Composite*, which is a combination of the Ionic and the Corinthian. The Doric and the Ionic columns were in use as early as the 30th Olympiad, B.C. 656, while the Corinthian is not known to have existed earlier than the 4th c. B.C.

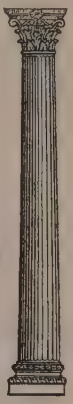
The *Doric* is said to have been invented by the Dorians; it was frequently employed by them in their temples, and corresponds with the dignified and serious character traditionally assigned to them. It has no base, the foot of the C. resting immediately on the base of the rest of the temple. The shaft is a circular stem on which the entasis is very observable. Only on rare occasions was it monolithic; it was usually composed of drums laid on each other without mortar, but fastened to one another with dowels of cedarwood. Lengthwise this C. was striped with circular indentures, called *whippings* by the Greeks, *flutings* by us, the edges of which form sharp angles. On the shaft rests the chief characteristic of every style—the capital. It consists of three parts—the *neck*, a continuation of the shaft, from which it is separated by one or more indentures, called *amulets;* the neck widens in its upper part, and is generally ornamented with several amulets. Above this is the principal feature of the capital, the *echinus*, a circular ledge projecting forcibly all round. It is the supporting power of the C. under the weight of the beams and roof resting upon it. Above it there is the third part of the capital, the formal-looking beaver, or *abacus*, a square slab with square edges, which receives the chief beam or architrave. The height of the Doric C. is usually only four or five lengths of the diameter at its base.



Doric Column.



Ionic Column.



Corinthian Column.

The *Ionic* C. is more slender than the Doric; this and its more ornamental appearance being supposed to give expression to the lighter and more versatile character of the Ionic people. Its height on the average is equal to eight diameters. The base has the *plinth* as its lowest part, and above it there are two or more bolster-like prominences, each called a *torus*, which are separated from each other by a round groove called the *scotia*. The length of the diameter diminishes less upwards than that of the Doric, and between the flutings there are small flat bands called *fillets*, in place of the sharp angles of the massive Doric C. The neck is embellished with ornaments; the echinus or *ovole* is less prominent, and shows the 'egg-and-arrow' carving which gives it the latter name. But the capital is rendered most striking by its *volutes*, which look like the abacus drooping under the weight of the architrave. There are two volutes to the face of the Ionic C., and two to the back. Sometimes, however, the volutes are placed diagonally, especially on the C. at the end of a row. Above them is a small slab, also ornamented, which receives the architrave.

The *Corinthian* C. resembles the Ionic in the proportions and mouldings of the base and shaft, but its capital is very strikingly peculiar to itself. It takes the shape of an open chalice formed by acanthus leaves. There are two rows of leaves, one above the other, eight in each row, the stems of the upper leaves rising from the same level as those of the lower. In the interstices between these masses of leaves are seen stems with smaller chalices at their tops, from which are developed two stalks, each of which droops like a volute under the weight of the abacus. The sides of the Corinthian abacus are concave in plan, being curved out so as to form a sharp point at each corner, which is cut off.

No authentic examples of the *Tuscan* C. have been left for observation; but it has been constructed according to a description given by Vitruvius in his work *De Architectura*. It differs from the Doric in having a base which consists of a plinth and tones; the shaft is not fluted, and the neck or collaring of the capital is separated from the shaft by a small convex moulding, called an *astragal*. Like the Doric, it has, as its chief feature, the echino-abacus capital.

The C. of the *Composite* order differs from that of the Corinthian mainly in the details of its capital, which is of a mixed character, blending the Ionic volutes with the Corinthian foliage. The outline of the leaves of the acanthus is, however, bolder than that of the Corinthian, and instead of two rows of leaves, there are sometimes three, between which volutes appear other flowers also, and the forms of men and animals. The order to which this C. belongs was specially affected by the Romans, the greater number of their large edifices being built in the Composite style. See ORDER, ENTABLATURE.

Column, Military, is a mass of soldiers several ranks in depth. A C. is said to be *open* when the spaces between the ranks composing it permit of their wheeling into line; otherwise it is a *close* or *half-distance* C. In action, authorities are not agreed as to the relative advantages of *line* and C.; English commanders have generally been in favour of the former, the French of the latter.

It is stated of the great Duke of Wellington that, while as Colonel Wellesley, he was still serving in India, he was observed by his brother officers to be in a restless and perturbed state of mind, and was heard to mutter at times during the day 'I feel sure they can do it,' and 'if they can they will whip the world.' Some of his friends began to fear that the climate had affected his brain; at length one of them ventured to ask for an explanation; whereupon he cried out excitedly, 'Why, fight in line! If ever I have a command in Europe, I'll make my men fight in line, and drop the column altogether.' He was as good as his word, and the result of the tactical change upon the British troops was another proof, if any were wanted, of the sagacity of the great commander.

Col'ure, a semi-obsolete term in astronomy, applied to any great circle of this sphere passing through the equinoxes and solstices.

Colym'bidæ, a family of *Natatores* or Swimming birds, represented by the Grebes and Loons or Divers, the latter being the typical forms. They have the three front-toes united by a web, and inhabit the coasts, seeking their food in the sea. In the grebes, the toes are united only at their bases by a membrane, and present broad lobes. The beak in all C. is conical and pointed, and the legs are placed far back on the body.

Col'za Oil is obtained by means of crushing-mills from the seeds of the Colza or summer rape. Other species of cabbage yield a similar oil. The plant is largely cultivated in France, and the N. of Europe generally. C. O. is yellow, and the quantity procured averages about one-third the weight of the seed. It is used chiefly for purposes of illumination. *Rape-cake*, the residue after expression of the oil, is useful for manure.

Co'ma (Gr. *kōma*, 'a deep sleep') is a term used in medicine to describe a state of more or less insensibility, from which a patient can with difficulty, if at all, be roused. In severe cases of C. there is on the part of the patient not only obliviousness to all around him, but dilated pupils, strong stertorous breathing, and flaccid hands and legs. C. may be caused by Apoplexy (q.v.), in which case the person cannot be roused at all, and one or both pupils are dilated; by Concussion (q.v.), in which the breathing is easy and the pupils natural, while the patient in general soon awakes to partial consciousness; by opium poisoning, in which case the pupils are contracted, the breathing slow and stertorous, and the patient at first can be partially roused; or by intoxication, in which case there is generally an alcoholic smell in the breath. The treatment depends on the cause.

Coma Bereni'ces ('hair of Berenice'), a small and inconspicuous constellation of the northern hemisphere, situated between the tail of Ursa Major and the head of Virgo.

Comac'chio (the ancient *Comacula*), a fortified town and bishop's see, in the province of Ferrara, Central Italy, between 2 and 3 miles from the Adriatic, in the midst of an unhealthy lagoon, 140 miles in circumference, and famous for its eel culture. Across the narrow belt of mud, which separates the lagoon from the Adriatic, canals have been constructed which admit the fry of the eel, mullet, &c., into the lagoon, where they fatten, and in due time are captured and sold. About a million pounds weight are caught annually. The eel-harvest is in autumn, and the men employed in it are lodged in barracks. There are rich saltworks in the neighbourhood. Pop. 10,464.

Comay'agua, a town of Honduras, a republic of Central America, on the river Ullua, near the S. edge of the plateau of C., noted for its beauty, fertility, and fine climate. The town was founded in 1540, became the seat of a bishop in 1561, but was almost destroyed in the civil broils that followed the 'emancipation' of the country from Spanish rule. It is now recovering, but its commerce is still unimportant, though a railway to Puerto Caballos, and to Fonseca Bay, on the Pacific, foreshadows a future prosperity. The only building of mark is the cathedral, and even of it nothing is fine but the outside. Pop. 6240.

Comayagua.

Comb (Old Eng. *camb*, Dutch *kam*, Fris. *kaem*, Low. Sc. *kaim*, Ger. *kamm*), an instrument with a series of teeth for arranging or fastening the hair, as well as for dressing and cleansing wool, flax, &c. Combs, as an article of the toilet, are of great antiquity; the Greeks and Romans used boxwood, ivory, and metal in their construction, but there is no evidence to show that women in early times employed combs to support the hair. Ancient burial-places in England have furnished examples of bone and ivory combs belonging to the Roman and Anglo-Saxon periods. In mediæval inventories of ecclesiastical treasures, combs are frequently mentioned, for it was customary for the priests before celebrating mass to wash their hands and arrange their hair. These ceremonial combs are usually carved or otherwise ornamented An ivory C., which belonged to St. Cuthbert is preserved at Durham, and that of St. Loup, of ivory, jewelled, and carved with symbolical animals, is to be seen at Sens. The materials used in C.-making are horn, bone, wood, ivory, tortoise-shell, hardened india-rubber, and metal. Horns, having their tips cut off, are rendered pliant by heat, split up in the direction of the grain, and pressed flat. In the manufacture of side and ordinary dressing-combs, a piece of horn of the required size is stamped out, and from it two combs are made at once by means of the *parting-engine*. This ingenious machine is provided with a tooth-cutter, having a vertical movement, and by means of a cogged wheel, the plate of horn is shifted, as the cutter is rising, through a space equal to the interval between one tooth of the C. and the next. When all the teeth are cut, two complete combs, the teeth of the one fitting exactly into the spaces of the other, are *parted* by a dexterous pull. The teeth are then finished off with wedge-shaped files, called the *graille*, *carlet*, *topper*, &c., and the whole smoothed, buffed, and polished. Tortoise-shell is similarly operated on. Imitation tortoise-shell combs are made by treating the horn with nitric acid, and staining it with a composition of soda ley, quicklime, red-lead, and dragon's blood. Small-toothed combs are cut with a circular saw. Cheap and durable combs are now extensively made from vulcanite, in much the same manner as those from horn.

Combe, Andrew, M.D., an eminent physician, was born in Edinburgh, 27th October, 1797. After studying medicine there and in Paris, he commenced to practise in Edinburgh in 1823, was appointed physician-in-ordinary to the King of Belgium (1836), which he was unable to retain on account of his health, and afterwards a physician-in-ordinary to the Queen in Scotland. He died at Edinburgh, 9th August, 1847. Three years later his *Life and Correspondence* were published by his brother George. C., who was in every sense a most excellent, amiable, and benevolent man, has enriched medical literature with various valuable works, of which may be mentioned *The Principles of Physiology applied to the Preservation of Health* (1834, 15th ed. 1860.) **George C.,** brother of the preceding, a phrenologist and philosopher, was born 21st October, 1788, at Edinburgh, where he was educated, and became a Writer to the Signet in 1812. In 1816 he made the acquaintance of Dr. Spurzheim, the well-known phrenologist, and ultimately adopted his principles. The fruit of this conversion was seen in his *Essays on Phrenology* (1819), and *Elements of Phrenology* (1824), which became very popular. In 1828 appeared his *Constitution of Man considered in Relation to External Objects*, which caused a considerable amount of hostile criticism. The real objection to C.'s philosophy is not what he says, but what he leaves unsaid. In 1833 C. married Cecilia, daughter of the famous Mrs. Siddons. In 1837 he retired from the practice of his profession in order to give himself up to scientific and philosophical study, and from his active pen proceeded numerous books, not only on Phrenology, but on Popular Education, Moral Philosophy, Criminal Legislation, and Prison Discipline, while he delivered courses of lectures on subjects with which he was familiar, in Great Britain and the United States, and on the Continent. His last work was published in 1857, entitled *The Relations between Science and Religion*. C. died 14th August, 1858. See Gibbon's *Life of G. C.* (Lond. 1878).

Com'bermere, Stapleton Stapleton-Cotton, Viscount, an English general, son of Sir Robert Salisbury Cotton, was born 14th November, 1773, at Llewenny, in Denbighshire. He entered the army in 1790, distinguished himself in India, especially at the siege of Seringapatam, and in the Peninsular War. In 1810 he received the command of the whole allied cavalry under the Duke of Wellington, and fought in most of the Peninsular battles, being wounded at Salamanca. He was raised to the peerage as Baron C. in 1814. Among the numerous offices he filled subsequently to Waterloo were those of Governor of Barbados, Commander of the Forces in the West Indies, Commander-in-Chief in Ireland, and Commander-in-Chief in India, in which last position he captured the famous fortress of Bhurtpore in 1826. In the same year he was made Viscount; in 1852 he succeeded the Duke of Wellington as Constable of the Tower, and in 1855 was made Field-Marshal. C. died 21st February, 1865.

Combina'tion (in sociology). This word has lately come into use, legally and politically, and denotes the union of persons having a common commercial interest, with the view of promoting that interest. It is chiefly employed in relation to the proceedings of the working classes for retaining monopolies and advancing the rate of wages. The promotion of these ends is chiefly sought after by means of what are called *trades unions*. In former times combinations, whether of workmen against their masters or of masters against their workmen, were illegal, and punishable summarily by justices of the peace. This state of law was modified by statutes 6 Geo. IV. c. 129; 9 Geo. IV. c. 31; and 22 Vict. c. 34 and very much altered by statute 38 and 39 Vict. c. 86, called The Conspiracy and Protection of Property Act 1875. An agreement or combination by two or more persons to do or procure to be done any act in contemplation or furtherance of a trade dispute between employers and workmen cannot now be indicted as a conspiracy if the act be not punishable as a crime. Trades unions and combinations, with the laws relating to them, were the subjects of a Royal Commission, which issued its report in 1869. The report gave a complete view of the recent alterations and working of the law regarding the subjects of inquiry. It is now provided that the purposes of trades unions shall not be held illegal because they are in restraint of trade, so as to render void or voidable any agreement or trust executed under them. Trades unions may be registered. The law repeats former enactments and provides against violence and coercion on the part of unionists, and criminal unions and illegal contracts are defined.

To render C., when not accompanied by intimidation of others, illegal, is plainly an infringement of personal liberty. If two or two hundred men—for the principle is the same in both cases—agree not to work for their masters under a certain rate of wages, they have just as much right to do so as their masters have to agree not to sell the produce of their workmen's labour under a certain price; the right in each case being unquestionable. It is equally plain that, when those who combine also try to force others to join them, *they* are infringing on personal liberty.

Combreta'ceæ, the Myrobalan order, a natural order of Dicotyledonous plants, natives of the tropics of America, Africa, and Asia, containing about 200 species, remarkable for their astringency. Myrobalans are produced by various species of *Terminalia*. See BEDDA NUTS.

Combus'tion may be popularly defined as the consumption of a substance with evolution of heat and light, when it is raised to a sufficiently high temperature in air or oxygen. The phenomenon of C. depends upon the union of the combustible body with oxygen, which, like other chemical actions, causes the disengagement of heat, and if sufficiently intense, of light also. Thus when charcoal is raised to a red heat, it continues to glow until it has burnt away, providing that sufficient air is present to support its C. On examining the substances which have been produced, it is found that they are wholly gaseous, and consist either of carbonic oxide or of carbonic acid, according as the supply of air has been limited or excessive. Candles, coal, gas, &c., contain hydrogen in addition to carbon, and when burned produce water as well as the oxides of carbon. The process of respiration is another and very beautiful instance of C. Venous blood, highly charged with effete and useless matters rich in carbon, is pumped by the heart into the lungs, and is there exposed over a large surface to the action of the oxygen of the air. The useless materials of the blood become oxidised to carbonic acid and water, and escape from the body during the act of exhalation, while a new supply of oxygen is taken into the lungs again during inspiration: the heat produced by this oxidation or slow C. is carried off to all parts of the system by the purified (arterial) blood, and serves to maintain the temperature of the body.

The term C. is sometimes used in a more general sense by the chemists to denote other chemical actions than those of oxidation, attended with extrication of heat and light. Thus when copper or antimony in a state of fine division are thrown into chlorine gas, they become red-hot and burn away, and in the same manner when a lighted candle is plunged into chlorine it continues to glow.

The theories regarding C. have varied from time to time, and have played an important part in the history of chemistry. Perhaps the most remarkable of these theories is that of *Phlogiston*, first brought forward by Stahl. Stahl believed that all combustible substances contained an inflammable material, which received the name of *Phlogiston*, *terra secunda*, or *terra inflammabilis*, and which was lost when they were consumed. Lead, for instance, when heated in air, smoulders away, and is eventually converted into a yellow powder (litharge). This yellow powder Stahl and his followers believed to be lead deprived of its phlogiston, or *dephlogisticated*. On heating litharge with charcoal, metallic lead is separated and the charcoal disappears. To account for this, it was assumed that the dephlogisticated lead took phlogiston from the charcoal and thus returned to its original state, whilst the charcoal lost its phlogiston and was converted into a gas. This theory was overturned by Lavoisier, who proved conclusively that a substance did not lose anything when burnt, but, on the contrary, gained in weight, and moreover gained in weight by an amount equal to that of the air consumed. The discovery of oxygen by Priestley paved the way for Lavoisier, and enabled him to explain the conversion of lead into oxide of lead or litharge when heated in air, and the subsequent *reduction* of the litharge by the charcoal, which removes the oxygen and forms with it the gaseous compound carbonic oxide.

Come'nius (*Komensky*), **Johann Amos,** an educational reformer, was born at Comna, near Brünn, 28th March, 1592. After completing his university studies, he travelled in Holland and England, and thereafter resided at Lissa, in Poland. The most important of his ninety-two works are *Janua Linguarum Reserata* (1631) and *Orbis Sensualium Pictus* (1658). Their object was twofold—to facilitate the acquisition of the power of speaking and writing Latin by weaving numerous Latin words, not exclusively classical, into paragraphs, in which they might be easily learned; and to combine the knowledge of things with that of words, by treating in the lessons of subjects readily intelligible by the pupils, such as animals, trades, sports, and so on. These works were widely popular both in Germany and other countries, and have been frequently translated, imitated, and extended. From his high reputation C. was invited to England, to Sweden, and to Hungary, to aid in organising public instruction. Towards the close of his life he settled at Amsterdam. He died at Naarden, 15th November, 1671. A Life of C., with his *Essay on the Education of Youth*, has been published by Mallalieu.

Com'es (Lat. 'companion') was the name given in the later times of the Roman Empire to a state official. Thus we find in the 4th c. an imperial officer in Britain called *Comes littores Saxonici* ('warden of the Saxon coast'), *i.e.*, of the E. coast of Britain, already exposed to the ravages of Low German pirates. In the Teutonic system the C. was originally one of the *comitatus*, or personal following of a chief, the Old English name for whom was first *Eorl* or *Gesith*, the latter of which means exactly the same thing as C.; but as the power of the kings grew, *Gesith* was dropped for *Thegn* ('servant'), which gradually took the place of the older *Eorl*. The result was that *Eorl* then became distinctively a title of higher rank, and implied greater power and authority. Under the form of Earl (q.v.), it now denotes a particular grade in the peerage, and is held to be the equivalent of Count, for the wife of an Earl is a Countess. See Freeman's *Norman Conquest*, vol. i. c. 3.

Com'ets are celestial bodies, distinguishable from planets and stars by their rapid motions, their usually irregular forms, and the more or less hazy definition of their edges. Before astronomy was established as an exact science, these phenomena were regarded with superstitious dread, and each received the credit of having occasioned any dire calamity which occurred after its appearance, such as famine, pestilence, war, the death of some great person, &c. The only danger, however, which can possibly ensue from the presence of a comet is that arising from a collision with our earth; but as to the consequences of such a chance we cannot, in the present state of our knowledge, do more than speculate.

The striking feature of C. when seen with the naked eye, and a feature which at once distinguishes them from other celestial bodies, is their hairy-like appendage or *tail*—hence the name, from Lat. *coma*, 'hair.' The rest of the comet, or the *head*, is of a nebulous appearance, consisting of a hazy *envelope*, and a more or less bright *nucleus*. These characteristics are, however, not universal, some C. presenting merely a globular nucleated mass, without any tail, others not even a nucleus. In several instances, more tails than one have been observed, and it has been remarked that these appendages, when present, are generally turned away from the sun. The orbits in which C. move never approach the nearly circular form of those of the planets, but are distinctly elliptical—sometimes so eccentric as to be undistinguishable, for the comparatively brief time the comet is visible to us, from a parabola. There are also authenticated instances of hyperbolic orbits, the C. describing which cannot return to the solar system, unless perhaps the course be permanently altered through the perturbing influence of some of the larger planets. Again, C. are found to move in planes inclined at all angles to the ecliptic, and to revolve round the sun with a motion as often *retrograde* as *direct*. As a comet approaches the sun, it diminishes in bulk, though to us, whom it also approaches, it may appear to increase. The tail is a later development, and is not present when the comet is first observed by the telescope. It is subject to constant changes and pulsations, sometimes seeming to sweep through space at a speed to which the planetary velocities are scarcely comparable. The head, when viewed through a telescope, not unfrequently presents the appearance of a series of concentric luminous rings, with a bright nucleus in the centre; while at other times the nucleus emits on the side next the sun jets as it were of flame, moving and vibrating as if in a region of conflicting currents.

One of the most interesting C. of modern times is Halley's—interesting especially as being the first whose periodic revolution was recognised, and whose return was boldly predicted by that celebrated astronomer. Noticing the great similarity between the elements of the C. of 1531, 1607, and 1682, Halley fixed the reappearance of the 1682 comet for the year 1759. As the time approached, Clairaut, calculating from the observations of 1682, and taking into account the possibly perturbing influence of Jupiter and Saturn, fixed its perihelion passage for 13th April, 1759. The true date was 12th March. Messrs. Damoiseau and Pontecoulant calculated its next return for 7th November, 1835, and the calculation differed from the observed time by less than a week. Its next appearance will be 1910, and the same comet has been identified with those of 1456 and 1378, the latter of which was observed by the Chinese. It is noticeable that this comet has been diminishing in splendour at each reappearance, and probably after a few more returns it will become invisible to the naked eye. The comet of 1744 is remarkable as having had six tails. The present century has been uncommonly rich in brilliant C., of which we may mention the two great ones of 1811; those of 1819, 1825, and 1847; that of 1843, whose head was only 96,000 miles from the sun's surface at its perihelion passage, and whose tail, not less than a hundred million of miles long, seemed to sweep through two right angles in two hours; the brilliant appearances of 1858 (Donati's) and 1861, both remarkable for the rapid evolutions and dissipations of their envelopes, and the latter further interesting from the now almost settled fact that the earth passed through the extremity of its beautiful fan-shaped tail on the evening of 30th June; and, lastly, Coggia's second comet of 1874. This list, however, gives little or no idea of the numerous C. visible by telescopic aid, and far less of the myriads which probably exist, but which have hitherto escaped detection. In 1894 four comets were observed. On 26th

March, Denning discovered one of faint light and possessed of a short tail, which Krueger thinks may be identical with the brighter comets of 1231 and 1746. On 3rd April, Gale at Sydney discovered a bright comet with a faint double tail, which in May became visible to the naked eye. The spectrum of this comet resembled that of Rordame-Quénisset's of 1893. On 8th May, Temple's comet, No. 2, of 1873, was observed from the Cape. It possessed no tail. On 1st November, Encke's comet was observed; it was very faint. The most interesting of these telescopic C., possessing as they do short periods, and therefore belonging more to our system than their farther-reaching brethren, are Encke's (period 3·29 years), De Vico's (5·46), Winnecke's (5·51), Brorsen's (5·58), Biela's (6·61), D'Arrest's (6·64), Faye's (7·44). Biela's comet was discovered by that astronomer in 1826, and identified with the C. of 1772 and 1805, in which latter year it was seen by Olbers with the naked eye. In 1846 it was observed to split into two portions, which were still distinct on its next appearance in 1852. In 1859 and 1866, though eagerly looked for, no signs of its existence were detected, and it was regarded by many as a thing of the past. Mr. Hind, however, calculated its perihelion passage for 6th October, 1872, from Dr. Michez's orbit of 1866, and prepared sweeping ephemerides for September and October, with variations of ± 8 days in perihelion passage. It escaped observation, however, till 30th November, when Mr. Pogson, Madras Observatory, received a startling telegram from Professor Klinkerfues, which ran thus: 'Biela touched earth on 27th; search near Theta Centauri.' After two mornings of vain search, a glimpse of it was obtained. Circumstances were more favourable on 3rd December, when the comet was seen with a bright nucleus and a faint but distinct tail. It has been doubted, however, whether this comet was really Biela's, and was not rather another and quite a distinct body. Coggia's small comet of 1873 has been identified by Professor Weiss of Vienna with the first of 1818, discovered by Pons at Marseille, the plane of whose orbit was so nearly parallel to that of Biela's, that by some it was supposed to have been derived from the latter by a splitting analogous to what was observed in 1846. Every year several of these hazy telescopic bodies are discovered, but they possess little interest save to the astronomer.

The first step towards the true comprehension of what C. really are was made by Tycho Brahé, when he demonstrated in 1577 that they were extraneous to our atmosphere. Not much more than a century later, Newton showed them to be subject, like planets, to the law of gravitation; and some time after the lapse of another century, Arago discovered that part, at least, of cometary light was *polarised by reflection*. This last discovery has been fully borne out by the spectrum investigations of Huggins, Donati, Secchi, Vogel, and others. It is apparent that C. shine partly by reflection, partly by their own light. The characteristic bright lines in Winnecke's comet coincide very closely with the bright lines in the spectrum of carbon taken in olefiant gas; but, in the majority of cases hitherto observed, there is *no* similarity in constitution to any such hydrocarbon. At the present stage of our knowledge, we cannot reason further concerning the composition of the gaseous portion of C.; but this at least is made out, that probably a comet consists of a cloud of solid particles, held together more because their individual orbits are somewhat similar, than because of their own mutual gravitation, and that therefore as it approaches the sun it shrinks in bulk, the orbits of the component meteorites rapidly converging, and the particles themselves coming into frequent collisions, thus generating sufficient heat to volatilise a part of the matter, and giving rise to all the varied changes observable in a comet's head by telescopic aid. This theory is supported by the coincidence, first noticed by Ochiaparelli, which seems to exist between the orbit of the August meteors and that of the second comet of 1862, and the further seemingly similar connection between the November meteors and the comet discovered by Klinkerfues and Pogson, and believed by them to be Biela's. When the meteor-cloud is sufficiently dense it is visible as a comet; and the extremely eccentric orbits which these bodies describe round the sun, the sometimes great inclinations to the ecliptic, and their frequently retrograde motions, show that, if the nebular hypothesis be granted, C. and meteors did not belong originally to the solar system, but are later importations caught up from surrounding space by the attraction of the sun and planets. All this is an evident inference; but when we come to the consideration of the tail, a new and greater difficulty meets us. It is scarcely possible that this tail can be one and the same material *appendage*, for that matter should be translated with a velocity of more than 30,000 miles per second—the velocity of the extremity of the tail of the comet of 1843 during its perihelion passage—is inconceivable. To meet this difficulty, Sir John Herschel has speculated on the possibility of a '*negative shadow*, a momentary impression made on the luminiferous æther behind the comet.' Professor Tyndall worked upon this idea, and explained the momentary impression as due to the decomposition by the concentrated rays of the sun of some chemical compound surrounding the comet—the head acting in some mysterious way as a lens. But if it act as a lens to sunlight, why not to starlight also? Further, whence comes the necessary organic compound? By assumptions of such a nature, any curious phenomenon could be plausibly explained; but no simplicity or better comprehension of the facts is gained. Professor Tait, however, merely discarding the once prevalent idea that C. must have extremely small mass—an idea *taken for granted* upon the ground that *one* comet in 1779 became entangled among Jupiter's satellites, which were not perceptibly perturbed by the encounter—has explained the whole mystery as an optical condition. He likens a comet to a swarm of sea-larks, viewed at such a distance that the birds are not *individually* visible; and in the remarkable changes of form which such a swarm seems to undergo, a consequence of the relative changes of position of the line of sight and the surface in which the birds are situated, he discovers an explanation for all the varied transformations observable in a comet's tail. There is no limit to the size of the component meteorites, but the smaller we suppose the integral fragments to be, the greater must be the average distance between contiguous ones in order to secure transparency to starlight—the less therefore the mass. Upon this hypothesis, the passage of the earth through the *head* of a comet would be fraught with great danger; but the probability of such an occurrence is evidently extremely small, if we assume that C. may approach the sun from any direction. This assumption, however, may require modification, if future research bear out the discovery of Houzeau, that of 209 C. considered by him, the major axes show a tendency to arrange themselves parallel to the double heliocentric meridian 102° 20′ and 282° 20′, being only 28° long. from the point towards which the solar system is moving.

Com'frey, a genus of plants of the natural order *Boraginaceæ* (q.v.), natives of Europe and the N. of Asia. There

Comfrey.

are only a few species known. *C. officinale* and *C. tuberosum* are natives of Britain, not uncommon in moist shady places. The former was at one time greatly valued as an application to wounds, and the young blanched shoots are sometimes used as a potherb, or as a substitute for spinach. The root contains a good deal of starch and mucilage; accordingly, when finely scraped 'and laid on calico to the thickness of a crown-piece, it forms an excellent bandage for broken limbs,' &c. (Bentley). A large-sized species—*C. asperrimum* of the Caucasus—may yet become of some value as a fodder plant for pigs and cattle, analysis showing it to be rich in flesh-forming principles: it contains much gum and mucilage and but little sugar. It was introduced into this country in 1811, but is as yet only cultivated as a garden plant.

Comines′ or **Comynes, Philippe de, Sieur d'Argenton,** a famous French chronicler, was born near Lille in 1445. In 1464 he entered the service of Charles, Comte de Charolais, afterwards Charles the Rash of Burgundy, but in 1472 he attached himself to Charles's rival, Louis XI., who, within five years, made him one of the richest nobles of France. Louis found in C. an astute and unscrupulous agent of his cruel and perfidious policy. After the death of Louis, Anne of Beaujeu banished C. from the court; but though a decree of Parliament of 24th March, 1488, had condemned him to lose a fourth of his estates, and to ten years' banishment, we find him as early as 1493 again engaged in important missions. He was employed both by Charles VIII. and Louis XII., the latter of whom restored his pensions, but withheld his confidence from the minister of Louis XI. He died, 17th October, 1509, at his castle of Argenton. C.'s *Mémoires* show him to have been a sagacious, clear-headed statesman; but, though admirably written, they offend modern feeling by the cold-bloodedness with which they detail the most iniquitous and revolting transactions, the sole merit of each of which seems to be its success. The first edition, which is imperfect, was published at Paris in 1523, in folio. C. plays an important part in Scott's *Quentin Durward.*

Comi′so, a town of Sicily, province of Siracusa, 43 miles W.S.W. of Syracuse, with manufactures of paper. Pop. 20,327.

Com′itas or **Com′ity of Nations,** a term of international law, signifying the effect given in one country to the laws and institutions of another in questions arising between the natives of both. See International Law.

Comi′tia (Lat. *cum*, 'together;' *eo*, 'I go'), were the great constitutional assemblies of the Roman citizens, duly summoned by a magistrate for the election of magistrates, the enactment of law, the declaration of war, and the trial of citizens on criminal charges. The *Comitium* was the part of the Forum where the C. met in early times, though afterwards their meetings were usually held in the Campus Martius. The C. were of three kinds, *C. Curiata*, *C. Centuriata*, and *C. Tributa*, in which the people voted respectively in curiæ, centuries, and tribes, according to the three modes of their political organisation. Each citizen voted in his own curia, century, or tribe; but each curia, century, and tribe had only one vote on the question submitted, and its vote was determined by the majority of voters within it. Thus, as some centuries, for example, contained a much larger number of voters than others, the decision might not be the opinion of the gross majority of the assembly. The C. Curiata were the most ancient, and were composed entirely of patricians. The C. Centuriata, instituted by Servius Tullius, were truly national assemblies, comprehending all citizens, whether patricians or plebeians, who had property to a certain amount. The C. Tributa were originally confined to the plebeians, and were convened for the first time in the trial of Coriolanus, B.C. 491. The word *C.* often means *elections*, as the C. were yearly convened under the republic to elect magistrates. The C. Calata were assemblies convened by the college of pontiffs, at which the people, sometimes in curiæ, at others in centuries, did not vote, but listened to and witnessed the proceedings, which consisted chiefly of the proclamation of the nones, the consecration of priests and kings, and the making of wills.

Comma, in music, a small interval (generally corresponding to a vibration-ratio of 81 : 80) occurring between the true pitches of two notes, which are represented by one only in the organ, pianoforte, and other tempered instruments. See Temperament.

Commandant′ is an officer of the army in merely temporary command. The designation is more frequently applied in foreign armies than in the British.

Command′er, in the British navy, is an officer next in rank above a lieutenant and under a post-captain. He ranks with a lieutenant-colonel in the army, and is unofficially addressed *Captain*. The full pay of a C. is £1 per day: when in command of a sea-going ship, an extra allowance is made, rising to as much as £141. A C. may either serve as second in command, or command independently, according to the rate of the ship.

Commander-in-Chief is the highest appointment in the British army. There is not, however, necessarily an officer of this rank in command of the home army, there having been no C.-in-C. since the death of the Duke of Wellington in 1852. At present the administration of the army is, by the War Office Act of 1870, vested, under the Secretary of State for War, in three officers, one of whom has the title of 'Commander-in-Chief.' The office has been held by Field-Marshal the Duke of Cambridge, his department being that of command and discipline. Though in theory all appointments and promotions are made by the crown, on the responsibility of the Secretary of State for War, the officer commanding-in-chief has practically the control of all these, except, perhaps, the very highest. He is responsible for recruiting operations, and for the allocation of the troops. The commander of the forces in India has the title of C.-in-C.

In June, 1895, it was announced in Parliament by the Secretary for War (Sir H. Campbell-Bannerman) that the Duke of Cambridge was about to retire from his post, and on the 19th August, 1895, the Marquess of Lansdowne, as Secretary for War, stated that the Duke would retire on 1st November, 1895, and would be succeeded by Field-Marshal Viscount Wolseley.

Comm′andite, Société en, is the French equivalent term for what we call a 'sleeping partner.' By the common law of France, a partner of this kind may, by agreement with his associate, determine the extent of his liability to the public. The justice of the legal principle has to a great extent been recognised by ourselves in the passing of the Limited Liability Act (q.v.). The French term arises from the commercial meaning of the word *commander*, to command. It is applied to the authorising of one person by another to transact business on his account.

Commelyna′ceæ, the Spiderworts, a natural order of Monocotyledonous plants, natives of the E. and W. Indies, Australia, Africa, and N. America. The underground stems of many of these, on account of the starch which they contain, are used for food. In the jointed hairs of the Virginia spiderwort, a common garden flower, and other species, the singular movement known as *Gyration* (q.v.) can be well examined. Altogether sixteen genera and more than 260 species are described. Some are accounted astringent, and therefore useful as applications to wounds; others are emmenagogue, &c.

Commen′dam. When a beneficed clergyman is promoted to a bishopric, he vacates his benefice by the promotion; but formerly the sovereign could give him the right to retain it. He was then said to hold it *in C.*, that was, ostensibly, until some one else should be provided for it. Future grants in C., whether of benefice, office, or dignity, were abolished by 6 and 7 Will. IV. c. 77.

Commendator.—In Scotland, in Roman Catholic times, the revenues of a benefice during a vacancy were collected by an officer called a C. He was properly a steward or trustee;

but the Pope, who was entitled to grant the higher benefices in *Commendam* (q.v.), abused the power, and gave them to commendators for their lives. This abuse led to the prohibition of all commendams, excepting those granted by bishops for a term not exceeding six months.

Commen′surable, a name applied to two numbers or quantities of the same kind, which are both divisible without remainder by a third number.

Comm′entry, the chief town of a canton in the department of Allier, France, in a hilly region on the Œil, 45 miles S.W. of Moulins by railway. It owes its great and sudden prosperity to large coal-mines in the vicinity, and to an extensive iron-work, employing several hundred men. Pop. 12,618.

Comm′erce, the exchange of produce and manufactures between persons of two or more different nations, either for other commodities or for money. When the exchange takes place between persons of the same nation it is called trade.

Commina′tion (Lat. *comminatio*, 'a threatening') is the name of a penitential service used in the early Christian Church. It is still read in the Church of England on Ash Wednesday. It purports 'to read the general sentences of God's cursing against impenitent sinners, gathered out of the seven-and-twentieth chapter of Deuteronomy and other places of Scripture.' See Bingham's *Eccles. Antiquities*.

Commissa′riat is the name given to the system by which armies are supplied with the necessaries of life. In the wars of Queen Anne's reign the troops were supplied by contract, a plan which is said to have led to considerable peculation on the part of the famous general who conducted them. In 1793 a commissary general was appointed, his duty being to superintend the contracts for supplying the army with food. In 1858 and 1859 a new organisation was introduced, the C. being made a department of the War Office. In 1870 it was merged in the 'Control Department,' by which the civil affairs of the army were administered, but now the C. and Transport Staff are united in the Army Service Corps, in which the former ranks of Deputy Commissaries General, Assistant Commissaries General, Deputy-Assistant Commissaries General, have given place to those in use in the other branches of the services.

Comm′issary, in ecclesiastical law, is an officer who acts for the bishop in a remote part of the diocese. In Scotland, following the abolition of papal authority in 1560, the supreme C. court was instituted by Queen Mary in 1563. It had jurisdiction in matrimonial cases, and had a double jurisdiction, one *diocesan* over the three Lothians, the other universal, by which it confirmed the testaments of all who died in foreign countries, or who died in Scotland without a fixed domicile. It also reviewed the judgments of inferior commissaries, of whom there was one in most of the principal towns of Scotland. The powers of the supreme court (abolished in 1836) were gradually transferred to the Court of Session; those of the inferior courts partly passed to the Court of Session and partly to the sheriff courts; but 'even yet,' says Sheriff Dove Wilson, 'the transference of jurisdiction is in form incomplete. In certain actions the sheriff assumes the style and title of C., and uses a seal decorated with the episcopal mitre.' See *The Introduction to Practice of the Sheriff Courts*, by J. Dove Wilson (Edinb.).

Commis′sion is in trade or commerce a writing or implied authority by which one, or more than one, person exercises the duties and powers belonging to another or to others. C. in law also is the warrant of authority by which any person acts judicially or otherwise. There are various legal operations conducted by C., of which the following are the most important :—

Commission of Oyer and Terminer.—This, in English law, is a C. directed to the judges and other gentlemen of the county to which it is issued, directing them to hear and determine in cases of alleged treasons, felonies, and trespasses. It is in virtue of this C. that the judges on circuit dispose of criminal cases. In urgent cases, a special C. of O. and T. is granted. It may be extended to Scotland, provided three Lords of Justiciary be in the C. See ASSIZE.

Commission of the Peace. See JUSTICES OF THE PEACE.

When a witness is out of the jurisdiction of a superior court, or is too ill to attend the summons of the court, his evidence can, by order of the judge of the court, be taken by an officer of the court, or other appointed person, the counsel of both parties being present, and the evidence being taken just as if the witness were in court. A commission is said to issue from the court to take the evidence.

Commission, Army, is the crown's warrant constituting a commissioned officer in the army. Formerly, under what was called the *Purchase System* (q.v.), the various ranks were mostly obtainable at a fixed price. But this system was abolished by royal warrant in July, 1871. Commissions in the probationary ranks are now given to the successful candidates in competitive examination. The limits of age for candidates for admission by competition to the cavalry and infantry are seventeen and nineteen; for students of universities who have passed certain examinations, the limits are seventeen and twenty-two; for B.A. or M.A. graduates, seventeen to twenty-three; and for candidates, who are officers in the militia and are nominated for commissions, the limits are eighteen and twenty-two. In the Artillery and Engineers, candidates, selected on examination (limits of age, sixteen to eighteen), are trained at Woolwich Academy. Lieutenancies are given to cadets who have passed an examination on the subjects of instruction. Further examination must be passed before getting a captain's C. in any branch of the service. Promotion is now by 'selection, tempered by seniority,' up to the rank of lieutenant-colonel (see COLONEL, BREVET) in the cavalry and infantry. In the Artillery and Engineers it is by seniority alone. Non-commissioned officers are the sergeants-major, sergeants, trumpeters, drummers, buglers, and in the Life Guards and Horse Guards the corporals. They mess by themselves, and rank between a commissioned officer and a private soldier.

Commiss′ionaire is an attendant attached to Continental hotels, but not forming a part of the establishment. Thus his services are not charged in the bill, and must be arranged for with the C. himself. No one is, of course, obliged to employ him. A corps of commissionaires was founded in London in 1859, chiefly through the instrumentality of Capt. Sir E. Walter, K.C.B. At first the admission to the corps was only open to wounded soldiers who had served in the Crimea and in India during the mutiny. Owing to the demand for commissionaires, the corps was increased to over 2000, the number at which it now stands. They are now to be found in all the principal towns of the United Kingdom, but every division is under the control of the Commandant, whose chief office is at 419, Strand, London, where persons who may be desirous of employing a well-trained, intelligent, and responsible officer, should apply for further particulars on the subject. The members are discharged or pensioned soldiers, and are employed as messengers, watchmen, timekeepers, &c.

Commission del Crederé is an Italian expression, used to denote the extra premium charged by an agent or factor for guaranteeing the solvency of a purchaser, and so making himself personally liable for the value of the goods which he has sold for his principal.

Commission Merchant is a merchant who sells goods on account of some one else. The C. M. is paid by a percentage, called *commission*, on the value sold.

Commis′sioner in Scotch Bankruptcy. Under the Scotch Bankruptcy Act, three commissioners are chosen without caution at the meeting for election of trustee. Their duty is to superintend, to advise, and assist the trustee, audit his accounts, and to fix his remuneration. They also declare the dividends. They are not themselves entitled to any remuneration. No one can be a C. who is disqualified to be a trustee.

Commissioners, Land, were appointed under the General Enclosure Act of 1845, and it became their duty to decide whether any common in England and Wales should be enclosed or not—greens of villages and towns, and lands in the Forest of Dean and the New Forest being outside the statute, as also were lands within fifteen miles of Charing Cross and within certain radii of some large towns. Many other powers were conceded to the Commissioners by the same statute as regarded allotments, roads, footways, burial grounds, &c. The Commissioners have been restrained by the Metropolitan Commons Act of 1876 from allowing an enclosure within fifteen miles of Charing Cross, unless it should be in their opinion for the good of the neighbourhood as well as for private persons. The Law of Commons Amendment Act of 1893 renders it necessary to obtain the consent of the Board of Agriculture before any enclosure of common land, purporting to be under the statute of Merton of 1236, or the statute of Westminster 2nd of 1285, can be held valid. It is estimated that at least 1,000,000 acres have been in this way brought under cultivation since 1845, yet no addition has been made to the amount of land cultivated owing to the fact that railways, towns, and roads have absorbed as many acres, if not more.

Commissioner of Police is the officer who has the supreme command of the Metropolitan police, and whose district embraces London and all places within a radius of fifteen miles of Charing Cross, not inclusive of the City of London, which has its own police. The C. of P. is appointed by, and acts under the control of, the Home Secretary. Sir E. Bradford, K.C.B., is C. of P., and under him are three Assistant Commissioners and five Chief Constables. The C. of P. and his subordinates are empowered to enforce regulations of the Police Acts respecting houses of public resort, driving vehicles and cattle, nuisances in thoroughfares, &c. They have also power to act on the river Thames, and they may at any time go on board vessels, and take cognisance of the conduct of persons on board.

Commit'ment for Trial. When a supposed offender is arrested, the justice before whom he is brought is bound immediately to inquire into the circumstances of the alleged crime, and to take the examination of the prisoner, and the evidence of those who bring him, in writing. If the charge appear groundless, the prisoner must forthwith be discharged; otherwise he must be *committed*, or give Bail (q.v.) for his appearance to answer the accusation at the adjourned inquiry or at next sessions or assize, and the prosecutor or person injured by the crime charged is bound over to prosecute. In Scotland the information is generally at the instance of the Procurator-Fiscal (q.v.), and C. for T. or discharge is given after the declaration of the accused and the Precognition (q.v.) have been taken before a magistrate. See IMPRISONMENT.

Committ'ee. When an assembly or body of men appoints a few of its members to do special acts, or to make special inquiry, those so appointed form what is called a C. It may, however, consist of only one member; or it may be formed of the whole body making the appointment by its assuming the functions usually discharged by a C. Thus, in Parliament, when the various clauses of a measure which has been passed on second reading—and thus been virtually adopted in its leading principle—come to be considered, a 'C. of the whole House' is formed for doing so. The Speaker leaves the chair, which is taken by the Chairman of Committees. (See PARLIAMENT.) Select committees are also appointed in the House of Commons and in the House of Lords for the consideration of private bills.

Commix'tion, a term of Scotch law, indicating the mingling of two or more substances. C. may produce a new subject, as where wine is mixed; or it may not alter the nature of either substance, as where grain is mixed, though the mixture may not be separable: in either case the whole becomes common property of the owners of the things mixed and their shares are in proportion to the amounts contributed by each. If the things mixed be capable of separation, as two flocks of sheep, the property continues distinct. This distinction is of some legal weight in questions which sometimes arise as to right of property.

Comm'odate, in Scotch law, is a gratuitous loan, the borrower being bound to restore the subject lent in the condition in which he received it. The *property*, therefore, remains all the time of the loan with the lender, and the only right acquired by the borrower is the use of the thing lent.

Comm'odore. A captain in the navy, when in command, has this title. He hoists a pennant indicative of his rank. Red indicates a C. of the first class, blue a C. of the second. He ranks with a brigadier-general in the army. The pay of a C. of the first class is £3 per day; of a C. of the second class, in addition to full pay, as a captain, and command money as captain and allowance as C. abroad, £1 per day; if not, 10s. per day.

Comm'odus, Lucius Aurelius, a Roman emperor, born A.D. 161, the son of M. Aurelius Antoninus, who educated him with unavailing care. On his father's death in March, 180, C. concluded an inglorious peace with the Marcomanni, and repaired to the capital to share in its dissipations. His character immediately exhibited itself as one of boundless licentiousness, cruelty, cowardice, meanness, and perfidy; and distinguished virtue, or conspicuous excellence of any kind, soon proved fatal to its possessor. Resigning the government into the hands of a succession of worthless favourites, he gave himself up to a life of gross wickedness and levity, and gratified a childish vanity by exhibiting himself as a dancer, a charioteer, a buffoon, and especially as a gladiator. He even claimed divine honours as Hercules. Marcia, a favourite, with Lætus and Eclectus, two officers of rank, learning that they were marked down on the tyrant's tablets for instant death, administered poison to him; but this operating slowly, they introduced Narcissus, a famous athlete, into his chamber, and he was strangled on the night of 31st December, A.D. 192.

Comm'on. This is a term of English and Scotch law, but the meaning in the former differs from that in the latter. In England, C. is the privilege of use which one man, or the public, has of the property of another; such as the right to walk over or to fish from the land of another, or to dig turf upon another's land, or to take wood, required for using in or upon, or furnishing, a house or farm, from another's estate; hence lands over which such rights exist are called *commons*.

Statute 39 and 40 Vict. c. 56, the Commons Act 1876, provides most stringently for the preservation of commons in opposition to the provisions of the Inclosure Acts wherever any inclosure meets with no approval from the Commissioners or Parliament.

In Scotland, where the legal nomenclature is that of the Roman law, C. rights are called *Servitudes* (q.v.), while a C. or commontry is a piece of ground belonging to several persons, frequently to the inhabitants of a district or village, the right of each usually amounting to nothing more than a servitude. Nice questions sometimes arise as to whether a right be of C. property or of servitude merely.

Common Agent is, in Scotch legal practice, an agent or solicitor before the Court of Session, employed to conduct a case in which several parties have a common interest. The two most important occasions for the appointment of a C. A. are in the process of Ranking and Sale (q.v.), and in the process of augmentation and locality. (See AUGMENTATION.) But a C. A. is also sometimes appointed in a process of Multiplepoinding.

Common Assurances.—Whenever an estate is transferred, the recipient is supplied with legal evidence of the transfer, so that he may not incur doubt, difficulty, or controversy in the enjoyment of the estate.

Common Debtor.—When the effects of a debtor have been arrested, and several creditors claim a share of them, the debtor is, in Scotch law, called the C. D.

Common Forms.—By this term is meant, in English law, the technical forms of expression used in legal writings. Statutes have been passed to substitute simpler and more generally intelligible expressions for many of these. But the fact that conveyancers were paid for the length of their work, not according to its value or difficulty, has rendered difficult the substitution of intelligible brevity for unintelligible prolixity.

Common Good.—In law this term is used to denote the property of a corporation, over which the magistrates have a right of administration solely for behoof of the corporation.

Common Informer.—Any person who to obtain the whole, or part, of the penalty prosecutes, or supplies evidence against, those who break the penal laws. In some instances the permission of the Attorney-General must be obtained before any prosecution can take place.

Common Interest.—This term is used in Scotch law to denote the interest which one person sometimes has in the preservation of that which is otherwise absolutely the property of another. Thus, the proprietor of a house may have a C. I. with the proprietor of a contiguous house in a chimney-can which is the property of the latter, if the falling of the can would injure the property of the former.

Common Property, in Scotch law, is property, whether heritable or movable, belonging to two or more proprietors *pro indiviso*. (See INDIVISIBLE.) The proprietors share the profit or loss according to their respective interests, and the consent of all is required in the management and disposal of the subject. Each joint-owner may sell his right, the purchaser taking his place; and the right may be adjudged (see ADJUDICATION) by the creditors of the C. proprietors, or of any of them.

Common, Tenancy in.—This term of English law corresponds to that of C. Property (q.v.) in Scotch law. It denotes the rights of property vested in two or more persons, no division having been made of the property. Each tenant, in law, has a distinct tenement and a distinct freehold. The estate is divisible by deed of tenants voluntarily, or by union of interests of all the tenants in one, or by compulsion of any one or more tenants.

Common Bench was a name given to the Court of Common Pleas.

Common Counts, short statements of the cause of an action made in a Declaration, which have been now displaced under Judicature Acts of 1873 and 1875 by Statement of Claim and Joinder of Causes of Action.

Common House, or **Common Room,** was an apartment in a monastery, presided over by a monk, called the *master*. A fire was constantly kept in it for the benefit of the monks, who were not usually allowed to have one anywhere else.

Common Law. The laws of England, like those of most countries, are largely regulated by customs resulting from experience, and confirmed by judicial decisions. Law so constituted is called C. L. It is to be distinguished from law created by statute, from the law of merchants, from the Civil and Canon law, and also from law as created or modified by Equity (q.v.). C. L. is overruled by statute law, and may be set aside or modified by equity, except in matters criminal. These involving public security, no judge can be allowed to administer them otherwise than according to the letter and to established authority. 'Immemorial usage' in C. L. does not refer to a period so remote as to be beyond historical record. The Common Law system in England is the application of the rules of law, derived from legal principles and judicial precedents, to any new combination of circumstances; and such application is usually made unless contrary to statute, reason, and convenience. The mere appearance of being unreasonable or inconvenient is not sufficient excuse for rejecting the Common Law. The Common Law as opposed to Statute Law may be said to consist of (1) military, maritime, academical and ecclesiastical laws; (2) local customs; (3) general customs.

By the Judicature Act, 1873, the Courts of Chancery, Queen's Bench, Common Pleas, Exchequer, Admiralty and Probate and Divorce were consolidated into 'The Supreme Court of Judicature,' to consist of two divisions, 'Her Majesty's High Court of Justice,' and 'Her Majesty's Court of Appeal,'—the former having original jurisdiction, with certain appellate jurisdiction from inferior courts; the latter appellate jurisdiction, with certain original jurisdiction incident to the determination of any appeal. The branches of the Supreme Court were by this Statute directed to administer Law and Equity concurrently.

The judges of the High Court consist of the Lord Chancellor, president, and the five justices of the Chancery division; the Lord Chief Justice, president, and the fourteen justices of the Queen's Bench division; the two judges of the Probate, Divorce, and Admiralty division, and the judge of the Court of Arches. It is a superior court of record, and exercises the jurisdiction previously pertaining to all or any of the Courts of Chancery and Common Law, Court of Admiralty, Common Pleas, Commissions of Assize, &c. For the convenient despatch of business it is divided into the Chancery, the Queen's Bench, and the Probate, Divorce, and Admiralty divisions.

The Court of Appeal consists of the Lord Chancellor, the Lord Chief Justice, and the President of the Probate, Divorce, and Admiralty, the Master of the Rolls, and two Ex-Lord Chancellors, *ex officio*; besides five Lords Justices of Appeal. It also is a superior court of record, exercising the powers and jurisdiction formerly held by the Courts of Appeal in Chancery and Bankruptcy, and in appeals from the County Palatine Court of Lancaster, the Stannaries Court, the Exchequer Court, Admiralty, Lunacy, and other Courts whencesoever appeals did spring. The jurisdiction of the House of Lords as a final Court of Appeal, however, remains practically unchanged.

In 1881, on the union of the three common law divisions in the Queen's Bench Division, the titles and offices of the Lord Chief Baron of the Exchequer and the Chief Justice of the Common Pleas were abolished. The division of the legal year into terms, as far as the administration of justice is concerned, has ceased; judges may sit and act at any time or place during or after term.

On 4th December, 1882, the Royal Courts of Justice, Strand, were opened by the Queen, when the Common Law Courts were finally removed from Westminster.

The above constitute the superior courts of common law. There are also inferior courts, as the County Court (q.v.), to which the corresponding court in Scotland is the Sheriff Court (q.v.); the Mayor's Court (London), the Court-Baron, the Borough Civil Court, the Hundred-Court, &c.

Common Prayer, the Book of, is the liturgy of the Church of England (and Ireland formerly). Till the time of the Reformation there was no such book in the vernacular, the only thing of the kind being the Latin liturgy, originally derived from the Gallican (see LITURGY), and revised by the Bishop of Salisbury, 1085. During the reign of Henry VIII., in 1537, Convocation published a book entitled *The Godly and Pious Institution of a Christian Man*, and containing the Lord's Prayer, 'Ave Maria,' Creed, Ten Commandments, Seven Sacraments, &c. Of this a second edition was published in 1540, under the title of *A Necessary Doctrine and Erudition for any Christian Man*. These, however, were more of the nature of a confession of faith than a liturgy; but the same year a commission was appointed to reform the rituals and offices of the Church, and the next year the prayers for processions and litanies were ordered to be translated into English and publicly used. In 1545 the *King's Primer* was published, containing the whole morning and evening prayer very nearly the same as in the present B. of C. P. In 1547, under Edward VI., a committee of divines was appointed, who composed, first, a *liturgy* proper, or order for the Communion (1547), and then public offices for Sundays and holy-days, and for Baptism, Confession, Matrimony, Burial, &c. This liturgy was approved by Convocation, and confirmed by Parliament and the King, 1548. To obviate certain objections, the book was revised under Archbishop Cranmer, when the Sentences, Exhortation, Confession, and Absolution were added at the beginning of the morning and evening services, the Commandments were added at the beginning of the Communion office, and some rites and ceremonies considered idolatrous were removed; and thus revised, it was again confirmed by Parliament, 1551. Interdicted under Mary, it was again introduced, with slight alterations, under Elizabeth. Nothing more was done till after the Hampton Court conference under James I., when some trifling alterations were made, such as the adding of some forms of thanksgiving at the end of the Litany, and an addition to the Catechism regarding the sacraments. After the Restoration, at the instance of the Presbyterians, another revisal was made, the chief alterations then made being that the Epistles and Gospels were taken out of the authorised version of the Bible, and that the office of Baptism for those of riper years and the forms of prayer at sea were added. The B. of C. P. as it now stands was then approved by Convocation, 1661, and confirmed by Parliament next year. See *Annotated Book of Common Prayer* (1875), and *An Introduction to the History of the Successive Revisions of the Book of Common Prayer* (Parker & Co., Lond.)

Commons. The dinner of members in colleges and inns of court is so called. There are separate tables for the Benchers (q.v.), for the barristers, and for the students and other members.

Commons, House of. See PARLIAMENT.

Common Sense, the Philosophy of, was the name given by Thomas Reid to the theory by which he hoped to avoid the sceptical conclusions which Hume had drawn from the idealism of Locke and Berkeley. The scepticism of Hume had indeed no connection with, but was opposed to, the idealism of Berkeley strictly so called, viz., the substantial existence of the ideal world in an all-perceiving mind; but it was undoubtedly founded on what has been called the representative theory of Locke, as extended by Berkeley to the primary qualities of matter. The general statement of Reid was that there are in the mind certain self-evident principles which cannot be proved by any arguments, but which must be accepted as the ultimate grounds of certainty. General acceptance, and the impossibility of explaining them by early training or false reasoning, may confirm this view, but the authority of these principles lies in the simple consciousness of them. They are either *Contingent;* for example, 'those things do really exist that we distinctly perceive by our senses;' the probable uniformity of nature; 'there is a certain regard due to human testimony in matters of fact:' or *Necessary*, consisting of grammatical, logical, mathematical, moral, metaphysical, and æsthetic principles; for example, every proposition is either true or false; whatever begins to exist must have a cause. This procedure of affirming with regard to every unexplained mental fact not merely that it could not be explained, but that it was unscientific to attempt its explanation, had already been adopted by Père Buffier, who declared that, among others, it was the deliverance of C. S. that 'my soul produces motions in my body;' a proposition which is declared to be inconceivable by some modern physiologists. The C.-S. philosophy was largely modified by Dugald Stewart, who introduced the phrase 'Fundamental Laws of Belief,' but it owes its final statement to Sir W. Hamilton. On the leading question of a belief in an external world, he says: 'We are immediately conscious in perception of an ego and a non-ego, known together and known in contrast to each other. This is the fact of the *duality* of consciousness.' This view he calls Natural Realism. All other views, Nihilism, Idealism, Materialism, &c., he declares to proceed on the non-recognition of this ultimate *dualism*, or primitive incomprehensible belief that a material world, solid and extended, exists, and that a perceiving subject also exists. Hamilton's doctrine of C. S. on this question is therefore quite different from the 'irresistible suggestion' of an external world which Reid declared to follow upon sensation. On other points Hamilton accused Reid of having, like Beattie and Oswald, regarded C. S. as an appeal to 'the undeveloped beliefs of the unreflecting many.' C. S. requires strict *universality* and *necessity* as well as *incomprehensibility* or *simplicity* in its principles. Necessity may be the result of a power or of an impotence of the mind. The Cartesian *cogito, ergo sum,* and the intuitions of space and time, are examples of the former; the law of the conditioned as applied to the notions of causality and moral freedom and substance affords examples of the latter.

Common Time, in music, is a rhythm in which strong and weak accents occur alternately, each bar or measure usually taking either the form strong, weak, or the form strong, weak, medium, weak. These primary subdivisions may be indicated indifferently as crotchets, quavers, or minims, the first being by far the most common, and having the time signature $\frac{2}{4}$ and $\frac{4}{4}$ or 𝄴. Each of them may be again subdivided into two or four parts, the relative accentuation of which is the same as that of the primary subdivisions. Rarely these secondary subdivisions are *three* in number (*i.e.*, each crotchet is divided into three quavers, &c.), in which case the rhythm is really changed into what is known as Compound C. T. (q.v.).

Commu'ni Dividen'do Ac'tio, in Roman law, was an action for the division of what was possessed in common by two persons or more. The principles of the Roman law on this subject are adopted in the law of Scotland.

Commun'ion, or **Holy Communion,** is one of the names given to the sacrament of the Lord's Supper, doubtless derived from the language of Paul in 1 Cor. x. 16, 17, although he does not call the sacrament by the name of C., but only says what it is or does. C. also meant the fellowship of the Church, expulsion from which, therefore, was called 'excommunication.'

Communion Elements (in law). In Scotland, in a process of Augmentation (q.v.), the court may allow for C. E., payable out of the Teinds (q.v.) of a parish.

Comm'unism means the negation of private property: it describes a society in which the land and instruments of production would be held as joint property, and used for the common account, industry being regulated by a magistrate, and the produce being publicly divided in equal shares, or according to wants, or on some other principle of distributive justice. Socialism does not involve necessarily the abolition of private property: it merely insists, as in St. Simonism and Fourierism, that the land and instruments of production should be the property of the association or of the Government; as was the case in the original Teutonic 'mark' and Indian 'village-community,' and would be partially the case if the state were to appropriate the 'unearned increment' of rent—*i.e.*, the increase of rent due, not to expenditure of capital, but to the fact of inferior soils being forced into cultivation by the pressure of population. Of C., on the other hand, the monasteries and the Moravians give examples on a small scale. In most cases, however, as with the Essenes of Palestine, the American Shakers (except the Inspirationists of Amanda and the Separatists of Zoar), the American Harmonists and Rappists at Economy and Beaver Falls, marriage is entirely given up, the society being recruited from converts or from adopted children. Robert Owen, on the other hand, the Scotch Communist, who founded the abortive experimental communities of Orbiston in Lanarkshire (1823) and Harmony Hall in Hampshire (1843), connected with his C. a scheme of selection and alteration in the family relations, by which the human character (believed by Owen to be wholly the product of education and not of heredity) was to be indefinitely modified into a form which would then be the natural support of C. This idea, found also in the *Republic* of Plato, is not characteristic of C., which, in the economical sense, was advocated by Louis Blanc, Cabet, and Proudhon: these men would not have admitted the 'mobility of the affections,' on which the projects of St. Simon, Fourier, and Enfantin were based. It is objected to C. that individuals would be tempted to shirk work. But under the present social system most work, even superintendence, is done for fixed wages or salaries—a state of things which would no doubt be altered by the general adoption of piece-work and the association of workmen in profits. C. would have as many checks against laziness and fraud as the present system. Nor, although marriage has been renounced by some Communists, does there seem much ground for supposing that, if it were retained, the society would unduly multiply. It is difficult to conjecture the force and direction of public opinion on such a matter. But the real difficulties in the way of C.

are the distribution of employments and their remuneration. Here the actual inequality of human beings comes strongly out. If the subdivision of labour is to be maintained, the selection of work cannot be a matter of indifference. Then, are wages to be exactly the same for the teacher of science and the hodman, who both honestly do their '*possible*'? This Blanc calls 'the point of honour of industry;' and Cabet, 'fraternity.' We have no example of a Communistic society with the fundamental institution of marriage. The American Shakers are successful economically, but the members become dull and stupid, and are unable properly to train the adopted children. The *ateliers* or national workshops of the French Revolution of 1848, as that of the tailors at Hôtel Clichy, failed from want of management. The bonus-paying concerns of Leclaire (painters), Dupont (printers), Briggs (colliers), have not been successful.

Commun'ity. Voluntary associations have no *persona standi in judicio*, but by special statute it is made lawful to establish societies for raising funds to relieve and maintain members during sickness, and to provide burial. Joint-stock banks may by statute sue and be sued in the name of their principal officer, on certain conditions prescribed in the statute.

Commuta'tion of Small Penalties. The Act 28 and 29 Vict. c. 127, provided a scale of equivalent terms of imprisonment for failure to pay penalties between 10s. and £5. This statute has been repealed by the Summary Jurisdiction Act, 1879, 42 and 43 Vict. c. 49, in which the following scale of equivalent terms of imprisonment are set forth:—sums not exceeding 10s. (seven days); from 10s. to 20s. (fourteen days); from £1 to £5 (one month); from £5 to £20 (two months); and above £20 (three months). The time specified in each case is the maximum, and any less term, as in the opinion of the court will satisfy the justice of the case, may be ordered.

Comne'nus, the family name of a dynasty of Byzantine emperors (1057-1204) and of emperors of Trebizond (1204-1461). See BYZANTINE EMPIRE, section headed *The Comnenian Dynasty*; also Christian names of individual rulers—*e.g.*, ALEXIUS COMNENUS, ANNA COMNENA, &c.

Co'mo (anc. *Comum*), a city in the province of the same name, N. Italy, and connected with Milan by railway, is situated at the S.W. extremity of Lake C. (q.v.), in a beautiful valley, encircled by hills and clothed with groves of olive and chestnut. The city itself is ill-built and filthy, but the suburbs contain some magnificent palaces and imposing public buildings. C. is surrounded by double walls, pierced by four gateways, splendid specimens of the military architecture of the Middle Ages. The Byzantine cathedral (1396) is faced with white marble, and contains some interesting monuments. Iron foundries and marble quarries are in the vicinity; there are manufactures of silks, woollens, hosiery, gloves, and soap; and a considerable trade is carried on with Italy and Switzerland by means of the lake. Pop. 25,518. C. was the birthplace of the younger Pliny, who enriched it with public works, a library, and other institutions.

The *Lake of C.* (Ital. *Lago di Como*, Lat. *Larius Lacus*) lies at the foot of the Alps, 700 feet above the level of the sea. It is 35 miles long, with a breadth nowhere exceeding 3 miles, but generally considerably less, and a depth of from 40 to 600 feet. The lake is formed by the river Adda, and divided in its southern portion into two great arms by the rocky peninsula of Bellagio. The scenery is singularly beautiful: hence the lake is much visited, and is traversed in all directions by steamers. The younger Pliny, who had several villas on its banks, speaks of it with much affection.

Comodo', an island of the Malayan Archipelago, in the Strait of Sapy, between the islands of Sambawa and Flores. It is 35 miles long, with an average breadth of 16 miles.

Com'orin, Cape, the S. extremity of Hindustan, a low sandy point, invisible to the mariner till he is within 10 or 12 miles of it. Eighteen miles inland is the Peak of C., which serves as a beacon to the passing ship; and towering aloft and stretching for miles behind this peak are massed the terminal heights of the Western Ghâts.

Cape Comorin.

Com'oro Isles, a group of four large and four small islands of volcanic origin, in the middle of the N. entrance to the Mozambique Channel, between Madagascar and the E. coast of Africa. They were discovered by Houtman in 1598. The names of the larger ones are Great C., Mohilla or Little C., Mayotta, and Anjuan. They rise to a great elevation, and can be seen at a distance of from 50 to 60 miles. The soil is fertile, and a tropical vegetation is everywhere seen—coco and areca palms, fine timber for shipbuilding, yams, bananas, mangos, ananas, citrons, &c. Rice, maize, cotton, indigo, and sugar are cultivated. The inhabitants are a mixed race of Arab and African descent, the majority being Mohammedans. A British consul resides there. The other islands are under French protection. Mayotta has been a French possession since 1848, and is valuable for the production of sugar. Mohilla is the most important from a commercial point of view; it carries on a considerable trade with Madagascar and the mainland. Area of group is estimated at 758 sq. miles; pop. at 62,500.

Company of a Ship includes all persons engaged in the working and management of the affairs of a ship, officers as well as Crew (q.v.).

Compari'son, in grammar, is the name given to the mode of marking the degree in which a quality is attributed to an object. It is customary to say that there are three degrees of C., *positive*, *comparative*, and *superlative*. Exception may be taken to this division on the ground (1) that the 'positive' does not *express* though it may *imply* C., and (2) that the kind of C. which it implies is quite different from that which is expressed by the second degree. Similar objections may be urged against calling the third or highest degree one of C. Admitting that the phrase 'degrees of quality' would be more logical and more simple than 'degrees of C.,' little or no harm can ensue by retaining a nomenclature which is easily interpreted by common sense. In English, German, and some other languages, there are two ways of expressing these degrees—(1) By inflection, which is the prevalent mode in Greek and Latin, as *bright*, *brighter*, *brightest*; (2) By using another word expressive of increase or decrease of the quality, as *conspicuous*, *more* (or *less*) *conspicuous*, *most* (or *least*) *conspicuous*. The former mode is preferred in words of one syllable, or in words of more than one where euphony would not be impaired. As a rule, it is only adjectives of quality that can be compared, and not all even of these. Such as express a quality not admitting of degrees—*e.g. round*, *square*, *whole*, &c.—cannot be compared.

For C. in rhetoric, see FIGURES OF SPEECH and SIMILE.

Com'pass, an instrument for indicating the magnetic meridian at any locality. As this meridian lies in a generally N. and S. direction, the C. is of special use in giving bearings of any object from a fixed place, and is of invaluable service to the mariner and traveller as a guide over unknown regions. All such instruments consist essentially of a magnet suspended so as to have as complete freedom of motion in azimuth as possible. The *Mariner's C.* is familiar to all, the only portion visible from above being the large circular card which is attached to the bar magnet, and marked with the so-called *points* of the C. Each quadrant contains eight points, which are named according to the following plan :—Beginning at N. and going towards E., we read N., N. by E., N.N.E., N.E. by N., N.E., N.E. by E., E.N.E., E. by N., E.; and the other quadrants are divided in precisely a similar manner.

The magnetic needle is subject to a variation with latitude, owing to the non-coincidence of the magnetic and geographical poles, so that it usually points to the W. or E. of the true N. This deviation is easily corrected; but a much more irregular deviation is produced by the reaction of the ship's iron upon the magnet. Various schemes have been proposed to remedy this, such as fixing the needle at the mast-head, thus reducing the action to a minimum, or by using two parallel magnets. The method employed in the British navy at present is to have the C. at a sufficient elevation above the bulwarks, so as to allow of it having an uninterrupted sweep of the horizon. By setting the vessel in the various directions, the variations of the needle may be obtained and tabulated for future use. Sir W. Thompson showed that if two masses of soft iron, large in comparison to the size of the needle, be placed at opposite sides of the magnet, the effect of other more distant portions of iron will be very small indeed; and accordingly he constructed a very sensitive C., differing from those ordinarily in use at sea in not having the card fixed to the needle or needles, which are here not more than 1½ inch in length, and which are as nearly *dead-beat* as they could be wished, and in having two spheroid masses of soft iron fixed close beside the double needle.

Mariner's Compass.

In 1894 an electric steering C. was invented by Bersier, a lieutenant in the French navy. No man is required at the wheel. A secondary circuit of an induction coil connects the needle of the C.-card, which emits an electrical stream of sparks. These pass to metal plates placed around the C.-bowl, and to whichever plate the needle points, that receives the sparks and acts upon an electric motor connected with the rudder. So that when the officer of the watch has set the course, he can leave the vessel to steer itself, as any movement of the needle to the port or to the larboard causes the electric stream to fall upon the lateral plates and thus to set in motion the electric motor, and restore the vessel to its original position by movement of the rudder.

Compass'es, instruments for measuring and transferring distances. The *Common C.* consist of two legs, joined together at one end by a pivot-joint, and may be used for describing circles. The *Beam C.* serve the same end, but are more accurate, and better capable of measuring greater distances. The points slide along a straight beam, and are clamped securely at the required distance. *Proportional C.* have two pairs of opposite legs, whose lengths, and therefore the distances between the points of each pair, can be altered to various proportions.

Compass'ionate Allow'ance. Certain annuities to children of deceased British military and naval officers, given by the state, are so called. They are tenable by boys up to eighteen years of age, by girls till twenty-one or marriage. They range from £14 to £40 per annum. A special C. A. was granted in 1855 and 1856 to the widows and children, or, in some cases, to other specified relations, of military officers killed in the Crimean war.

Com'pass Plant, a plant of the western prairies of America, so called because it is said to turn the faces of its leaves uniformly in a N. or S. direction; 'the leaves on the developed stems of the flowering plants taking rather an intermediate position between their normal arrangement on the stem and their peculiar meridional position. The settlers, when lost on the prairies on a dark night, get their bearing by feeling the direction of the leaves' (Brown). The reason of this is, that owing to the Stomata (q.v.) being more equally distributed on both sides of the leaf than is usual in other plants, both sides are equally sensitive to light.

Compear'ance, a term of Scotch law, denoting the appearance made for a defender in an action.

Compearer.—Any one not called in an action in Scotland may *compear* and claim to sist himself on the ground of having an interest in it. If his claim is sustained he is called a C.

Compensa'tion, in physics, a method for eliminating or neutralising unavoidable errors, by introducing others equal but opposite. See PENDULUM and BALANCE-WHEEL for common instances.

Compensation, in law. Where two persons are indebted to each other, their debts, if equal, are held by law to extinguish each other; if unequal, to leave only a balance due. In England the allegation of trespass or wrong done by the plaintiff cannot be pleaded by the defendant in an action as a *set-off* against the claim of damage. The defendant's remedy must be by a cross action. This is greatly the doctrine of Scotch law also.

By a legal anomaly no action used to be maintainable against a person who, by wrongful act, neglect, or default, caused the death of another, while the offender was liable if the sufferer was merely hurt. But this defect has been remedied by Lord Campbell's Act, which provides that any one who has caused the death of another, even under circumstances which make the offence felony, shall be liable in damage at the instance of the executor or administrator of the deceased for behoof of the wife, husband, parent, or child, provided that, if death had not ensued, the offender would have been liable. The action must be begun within twelve months after death, and not more than one action can lie in respect of the same subject matter of complaint.

Competi'tion (which, like its French equivalent *concurrence*, suggests the idea of a struggle for a prize) has been denounced by socialists as a principle of social disorder, and lauded by optimist writers in political economy as the force which overrules private interest for the general good. Practically, however, C. may be best described as the absence of restriction upon individual judgment in industrial affairs. The restriction may be enforced by either law or custom. Thus the usury laws (demolished in this country by Bentham) prohibited the taking of interest beyond a certain rate; the land-custom of India fixed the rent payable for occupancy. In fact, only in modern times has free C. under contract generally superseded the rule of *status* and custom among advanced nations. Another form of C. which was frequently either excluded or hampered by treaty was that between different countries in the same market. Either the privilege of exclusive importation was conceded to a favoured colony or neighbour, or native industry was bolstered up by prohibitory duties on importation. But no more striking change has taken place than with respect to wages, which were formerly regulated either by statute or statutory magistrates, but are now fixed by agreement between capitalists and trade societies or individuals, both parties looking to the actual and probable state of trade. Some of these restrictions were no doubt suitable to a stationary society isolated from other societies, but with regard to them all, there is no doubt that they were incompatible with the progressive movement in industry and trade which has marked the last century. Each country devoting itself to the department in which it has either the 'greatest superiority or the least inferiority;' each producer endeavouring by ingenuity or economy to secure a sale by furnishing his commodity at a less cost to society; each capitalist bidding for the labour he requires, and bidding more highly for the more skilled labour: such is the picture presented by perfect C. As Bastiat says, its tendency on the whole is to give every one a larger share of the 'gratuitous utility' of nature, by the advantages which science and invention have attained from nature. But the ideal C. nowhere exists. Manufacturers and traders combine to preserve prices and to sink wages; in particular industries and particular nations enormous vested interests oppose the introduction of new methods; trades unionism endeavours to identify the individual workman with his class. It is only where, as in the case of railway and gas companies, &c., a practical monopoly in a district exists, that the state can wisely even specify a *maximum* price or a *maximum* profit.

Compiègne (Lat. *Compendium*), a town in the department of Oise, France, on the left bank of the Oise, a mile below its junction with the Aisne, and 60 miles N.N.E. of Paris by railway. Boatbuilding, hosiery, ropemaking, are among the principal industries; and there is a trade in coal, wood, and grain. The chief edifice is the palace, originally built by St. Louis, and rebuilt by Louis XIV. Here, on the 27th March, 1810, Napoleon I. received his bride, Maria Louisa, Archduchess of Austria. It was also a favourite hunting seat of Napoleon III., and is surrounded by a vast park. Jeanne d'Arc was made a prisoner before the walls of C. in 1430. Pop. 14,498.

Com'plement, the amount by which a given magnitude falls short of some fixed magnitude. Thus the arithmetical C. of a number is the difference between it and the next higher power of ten; the C. of an angle or arc is the amount by which it falls short of a right angle or a quadrant; the C. of a common logarithm is found by subtracting it from ten.

Compo'nee, Compony, or **Gobony,** in heraldry, is a term describing the field of any charge divided into a single row of small squares, alternately a metal and a colour. When there are two such rows, the field is said to be *counter-C.;* when more than two, it is *Checky* (q.v.).

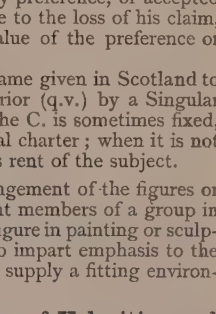
Compos'itæ, Synanther'eæ, or **Aster'aceæ,** the most extensive natural order of Dicotyledonous plants, belonging to the subdivision *Corolliflora* (or, according to others, to the *Calyciflora*), herbs or shrubs, universally distributed. In the northern regions these plants are all herbaceous, but in the southern hemisphere they are occasionally shrubby or even arborescent. There are now 9000 species known. They have been usually divided into the following sub-orders:—(1) *Tubulifloræ*, most abundant in hot climates. *Senecio*, Daisy, &c., are good examples. (2) *Labiatifloræ*, almost entirely confined to the extra-tropical regions of S. America. *Mutisia* is an example. (3) *Liguliflora*, most abundant in cold countries. The Chicory (q.v.) and Dandelion (q.v.) are examples. Their properties are variable, though it may be said that the whole order is pervaded by a bitter principle, so that most of them are tonic. Some, owing to the presence of a volatile oil, are aromatic, and diaphoretic. Acrid stimulative properties are possessed by others, while most of the *Liguliflora* abound in a milky juice, which is bitter, and sometimes narcotic. To enumerate all the economic plants of this great and important order would be impossible within our space. Wormwood (q.v.), Chamomile (q.v.), Elecampane (q.v.), Tussilago (q.v.), Arnica, &c., are among the medicinal plants furnished by it. The Artichoke (q.v.), salsify, endive, lettuce, &c., are eaten. The safflower and sawort supply dye-stuffs. The sirrehout of the Cape of Good Hope furnishes a close-grained beautiful wood, valued by cabinetmakers.

Composi'tion. The creditors of an insolvent person are said in law to accept of a C. when they agree to give him a discharge in full, on his paying them a part instead of the whole of the debt he owes them. In England, the creditors of one who is insolvent may, without any proceedings in bankruptcy, resolve to accept a C.; but, to make the resolution binding on the minority, it must be carried by a majority in number and three-fourths in value of the creditors, at two meetings convened in a prescribed manner. By the Deeds of Arrangement Act of 1887, 50 and 51 Vict. c. 57, arrangements outside the bankruptcy law must be registered with the Registrar of Bills of Sale within seven days after the first execution of the deed by either of the parties, otherwise such arrangements are void. In Scotland, no creditor can be compelled to accept a C. until the bankrupt has been examined under sequestration. All preferences and collusive agreements for concurring in settlement by C. are void, and under the Scotch Act a creditor who has obtained any preference, or accepted any payment for his consent, is liable to the loss of his claim, and to repayment of double the value of the preference or payment which he has accepted.

Composition to a Superior is the name given in Scotland to the entry-money paid to the Superior (q.v.) by a Singular Successor (q.v.). The amount of the C. is sometimes fixed, or taxed, as it is called, in the original charter; when it is not so, the superior is entitled to a year's rent of the subject.

Composition, in art, is the arrangement of the figures or objects of a picture, or of the different members of a group in sculpture, or of the lines of a single figure in painting or sculpture, which is found best at once to impart emphasis to the prominent idea of the work, and to supply a fitting environment of harmony and grace.

Composition and Resolution of Velocities and Forces constitute the most important and fundamental principles of dynamical science. Suppose a body to receive an impulse in a northerly direction, which would produce a velocity of 10 miles an hour; and suppose it further to receive a simultaneous and equal impulse in an easterly direction; the question immediately arises, In what direction and with what velocity will the body move? At the end of an hour the body will obviously have proceeded 10 miles N. and 10 miles E.; and therefore it will have travelled in a N.E. direction with a velocity of $10\sqrt{2}$ miles an hour. This principle is easily extended to the general case of any two velocities making any direction with each other. Let O A and O B represent in direction and magnitude two velocities, which are communicated simultaneously to a body at O; then it appears by a simple inspection of the figure, and a knowledge of Newton's first law (see MOTION, LAWS OF), that the body will move with a velocity represented in direction and magnitude by O C, the diagonal of the parallelogram whose sides are O A and O B. O C is termed the *resultant* of the two *component* velocities O A and O B. The reverse problem, to *resolve* a given velocity in two given directions, follows as an immediate deduction from this. Thus, to resolve O C along O P and O Q, we have simply to draw through C, C B and C A parallel respectively to O A and O B. Forces are compounded and resolved in precisely the same way, as is at once deducible from Newton's second law, that 'change of motion is proportional to the impressed force, and takes place in the direction of the straight line in which the force acts;' and accordingly we may take O A and O B as representing in direction and magnitude the forces which produced these velocities. Hence the resultant force is what would produce the resultant velocity



O C, therefore is represented by O C in both direction and magnitude. See VELOCITY.

Compostell'a, Order of St. James of, a Spanish order of knights, founded at Santiago de C., in the N.W. of Spain, and sanctioned by the Pope in 1175. The original founders were thirteen noblemen in conjunction with the canons of St. Eloy; and their immediate object was to protect against the Moors the numerous pilgrims who visited C. in honour of the relics of St. James the Elder, patron of the city and of Spain, which were believed to be built into the foundations of the cathedral. The affairs of the order were controlled by a council of thirteen, and vows of poverty, obedience, and celibacy were taken by the members; but the order being entitled to retain whatever was won from the Moors, its wealth became enormous; and its power grew so formidable as to excite the fears and jealousy of the crown. The Pope accordingly transferred the grand-mastership of the order permanently to the crown in 1522, which led to a rapid decline of its importance.

Com'posts, a kind of manure consisting of lime, earth, and organic refuse matter gathered into a heap to promote fermentation or decay, the mass being turned over at regular intervals to render it homogeneous before transferring it to the land. C. available for one or more of the cultivated crops may be made with all kinds of farm refuse, as potato-haulms, weeds, leaves, hedge clippings, as well as scourings of ditches, road scrapings, &c., mixed with lime, in the proportion of one load of lime to five loads of refuse. The refuse of manufactures, as wool and flax waste, hair and horn clippings, soap waste, ammoniacal liquor, &c., mixed with earth, constitutes excellent C.

Com'pound An'imals, the name given to animals which are composed of a greater or less number of distinct forms. The included organisms of a compound animal—of which the Tapeworms, *Polyzoa* (q.v.), or Sea-mats, the *Hydroid* zoophytes, and the compound *Tunicates* (q.v.) form good examples—are termed *zoöids*, whilst the entire compound form, however numerous its zoöids, is itself named the *individual*. Any *individual* animal in zoology is defined as the result of the *total* development of a *single* egg. Whatever a single egg gives rise to is an individual, and this latter may be *simple*, or consist of one animal, as in higher forms; or be *compound*, as in the examples given. The compound form at first consists of a single *zoöid*, which by a process of *gemmation* or budding gives rise to the compound organism.

Compound Common Time, in music, is a rhythm in which the primary subdivisions of each bar are accented as in Common Time (q.v.). Each of them, however, is indicated (in ordinary musical notation) by a dotted crotchet, minim, or semibreve—generally the former (for which the time signature is $\frac{6}{8}$), and is subdivided into three parts, which have the relative accentuation:

Strong. Weak. Weak.

Each of these secondary subdivisions becomes, according to the notation of the primary, a quaver, crotchet, or minim, and are frequently again subdivided into two parts, upon the first of which the stress falls.

Compound'ing of Fel'ony, or **Theft Bote.** When one who has been robbed takes back the article stolen on an agreement not to prosecute, he is guilty of C. of F., and is punishable at common law by fine and imprisonment. By 24 and 25 Vict. c. 96, if anyone advertise a reward for the return of any property '*lost or stolen*,' and in such advertisement use any words purporting that *no question will be asked* or that the reward will be given or paid for any property stolen or lost without seizing, or making inquiry after, the person producing such property, or if any one promise or offer by public advertisement to recoup any pawnbroker or other person who may have advanced money upon, or bought, the property stolen or lost, he, as well as the printer and publisher of the advertisement, is liable in a penalty of £50, with costs, at the instance of any one suing for the same. No action for the penalty can be raised without concurrence of the Attorney, or Solicitor, General. Any one taking a reward for helping the owner to recover stolen property, unless he cause the thief to be brought to trial, is guilty of felony and liable on conviction to penal servitude for a term of three to seven years or to imprisonment for any term not exceeding two years with or without hard labour and with or without solitary confinement, and if a male under 18 years, with or without whipping.

Compound Interest, in law, or interest with *Annual Rests*, is never allowed on the sum in the original obligation or agreement; but there is commonly a posterior contract to accumulate interest and make it a principal bearing interest. This is a general rule of law; but in cases of hardship, annual rests may be allowed, and the House of Lords is empowered by statute to allow C. I. on appeal from Scotland, if it shall think fit to do so.

Compound Triple Time is a rhythm bearing the same relation to Triple Time (q.v.) that compound common time (above) bears to common time. Its primary subdivisions are generally noted either as dotted minims or crotchets, for which the time signatures are respectively $\frac{9}{4}$ and $\frac{9}{8}$.

Compressed-Air Bath, an apparatus invented by M. Laburié of Paris, in 1832, and since introduced into hydropathic establishments, which is efficacious as a cure for asthma, bronchitis, phthisis, &c. The increased pressure of the atmosphere produced by its means seems to invigorate the lungs, compelling them to more rapidly perform their functions of inhalation and exhalation, and thus to purify the blood and restore the body, and especially the breathing organs, to a healthier and more natural condition.

Compressibil'ity, one of the properties of matter, in virtue of which a body is diminished in volume under increased pressure. It is usually accompanied by evolution of heat, and in such cases the application of heat is attended with expansion. All gases are easily compressible, but the name *compressible* gas is restricted to such as have been compressed to the liquid state. Liquids for long resisted all attempts at mechanical compression, and their C. is exceedingly small, being measurable only by the most refined processes. Solids present various degrees of C., but its existence proves either that matter is porous, or that the ultimate particles are capable of compression, the former at any rate being probably true.

Com'promise, in English law, is understood to be a mutual promise of parties to submit matters in dispute to arbitration, or is actually the adjustment of the claims of the parties who agree to the arrangement. In Scotland the analogous terms are *Submit* and *Refer*.

Compto'nia, a genus of Deciduous bushy shrubs belonging to the natural order *Myricaceæ*, natives of N. America, and named in honour of Henry Compton, Bishop of London about the year 1714, and the introducer of many exotic plants into England. *C. asplenifolia*, known in the U.S. as the 'sweet fern,' is employed in that country as an astringent and tonic. In France it is sometimes called *Liquidambar à feuilles de Ceterach*, though it has no connection with the true Liquidambar.

Computation of Time, in law. The question of whether or not a particular period of time has legally expired may have a most important effect on the rights of parties. Thus, in Scotland, where the grantor of a deed challenged under the law of Deathbed (see DEATHBED, LAW OF) lived for fifty-nine days and three hours after executing the deed, the court held it to be reducible, on the ground that the law requires the grantor to have lived for sixty days, without counting the day on which the deed was executed. This decision was affirmed by the House of Lords. Had the grantor lived to the morning of the sixtieth day, the legal maxim, *Dies inceptus pro completo habetur*, would have been applicable, and the deed would have been good. There has been a decision in accordance with this principle.

Com'rie, a village on the Earn, Perthshire, 20 miles W. of Perth, in one of the most beautiful districts of Scotland. Slight earthquake shocks are frequently felt here. C. has distilleries and some manufactures of woollens and cottons. Pop. of village 870.

Comte, Auguste, the founder of the school of 'Positive Philosophy,' was born at Montpellier, 19th January, 1798, of Catholic and royalist parents, and early gained a place in the *École Polytechnique* through his mathematical talent. Expelled from that institution for insubordination, he taught mathematics privately, became secretary to Casimir Périer, and from 1818-24 was associated with St. Simon, who no doubt inspired him with the idea of reconstructing social order, expressed in the *Plan des Travaux Nécessaires pour Réorganiser la Société.* In 1824, in an essay in the *Producteur*, C. published his theory of progress from the military offensive *régime* through the military defensive to the industrial pacific; this, he said, depended on the transition from theological conceptions through the abstractions of metaphysics to positive conceptions. Spiritual reorganisation must be based on demonstrated truth, not on faith in the invisible. Next year he made an unhappy marriage, when he had only one pupil, General Lamoricière; and in 1826, before an audience containing Carnot, Humboldt, Poinsot, De Blainville, &c., he began that course of seventy-two lectures on Positive Philosophy, which was interrupted by his insanity. The course was resumed in 1828, and afterwards appeared in six elaborate volumes between 1830 and 1842. During that period he was in easy circumstances, but the character of his doctrines drove him from office and employment, and after receiving aid from Grote, Molesworth, and other admirers for some time, he gave up working for bread, and lived for the rest of his days on an annual subscription from his disciples. In 1845 began his friendship with Mlle. de Vaux, which seems to have infused a depth and tenderness of moral and æsthetic feeling before unknown to his nature. This appears in his second great work, *Système de Politique Positive*, in four volumes, which appeared between 1851 and 1854, and still more in the *Catéchisme Positiviste* (1852). His latter years were full of religious mysticism, almost asceticism. He died, 5th September, 1857. The object of the Positive Philosophy has been described 'as the condensation of all knowledge into a homogeneous body of doctrine, capable of supplying a faith and consequently a polity.' The value of C.'s *Hierarchy of the Sciences* has been violently disputed among eminent *savans*, but with the exception of a few disciples (of whom Congreve, Bridges, Beesly, and Harrison are the most prominent in England), all have joined in condemning the artificial and prosaic ceremonialism which he wished to substitute for a religion growing naturally out of human devotional feeling. Thus the *Catechism* includes a Trinity, consisting of (1) Humanity, or *Grand Être*; (2) Space, or *Grand Milieu*; and (3) the Solar System, or *Grand Fétiche.* This has been wittily called 'Catholicism *minus* Christianity.' On the other hand, his view of the sciences as abstract and concrete; his treatment of sociological questions as requiring a combination of historical generalisation with deductive reasoning from the truths of psychology; his warnings in the *Politics* against the dangerous notion of an indefinite power of variation in human nature, are entitled to great praise. Minor peculiarities of C.'s system are that he does not recognise psychology as a distinct science, because mental life is merely a counterpart of cerebral function, and the introspection of consciousness is untrustworthy; and that he does not discuss the general subject of scientific evidence. Comtism, as a philosophy of knowledge is widely accepted; as a practical faith it is absolutely stationary. Littré, the author of the French dictionary, is certainly the most illustrious, perhaps the *only* illustrious name associated with the system.

Con or **Col** (Ital. 'with'), a word used often in music, as *C. fuoco*, with fire; *C. Spirito*, with spirit, &c.

Con'can or **Kon Kan,** a maritime territory in the province of Bombay, now subdivided into the districts of Thana, Kolaba, Ratnágiri, and Kánara, having an area of 13,639 sq. miles, and a pop. of 537,983. The history of C. begins about the third century B.C., when the Mansies ruled over the country. Since then C. has changed hands several times, passing from the Hindus to the Mohammedans, the Portuguese, the Maratthas, and finally to the British. Greek merchants traded with C. Beni-Israel, supposed to be the lost tribes, settled here, and in the 7th c. crowds of Parsees flocked to the district, and their descendants may be seen in numbers at the present day, at Bombay and all the smaller towns, busily engaged in commerce. The country is heavily watered (100 inches) during the monsoon, and intersected by many streams from the W. Ghâts, yet during the dry season the soil is parched up and unproductive.

Concave' and **Convex',** two relative terms applied to curved surfaces; the former when an intersecting plane lies between the surface and the spectator, the latter when the plane lies on the further side. See LENS, MIRROR, OPTICS.

Concentai'na, a town in the province of Alicante, Spain, 4 miles N.E. of Alcoy, with manufactures of linen and woollen fabrics, of soap, paper, and bricks, of wine, oil, and brandy, and a trade in cattle and grain. Pop. 7758.

Concen'tric circles and spheres are those which are described with the same centre. C. central curves and surfaces of the second order have the same foci. These latter possess many curious mutual properties, which are discussed in Salmon's analytical treatises.

Concep'cion, a city of Chili, on the right bank of the Biobio, near its mouth, with a pop. of 25,120. Its port, Talcahuano, on the bay of C., is, after Valparaiso, the best in the republic, exporting largely hides, tallow, wool, and salted beef. The imports in 1894 were estimated at £1,715,654, and the exports at £1,128,316. The *province* of C. has an area of 3535 sq. miles, and a pop. of 237,844.

Conception of Our Lady, an order of nuns founded in Portugal in 1484 by Beatrix de Sylva, sister of the first Count of Poralegro, and confirmed by Pope Innocent VIII. in 1489. At first they followed the rule of the Cistercians, but after the death of Beatrix de Sylva, Cardinal Ximenes imposed on them the rule of St. Clara. The order spread into Italy and France. Their habit is a white robe with a figure of the Virgin holding the Child, and a blue mantle.

Con'cert, a name given to any musical performance except that of an opera. The first regular series of concerts seems to have been instituted by 'the Academy of Ancient Music,' an English society, which was formed in 1710, and existed until nearly the close of the last century.

Concerti'na, a musical instrument in which the sounds are produced by the passage of air through reeds, the wind being supplied by bellows which form part of the instrument, and can be extended and compressed by the hands while the fingers are left free to manipulate the keys. The C. has no importance musically.

Concer'to, a musical composition in symphony form, for a solo instrument with orchestral accompaniment. The solo parts in the modern C. are generally for the pianoforte or the violin.

Conchol'ogy (Gr. 'the science of shells') is now obsolete as a separate branch of zoology, since to understand the shell-structure of any animal we must have an idea of the animal itself. The name is mainly characteristic of the *Classificatory* period of zoology, when *Taxonomy* was deemed everything in natural history, and when *Structure* had a subsidiary place. See MOLLUSCA and SHELL.

Con'clave (Lat.) is the place in which the cardinals of the Roman Catholic Church meet for the election of a new pope, or the assembly itself. The cardinals, with not more than two attendants (called conclavists) to each, or three to a prince, are *locked* (hence the name) into a large room which is generally in the palace of the Vatican, till the election is over, having their food passed in through a small opening, and living in small cells within the room. The canon appointing these regulations was passed by the Second Council of Lyon, 1274.

Concord, a pretty town in Massachusetts, near the Concord river, 18 miles N.W. of Boston. On the 19th of April, 1775, the first skirmish of the Revolution took place here, and a monument, on the banks of the river, marks the spot where two English soldiers fell. C. is famous as the residence of Ralph Waldo Emerson; and it has, at different times, been a favourite residence of American *literati*, as Hawthorne, Thoreau, Alcott, and Hoar. Pop. 4427.

Concord, the capital of the state of New Hampshire, on the right bank of the Merrimac river, 59 miles N.W. of Boston. It was formerly called Rumford, and here Benjamin Thompson, afterwards Count Rumford, resided for a while. The town extends along the river for two miles, and contains the state-house and some other handsome public buildings. It has a thriving business in iron, steel, carriages, leather, and woollen goods. Pop. 17,004.

Concor'dance is an index of all the words in a book arranged alphabetically, with references to all the passages in which they occur, which may also give the different shades of meaning in which the words are used. A C. was first felt to be useful or necessary for the Scriptures, which were continually made the subject of appeal in learning, teaching, and disputation on religious matters. The first attempts at a C. were made by Antony of Padua (1195-1231), and Hugo de St. Chers (died 1262), both being from the Vulgate. The first Hebrew C. was written by R. Nathan (1448); the best is that of Fürst (1840), based on Buxtorf's (1632). The first Greek C. to the New Testament was written by Birck, a Lutheran clergyman (1500-54). The first C. to the English New Testament was made by Thomas Gybson (before 1540), and to the entire Bible by John Marbeck (1550). All were superseded by Cruden's, 1737, which is yet the best. Young's C. (1880) is also most valuable.

There are also *secular* concordances, such as Clarke's *C. to Shakespeare*, &c.

Concor'dat is a treaty regarding ecclesiastical affairs between the Pope, as representing the Catholic undivided Church, and a particular temporal sovereign. The matters treated of from time to time have been such as the right to nominate, and the right to confirm, bishops; the right to nominate to benefices while a bishopric is vacant; the right to the income of vacant benefices; and the particular taxes of *annates*, tenths, &c.; appeals to Rome; the authority of councils and of national customs against the Pope individually. The rights or claims of the national Catholic Churches used to be expressed in pragmatic rescripts, as in the French Pragmatic of St. Louis (1258); and these national claims were generally modified by concordats, as in that between Leo X. and François I. in 1516, the effect of which, however, was postponed by the Ampliative Dispositions. Questions of the treatment of heretics, of the Papal power of excommunication, and of the reception of Papal nuncios, and of the *Pase*, *Placito*, *Exequatur*, Letters of *Pasatis*, or *Placitum Regium* (the authority given by a sovereign to the publication in his territory of Papal bulls or briefs), also occurred in concordats. In 1682 the French clergy, founding on the Decrees of Constance, issued their celebrated declaration as to the *Régale*, which was acted on through the 18th c. In 1801 a C. was arranged between the Consul Napoleon and Pius VII., the nomination of bishops being by the first, the institution by the latter. Under the Revolution the institution of the constitutional bishops had been by the Metropolitan. The organic articles of the same year carefully provided for an examination of bulls coming into France. The earliest German C. is the Calaxtinum between Emperor Heinrich V. and Calixtus II. in 1122. The writings of Van Espen and the vigour of Joseph II. greatly weakened the power of the Papal nuncios in Germany in the 18th c. The German C. of 18th August, 1855, was, of course, destroyed when the N. German Confederation came into existence in 1867. In Spain a C. in 1753 vested all 'patronatos' in the home authorities, the Pope reserving fifty-two benefices, and receiving twenty-two million *reales* as compensation for *annates* and fees on briefs. The concordats of 16th March, 1851, and 25th August, 1859, were more favourable to Rome. In fact, Spain has always been at arm's length with the Pope on the Ultramontane question. Philip II. instituted a council, 'Concejo de la Camara,' to protect the constitution of the national Church, and Philip V. appointed a general agent at Rome, through whose *Visto Bueno* communication with the Vatican on certain matters must be made. In 1760 Benedict XIV. finally admitted the right of presentation to exist in Portugal. Carvalho strongly resisted Papal encroachment in the beginning of the 19th c. There was a Portuguese C. of 21st February, 1857. The Sardinian and Neapolitan concordats have now lost their interest. The Papal Encyclical, named *Quanta Cura*, published with a syllabus, 8th December, 1864, and the bull named *Pastor Æternus*, published 18th July, 1870, indicated what sort of C. the Papal power desires to make at the present day. Under the Italian Statute of Guarantees, the Pope is merely a spiritual power. The Austrian C. was practically abolished in 1874.

Concordia, the goddess of Peace, to whom several temples in Rome were dedicated. Camillus erected a shrine to C. to commemorate the happy conclusion of the feud between patricians and plebeians, the result of the passing of the Licinian rogations. The representations of C. were the figure of a matron holding in one hand an olive branch and in the other a cornucopia. Two hands clasped together and two serpents entwined symbolized C.

Concordia.

Con'course, a term of Scotch law. —*Concourse of Actions* means the right, by Roman law, accorded to a person of bringing more than one action on the same ground of right. The law of Scotland knows of no such concourse.—*Concourse of the Lord Advocate* means the necessary concurrence of the Lord Advocate in a criminal prosecution at the instance of a private individual.

Concrete (Lat. *concretum*, 'grown together') is a term in philosophy used to denote the opposite of Abstract. It means that an object is considered not merely in reference to pure essence, but as we find it in actual existence, invested with accidental qualities and attributes from which it can be dissociated in thought by an exercise of the reason. There are degrees of concretion as well as of abstraction. Take 'man' as an example of an abstract notion. The idea expressed by the word is stripped bare of everything but the mere attribute of humanity. We begin the process of concretion when we advance to the conception of an 'Aryan,' still further when we reach a 'European,' an 'Englishman,' a 'Londoner,' &c.; but the proper C. is none of these; it is the particular individual of whom we think, and in whom the various properties or peculiarities cohere.

Con'crete, a mixture of mortar with coarse materials, such as gravel, flint, pebbles, &c. At one time the French term *Beton* was used where the matrix was *hydraulic* mortar, and C. in other cases, but the latter word has now the more general meaning. The base of the mortar used is, in the best C., a hydraulic cement. For inferior C. lime is sometimes used, in which case 'poor' limes are better than 'rich.' The mortar should be made first, and the additional sand, &c., added afterwards, although in England sometimes the whole of the sand required to make both the mortar and the C. is frequently added at once. In the best C. Portland Cement (q.v.) is generally used, in the proportion of 1 part of cement to from 5 to 10 parts of aggregates in ordinary cases. C. is chiefly used for the foundations of buildings and masonry structures in general, and of late years it has found more and more extended application, both in foundations and superstructures in harbours, breakwaters, and other marine works. For these purposes huge blocks of C., weighing in some cases hundreds of tons, have been constructed in suitable moulds on shore, and when hardened conveyed to their destination by floating or travelling cranes. In this way the labour of erection and building below the water-line is very greatly reduced, while the greatest possible stability is attained.

Concre′tion, in medicine, is the formation of a solid substance either in some tissue or in the stomach, &c. In certain diseases salt of lime is deposited as a solid mass in the lung or the tissue, but the name is generally applied to a solid substance found in the stomach, &c., formed either by the undigested food matting together so as to cause an obstruction, or by some indigestible substance having been swallowed. Concretions are much more common in ruminating animals than in man. In the latter they sometimes consist of hair, cotton, or other substances. They are often found in concentric rings arranged round a nucleus. Concretions are apt to be originated by the use of certain medicines, as magnesia. When they become very large they require prompt measures on the part of the medical practitioner.

Concurr′ent Jurisdic′tion. Where jurisdiction may be exercised at the choice of the suitor in the same cause by two courts, or more, they are said to have C. J. The rule, then, is that the court which first exercises its jurisdiction excludes that of the others. In civil cases, the plaintiff may cite a defendant to appear before any competent court or judge.

Concus′sion (Lat. *concussio*, 'a shaking') is a term in medicine used to denote an injury to the nervous system brought on suddenly by external violence. Sometimes there is no lesion of the nervous substance or of any other structure; at other times there is laceration of the brain or other serious injury. C. is followed by insensibility and loss of all voluntary motion; the patient lies quite helpless; the pupils are unaffected by light; the pulse is feeble, and the breathing slow and scarcely perceptible. There are degrees of C. from the slightest interference with the functions of the nervous system, to that severe case in which the patient dies instantaneously. In the former cases he soon recovers consciousness, but for some time afterwards he suffers from confusion of ideas, often accompanied with noises in the ears. The proper treatment consists in keeping the patient perfectly quiet in bed, and in attending carefully to the wants of nature.

Con′dé, a name common to several French towns. Of these, the best known are—(1) **C.**, or **C. sur l'Escaut,** a town and border fortress in the department of Nord, at the confluence of the Haine and Scheldt, 7 miles N.N.E. of Valenciennes, with an arsenal and sluices for the defence of the town. It is a great entrepôt for coal. Pop. 4772.—(2) **C. sur Noireau,** a town in the department of Calvados, 25 miles S.S.W. of Caen, where the Noireau and Durance meet, with manufactures of cotton, nails, cutlery, and leather, and a trade in flax, thread, horses, cattle, &c. It came to the house of Bourbon in 1487, and gave name to a famous branch of that house. Pop. 6764.

Con′dé, a famous French family, which takes its name from the town of C. (q.v.), can be traced as far back as the close of the 12th c. In the year 1200 a certain Godfrey obtained part of the barony of C., and was thenceforth known as Godfrey de C. His great-granddaughter, Joanna de C., in 1335, married Jacques de Bourbon, Comte de la Marche. Their second son, Louis de Bourbon, Comte de Vendôme, received as his inheritance the barony of C. His great-grandson, **Louis de Bourbon,** in virtue of his relationship to the royal family, took the title of Prince of C., and is regarded as the founder of the new house of that name. Louis was born 7th May, 1530. He was a son of the Duc de Vendôme, and brother of Antoine, King of Navarre, and first distinguished himself in arms under De Brissac. He defended Metz against the forces of Charles V., assisted in the capture of Calais, and fought on the field of St. Quentin. At the conspiracy of Amboise he resolved to head the Reformed party against the Guises, and was only saved from execution by the death of François II. When civil war broke out on the massacre of Vassy, C. led the Huguenot forces from the Loire to Paris, and afterwards to the battle of Dreux (1562), which brought temporary peace. On the renewal of the war at St. Denis (1567) he and Coligny were still the recognised leaders. C. fell at Jarnac, 15th December, 1569, after maintaining a furious but unequal contest with the Duc d'Anjou's army. Although chivalrously brave, C. had no other quality of a commander; he was of licentious life, although he professed deep attachment to the Reformed Gospel.—**Louis II. de Bourbon, Prince de C.,** known as 'the Great C.,' born 8th September, 1621, was great-grandson of the preceding, and son of the feeble prince, whose wife attracted Henri IV., and the nephew of Prince Henri of C., who fought so bravely in the closing scenes of the civil war of the Huguenots. The Duc d'Enghien, as he was called, received a careful education; his mother, Charlotte de Montmorency, then holding a sort of literary court at the Hôtel de C. Marrying a niece of Richelieu, he obtained high command in the army, and just as Louis XIII. died he made his reputation by the brilliant victory of Rocroy (19th May, 1643), in which the Spanish army of Fuentes and Albuquerque was completely routed, a result to which C.'s strategic skill, decision of movement, and personal bravery all contributed. He next co-operated with Turenne in the Fribourg (Baden) campaign against Mercy, and repaired the losses of the former at Marienthal by the defeat of the latter at Nordlingen (Bavaria). The capture of Courtray and Dunkirk marked his first campaign in the Netherlands, to which, after an unsuccessful attack on Lerida, in Catalonia, he returned in 1648, and by his crushing defeat of the Archduke Leopold at Lens brought about the Peace of Westphalia. In the Fronde C. supported Mazarin and the queen-mother against the Frondeurs, but falling himself into disgrace, he afterwards attempted to organise a still greater rebellion, in which he was assisted by Nemours, Lorraine, and Le Rochefoucauld, &c., and opposed by his companion Turenne, who was successful at Gien, but defeated at the Faubourg St. Antoine. C. was in 1652 declared a traitor; he entered the service of Philip IV. of Spain, and for six years conducted a brilliant war in French Flanders against Turenne, whose victory of Dunes (1658) was followed by the Peace of the Pyrenees, C. being received back into the favour of Louis XIV. The enmity of Louvois and Turenne gave C. the chief command of the French army in Franche Comté (1668) and Holland (1672-74), where he measured his skill without disgrace against that of the Prince of Orange in the bloody field of Senef. His old age was spent at Chantilly, where La Bruyère lived with him, and Boileau and the other literary stars of the period were frequently seen. He died 11th December, 1686. Bossuet, who latterly had great influence over him, pronounced a magnificent funeral oration. Very different estimates of C.'s character, his political ambition, and his behaviour to his friends, have been formed. His military genius lay chiefly in daring, persistent assault, and he was therefore not sparing of human life.—**Louis Joseph de Bourbon, Prince de C.,** born at Chantilly, 9th August, 1736, was the son of the Duc de Bourbon, minister of Louis XV. He first distinguished himself at Johannisberg (1762), and other engagements in the Seven Years' War. Army and financial reform and a splendid hospitality occupied his attention till the Revolution, when he emigrated. The corps which C. then formed served in the campaigns of Wurmser, in the Austrian service; in the English service at Ober-Kamlach and Biberach (1796); and in the Russian service at Constance (1799). It was discharged in 1801, and C. came to England, where he remained at Malmesbury till the Restoration. He died 13th May, 1818. C. was the grandfather of the Duc d'Enghien, whose official murder so much injured Napoleon's reputation. He was concerned in the Pichegru conspiracy.

Conden′ser, an apparatus for cooling vapours down to the temperature at which they become liquid. There are various kinds of condensers in constant use, differing considerably in detail; but all work upon the same principle—namely, that of passing the vapour through a tube surrounded by material at the temperature required for the condensation. (See DISTILLATION.) The name C. is also applied to an electrical apparatus, by means of which a charge of low tension, distributed over a conductor, is concentrated, so that its otherwise insignificant effects are rendered visible to the experimenter. Its action depends upon the theory of electric induction, and may be simply conceived of as follows. Suppose two equal flat disks, A and B, formed of a good conducting material, to be placed close to each other, with only a thin layer of some non-conductor between. Let A be put in connection with the source of electricity, B. with the ground. The charge on A induces an opposite charge on B, which reacts upon the charge on A, thus, as it were, disguising a portion of it. Now, the whole charge on B is disguised, but only a portion of the charge on A; that quantity being free with which A would be charged if the C. B were not present. The more nearly equal the induced charge is to the inducing charge, the more effective the C.; and the ratio between the charges is dependent to a great extent upon the specific inductive capacity of the non-conducting separating layer. See DIELECTRIC, ELECTRICITY.

Condescen′dence is the name given in Scotch law to a judicial pleading. The Summons (q.v.) sets forth the name and designation of the pursuer (plaintiff) and defender, and the conclusions of the action. The statement of the grounds of action are set forth in the C., with a note of pleas in law subjoined. The C. is annexed to the summons, and forms part of it. The Defences (q.v.) must be in the form of answers to the C., with statement of the defender's allegations of fact, if necessary, and a note of his pleas in law. The summons is signed by a Writer to the Signet (q.v.), and the defences by counsel. If the pursuer do not choose to close the Record (q.v.) upon summons and defences, he revises his C., and the defender revises his defences. The record is then adjusted before the Lord Ordinary (See ORDINARY, LORD) in Chambers, and closed.

Condic′tio Indibiti is a term of Roman law for the reclaiming of money paid under an erroneous belief of its being due. It has been decided by the House of Lords (Wilson *v.* Sinclair, 7th December, 1830), that when a person pays money under an error, he has no right to recover unless the error be as to fact. Error as to law is not a valid ground for recovery.

Condill′ac, Étienne Bonnot, Abbé de, a French philosopher, was born at Grenoble in 1715. In the course of a studious life he published several essays and treatises on philosophy and logic. He also wrote upon Grammar, Ancient and Modern History, &c. His friend, Mademoiselle Ferrand, suggested many of his ideas. C. died 3rd August, 1780. At first a disciple of Locke, describing with special care the function of language in the formation of complex ideas, and in the development of mental faculty, C. afterwards maintained that innate faculties were as much a mistake as the 'innate ideas' which he ridiculed in Descartes, Malebranche, and Leibnitz, and that all knowledge and all mental faculties were derived from sensibility, being in fact only 'sensations which transform themselves differently.' Thus memory, attention, judgment, &c., were merely sensations persisting in a certain way. Similarly all the emotions were transformed desires, and desire was simply the withdrawal of sensation. It followed that the lower animals have not such vivid sensations as man (an exceedingly doubtful matter). C.'s philosophy, partly adopted from Gassendi and Hobbes, and enthusiastically applied by Diderot, De Tracy, and the other *idéologues*, consisted (1) in nominalism, (2) in the confusion of sensation with ideation. His analysis of the faculties, proceeding on this confusion, becomes merely verbal, his language constantly assuming the separate laws of mental growth which his theory denies. While, however, he conceived of the operation of (*e.g.*) memory as a mere mechanical tendency to motion, growing up through repeated motions, he also conceived the soul as a perfectly distinct entity, of whose life nervous motions were only the occasional cause. His theory led him to attach exaggerated importance to language, of both artificial and natural signs, which, if properly arranged, he regarded as being an accurate register of human experience. Reasoning was, therefore, speaking properly. C. is remarkable for the clearness and simplicity of his style, and is perhaps best seen in his criticism of the abstract systems, such as the Leibnitzian monads, the ideas of Descartes, &c.

Con′diments are agents used at table to aid the alimentary functions, and to give relish to such articles of food as are difficult of digestion, as fish, veal, vegetables, &c. The simpler C. are salt, butter, sugar, pepper, mustard, vinegar, and pickles. In hot countries, where the digestion is more liable to languish, stronger C. (*e.g.*, betel and curry) are in extensive use.

Condi′tion. In logic, conditions are the antecedents which combine to produce a certain effect, the antecedent which directly brings about the effect being termed the cause. Thus, a spark of fire might be termed the cause of an explosion, though, in reality, it is only the apparent occasion, and the nature of powder a C. necessary to produce the effect. 'The real cause,' says Mill, 'is the whole of the antecedents. Though we may give the name of cause to that one C. which brings about the effect without further delay, this C. has no closer relation to the effect than any of the other conditions has.' See Mill's *Logic*, book iii. chap. v.

Condition. In the real property law of England, it was at one time held that the gift of an estate by the lord to a vassal and the heirs of his body was a gift on C. of his having heirs of his body, and that if he died without having had heirs of his body the estate must revert to the lord. The C., however, was so far fulfilled by the vassal having heirs of his body, that, even though they predeceased him, he might alienate the land. An estate so bestowed may now, by certain legal procedure, be made an absolute gift.

Conditio si sine liberis decesserit.—By Roman law, a gift of estate made when the donor had no children became void on his having children. The principle of this law is recognised in Scotch law in testamentary settlements and in donations *mortis causa*.

Conditional Institute, a Scotch legal term. Under destinations of real property, the immediate disponee of the grantor is called the *institute*. Those to whom the property is destined, failing the institute, are called *substitutes*. When the destination to the immediate disponee is conditional, he is called a C. I. A C. I. takes the property as disponee, but a substitute takes as heir.

Conditional Legacy. When a bequest be made dependent on the occurrence or non-occurrence of some uncertain event, it is called a C. L.

Condi′tional Obliga′tion. An obligation depending on a condition has no force until the condition exist, but the grantor cannot revoke the ground of hope which he has given. Contracts are null if illegal or impossible conditions are annexed. But such conditions, or frivolous conditions, annexed to a legacy, are merely held *pro non scriptis*, and non-compliance does not affect the right of the legatee.

Condi′tioned. The philosophy of the C. is the name given by Hamilton to a particular application by him of the doctrine of the relativity of human knowledge. 'There is no ground,' he says, 'for inferring a certain fact to be impossible, merely from our inability to conceive its possibility.' This arises, not merely from the limitations of human experience, which, by creating certain powerful associations, exclude others, but because the human mind may be naturally incapable of conceiving many things. Besides the two ordinary meanings of inconceivability, however, viz., impossibility of representing the thing as an image, and impossibility of realising the thing as possible, Hamilton adopted a third, viz., impossibility of explaining, proving, or comprehending under a more general notion. He then states his theory: 'The C. is the mean between the two extremes—two unconditionates, exclusive of each other, neither of which can be conceived as possible, but of which, on the principles of contradiction and excluded middle, one must be admitted as necessary.' This he applies to the antinomies of space, time, free will, &c., maintaining that limited and unlimited space are alike inconceivable, but yet one is necessary.

Condona′tion in the law of England and of Scotland means *forgiveness*. A plaintiff may condone an offence either by an act implying forgiveness, or by complicity with the wrong-doing of the defendant. C., as accessory or accomplice, bars the suit of the plaintiff. The word is chiefly used in actions of divorce.

Con'dor, an American species of Vulture (q.v.), inhabiting elevated parts of the Andes, and of large size, the average length being between 4 and 5 feet, and the expanse of wings being about 14 feet. The tail is wedge-shaped. The plumage is black; the males have white wings, and their heads are combed and provided with wattles. The beak is curved at its tip. The food consists of carrion, and these birds consume large quantities of food. The King Vulture, another species of this genus, inhabits Brazil and Guiana. Its plumage is red above and white beneath, with black tail and wings. The Californian vulture is a third species of the genus to which the C. belongs.

Condor.

Condor'cet, Jean Antoine Nicolas de Caritat, Marquis de, a French philosopher, born at Ribemont, Picardy, 17th September, 1743, of a noble family, was educated by the Jesuits of Reims, and at the College of Navarre, Paris. His talent was chiefly mathematical, and his *Mémoires* on the integral calculus, probabilities, and the higher analysis generally, won the admiration of D'Alembert and Lagrange, the former of whom secured, in 1773, C.'s election as secretary to the *Académie des Sciences*, though Buffon's friend Bailly was a candidate. In this position he wrote many of the finest *éloges* in French literature, notably those of Buffon, D'Alembert, Franklin, Lafontaine, &c. He pled warmly against religious distinctions in scientific societies, asking whether a society containing the Atheist Aristotle, the Catholic Descartes, the Unitarian Newton, the Calvinist Huyghens, the Deist Leibnitz, the Jansenist Pascal, the Mahommedan Al Hazen, &c., &c., would not be the best of its kind. Drawn by his friendship for Voltaire and Turgot into social discussions, C. wrote against Necker for free trade in corn and against the feudal taxations. From 1776 to 1791 he held a position resembling the Mastership of the Mint. The lives of Turgot and Voltaire, the slavery abolition question, and religious equality, occupied his attention as well as his official duties. His activity in writing on political questions immediately before and during the first years of the Revolution was great. As member of the Legislative Assembly of 1791 and the Convention of 1792, he prepared reports on the question of peace or war, was influential in taking the custody of registration from the clergy, strongly opposed the capital sentence of the King, and was consulted on all constitutional points of importance. On the expulsion of the Girondins, however, he was denounced by the Committee of Public Safety, and compelled to hide for six months in the house of Mme. Vernet, where he composed his famous *Esquisse des Progrès de l'Esprit Humain*, afterwards printed by order of the Convention. Leaving this shelter, which exposed his friend to the penalty of death, C. escaped from Paris, but was retaken, and died by poison, self-administered, at Bourg la Reine, 28th March, 1794. C. had a noble wife, who strengthened him greatly in his separation from the aristocratic party to which he by birth belonged, and in his persecution by the Terrorists, whose constitution of '93 he had opposed. She was the sister of Marshal Grouchy and the sister-in-law of Cabanis. She translated Adam Smith's *Theory of Moral Sentiments* into French. During her husband's concealment she supported herself by painting portraits, the Government having sequestered C.'s property. C. himself was a man of delicate sensibility and warm affections, and undoubtedly one of the greatest intellectual figures in the Revolution. His theory of human progress has been blamed as establishing a rather inconsistent division of history into periods; one being political, another scientific, another religious. His conclusions that equality, or *equal freedom* of nations and classes (as regards trade, wealth, education, government, &c.), will be established, and that human nature is indefinitely perfectible morally, physically, and intellectually, have excited much mistaken ridicule. C. in fact announced the truth that the mental acquisitions of one generation are not dissipated, but transmitted to its successor; he insisted that this might take place with regard to morality as well as intellect; he did *not* suppose that medical science would ever make man immortal.

Condottïe'ri, soldiers of fortune of the 14th c., whose services in warfare were sold to the side that promised most plunder. The quarrels of the petty Italian states gave these mercenaries constant occupation. Among their celebrated chiefs were Francis of Carmagnola, and Sforza, who became Duke of Milan.

Battles were fought by *arrangement*: a general who could not, or would not, pay his C., found himself deserted at the most critical time of the campaign. Commanders of opposing bands of C. would compare notes and talk the matter over quietly before the battle, deciding amongst themselves to which side victory should fall, and that *without bloodshed*, so far as they were concerned, although there usually followed much slaughter of those unconnected with the C., and of the people in whose territory operations were proceeding.

Conductiv'ity, thermal or electric, of a given substance, is the amount of heat or electricity which flows through a cube of unit volume in unit time, the difference of the temperature or potentials of the opposite sides being unity. The late Principal Forbes has shown that the thermal C. of pure metals is probably inversely proportional to the temperature from absolute zero, and the same law seems to hold in the case of electric conduction. This law is deducible from theory, upon the hypothesis that heat, during its conduction, arranges itself exactly as it would do if let down from the hotter to the colder part by a perfect engine, *i.e.*, so disposes itself that the least possible amount of work can be got from it during the operation. (See THERMODYNAMICS.) Non-metallic substances are in general bad conductors of heat, and frequently non-conductors of electricity; and these increase in conducting power as their temperatures rise. Liquids are of small conducting power as compared to solids, and the experimental determination of their C. is a matter of considerable difficulty, in the one case owing to the disturbing effects of the thermal convection currents produce, and in the other, if the liquid be a chemical salt or compound, to the electrolytic action and polarisation which generally supervene. The C. of gases is still more difficult of determination, radiation and convection playing by far the most important part.

Conduc'tor, in music, the director of a performance. The C. generally stands in front of the performers, and marks the time for them with a baton, while at the same time he indicates the expression and the entrances of the different parts or instruments. The C. of an orchestra must be distinguished from the *leader*, who is the principal first violin.

Cone, the solid formed by drawing lines from every point of a closed plane curve to a given point not in the plane of the curve. If the C. be cut by a plane parallel to the base, the curve of section is similar to the base, and the solid bounded by these parallel planes is called the *frustrum*. The most important C., however, is the *right C.*, which may be generated by the rotation of a right-angled triangle about one of its sides. If it be intersected by a plane perpendicular to the axis of rotation, the curve of intersection is a *circle;* if by a plane inclined at any angle, but cutting both sides of the C., an *ellipse;* if by a plane making with any side an angle equal to the vertical angle of the C., a *parabola*; and if by a plane making any inclination less than this, a *hyperbola*. For the special properties of these conic sections, reference must be made to the several articles.

Conegliaʹno, a town of N. Italy, province of Treviso, 28 miles N. of Venice by railway, with several churches, a hospital, and manufactures of silks and woollens. Pop. 9260.

Cone-Shell, a genus of Gasteropodous mollusca, belonging to the family *Conidæ*, in which the shell is inversely conical, the aperture long and narrow, and the outer lip notched near the suture. The *operculum* is minute and of lamellar structure. This family belongs to the *Siphonostomatous* (or 'siphon-mouthed') division of Gasteropoda, and to the order *Prosobranchiata*, in which the gills are placed anteriorly to the heart. These molluscs are common in the Mediterranean and in tropical seas.

Confarreaʹtion, a Roman form of marriage ceremony, deriving its name from the *panis farreus* (bread made of spelt) used on the occasion. The children of parents so married were alone eligible for certain offices of the priesthood.

Confecʹtionery. Under this name are included the various manufactures of sugar for use as sweets, or *bonbons*, as they are called by the French. The simplest form in which sugar is prepared for eating is when it is crystallised from a solution into candied sugar. It is generally prepared from raw sugar, and has a brown colour; but when tinted, refined sugar is employed, and the colouring material added to the solution. The crystallisation takes place around thin slips of wood or pieces of twine, which are always found in the core of the material. Sugared almonds, cloves, caraways, corianders, &c., and sweets having a core either of fruit or baked sugar, as in the case of 'pan drops,' all of which are included in the French *arages*, are thus prepared. The cores of fruit or sugar are placed in a large copper pan, revolving at an angle of about 45°, heated by steam admitted to circulate between its outer and inner surfaces. The revolution of the pan at this angle causes the materials within it to be in constant motion tumbling over each other. A gentle stream of sugar solution is allowed to trickle continually into the pan, and the continual motion of the materials secures a proportion to each separate piece, and at the same time keeps them from adhering to each other, while the heat dries off the superfluous moisture. Thus the cores become gradually and uniformly encrusted in pure sugar, and the longer the process continues, the thicker becomes the coating. Ordinary lozenges (*trochisi* of druggists) are prepared from loaf-sugar broken, and ground to a fine powder. This is baked up into a stiff cake with a pure solution of gum arabic, rolled out to the required thickness, and the lozenges cut out by hand or machine. They are then put aside to harden and dry in trays. The paste may be tinted with any colouring material, and flavourings such as peppermint, ginger, clove, rose, musk, &c., are introduced in the baking. Medicated lozenges are an elegant and pleasant form of administering minor remedies for coughs, children's ailments, &c., when suitable ingredients are introduced into the paste; but the use of lozenges containing morphia, codeia, and other narcotic substances should be carefully guarded. Pastilles are preparations containing a large proportion of gum, in which the sugar is wholly dissolved, and they are usually tinted and flavoured with fruit essences. Preparations of boiled sugar form a distinct class by themselves, and occur in a variety of forms, such as 'drops,' barley-sugar, rock, balls, &c., variously tinted and flavoured. The sugar is dissolved by heat over a fire, care being taken to keep it from burning, and when poured out in thin layers it is worked up into its various forms, after it has acquired such a plasticity as enables it to be handled. Toffee or butter-scotch is made by boiling up sugar, honey, and butter together, but frequently the honey is altogether omitted from the preparation. The French excel in the preparation of various sweets, and their *fondants* have often an exquisite flavour, and are manufactured in a very attractive manner.

Confederaʹtion of the Rhine, a confederacy formed by Napoleon when he destroyed the Holy Roman Empire in 1806. It consisted of sixteen German princes, who disowned connection with the ancient empire, allied themselves with France, and acknowledged Napoleon as protector of the league. It undertook to furnish him, in war, with 63,000 soldiers. This unpatriotic alliance was dissolved in 1813, on the fall of Napoleon, and the Germanic Confederation was constituted in its place in 1815.

Conʹference, in English, means the professional interview of an attorney or solicitor and counsel. When barristers meet professionally for friendly deliberation, the meeting is called a *consultation*.

Conferʹva, the type of the division of green-spored Algæ (q.v.), called *Confervaceæ*. They are exceedingly delicate, thread-like, articulated, cellular plants, found mantling the surface of stagnant pools, and constituting much of the 'scum' of such collections of water. When dry, the masses of confervæ look like cotton, and, indeed, have been used as a packing instead of tow, to support fractured limbs. It has been proposed to apply these cotton-like masses to economic purposes, but the project has not yet taken any tangible shape.

Confesʹsion, in the ecclesiastical sense, means the acknowledgment of sin, accompanied with submission to penitential discipline, and the reception of an authorised sentence of reconciliation. All Christians admit that they are to confess their sins to God. The sacrifices or 'sin-offerings' which, from the first, were offered to Jehovah for pardon of sin, always implied C. of that sin, whether openly expressed or not. According to the Jews, repentance could not be complete without C., of which their Rabbis enumerated three kinds. The ministry of John the Baptist was based on the same principle. In the early Christian Church, C. was practised, along with other exercises, as a preparation for baptism; and this C. was sometimes public and sometimes private. In the case of public, scandalous offences, transgressors were obliged particularly to promise to forsake them; but no public or particular C. of private offences was required of men at baptism, beyond what was implied in the general renunciation of Satan, and all his works. Those who were guilty of public, notorious, and scandalous crimes after baptism had to undergo public Penance (q.v.) before being again admitted to the communion. As to private offences, sometimes public C. and penance were made for them, and sometimes a public minister was appointed to hear men's C. and direct their repentance; but this was by no means an essential condition for communion, much less were auricular C. and private absolution from a priest; it was all a matter of advice and free choice. But in the fourth Lateran Council (1215) Pope Innocent III. published a decree, requiring it to be held as an article of faith that every one is bound, by a positive divine ordinance, to confess his sins to a priest, and the dogma of auricular C. was fully established in the Roman Catholic Church. In the standards of the Church of England, C. is permitted, and in some cases recommended. The practice fell into almost complete disuse, however, after the Reformation; but in modern times it has had a great revival in the High Church party. Public C. is practised among certain Nonconformist communities. See Bingham's *Antiquities of the Christian Church*.

Confession, in law, means avowal or admission of an allegation. In England, in a criminal case, a jury may convict a prisoner on his C. without further evidence, provided it be made without intimidation or bribe. In Scotland, corroboration is required, the C. being merely held as evidence. In a civil action, refusal to deny an allegation within the knowledge of the party is held as C. of its truth. C. before an ecclesiastical court, even though followed by public Church censure, is not in Scotland held as proof in any civil or criminal matter by a lay court.

Confession and Avoi'dance is, in common law pleading in England, the admission of an allegation of the opposite party, but with the addition of some circumstance which destroys its legal effect. Some pleas of this kind urge justification or excuse, while others endeavour to show discharge or release.

Confession, Judgment by, in England, is judgment against a defendant on his admission of the law and facts alleged against him.

Confes'sional is an enclosed seat or recess in Roman Catholic churches in which a priest sits to hear penitents make confession. The usual place used to be an open seat in the chancel; the modern C., resembling a sentry-box, with a small window for penitents to speak through, being of recent introduction.

Confessions of Faith might be called elaborated Creeds (q.v.). The principal C. of F. extant, which were composed at the time of the Reformation or soon after, are the following:—Confession of the Roman Catholic Church, contained in the decrees of the Council of Trent (q.v.); Confession of the Lutheran Church, contained in the three ancient creeds, the Augsburg Confession (q.v.), and Melancthon's Apology, the Articles of Schmalkald, Luther's Catechisms, the Concordienformel, and the articles of Visitation (1592); Confession of the Reformed or Calvinistic Churches—the Helvetic, Tetrapolitan, Gallic, Palatine or Heidelberg, and Belgic; Confession of the Anglican Church—the Thirty-nine Articles (q.v.); the Confession of the English and Scotch Presbyterian Church, and the Westminster Confession of Faith and Catechisms, drawn up by the Assembly of Divines who sat at Westminster from 1643 to 1649.

Con'fident Person means in law an intimate associate or dependent. The term is especially applied to a partner in business, steward, agent, or servant of any one. Deeds of an insolvent person in favour of those so connected with him, if granted without adequate consideration, are, in Scotland, reducible by statute. See CONJUNCT PERSONS, COLLUSION, CONSIDERATION.

Confidential'ity, in law, denotes the legal privilege which some communications have. Letters between agent and client have the privilege of C., as do in certain cases communications between husband and wife, and secrets of states. No action of damage can be founded on them, nor can anybody be required to produce them in a suit or action. How far the privilege extends has been the subject of much legal discussion. It has been decided that a former agent is bound to secrecy, and in England the tendency of decisions has been towards a wide view of the privilege (see Dickson on *Evidence*). In Scotland it is still doubtful whether confessions made by a criminal to a clergyman are privileged. In England it has been decided that they are not. Physicians are not entitled to withhold communications, however confidential. In Roman Catholic countries the 'Seal of Confession' is held inviolable. Husband and wife are admissible as witnesses for and against each other in civil suits, but neither is a competent witness against the other in a criminal case. See EVIDENCE.

Confirma'tion is a rite supplementary of the sacrament of baptism, and without which no one is admitted to the sacrament of the Lord's supper. It means literally a *strengthening*, and is so called because they who receive it are understood to be strengthened thereby for the fulfilment of their Christian duties. There has been a controversy between Romanists and Protestants as to whether such a rite existed in the time of the apostles, or whether it originated at a later date. Be this as it may, it was, in the early Church, always performed in connection with baptism. The full ceremony of baptism consisted, besides the immersion, of unction, of the sign of the cross (the seal of the Lord), and of the imposition of hands accompanied with prayer; and by the name of one or other of these three actions it was generally known. Baptism thus consisted of a negative and a positive part: the cleansing from sin, signified by the immersion; and the importation of the Holy Spirit, signified by the imposition of hands. Now, as the Holy Ghost was given by the laying on of the apostles' hands (Acts viii. 14-19, and xix. 1-6), this power was reserved exclusively for their successors, the bishops. Accordingly the latter part of the rite of baptism, which afterwards became to be called C., could only be performed at the same time with the immersion (which could be performed by the presbyters, and even the deacons) if the bishop happened to be present. If not, it was performed by him at the first opportunity, for which purpose he went periodically through his diocese. It was not till the 13th c., however, that C. came to be regarded as a separate ordinance from baptism, even in the case of infants, to whom at first the eucharist also was given at the same time. The Council of Trent (1545) pronounced it to be a true and proper sacrament. In the Eastern Churches, baptism, C., and the eucharist are all administered yet in immediate succession. In the Western Churches, for the last three or four centuries, a delay of seven years has been interposed between infant baptism and C. In the Anglican Church, this delay is extended to fifteen or sixteen years. See Blunt's *Dict. of Doct. and Hist. Theology*, Smith's *Dict. of Christ. Ant.*, and Bingham's *Eccl. Ant.*

Confirmation, in English law, means the conveyance of a voidable right in land or of a particular estate to a person in possession, by which the former becomes valid and unavoidable, and the latter greater. In Scotch law, C. means the form in which a title is conferred on the executor of one deceased to administer. The process for C. goes on before the Commissary (q.v.) of the district.

Confirmation, Charter of, in Scotch conveyancing, is the title of a charter granted by the superior to the purchaser of a property. It is so called because it confirms the rights granted to the purchaser under the Disposition (q.v.) in his favour, and the Sasine (q.v.) following upon it.

Confisca'tion was the forfeiture of lands or goods to the crown, being part of the punishment of certain crimes. This has been abolished by statute 32 and 33 Vict. c. 23.

Con'flict of Laws. There is no kind of question more perplexing to the mind of lawyers than that which springs from the confliction of the law of different states. An individual may have two nationalities by parentage, and many nationalities by residence and right of property in various countries; thus it may be very difficult to say under the law of which country this individual or his right of property ought to be. Even in the Roman Empire the C. of L. was very embarrassing, for the inhabitant of one province was not subject to the jurisdiction of the magistrate of another. But it has been since the Roman Empire dissolved into the various kingdoms of modern Europe that the full force of the difficulty has been felt. In the United States of America it has been also very greatly felt, owing to the partially independent character of the states forming the Union. In Great Britain, the chief conflict of law has arisen from the difference in the legal doctrine of England and Scotland respecting the constitution of Marriage (q.v.), and in the determination of other points involving questions of Domicile (q.v.). See Story's *Conflict of Laws*.

Confor'mable Strata, in geology, are strata deposited one above the other in parallel layers. They indicate the absence of any great physical disturbance (save perhaps an interrupted but gradual rise or fall of the whole district) during their deposition, and point to a comparatively short geological time between the formation of any two.

Confron'té, or **Com'battant,** in heraldry, two lions or other beasts of prey, face to face, rampant.

Confu'cius (a Latinised form of *K'ung Fu-tsze*, 'the Master Kung'), the son of Shu-leang Heih, a brave soldier of ducal descent, and Chingtsae Hen, was born in the district of Tsow, now Yenchow, 21st of 10th moon, B.C. 551. His father's death left him poor. After a studious youth, he married at the age of nineteen, and then became keeper of grain stores, and afterwards of the public lands and fields. At the age of twenty-two he began publicly teaching for fees the 'doctrines of antiquity.' In 528 B.C. he lost his mother. After a long study of the history, literature, and institutions of the empire, C. obtained from Prince Ch'aou, through a favourite pupil, Hohe, the means of travelling from his native state of Lu to the state of Chow, where he met Laou Tau, the founder of the Rationalistic sect named Taouists. Civil commotion in Lu next forced C. to retire to the state of Tse, where he enjoyed the friendship of the King, and extended his knowledge of music. From 515 to 501 B.C., he remained in Lu without public office, but with an increasing number of disciples. After the expulsion of the usurper, Yang Hu, C.'s success as chief magistrate of the town of Chung-tu led to his appointment by the Prince Ting (of Lu) as Assistant-Superintendent of Works (in which capacity he carried out a survey, and many agricultural improvements), and latterly as Minister of Crime. His determined opposition to the great private families, and his administrative power, made him many enemies in Lu and Tse; in 496 B.C., he was driven from the court, and spent the next thirteen years in wandering from state to state, chiefly in Wei, Ch'in, and Ts'u. In 483, he returned to Lu, where he spent the last five years of his life, consulted occasionally on public affairs, but chiefly engaged in revising his works on rites and history, and in the reformation of music. After losing his son Le, and his disciples Yeu Hwuy and Zsze-lu by death, C. himself died, on the 11th of the 4th moon, 478. His disappointments in life were compensated by the universal veneration of his memory. His classics have become the text-books of instruction in all schools and colleges, and the subject of competitive examination for civil posts. He not only receives titles of honour, as the Ancient Teacher, the Perfect Sage, &c., but in association with his ancestors and four eminent disciples, he is regularly worshipped in temples built for the purpose, the Emperor performing an act of public worship twice in the year. The immense literary class of the empire transmit the influence of C., which extends to the Taouist and Buddhist population, as well as to the pure Confucians. The Chinese classics consist of the Five *King* (or canonical works), which are the Yih (Book of Changes); the Shu (Book of History); the Shi (Book of Poetry); the Le Ke (Book of Rites); the Ch'un Ts'ew (Spring and Autumn), a chronicle of events from 721 to 480 B.C.; and the Four *Shu* (or writings), which are the Lun Yu (or the Confucian Analects or Digested Conversations of C.); the Ta Hëo (Great Learning), attributed to Tsang Sin; the Chun Yung (Doctrine of the Mean), ascribed to K'ung Keih, the grandson of C., and the works of Mencius. These works (which have been the subject of innumerable commentaries) were first completely collected by the Emperors of the first and second Han dynasty. Since the beginning of the Christian era they have been jealously preserved by the state, but it should be remembered that the original text was put together from scattered bamboo tablets, which the Tsin dynasty (B.C. 255-202) had endeavoured to destroy. The Ch'un T'sew is the only work entirely composed by C. The great feature in the philosophy of C., is that he professes to base everything on the past; to revive the wisdom of early sages, and the purer and more scrupulous rites and ceremonies of former times. Possessed of high and noble conceptions of morality, and of a warm and generous disposition, he nevertheless, in accordance with the genius of his race, put a faith in the minute external regulations of life which is pedantic and incomprehensible to Europeans. This faith has communicated itself to the empire, and has survived through many political revolutions to the present day. It is probable that C., while insisting on the duty of ancestor-worship (a form of human service revived by Comte), had little belief in the objective existence of the Shang-Te, or Supreme Spirit, mentioned in the Book of History, or of departed relatives and friends. Women have always been oppressed in China; 'talkativeness' being one of the seven grounds of divorce laid down by C. The despotic principles thus applied to the five relations of society (including those of friendship and of elder and younger brother), must have been useful in establishing the centralisation of the imperial power, and the suppression of feudalism. C.'s negative expression of the Golden Rule of Christ has often been commented on; his ethical code, however, permits blood-revenge, a thing repugnant to Christian ethics. See Legge's *Chinese Classics.*

Confucius.

Confu′sion, a term of Scotch law, denoting the extinction or suspension of an obligation by the debt and credit devolving on the same person.

Congé-d'Élire is the sovereign's licence to the dean and chapter to *elect* a new bishop when the see is vacant. It is accompanied by letters-missive from the crown, naming the person to be elected. If the election is delayed beyond twelve days, the nomination may be effected by letters-patent from the crown. If the dean and chapter elect any other than him who is named, they incur the penalties of a *Præmunire* (q.v.).

Con′ger Eel, a genus of Teleostei, included in the suborder *Malacopteri,* and differing from the ordinary eels, chiefly in the length of the dorsal fins, which commence above the pectoral fins. The upper jaw is larger than the under jaw. The tail is elongated and pointed. The C. E. may attain a length of from 3 to 6 feet, and a thickness equal to that of a human leg. The colour is a brownish-black above, and a white beneath. It is the only British species, and is fished chiefly on the S. coasts of Britain. The flesh is coarse. The baits used in its capture are small fishes of various kinds.

Conges′tion, in medicine, is a term used to denote that condition in which there is excess of blood in a part of the system. It is of three kinds:—(1) *Active C.,* in which there is an increased flow of blood to a part through the arteries. This occurs in all local inflammations, and was denominated by the older surgeons *determination of blood to the part.* It may result from the application of some irritant, as is seen in the redness produced by a mustard-poultice, which is due to the increased flow of blood to that part. Active C. often ends in hæmorrhage, especially when situated in a mucous membrane, as in the stomach. (2) *Passive C.,* when the excess of blood in the parts is due to want of tone in the small blood-vessels (capillaries). These capillaries are dilated, and the circulation of the blood in the part is sluggish, and as a consequence the serum of the blood is exuded, and dropsy is the result. Passive C. is often the result of Active C. (3) The *Mechanical C.* of some authors is C. due to obstruction in some vein, as a tumour pressing on a vein. Tight garters will produce C. of the lower extremities. Mechanical C. produces a variety of passive C. In active C. the part is generally bright red; in passive C. it is more or less of a dark-purple colour. Treatment of C. will depend on the kind of C. present. In all cases the cause is to be removed if practicable. In passive C., iron tonics internally, and astringents, as alum or zinc, externally, will often do good.

Con'gleton, a market-town and borough, Cheshire, on the Dane, 33 miles E. of Chester, with manufactures of cotton and silk. C. silk fabrics are of superior quality. Many of the houses consist of timber-framing and plaster, which gives the town a picturesque and ancient appearance. Pop. reg. subdist. 18,547; mun. bor. and civ. par. (each) 10,744.

Conglom'erate, or **Pudding-Stone,** is a rock composed of water-worn pebbles (usually quartz or other highly siliceous mineral), cemented together by a matrix of sand, clay, or lime. It indicates the position of a former coast-line, and a subsequent depression below the sea. *Breccia* differs from C. in being made up of angular fragments.

Congo, or **Livingstone,** the greatest if not the longest river of Africa, drains the region lying to the W. of the Great Central Lakes, and enters the Atlantic in lat. 6° S., 200 miles N. of Loando. It issues from the S.W. extremity of Lake Bangweolo or Bemba (q.v.), and flows N. as the Luapula to Lake Moero, then in a N.W. direction, and after passing through the W. side of the Marungu country, it takes a great curve to the W. before reaching Nyangwe, the most westerly point attained by Livingstone (April-June, 1871), and the point from which Stanley began to trace its course. The C. then flows due N., and under the equator rushes over five cataracts, called Stanley Falls, round which Stanley's boats had to be dragged for 13 miles. One of the most remarkable and unexpected of Stanley's revelations was this great northerly sweep of the river, which takes it to 1° 45′ N. lat. On leaving Upoto on the left bank it trends S.W. to the Atlantic, taking the name C. (*Kwango*). It has an estimated drainage area of 1,400,000 sq. miles, and a length of over 3000 miles. Stanley named many affluents, but explored none. One, the Sankuru, is obviously Cameron's Sankorri; another, 2000 yards wide at its junction (about lat. 1° N.), is called Aruwini or Biyerre, and is supposed to be Schweinfurth's Welle. Stanley reports that for 780 miles (16° 50′-25° 50′ E. long.) the C. is continuously navigable, but for 170 miles the lower course is impeded by rapids and cataracts. The country through which it flows is densely wooded; oil-palms, white cotton, india-rubber, ground-nuts, and ivory are superabundant. The basin of the Upper C. is rich in copper and gold mines. Stanley gave the name 'Livingstone' to the whole river. See Burton's *Gorilla Land and the Cataracts of the C.*; Monteiro's *Angola and the River C.* and Stanley's *Through the Dark Continent*, &c.

Congo Snake, a harmless batrachian, occurring in the southern of the United States of America. It breathes through branchiæ at the sides of the neck. It possesses four small limbs; the fore arms have two fingers and the hind two toes. The colour is bluish black and the length about 2 feet 4 inches. The C. S. lives in muddy ditches and is often found in rice-fields, where it feeds on insects and small fish or molluscs.

Congo Snake.

Congrega'tion, means—(1) in its largest sense, the visible Church, or the whole body of Christian people considered as assembled in some act of fellowship; and then popularly (2) the worshippers assembled in a particular place; (3) also it was the ancient name for a Chapter (q.v.); and (4) in the Roman Catholic Church it means a council or court of cardinals and other divines.

Congrega'tionalists, the proper name of the body of Christians best known as Independents (q.v.).

Congress is the term applied to a conference of European sovereigns, or of their plenipotentiaries, to consider matters of international interest, and generally to adjust the Balance of Power (q.v.). Such were the Congresses of Vienna, held in 1815; of Carlsbad, in 1819, for adjusting the position of Germany; and of London, in 1826, for fixing the fate of Greece. At a C. there is no presentation of credentials on the part of the members, although they exchange and examine the warrants under which they act. In the U.S. and some other of the American republics C. is a collective name for the Senate and the House of Representatives, but had originally a similar meaning to what it has in Europe.

Con'greve, William, one of the greatest of our comic dramatists, was born in Stafford in February, 1670, and educated at Dublin. He soon abandoned the law—for which he had studied—in favour of literature. His first comedy, *The Old Bachelor*, written at the age of twenty-three, won him the patronage of Lord Halifax, through whom he obtained a place in the Pipe Office and a post in the customs. After writing two comedies, *The Double Dealer* and *Love for Love*, he produced the *Mourning Bride*, a stilted tragedy, which met with enormous success. His last comedy, the *Way of the World*, being coldly received, he gave up writing plays, and spent the rest of his life in wealthy leisure. He died 19th January, 1729. His career was eminently successful. Ministers competed to offer him sinecures; poets competed to praise his works. Dryden, Pope, Swift, Steele, and Addison, were united in admiration of him. There is little humour, and, excepting in *Love for Love*, little feeling in his plays. The *Way of the World* is a masterpiece of brilliant dialogue; there is in it a perpetual sparkle of piquant conceits, arch raillery, and sprightly repartee and innuendo. The best edition of C. is that by Leigh Hunt. See also Thackeray's *English Humourists*, and Macaulay's Essay on the *Comic Dramatists of the Restoration.*

Con'gruous. In the theory of numbers, two numbers, a and b, are said to be C. to one another with respect to a third, c, when $\frac{a-b}{c}$ is a whole number. The student is referred to the works of Gauss, Poinsot, and Jerret for the curious properties of C. numbers.

Co'ni or **Cuneo,** an episcopal city of N. Italy, and capital of a province of the same name, at the confluence of the Stura and Gesso, 48 miles S.W. of Turin, with which it is connected by railway. The streets, with the exception of the principal one, which has arcades throughout its entire length, are mere lanes. The position of C. gives it a large traffic with Lombardy, Switzerland, and Germany, the merchandise from the port of Nice for these countries passing through it. Pop. 24,924.

Conif'eræ, an order of Dicotyledonous trees and shrubs, chiefly remarkable for the seeds being *naked*, and lying behind scales (generally woody), which make up the compound fruit called a cone (hence the name C., or cone-bearers). They also constitute the subdivision *Gymnospermæ*, or naked seeded plants. There are two sub-orders *Abietinæ* and *Cupressineæ.* Some of the species are rather variable, and have been unnecessarily multiplied on very slight grounds. The number may be given at about 130; they are distributed all over the world, but chiefly in northern and temperate climates. The region of America immediately to the W. of the Rocky Mountains is rich in some very beautiful forms, *e.g.*, *Sequoia sempervirens* and *Sequoia* (*Wellingtonia*) *gigantea*, the latter of which is one of the largest known trees. It grows in two or three clumps in the Sierra Nevada and vicinity, in California, and though the height of these 'big trees,' as they are called in California, has been much exaggerated, the highest reaches 325 feet, and the stump of one which had fallen before the grove was discovered by the white, is 30 feet in diameter. A house is now erected on it, in which dancing-parties are held. Neither this species, nor its close ally *Sequoia sempervirens* (the redwood), has been ever found in the neighbouring states of Oregon, or, indeed, out of California. The order possesses many excellent timber trees, which also yield resin, pitch, tar, turpentine, &c. The wood of all of them is marked with dots or disks, by which it can at once be distinguished under the microscope. The Yews (q.v.) are by some authors considered as a tribe of C. (*Taxineæ*), and by others as a distinct order (*Taxaceæ*).

Coni′ine is an Alkaloid (q.v.) contained in hemlock, and is a volatile liquid, boiling at 168° C. It possesses a powerful, pungent odour, like that of tobacco, and is very poisonous. C. is a strong base, and forms crystalline salts with acids. It has been prepared artificially.

Coniros′tres, a sub-order of Insessorial (q.v.) or Perching birds, distinguished primarily by the conical shape or form of the beak, whilst the upper mandible is not markedly toothed at its apex. Of this group the sparrow (q.v.), hawfinch or bullfinch, crow, starling, hornbill, finch, and lark are good examples. These birds are chiefly granivorous in habits.

Conjoin′ing of Pro′cesses, a term of Scotch law. Where two or more processes in the Court of Session relate to the same matter and affect the same parties, the court may conjoin them. They are then discussed together as one group.

Con′jugal Rights, a Suit for Restitu′tion of, is a suit arising from a husband or wife, without legal cause, insisting on living separately; in which case, the courts will decree them to come together, 'if either,' as Blackstone remarks, 'be weak enough to desire it.' The Divorce Court before which the suit is brought does not attach the party disobeying the decree though it will order the husband, if the wife be the petitioner, to make certain payments to her from time to time. Neither party can forcibly carry out the decree of the court, so that neither can seize and detain the other by force.

Conjuga′tion (Lat. *conjugo*, 'I yoke together') is the grammatical designation of the classes into which verbs have been divided, with the view of exhibiting collectively the various methods of denoting the relation of voice, person, number, mood, and tense. These relations are expressed in some languages (as in Sanskrit, Greek, Latin) by additions to and alterations upon the verb-stem; and in others (as in English, &c.) by distinct words. As the mechanism of inflections practically draws half its facts from Latin and its derivatives, we shall take Latin as an example of the former class. In Latin verbs the inflections in a C. express the voices, active and passive (sometimes called reciprocal, or middle); the numbers, singular and plural; the persons in each number, first, second, third; the moods, indicative, subjunctive, and imperative; the tenses, present, future, and imperfect, denoting incomplete action, and perfect, future perfect, and pluperfect, denoting complete action. There are also comprehended in C. indeclinable substantives, called infinitives, verbal adjectives, called participles, a verbal substantive, Gerund, and a verbal adjective, Gerundin, and the supines, the accusative, and the ablative case of a verbal noun. Every person in the Latin verb is a complete sentence, the simplest form being found in the singular of the present indicative active, where we have only the stem and the person-word, *ama-s*, 'thou lovest.' The word *scrib-er-e-nt-ur* exhibits the inflections attached to the stem to express the various verbal relations; *scrib*, the stem, signifies *write*; *'er*, indicates past time; *e*, the subjunctive mood; *nt*, the person in the plural, 'they;' and *ur*, the passive voice. The ordinary Latin conjugations are four in number, distinguished by the last or characteristic letter of the stem; (1) verbs whose stems end in *ā*; (2) in *ē*; (3) in a consonant, in *u*, or in *ĭ*; and (4) in *ī*. In English, as in all the German dialects, there are two great conjugations, distinguished by the form of the preterite. The first, called the Strong C. forms the preterite from the root without the addition of any foreign element: as ride, rode; fling, flung; hold, held. The second, called Weak C., comprises verbs that form their preterites like kill, kill-ed; move, move-d; dip, dip-t. The verbs of the Strong C. are comparatively few in number, but they are all native English, and give our speech much of its peculiar strength and flavour; the Weak C., on the other hand, is recruited by all the contingents derived from other languages. (See Latham's *English Language*, ch. i. ss. 17-25, and Whitney's *Language and its Study*.)

Con′junct Persons. Under the Bankruptcy Statutes of Scotland, all those who, by their relationship to one who is insolvent, would be legally incapable of being judges in a cause in which he might be concerned, are termed C. P. Deeds in favour of any conjunct person by the insolvent, if granted without adequate consideration, are, under statute, reducible.

Conjunc′tion, in astronomy. Two heavenly bodies are said to be in C. when they occupy the same portion of the heavens, as, for instance, the sun and moon at new moon. When Mercury and Venus are between us and the sun, they are said to be in *inferior C.*, and when the sun is between us and them, they are in *superior C.* The other planets can only be in superior C. Chinese history records a C. of five planets in the reign of the Emperor Thuen-hin, B.C. 2514-2436.

Conjunctions (Lat. *con* and *jungo*) are the parts of speech which join sentences and independent words. They are either (1) *Co-ordinate C.*, joining independent propositions, as *also*, *and* (*Copulative C.*); *or*, *else*, &c. (*Disjunctive C.*); *but*, *yet*, &c. (*Adversative C.*); *for*, *hence*, &c. (*Illative C.*); or (2) *Subordinate C.*, joining a principal sentence to a dependent or modifying clause; *for*, *because*, *since*, *as*, *if*, *unless*, *lest*, *that*, *whether*, &c. *Compound C.* are such expressions as *not*, *only*, *nevertheless*, *howbeit*, *provided that*, &c.; and C. used in pairs, as *either*, *or*; *both*, *and*; *as well as*, &c., are called *Correlatives*. C., which are of comparatively recent growth, language being at first too simple to require them, have been formed by lessening the meanings of other words. Thus, *as* and *also* are contractions from the Old Eng. *eal swa*, ('altogether,' 'thus'); *or* is a contraction from *other*; *and* originally meant *against* (O. H. Ger. *anti*); the conjunction *than* comes from the adverb *then*; the conjunction *therefore* from a demonstrative pronoun and a preposition; the conjunction *because* from a noun and a preposition; and the conjunction *that*, from the pronoun *that*—such a phrase as 'I know *that* he is here,' being altered from 'he is *here*, I know *that*.' (See Morris' *English Accidence*, ch. xvi., and Latham's *Eng. Lan.* ch. xxvi.)

Conjunction of Cells, a term applied to a peculiar phenomenon of reproduction in plants, such as *Desmideæ*, &c., when, as among the *Confervæ*, two cellular filaments approach, each one of them gives forth a protuberance which unites with the opposite cell, after which the two contiguous walls get absorbed, so that an open passage is left between the two cells. Through this opening the endochrome of one Cell (q.v.) passes into the other, and after various changes becomes a *Zoospore*, and the cell-water bursting, liberates the spores.

Conjunct′ly and Sev′erally, a Scotch law-term denoting the form of obligation by which two or more persons become each bound to discharge the whole obligation. A creditor in such circumstances may either exact performance in part from each, or enforce the whole obligation against one, leaving him to seek relief from the rest. The corresponding term in English law is Jointly and Severally (q.v.). There is some difference here shown in the law of the two countries with regard to joint obligations.

Conn, Lough, a lake in the county of Mayo, Ireland, together with Lough Cullin, from which it is separated by a narrow channel, crossed by a bridge called the Pontoon, is 13 miles long and from 1 to 3 broad, and is studded with isles.

Connara′ceæ, a natural order of calycifloral Dicotyledonous trees or shrubs, consisting of about forty-two species, natives of the tropics of America and of the Old World. The best-known of the six or seven genera are *Boswellia*, *Balsamodendron*, and *Amyris*. They are universally characterised by the abundance of fragrant resinous or gum-resinous juice which they possess. A few furnish good timber; some are poisonous; while others are bitter.

Conn′aught, the most western, smallest, and most barren of the four provinces of Ireland, bounded N. and W. by the Atlantic, S. by Munster, and E. by Leinster and Ulster, comprises the five counties of Galway, Leitrim, Mayo, Roscommon, and Sligo. Its greatest length is 105 miles; its greatest breadth, 92 miles; area, 6867 sq. miles. The W. coast, indented with numerous bays and harbours, presents a great variety of the most picturesque scenery. From 1841 to 1881, the population, owing to emigration and other causes, fell from 1,420,705 to 817,197, and since then it has still further decreased to 724,774. C. is the most purely Celtic and wretched part of Ireland. It was long ruled by the O'Connors, but passed under English authority in the reign of Elizabeth, and was then subdivided into counties.

Connecticut (pron. *Connet'icut*), one of the original thirteen states of the Union, lies between Massachusetts on the N., Rhode Island on the E., Long Island Sound on the S., and New York on the W. Area, 4845 sq. miles. Pop. 746,258, of whom 12,820 are described as coloured. It is watered by the C., the Housatonic, the Thames, the Farmington, and the Quinepiack. Much of the soil is poor; in the N.W. it is hilly; in the centre it is sandy and gravelly; but in the valley of the *C. river* there is a large tract of fertile and meadow land, extending from Wethersfield into Massachusetts, and producing large crops of hay, tobacco, maize, onions, and fruit. The chief cereals of C. are Indian corn, oats, rye, and buckwheat. C. has varied mineral resources: iron at Salisbury, cobalt, nickel, and freestone at Portland. It is noted for numerous industries, every stream being utilised for machinery. The staple manufactures are clocks, carriages, arms, cutlery, plated silver, paper, copper, brass, and indiarubber goods. Banking and insurance are extensive. The state capital is Hartford. Other towns are Newhaven, Bridgeport, Norwich, Waterbury, Middletown, New Britain, and New London. C. is celebrated (in America) for its education, literature, and theology. Early in this century it founded a school fund (from the proceeds of public lands in Ohio), now amounting to $2,046,035, and rendering elementary education almost free. There is an attendance of 151,624 under 4307 teachers. Besides the elementary schools, there is a large number of private and secondary schools. There are three universities, Yale College (q.v.), in Newhaven, the Wesleyan University, in Middletown, and Trinity College (Episcopal), Hartford, attended by 2379 students, under 232 professors and teachers. The average daily attendance at the public schools is estimated at 86,255. There are also ladies' schools of a comparatively high order in Farmington, Hartford, and Newhaven.

State Seal of Connecticut.

C. ('the land of steady habits') was colonised by the New England Puritans, who arrived in Windsor and Hartford in 1633, and in Newhaven in 1638, and their churches were established by law till about 1818. Charles II. granted the colony a charter in 1661, which remained in force till 1818. During the time of James II. it was concealed for safety in the 'charter oak' tree.

Connecticut (Ind. *Quonetocut*, 'the long river'), the largest river between the Hudson and the St. John, rises in 45° 15′ N. lat., and flows S. between Vermont and New Hampshire, crosses Massachusetts and the state of C., and enters Long Island Sound at Saybrook, after a course of 400 miles, and a descent of 1600 feet from its source. It is navigable to the city of Hartford (50 miles) for vessels drawing 8 feet of water. It is famous for its *shad*, a large and most delicate fish. The river in spring overflows and enriches large tracts of meadow land, and the valley presents many scenes of varied and cultivated beauty.

Connective Tiss'ue. This name is given by modern histologists to a number of tissues which originate from the same primary structures in the middle layer of the embryo of all animals. Although widely different from each other, both chemically and histologically, in the mature condition, yet on account of this primary relationship they are usually grouped together under the name of C. T. The members of the group are cartilage, mucoid tissue, reticular C. T., ordinary C. T., usually known under the name of white fibrous, or areolar tissue, fatty or adipose tissue, bone, and one of the principal substances entering into the composition of tooth, called dentine. A description of the histological characters of these various tissues will be found under their appropriate headings. The C. T. group form a framework for supporting the other tissues, such as vessels, glandular cells, muscular fibres, and nerves. In disease, as has been shown by Virchow, the great German pathologist, the C. T. group is often the most active tissue of the body, and many luxuriant growths and tumours may be traced to it. According to Frey, an authority in matters relating to minute structure, the histological characters of the group of connective tissues are—The embryonic rudiments consist of aggregations of spheroidal formative cells, having no membrane, and enclosing nuclei. A soft, homogeneous intercellular matter of albuminous character is formed between these cells. In course of time the cells as well as the intercellular substance undergo changes. The intercellular matter divides into fibrous masses or fibrillæ, while the cells become short and stunted, or may unite together by long processes so as to form a delicate network. Sometimes calcification, or a deposition of earthy salts, chiefly those of lime, occurs in the intercellular substance. Coincidently with those histological changes, chemical metamorphoses also occur—the albuminous matter of an early period giving place to mucin, chondrin, or elastic matter.

Connoisseur (Fr. from (old) *connoitre*, 'to know;' Lat. *cognoscere*, 'to become acquainted with') is one whose knowledge and comprehension of art is complete enough to entitle him to pass a critical judgment in music, painting, and sculpture, or in any of these. The word is sometimes mockingly applied to pretenders, or to *conoscitori sensa cognizione*, or judges uninformed. See COGNOSCENTI.

Co'noid, a surface generated by a straight line which moves parallel to a given plane upon two fixed lines or *directors*, one of which is rectilinear. The best-known conoids are the *hyperbolic paraboloid*, both of whose directors are straight lines in different planes, and the *skew helicoid*, a familiar example of which is afforded by the under surface of a spiral staircase.

Con'quest, a term of Scotch law denoting real or heritable rights which any one has acquired by purchase, donation, or Excambion (q.v.); real estate acquired by succession being called *heritage*. When left to the destination of law, heritage descends to the heir of line, and C. ascends to the heir of C. This separation of succession can, however, only take place where the deceased has died without lawful issue, having a brother older and a brother younger than himself, or having an uncle older and an uncle younger than his, the deceased's, father; or, in the event of there being issue of one or other of these brothers or uncles, he being deceased. In such cases, heritage descends to the immediate younger brother of the deceased, or to the next younger brother of his father, or to the representatives of either, but C. ascends to the immediate elder brother, or uncle, or representatives. In all cases the full relationship by blood excludes the half. In contracts of marriage, the C. acquired during marriage, or a proportion of it, is frequently settled on the heir, or on the issue of the marriage; but under a provision of this kind, C. is held to mean only such an accession of estate as makes the husband richer, and does not therefore necessarily include all that he acquires during the marriage by singular title.

Consal'vi, Ercole, Cardinal, an eminent Italian ecclesiastic and statesman, was born at Rome, 8th June, 1757. As secretary of state to Pius VII., he concluded the concordat between Napoleon and the Papal States in 1801, although he subsequently opposed his aggressions upon Rome. During the latter part of his life he distinguished himself as a reformer of abuses, abolishing monopolies and feudal taxes. He died at Rome, 24th January, 1824. C., who was a moderate and sensible politician, also deserves favourable mention as a patron of literature, science, and the fine arts.

Consanguin'ity is the relationship of persons descended from the same ancestor. It is either *lineal* or *collateral.* Lineal C. exists between the generating and the generated; thus a man is lineally related to his children, grandchildren, and to his remotest descendants. Collateral C. exists between those who have had a common ancestor; brothers, cousins, &c., are so related. Connection by marriage is called Affinity (q.v.).

Conscience, Courts of. These were English courts of law in London and other towns for the recovery of small debts. In some C. of C. the limit was forty shillings; in others, as much as £5. They have been abolished, and have given place to county courts. For Scotland, see SHERIFF; DEBTS, SMALL.

Conscience, Hendrick, a brilliant Flemish novelist, and one of the founders of the Flemish or national school of literature, was born at Antwerp, 3rd December, 1812. In 1830, at the outbreak of the Belgian revolution, he entered the army and served six years. In 1837 he published his first work, 'The Year of Miracles,' and at once found himself famous. In the following year appeared his great national romance, 'The Lion of Flanders,' and from this date he continued annually to pour forth novels, romances, sketches of country life, &c. He was appointed Assistant-professor in the University of Ghent in 1845. In 1858 he published an autobiography in the *Revue Contemporaine.* In 1870 he gained the 'prize of literature;' in 1871 he published a romance, in 1874 two stories of contemporary manners, in 1875 a touching tale entitled 'The Fear of Shame,' and in 1876 a story of Charles the Bold. Most of his works have been translated into all the great European tongues. C. was a fine literary artist, clear in thought, pure in sentiment, and charmingly pictorial in his sketches of national life. He died September, 1883.

Conscience-Money. When the Income Tax Commissioners find that a person has understated his or her income, they demand a sum supposed to be equal to the tax evaded. Instead, however, of inflicting the legal penalty, the Commissioners sometimes give the defaulter an opportunity of forwarding the amount to the Chancellor of the Exchequer as C.-M. Other departments of the Government, as, for instance, the Post Office, occasionally obtain payments of C.-M., and many large insurance companies receive similar remittances. The sums received by the Chancellor of the Exchequer for many years averaged about £6000. In 1885 nearly £10,000 was received, the largest amount on record.

Con'sciousness has been defined by Hamilton as the recognition by the 'mind or *ego* of its own acts or affections.' This includes the whole of human knowledge, but it is objectionable as suggesting that intellectual effort or discrimination is a necessary element in C., whereas intense feeling may produce the maximum of C. accompanied by the minimum of intellectual activity. Again, Hamilton includes in C. an immediate knowledge of objects external to the mind, but present in time and space, to the exclusion of the past, the future, and the distant. This, however, is to fix scientific nomenclature with reference to a metaphysical theory. C. is simply a generic name for all human feelings (including therein the spiritual side of ideas, emotions, and volitions) 'which rise above a certain intensity.' It therefore includes the complex operation of belief, whether the belief be false or true, *i.e.*, corresponds with a real object or not. In the formation of the habits which have been called 'secondarily automatic,' we find mental trains sinking out of C., as repetition makes them easier, and therefore less in need of attention. The question is still debated whether, in such cases, the mental product is realised by purely physical changes, or whether slight modifications of C. may not be irrecoverably lost by the memory. This is closely connected with the larger question whether C. is merely the spiritual expression of parallel changes in the brain, or has itself the power of reacting upon the brain and impressing a direction upon the nervous force. C. was also applied by Reid and Stewart to the self-introspection or subjective analysis, which they regarded as the most powerful instrument of mental science. Whatever they find in C. to be 'universal and necessary,' or going beyond what experience justifies, is on this method pronounced to be a simple or ultimate deliverance of C. The 'experience' school, on the other hand, contend that 'necessary beliefs,' of which the opposite is inconceivable, are easily generated by experience and the laws of mental association.

Consciousness.—This is a mental condition for which it is impossible to give a definition physiologically. We can only state some of its conditions. It appears to depend (1) on the integrity of grey matter on the surface of the brain, which must not be torn, cut, lacerated, bruised, or compressed by accident; (2) on the absence of extensive disease of the grey matter; (3) on the absence of compression of the grey matter either by a foreign body, depressed bone, or by an effused fluid, such as serum, blood, or lymph; and (4) on a healthy quality and due supply of blood. The blood must not contain any substances which, by acting on the grey matter of the brain, cause a state of coma.

Conscrip'tion, or compulsory military service, as opposed to the system of voluntary enlistment, was the rule in the ancient republics of Athens, Sparta, and Rome, and in modern times has been adopted by nearly every European nation except the British. At Sparta the period of service was from the age of twenty to sixty; at Rome, from seventeen to forty-six. It was not till 1798 that Jourdan's celebrated law of C. was passed by the French Council of Five Hundred, making five years' service compulsory in the case of every able-bodied citizen, and enrolling the whole male population between the ages of twenty and twenty-five. Later on, for the purpose, it is said, of evading the obligations of the Treaty of Tilsit, Prussia commenced the 'short service and reserve' system. See ARMIES, MODERN.

Consecra'tion, or the devoting or setting apart of persons or things to a deity, is a rite which has been practised more or less by most nations, heathen as well as Christian. Among the Israelites, not only were priests, prophets, and kings consecrated, which in the case of the first was done by washing (symbol of the putting away of the filth of sin), clothing with an official costume (symbol of endowment with the character required for the office), anointing with oil (symbol of divine life), filling their hands with a wave-offering (symbol of offering praise and thanksgiving), and sacrifices, but also the Tabernacle and everything in it, Solomon's Temple, and even private houses (Ps. xxx. title), and the walls of their cities (Neh. xii. 27). In the early Christian Church, not only were the clergy, virgins, and widows consecrated, but also churches, the elements in the Eucharist, the water used in baptism, and the Chrism (q.v.) used in the various sacraments. An inferior kind of C., or what was in some cases a part of the fuller rite, called Benediction (q.v.), was applied to a multitude of persons and things—kings, travellers, persons receiving the sacraments, churches, altars, vestments, vessels, bells, candles, ashes, palms, churchyards, houses, ships (still preserved in the 'christening' of a ship), food at meals, the first-fruits of corn, wine, and fishings, &c. Many of these consecrations and benedictions are preserved in the Roman Catholic Church. In the Episcopal Protestant churches, bishops, churches, cemeteries, and the *instrumenta* of divine service are consecrated. See Blunt's *Dict. of Doct. and Hist. Theology.*

Conseguia'na, a volcano of Nicaragua, Central America, about 10 miles from the Pacific, on the S. side of the Bay of Fonseca. The crater is 3800 feet above the level of the country; its walls descend sheer to the depth of 200 feet, and it is half a mile in diameter. The eruption of January, 1835, desolated a fertile grazing district, studded with majestic cedars, which, where not uprooted, stand out scorched and barkless.

Consent′. A person can consent only when he has the physical and mental power to do so and the free and serious use of such power. In all contracts, in themselves good by law, it is understood that there has been the free C. of the parties to it. Thus, if, as frequently happens, it should appear that there has been a misunderstanding instead of an understanding in a nominal agreement, or that one of the parties to it is legally incapable of giving C., the nominal agreement is legally null or reducible. But if acts have been done or left undone on either side under an apparent agreement, neither can draw back. Questions involving proof of C. must ever continue to give rise to litigation, from the infinite variety of circumstances by which it may be proved or disproved, or by which it may be shown to have resulted from aberration of mind. Where C. is the result of essential misconception, it is of course only nominal, and therefore invalid. Even where no ground of nullity exists, C. may, under certain circumstances, be withdrawn.

Conservation of the Peace. Several high officers of the crown have, as regards preservation of the peace, jurisdiction throughout the kingdom. Minor officers are only empowered to act within their own jurisdiction. See CONSTABLE, JUSTICE OF THE PEACE.

Conser′vatoire (*Conservatorium*), the name by which the Continental music-schools are known. These were originally benevolent institutions, in which musical education and board were given gratuitously to poor children. They have now to a great extent lost this character, except in so far that state endowments in many cases enable them to give musical education for very low fees.

Conser′vatory (Lat. *conservo*, 'I preserve') is a glazed structure, artificially warmed in winter, in which exotic plants are grown. It is kept cooler than a hothouse, and is distinguished from a greenhouse by the plants in it growing in beds on the floor, and not in pots or tubs or on shelves. It also differs from an orangery in not having an opaque roof. The largest and finest C. in the kingdom is at Chatsworth (q.v.), in Derbyshire, the seat of the Duke of Devonshire. It is 277 feet long, 123 feet wide, and 67 feet high in the centre. It is composed wholly of iron and glass, and furnished the idea on which exhibition buildings, from that of 1851 onward, have been constructed. Among the other principal conservatories in this country are those at Alton Towers, Staffordshire, which are 300 feet long, and those at Mount Edgcumbe, near Plymouth, Wilton House, near Salisbury, and Kew Gardens and the Crystal Palace, near London. Among those to be found on the Continent, may be mentioned the conservatories at the palaces of Schönbrunn, near Vienna, and Sans Souci, near Berlin.

Con′serves, a name given to different kinds of confections, consisting chiefly of fruits preserved in sugar, also by druggists to palatable compounds enclosing nauseous medicines.

Con′siderant, Victor Prosper, a French Socialist, born at Salins, Jura, 12th October, 1808. He entered the *École Polytechnique* in 1826, but withdrew in 1831 to propagate Fourierism. On the death of Fourier (1837) he undertook the direction of *La Phalange*, the organ of the party, and, supplied with funds by an Englishman named Young, he made a trial of the system of the Social colony or *Phalanstère* in the department of Eure-et-Loir. But his attempts to revolutionise society signally failed. For his share in the democratic movement of 13th June, 1849, he had to flee into Belgium, whence he embarked for Texas to make a new trial of his system. Here he founded a Societarian community, *La Réunion*, which, after a season of fitful prosperity, finally collapsed. C. returned to France with his family in August, 1869. He was a prolific writer, but his works are no longer notable.

Considera′tion, in law, is the name given to the price, matter, or motive of inducement to grant a deed or other obligation, or to enter into a contract. Where the obligation is incurred without C., it is called *voluntary* in England, in Scotland *gratuitous ;* when incurred *for C.* it is so termed in England, and in Scotland *onerous.* In England the rule of law is that a contract without valuable or sufficient C. is invalid, except under a formal deed. But even deeds may, under certain circumstances, be set aside if granted without C. In England they are ineffectual, by statute, against creditors when the grantor is insolvent at the time of granting the deed. In Scotland the law is similar, no proof of insolvency being required when the deed is in favour of Confident Persons (q.v.) or of Conjunct Persons (q.v.).

Consign′ment. In mercantile law, this term is generally applied to goods delivered or transmitted by one merchant to another, or by a merchant to an agent or factor for sale, or for other specific purpose. The bankruptcy of consignor or of consignee often gives rise to questions of great legal nicety with respect to reputed ownership, and on other points connected with the rights of the parties or their creditors.

Consis′tory (Lat. 'a standing or waiting place,' specially used in ancient times of the place where the emperor's council met), denotes an ecclesiastical court held in some place belonging to a cathedral. It is held by the bishop's chancellor or his commissary for determining matters under spiritual cognisance, arising within the bishop's jurisdiction. An appeal lies to the archbishop of the province. Before the establishment of the Court of Probate, the C. courts granted probates of wills for Chattels (q.v.).

Consola′to del Maré (Ital. 'the consulship of the sea'), a code of maritime law, constructed on the laws and trading customs of the great commercial cities of the Mediterranean —Venice, Genoa, Barcelona, Marseille, &c. See MERCANTILE LAW.

Con′sole (Fr. *console*, a 'pier-table'), a bracket or corbel of any kind in classical architecture. It is used as a support for the cornice, or to place figures or busts upon. Frequently in the form of the letter S, it is sometimes richly ornamented. It is called also an *ancone.* See CORBEL, MODILLION, BRACKET.

Console—reversed.

Consol′idated Fund. The aggregate produce of the branches of the public revenue of the United Kingdom is paid into the Bank of England to the credit of what is called the C. F. It is chargeable with the interest of the national debt, and the salaries of judges, ambassadors, and other important officers of the state, and it is mortgaged for payment of a yearly sum to maintain the Civil List (q.v.). On all these being satisfied, then the residue may be applied to the uses approved of by Parliament.

Consolida′tion. When applied to Acts of Parliament, C. means the throwing of various Acts regarding the same subject into one Act; this tends to secure congruity in their provisions. In the feudal law of Scotland, C. means the reunion of the property with the superiority after they have been feudally disjoined.

Con′sols. A portion of the British National Debt is so called. The word has its origin in the Consolidated Annuities Act of 1757. By that statute a variety of Government stocks were thrown into one fund, for which one account is kept in the Bank of England. See DEBT, NATIONAL.

Con′sonance, the pleasing effect to our ears of the combination of certain musical sounds. The physical phenomena, which give rise to C., are only now beginning to be understood. If two simple tones, not of the same pitch, be sounded together, they cause a series of compound waves in the surrounding air, which go through a continual series of changes in amplitude, and of which, therefore, the sound undergoes regular changes in intensity. The number of times in a second which the maximum loudness occurs is equal to the difference between the number of the vibrations of the notes in the same interval of time. Each recurrence of maximum loudness is called a beat. C. and dissonance differ only in degree—not in kind—and both are caused by these beats, which when moderately rapid are harsh and rough (making a dissonant interval), but when very rapid are pleasant (causing C.). The effect of the beats depends upon their *absolute number* per second; but for any given interval this will be much less in a low than in a high octave, so that in the latter the rapidity necessary to convert dissonance into C. is reached within a shorter interval than in the former. For notes in middle compass the maximum roughness occurs at about a semitone, and C. commences before a minor third is reached. The interval, in which the beats are disagreeable, is called the *beating distance*.

Con'sort (Lat. *consors*, 'a sharer or partner of the same lot') is the title of the husband or wife of the reigning sovereign of a kingdom. A Queen-C. does not, as other women do, according to legal theory, fully merge her personality in that of her husband, who, according to Coke, is held to be so engrossed with state affairs that he has no time for such supervision of domestic matters as ought to be exercised by a private individual. The Queen-C. must, therefore, discharge the domestic functions which usually belong to the husband. Her privileges are almost exclusively those of precedence and of etiquette. The husband of a Queen-regnant of England does not by marriage acquire the title of C., or any English title. The title of Prince-C. was, in 1857, conferred on the late husband of Queen Victoria by letters patent. The title of King-C. has never been given to any one in England.

Conspir'acy. The Lat. *conspiratio* denotes a harmony, lit. a 'breathing together' either in good or evil; in modern usage the latter sense predominates, but does not exclusively prevail. As a rule, 'conspirators' mean mischief, but men may honourably conspire to rid themselves of a tyranny. In law, the term C. has an extensive and undefined application. It infers confederacy, and for a criminal object. There are many acts which are not criminal when done by an individual, but which become so when effected by several with a common design. Thus, any one attending a theatre may express his approval or disapproval of the piece or of the acting, but if several agree to condemn a play or hiss an actor, they will be guilty of C. (2 Camp. 358). Any combination whose *object* is to injure public trade or to defeat the law is C. C. is—unless the offence be felonious and actually committed, when it is a felony—a misdemeanour and punishable with imprisonment and hard labour. See COMBINATION.

Con'stable, from the Old Fr. *conestable* (mod. Fr. *connétable*), Lat. *comes stabuli*, 'overseer of the (imperial) stable,' a dignitary of the Roman empire, transferred to the Frankish courts, whose name was corrupted into *connestabulus* and *comestabulus* at least as early as the 9th c. Originally the commander of the royal Frankish cavalry, the C. became in the 13th c. the commander of all the military force of the kingdom; and in France particularly the name recalls some famous historical personages, both good and bad. Suppressed by Louis XIII. in 1626, the office was revived by Napoleon, who created his brother Louis Grand C., Marshal Berthier being made Vice-C. At the restoration of the Bourbons, the office was again abolished, and it has not since been restored. In England a Lord High C. was appointed shortly after the Conquest. He and the Earl Mareschal (a word of similar meaning) were joint judges of the Court of Chivalry (q.v.). The office was abolished by Henry VIII., on the attainder of the Duke of Buckingham. At coronations, and on some other great state occasions, a Lord High C. is appointed for the time. In Scotland, the Lord High C. had anciently the command of the king's armies while in the field in absence of the king. He was likewise judge of all crimes and offences committed within four miles of the king's person, or within the same distance of the Parliament, or of the Privy Council, or of any general convention of the states of the kingdom. The office is hereditary in the family of the Earl of Errol, and is reserved by the Treaty of Union, and by statute 20 Geo. II. c. 43. It confers the dignity of first subject in Scotland next to those of royal blood.

Constable of a Castle was in ancient times the keeper of a castle. In England, constables were of three kinds—high C., petty C., and special C. The office of high C. was not confined to any particular town or parish, but extended to the Hundred (q.v.) to which he was appointed. The office was abolished by Statute 32 and 33 Vict. c. 47 in England and Wales and the Justices' clerk was appointed to perform all duties of High C. in connection with notice of special sessions, &c. The jurisdiction of the petty C. extends to the parish or borough for which he is chosen. He is appointed by the Watch Committee in boroughs under 10,000 in population and by the County Council in all boroughs above that amount of inhabitants whereever the Municipal Corporation Act of 1882 applies. The county constables are, under the Local Government Act, 1888, appointed by a joint committee of the Justices and the County Council. The special C. is an auxiliary appointed on emergencies. The general legal duties of a C. are to prevent violation of the law, and to apprehend offenders. In discharge of their duty, they may require the assistance of bystanders, who are bound to give it under pain of fine and imprisonment. A C. may break open doors to preserve peace, and he may arrest and imprison on reasonable grounds and suspicions.

Constable, John, an English landscape-painter, was born in the village of East Bergholt, in Suffolk, in 1776. The son of a proprietor of several mills, he was engaged about his sixteenth year in learning the miller's business, but his father's scheme that he should inherit the mills was frustrated by his desire to become a painter. After receiving lessons from Reinagle, he was admitted a student at the Royal Academy, 4th February, 1799. Many years elapsed before the charming simplicity, freshness, and fidelity of his art met with appreciation, but eventually the tide of fame set in, and he was elected an Academician in 1829. He resided latterly at Hampstead Heath, and died suddenly in London 30th March, 1837. Three of his finest works are 'The Corn-Field' (National Gallery), 'The Glebe Farm,' and 'Dedham Vale.' His art, says Ruskin, is 'original, honest, free from affectation, and manly in manner.'

Con'stance, or **Kostnitz,** a fortified city on the S. or Swiss shore of the lake of the same name, but belonging to the Grand Duchy of Baden, lies at the point where the Rhine connects the main sheet of water with the Untersee, about 65 miles E. of Basel by railway. It communicates by bridge with Petershausen, a suburb on the N. side of the Rhine. The most notable buildings are the fine Gothic cathedral, begun in 1052; the bishop's palace; St. Stephen's Church, built in 831; the Franciscan convent, now a ruin; the Dominican monastery, now a cotton factory; and the Kauf-haus, or merchants' hall, built in 1388. C. was formerly a free imperial town. Having fallen under the ban of the empire in 1518, it was ceded to Austria, which handed it over to Baden in 1810. C. has manufactures of cotton, silk, watches, and musical instruments. It has also sawmills, and many of the inhabitants are engaged in fisheries, and in cultivating vineyards and gardens. Pop. 16,235.

Constance (Lat. *Lacus Brigantinus*, Ger. *Bodensee*), a lake of Central Europe, whose N. shore is German (Baden, Würtemberg, Bavaria), and its S. shore Swiss (Thurgau and St. Gall); while its eastern end reaches Austrian territory (Tyrol). It lies from 1280 to 1380 feet above the level of the sea, is 44 miles long, and 9 broad (at its greatest), and attains in some parts a depth of 960 feet. The Rhine traverses it from E. to W. The lake is divided into two arms—the more northerly called Uberlingen Lake, and the other Zellersee or Untersee. In the course of time it has contracted itself considerably, having once extended some miles further from the beach. A singular phenomenon is its sudden rising, after a thaw, from the melting of the snow. Since 1824 there have been steamers on the lake. Its navigation, for sailing vessels especially, is dangerous when the wind blows strongly from E., S., or N.W. Numerous species of aquatic fowl, as many as sixty, it is said, and twenty-five species of fish, belong to the lake.

Constance, Council of, was held at the town of C. during the years 1414-18. Its professed purpose was to bring to an end the 'great schism' in the Church, and to make a clean sweep of all ecclesiastical abuses. The council, reluctantly summoned by Pope John XXIII., who foresaw the fate that awaited him, was attended by an immense number of dignitaries. Besides the Pope himself and the Emperor Sigismund, there were present 26 princes, 140 counts, more than 20 cardinals, 7 patriarchs, 20 archbishops, 91 bishops, 600 other prelates and doctors, and about 4000 priests. The three rival Popes of the time—John XXIII., Gregory XII., and Benedict XIII.—were deposed, and a new Pope, Martin V., was elected. Before this election, however, took place, the council formally declared itself the supreme judicial and legislative authority in the Church, but its projected 'reforms' were indefinitely postponed; for Martin V., a few months after his election, dissolved the council in alarm, lest his power should be lessened by its pretensions. The discussion of ecclesiastical reforms was first resumed at the Council of Basel (see BASEL, COUNCIL OF). How little this splendid—or perhaps one had better say *showy*—assembly really cared for the advancement of learning or the cause of truth, is seen in the iniquitous trial of John Huss and Jerome of Prague on charges of heresy. Among their bitterest enemies were some of the leaders of this *quasi*-reforming council, which is more likely to be remembered with abhorrence for the burning of the Bohemian Reformers, than with respect for its insincere and impotent schemes for the purification of the Church.

Con'stant, in mathematics, is a quantity which, entering into an analytical expression, does not vary under the conditions of the problem—*e.g.*, *radius* and *co-ordinates* of the centre of a sphere given in position and magnitude, *mass* in the equations of motion of a particle, *force of gravity* in those of a projectile, *energy* of a conservative system uninfluenced by external forces, &c.

Con'stant de Rebecque', Henri Benjamin, a French politician and journalist, was born at Lausanne, 25th October, 1767. The son of a Swiss officer in the Dutch service, he received much of his education at Oxford and Edinburgh (where he met Mackintosh and Erskine), and after a good deal of European travel (in the course of which he made the acquaintance of Marmontel, Kant, and Gibbon), married and settled for some years in Brunswick. In 1795 he began at Paris his career as publicist. He supported Talleyrand and the other moderate republicans who formed the 'Constitutional Circle,' or 'Club of Safety,' opposed to the 'Clichy,' or royalist club. In 1799 he published his work on the consequences of the counter-revolution of 1660 in England, and entered the *Tribunat*, from which he was expelled by Napoleon in 1802, and even driven out of France. In company with Madame de Stael he went to Weimar, where he saw the great stars of German literature. He translated Schiller's *Wallenstein* into French. After a long stay at Göttingen, C. returned with the Bourbons in 1814, and relying on the promises of liberty in the *Charte*, supported the Government in the *Journal des Débats*. During the Hundred Days C. astonished his friends by accepting a place in the Emperor's Conseil d'État. Under the second Restoration he was more decidedly in opposition, attacking the election and press laws in the *Mercure* and the *Minerve*, and insisting in his *Cours de Politique Constitutionelle* (1817-20) on the observance of representative principles as the only security of social order. The biting sarcasm with which he had attacked the oppressive Government proceedings in the Lainé and Regnault affairs was displayed to great advantage in the discussions in the Chamber of Deputies, to which he was elected in 1819. Under Charles X. he opposed the Spanish war, the laws of sacrilege, succession, &c., and in the Revolution of 1830, along with his friends Laffite and Lafayette, took a leading part. He died 8th December, 1830. In the midst of politics C. found time to elaborate his well-known *Religion Considérée dans sa Source, ses Formes, et ses Développements* (Par. 1824-31), in which he traces the sentiment of religion through the various positive institutions which have been confounded with it, and explains the causes which have led to the growth of these institutions, and on which religion itself does not depend. His remarks on savages are especially valuable. In politics his cardinal dogma was Individualism, a term of dangerous vagueness, but the value of which he could hardly exaggerate during the Bourbon rule.

Constan'tia, a district of Cape Colony, S. Africa, 12 miles distant from Cape Town, on the E. and N.E. slopes of the Table Mountain range, famous for the excellence of its wine. This is due mainly to the alkalies present in the soil, but also partly to the shelter afforded to the vineyards by the encircling hills. The export (known to have reached 1,000,000 gallons about 1860) has greatly declined. The vines of C. were brought from Shiraz in Persia.

Constanti'na, a town of southern Spain, province of Sevilla, 40 miles N.N.E. of Seville, in a mountainous district. It has manufactures of soap and leather, and a trade in corn, wood, and wine. Pop. 11,953.

Constantine', the capital of the department of C. (pop. 1,714,539), in the French colony of Algeria, 195 miles E. by S. of Algiers, stands on a rocky height, washed on three sides by the Rummel, which rushes through a deep ravine, 60 feet broad. The town is 830 feet above the river. A wall, built of stones sculptured by the Romans, and having four handsome gateways, surrounds the city. The streets are narrow and filthy, and none of the public buildings deserve especial notice. C. has manufactures of woollen stuffs, saddlery, boots and shoes, and a trade in corn and wax. Pop. 46,581, of whom only 12,006 are French-born, or naturalised citizens. C. is the *Cartha* ('city') of the Carthaginians and the *Cirta* of the Romans. It derived its present name from Constantine the Great, who rebuilt it after it had been destroyed in the wars of Maxentius.

Con'stantine I., Caius Flavius Valerius Aurelius, surnamed the 'Great,' was the son of Constantius Chlorus, one of the joint rulers of the Roman empire, and of Helena, a woman of obscure origin. He was born at Naissus, in Dacia, A.D. 272 or 274. Instead of going with his father, whose province was Gaul, Spain, and Britain, C. remained in the service of Diocletian (q.v.), till his popularity with the soldiers roused the jealousy of Galerius (q.v.). His exploits in the distant East are recorded in an exaggerating spirit by the historians of later times, but there is no doubt that in an atmosphere of danger and distrust he acquired a wariness and strength of character, a penetration of understanding, and a courage of soul that marked him out for future greatness. When C. found that his life was really in peril, he secretly fled to his father, arrived just in time to accompany him on his expedition to Britain (305), and took part in some campaigns against the Picts or Caledonians. On his father's death at York, he was proclaimed *Augustus* by the troops, but prudently contented himself with the inferior title of *Cæsar*, thereby frustrating the malice, though he could not escape the hatred, of Galerius. For six years he remained a stranger to the rest of the empire, but full of activity within his province, which embraced Britain, Gaul, and Spain, encouraging agriculture, enfranchising the towns, improving political administration, and inspiring the turbulent Franks of the Rhineland with the wholesome fear of his power. Like

Coin of Constantine.

his father, he ignored the edicts issued against the Christians, and thus the new religion rapidly spread in the W. of Europe. Meanwhile Galerius was ruling so tyrannically that the Romans called in Maxentius (a son of Maximianus, formerly a colleague of Diocletian) to help them. He assumed the purple along with his father, defeated Severus, an obscure creature whom Galerius had invested with supreme power, and forced Galerius himself to retreat to Pannonia. But father and son now quarrelled. The former took refuge with C., then conspired against his benefactor, and in 310 was strangled at Marseille. Maxentius next made himself so hateful to the people of Rome that the senate sent a message to C. to come and save them from their Emperor. C. thereupon crossed the Alps (311), defeated the armies of Maxentius at Turin, Verona, and finally at Rome; his rival being drowned while attempting to escape (312). In the East, affairs now stood thus:—Galerius had long had a colleague, Maximinus, with the title of Cæsar, but in the place of Severus he put another called Licinius. This drove Maximinus into rebellion, and Galerius was compelled to grant the purple. His death, in 312, led to a fierce struggle between Licinius and Maximinus, in which the latter was vanquished, and soon after poisoned. The Roman empire was now (314) divided between C. and Licinius, who were brothers-in-law, the latter having married Constantia, sister of C. At first they were on good terms, but a difference of policy soon showed itself. There may have been jealousy and plotting on the part of the lesser man, but the great fact is, that in the final struggle between the old Paganism and the new religion of Christ, Licinius made himself the champion of the former, and fell with the worship of Zeus and Apollo. After two conflicts (314-315 and 323), C. remained sole master of the Roman world. Almost the first solemn act of his monarchy was to make the Christian religion the religion of the state. Everywhere churches arose and temples fell; the statues of the old divinities were gradually removed from public view; the offices of state were mainly conferred on the followers of the new faith; bishops were invested with civil authority, and money was liberally given from the imperial treasury to relieve the wants of the Christian poor. In 325 C. presided at the first Œcumenical Council ever held by the Christian Church, the Council of Nicæa (q.v.). In 330 he laid the foundations of his new capital, named after himself, Constantinople (q.v.), and after a career of enormous activity and turmoil, died at Nicomedeia, 22nd May, 337. The chief blot on his fame is the execution of his son Crispus, a gallant and popular youth. That many other persons perished at the same time (326) may perhaps suggest the notion of a political conspiracy being the real cause of the odious act. The story of C.'s conversion, as recorded by Eusebius, is a point on which superfluous attention has been bestowed. His character is not difficult to read. It was massive, practical, just. He weighed the influences that were moving men, and long before he proclaimed himself a Christian had realised the fact that the new religion was the strongest and purest agency in the state. It was natural he should acknowledge its claim to a divine origin. All this is consistent with an adherence to certain Pagan forms, and an indifference to theological orthodoxy. The greatness of Christianity lay in its broad life-giving power, not in distracting dogmas, and C. loved best moderate men like Eusebius, who tried to steer a middle course between the fanatics on either side. See Gibbon's *Decline and Fall* and Stanley's *History of the Eastern Church*.

Constantine, Paulovich, a Russian grand-duke, second son of the Emperor Paul I., was born 8th May, 1779. He served in Italy in 1799, and distinguished himself at Austerlitz, but held no important command till 1815, when his brother, the Emperor Alexander, appointed him generalissimo of the Polish armies. Having, in 1822, renounced his claims to the throne, his younger brother Nicholas succeeded on the death of Alexander in 1825. C. failed to conciliate the Poles, who broke out into insurrection in 1830. He retired to Bialystok, which he was ordered to quit. He then withdrew to Vitebsk, where he suddenly died, 27th June, 1831.—**Constantine Nicolaëvich**, Grand-Duke of Russia, and second son of the Emperor Nicholas, was born 21st September, 1827. As Grand-Admiral of Russia, he commanded the fleet in the Baltic during the Crimean War, and at its close, as leader of the old Russian party, he strenuously opposed the concessions made to the Allies. He was for some time President of the Council of the Empire, and chief of a regiment of hussars.

Constantino'ple (the Turkish *Stambul* or *Istambul* is a corruption of the Greek *Es tan polin*, 'into the city'), so named because built by Constantine the Great, occupies the site of the ancient Byzantium (q.v.). Its splendid position on the promontory which serves as a connecting link between the Eastern and Western worlds recommended it to Constantine as the site of his capital, when he had resolved on removing the seat of empire from Rome. The 11th of May, A.D. 330, is marked as the birthday of the new city, but the rites of inauguration lasted forty days. Thenceforth it became the seat of the Roman emperors till the reign of Valens and Valentinian, when the empire was divided; after which it continued to be the capital of the Eastern or Byzantine empire till its capture by the Turks in 1453. Since that time it has been the residence of the Turkish sultans. The city proper is situated on a triangular promontory on the European side of the Thracian Bosporus, or Channel of C., an arm of which, the Golden Horn, penetrating above 5 miles into the land, forms at once the northern boundary of the city and a magnificent harbour. On the opposite side, on the peninsula of Pera, are the suburbs of Galata, Pera, and Tophana, while Scutari lies on the Asiatic side of the Bosporus. There are in all eighteen suburbs. C. was formerly completely walled in, but its ancient defences have either disappeared or are in a dilapidated condition, with the exception of the inland or W. wall, a fine specimen of mural architecture. From the Golden Horn the city, built on a series of gentle hills, with its mosques, minarets, and cypresses, presents an imposing appearance; but the interior, with its narrow, crooked, filthy, ill-paved streets, swarming with hungry masterless dogs, and its ill-built houses of wood and earth, is sadly disappointing. Considerable improvement has, however, taken place in the architecture of C. of late years, from extensive quarters of the city having been destroyed by several great fires, and the spaces thus cleared having been rebuilt with substantial structures of stone. Of its 379 mosques (with each of which is connected at least one elementary school—for boys only, of course), the most interesting is that which was formerly the Church of St. Sophia, built in the reign of Justinian, though the largest and most splendid is that of Suleiman. The Seraglio, or palace of the Sultan, is of vast extent. Its principal entrance, a large and lofty gate, has given origin to the phrase 'the Sublime Porte,' all political and diplomatic business being supposed to be transacted under it. The other objects of interest are the two obelisks of the Atmeidan (the ancient *Hippodrome*), the Citadel of the Seven Towers, and

St. Sophia, Constantinople.

numerous bazaars and caravanserais. Galata is the centre of trade, Pera is the residence of Europeans and of the foreign ambassadors, the naval arsenal is at Hassim-Pacha, and Fanar is the Greek quarter. There are public libraries, and numerous charitable institutions. The manufactures of C. are chiefly in steel, arms, leather, saddlery, paper, and fez caps. In 1893 (latest returns), 17,876 vessels entered and cleared the port, representing 11,638,735 tons. Corn, wool, and goat's hair are the principal exports, while cotton goods are the chief imports. The Turks have allowed the carrying trade in their own waters to fall in great part into the hands of foreigners. An underground railway, to connect the lower part of Galata with Pera, was opened in 1875. Three lines of tramways have been established in C., and one on the Galata side of the Golden Horn. Omnibuses and cabs are in use. Railway communication connects C. with Adrianople (210 miles) and Saremby (152 miles) in E. Rumelia, and thence passes N.W. to Servia and Austria. Pop. estimated at 874,926, of whom 386,000 are Mohammedans; 153,000 are Greeks; and 150,000 are Armenians. It is impossible to hope that C. will recover its former grandeur under the enervating rule of the Mohammedans, but it is possible to look forward to the day when the powers of Europe will allow their jealousies to remain at rest for a time and so permit the Greek, the Slav, and the Bulgarian to sweep the Turk across the Bosporus back to his native Asia.

Constella'tion (Lat. *con.* 'together,' and *stella*, 'a star'), a grouping together of stars under one denomination. The ancient astronomers gave to each C. the name of some person or thing to which they fancied the arrangement of the stars bore some resemblance; and this method of nomenclature, convenient in many ways, was recognised and even extended by later and modern astronomers. The work of Eudoxus (B.C. 370), giving the constellations recognised in his day, is lost; but Aratus' paraphrase of it names forty-five constellations. Ptolemy in his *Almagest* enumerates forty-eight, being the catalogue constructed by Hipparchus. Hevelius added twelve; Halley, eight; Beyer, twelve; La Caille, fifteen; which, together with other minor additions, make up the number to about 107. Notwithstanding the attempts of certain pious astronomers of the Middle Ages to overthrow the mythical nomenclature of the Greeks and Romans (Bede, for instance, substituting the twelve apostles for the signs of the zodiac), the ancient names have continued intact to this day.

Constitu'tion, in politics, signifies the system of a state on which its executive Government rests, and by which its laws are made. The term may also be held to embrace these laws whether statutory or consuetudinary; the latter being the result of tacit constitutional sanction. The basis of the C. of a state may be broadly stated to be the will of its people having material power; individual influence being generally regulated in its power over the will of others by the extent of the individual's control over material resources, and by the force of his convictions. To a certain extent this constitutional basis is always inharmonious; hence it divides into political parties, each of which strives by getting a majority to direct the affairs of the state, the minority being bound to yield; without which rule in the political game government would be impossible. And the stability of the C. of a country, and the benefits which flow from that stability, depend on the good faith with which this rule is observed. In England, fierce as have been the political contests of the last hundred years—over Catholic Emancipation and Free Trade, for example—the defeated minority have happily never appealed to the last tribunal—that of physical force.

In England the supreme power is divided into the legislative and executive. By constitutional fiction the former is vested in the sovereign and Parliament jointly, the latter in the sovereign alone. Really, the legislative function is exercised by Parliament (q.v.) alone; the executive by that portion of the Privy Council (q.v.) called the Cabinet, though it does not form a recognised part of the C. of England. See RIGHTS OF THE PEOPLE.

Constitution, Decree of, a term of Scotch law usually applied to those decrees which are requisite to found a title in the person of the creditor in the event of the death of the debtor. But every decree, by which the extent of a debt or obligation is ascertained, is a D. of C.

Constitutions, Provincial, were decrees made in the provincial synods held under various Archbishops of Canterbury, from Stephen Langton under Henry III. to Henry Chichele under Henry V. The last were adopted by the province of York in the reign of Henry VI.

Con'sul (*consules*—'those who go together,' 'colleagues') was the highest office in the government of republican Rome, embracing both the entire civil authority and the supreme command of the army. On the expulsion of Tarquin this magistracy was immediately instituted—the two first consuls being Lucius Junius Brutus and Lucius Tarquinius Collatinus. The consuls were two in number, were invested with equal rights, and held office for one year. In earlier times, the chief magistrates were called *prætors*, the title C. having been introduced in 305 B.C. The C. was elected in the *comitia centuriata*, presided over by a C., except when the appointment of a dictator had put the consular power for a time in abeyance. Under the Licinian law, in 366 B.C., L. Sextius was the first plebeian C.; and, after a protracted struggle between the two great classes in the state, both consuls were plebeians, B.C. 172. At first the consuls enjoyed all the privileges of the kings, except the priestly power, but they lost in succession the censorship and the judicial power. They were held in check by each C. having the power of vetoing the other, by the possibility of their being called to account at the close of their term of office, and by the power of the senate. When emergencies demanded it, the senate passed a decree *viderent consules ne quid respublica detrimenti caperet*, which invested them with unlimited power. Their outward badges of distinction were the procession of twelve lictors with fasces before them in a line, whenever they appeared in public; the *toga prætexta*, a cloak with a scarlet border; and the seat, ornamented with ivory, called the *curule chair*. At the close of the republic, the office of C. declined in power, and under the empire the C. was merely honorary, elected by the senate, and sanctioned by the emperor. Sometimes the emperors themselves assumed the consulship.

Consul, Mercantile, is an officer appointed by one state to reside in another to attend to the interests of his countrymen, but he may be a foreigner to the country which he represents. Consuls are generally divided into consuls-general, consuls, vice-consuls, and consular agents. A C. should be able to speak fluently the language of the country in which he resides. He ought also to have a fair knowledge of its laws, in so far as they affect the interests of the merchants or travellers of his country. It is the duty of a C. to endeavour to obtain redress for any citizen of the country he represents, who may appear to him to have been illegally treated within his jurisdiction; but a C. is not called on to interfere in a mere dispute between any such citizen and a foreigner. If an Englishman abroad be robbed or cheated, he may go for advice to his C., who ought in courtesy to give it, but for redress he must look solely to the authorities of the place. A C. can in no case come between any such citizen and the law of the country to which he is accredited; to which law the C. is himself subject. He has, however, the privileges of an Ambassador (q.v.). He can perform the acts of a notary public; deeds executed by him being valid, and held as done in England. The marriage of British subjects abroad is made valid by recording it in the books of the local British C., or of his legally-appointed representative during his absence, &c., whenever he or his representative is satisfied that a marriage between the parties, of whom one, at least, is a British subject, has been duly solemnised in the place, in accordance with the local law of the country. The consul, &c., can solemnise marriages himself, provided he do so in accordance with the regulations set forth in the different statutes, and provided he has the Secretary of State's authority. The salary of agents and consuls-general ranges from £900 to £4000 a year; that of consuls-general from

£600 to £2000; that of consuls from £150 to £1200; and that of vice-consuls from £40 to £720. The most onerous duties of a C. are usually those connected with trade. He must, if requested, attend any arbitration concerning property between masters of British ships and freighters who are inhabitants of the country to which he is accredited.

Con'sulate (Lat. *consulatus*, 'consulship') the name given to the chief magistracy of the French republic after the revolution of the 18th Brumaire (q.v.). It was first conferred upon Bonaparte, Sièyes, and Ducos, by the rump of the Council of the Ancients and the Five Hundred. On 13th December, 1799, Bonaparte was made First Consul, with absolute power, an income of 500,000 francs, and all the pomp and circumstance of monarchy, and held the office till 1804, when he made himself Emperor.

Consumption, in political economy. In considering certain questions in political economy, it is necessary to distinguish between C. which is temporary and reproductive, and C. which is unproductive. Money spent in improving land, or in educating the *workman* or *workwoman* for the occupation to be followed, whether in the highest arts and professions, or in the humblest and least advanced employments, is an instance of the former: the human labour and material so consumed will bear fruit. Money spent in war is held by some to be an example of the latter, yet such cannot be said of all wars, as the beneficial result to humanity at large may be far greater than the loss to the individual bodies of men or states. Unproductive consumers are they who live upon the charity of living or dead persons, or do not themselves contribute their full share to the amount of *labour* required from the entire mass of mankind by the laws of Nature (or rules drawn from past experience). This *labour* is of every imaginable sort and condition, and ranges from the careful attention of the mother herself to her child's wants and necessities, the song of the musician, and the output of the miner, to the analytical appeal of the savant, the unceasing solicitude of the master mariner, and the ambitious toil of the cabinet minister.

Con'tact. In geometry, two curves are said to be in C. when they have *two*, *three*, or more consecutive points in common, constituting contacts of the *first*, *second*, &c., orders respectively. Two straight lines cannot be in C. without completely coinciding; and a straight line or plane can only have a C. of the *first* order with any curve or surface, being, in this case, a tangent or tangent plane.

Conta'gion (Lat. 'touching together') means a communication of disease by one individual to another. Contagious diseases are only propagated by the poison being conveyed in some form or other; consequently some countries are exempt from particular kinds of these—*e.g.*, Australia, from smallpox. How such diseases first arose we cannot tell; but now they are only spread by a mode which does not account for their origin. As a rule, they attack the same individual only once.

Contari'ni, a noble and illustrious family of Venice, rose to eminence in the 11th c., furnished many doges, warriors, &c., to the state, and only waned with the republic itself. In 1380 the representative C. led the Venetian fleet against the Genoese, defeated them, and saved Venice. **Ambrogio C.,** ambassador to Persia (1473-77), wrote an account of his travels in Persia, India, and Constantinople.

Contempt', in law, is an offence of various kinds. The embezzlement of public money by a public officer is a C. punishable under parliamentary impeachment by fine and imprisonment. To accept a pension from a foreign prince without consent of the crown is a C. of the Queen's government. So it is to drink to the 'pious memory' of a traitor, or for a clergyman to absolve at the gallows a criminal persisting in the treason for which he is about to suffer.

Contempt of Court.—In the first place, an inferior judge or magistrate is guilty of C. of C. when he administers justice oppressively, unjustly, and not in accordance with the regulations prescribed for his court; an attorney or solicitor is guilty of C. of C. when he acts unjustly, dishonestly, fraudulently, &c., by his client; a sheriff or other executive officer of a court is guilty of C. of C. when he abuses the process of the court and acts oppressively, corruptly, &c., in reference to persons with whom he has to deal in the performance of his duties connected with the court; a juryman is guilty of C. of C. when he eats or drinks without permission of the court, or when he does not attend court, being properly summoned, or does not perform his duty when there; a witness is guilty of C. of C. when, duly summoned, he does not appear, or does not give his evidence at all, or properly, &c.; any person is guilty of C. of C., when he, being a party to any matter before a court, disobeys its order, &c., or when he misbehaves himself in court, or attempts to intimidate, corrupt, obstruct, &c., any suitor, witness, or officer of the court, or when he speaks or writes disrespectfully of the judge, &c., of the court.

When a person is charged with C. of C. out of court, a rule *nisi* is moved for, and the person may file affidavits to show cause why he should not be committed. On the other hand, any judge of a superior court may summarily commit a person for C. of C. within the court or in his presence. Punishment is fine or imprisonment; to the latter there is no statutory limit.

Contempt of Parliament is an infringement of a privilege of Parliament. These privileges are large, and are purposely kept indefinite to suit the times. In the famous contest between the House of Commons and the newspaper reporters in 1771, J. Miller, of the *London Evening Post*, was arrested in the City of London by the Speaker's warrant. Miller being brought before the Lord Mayor, his lordship declared the arrest illegal, discharged Miller, and committed the messenger for assault. The House of Commons sent the Lord Mayor and Alderman Oliver, similarly implicated, to the Tower of London, while the Speaker's messenger was tried at Guildhall for the assault, found guilty, and sentenced to fine and imprisonment. The power of Parliament to imprison ceasing at the end of the session, on the day of prorogation the Lord Mayor and Alderman left the Tower in triumph, and at night the City was illuminated. The contest ended in practically establishing the right of reporting the debates of Parliament, but the resolution affirming that to do so 'is a notorious breach of the privileges of the House,' remains unrevoked on the journals; and every now and then this opposition between the legal theory and that which has become established usage gives rise to perplexity. See PARLIAMENT.

Con'ti, House of, a branch of the House of Condé (q.v.), which took its title from the small town of C., not far from Amiens.—**Armand de Bourbon,** first prince of C., the brother of the great Condé, was born in 1629. Although of a feeble constitution, and originally intended for the Church, he took to a military career, first as the opponent, and next as the ally of his brother, and distinguished himself in Calabria. He retired from the world in 1657, gave himself up to works of piety, and died at Pezenas in 1666.—His eldest son, **Louis Armand,** who was born in 1661, died of smallpox in 1685. Having no children, he was succeeded by his brother, **François Louis,** born at Paris in 1664, and by far the ablest of this family. He was possessed of the highest military talents, which would have been displayed to more advantage had he not, during the greater part of his life, been under a cloud of royal displeasure. As it was, he distinguished himself in Hungary, and, under his friend Luxemburg, at the battles of Steenkirk and Neerwinden. In 1709 Louis XIV., who had been persuaded by the great Condé before his death to pardon C., appointed him to the command of the army in Flanders, but he died in the same year. His scientific attainments were considerable, and as he had many popular qualities, he was much regretted by the French nation. Saint-Simon, in his *Mémoires*, has given a fine sketch of his character and appearance.—His son, **Louis Armand** (1695-1727), had the cultivated tastes, if not the brilliant genius, of his father, but unfortunately he succumbed to the gross dissipations of the Regency.—**Louis François** (1717-76), son of the preceding, revived the military fame of the family, signalising himself in the war with Austria and Sardinia; but he had the misfortune to incur the aversion of Madame de Pompadour, and during the Seven Years' War languished in retreat, while the French troops were being led by a Soubise. The H. of C. became extinct in the person of his son, **Louis François Joseph** (1734-1807), who died in Spain.

Con'tinent (Lat. 'holding together') a term usually applied to the great land masses as distinguished from islands. Ordinary speech recognises five continents—Europe, Asia, and Africa constituting the Old World, and America and Australia the New World. Strictly speaking, the Old World constitutes but a single C., the separation of Africa from the mass by the Suez Canal being merely artificial. The New World is also a single C., though sometimes the two Americas rank each as one. In the midst of seeming irregularity certain uniformities have been long observed. Bacon remarked that the continents ran out in points towards the S. and broadened towards the N. Johann Reinhold Forster made these southern promontories the extremities of mountain ranges, while archipelagos lay over against their eastern sides, their western being hollowed out by large bays. Steffens recognised only three continents, consisting each of two land divisions united by an isthmus, having an archipelago on one side and a peninsula on the other. These are (1) America; (2) Europe, with Western Asia and Africa; and (3) the remaining part of Asia and Australia, formerly connected by an isthmus, which was disrupted in later times. Ritter notices that the greatest expansion of the land of the eastern hemisphere is from E. to W.; of the western, from N. to S. Humboldt calculated the height of the centre of gravity of the land masses, with the exception of Africa, at 1007·267 feet. A special meaning of *the* C. is the mainland of Europe as opposed to England.

Continen'tal Sys'tem is a name given to the method devised by the first Napoleon for cutting off connection between England and the Continent. It began with the 'Berlin Decrees,' issued 21st November, 1806, declaring the British Islands blockaded, and prohibiting correspondence, commercial or otherwise, with them; declaring all merchandise belonging to Englishmen a lawful prize, and even Englishmen themselves, found in a country occupied by French troops or by their allies, prisoners of war. England retorted with an Order in Council, 7th January, 1807, prohibiting all neutral vessels from entering any port belonging to France or her allies, and confiscating, with its cargo, every ship that violated this order; and this was followed in the end of the same year by another order, placing under the same restrictions, as if they had been blockaded, all harbours and places of France and her allies, in Europe and the colonies, as well as every country with which England was at war, and from which the English flag was excluded. After this, numerous opposing orders were issued on both sides, but, on the fall of Napoleon, the C. S., which had helped to increase the hostility to him, was given up.

Contin'gent, a word of ambiguous signification, but applied usually to the quota of troops furnished by tributary or allied states to the common army. The Indian army, during the Mutiny, had several contingents, whose disloyalty seriously injured the general efficiency.

Contingent, a term of English law, having a variety of applications.

Contingent Legacy.—If a legacy be left to any one on the condition of his attaining the age of twenty-one, it is C.; and if he die before that age, the legacy lapses.

Contingent Remainder is when an estate in remainder (see ESTATE and REMAINDER) is limited to take effect either to an uncertain person or upon an uncertain event.

Contingent Use is a use limited in a conveyance of land, which may or may not happen to vest according to the contingency expressed in the limitation of the use. A C. U. requires a particular estate to support it.

Contingent Debts are debts due in a certain event. Creditors in such debts are in Scotland allowed to rank on the estate of a bankrupt. A discharge under the sequestration statute in Scotland is effective against C. D., but in England the rule is the other way.

Contingent Processes.—In Scotland, when processes are likely to throw light on each other, the first enrolled is held to be the *leading process*, and those subsequently brought into court may be remitted to the same judge or division (see SESSION, COURT OF) *ob contingentiam.*

Contor'niate (Ital. *contorno*, 'the outline of a design'), an ancient bronze medallion, having a curved furrow on each side, and supposed to have been struck in the time of Constantine and his successors.

Contort'ed Strata, a name applied in geology to the appearance presented by some beds of rocks, in which they exhibit a twisted aspect, their edges presenting crooked and curved lines. This appearance is said to be due to lateral pressure, or to subsidence and pressure of *curved* surfaces.

Con'tra (Ital. 'opposite to'), a term often applied in music, in the sense of lowness or depth, as in Contra-Bass (q.v.).

Contraband Goods are goods imported or exported without paying legal duties—against the 'ban' or proclamation of law. When the buyer of C. G. knows them to be contraband, he has no claim for delivery, nor action of damages for breach of contract. Nor is an action competent on a bill of exchange granted for C. G. in the hands of a drawer, or of his trustee. See SMUGGLING.

Contraband of War is a term applied to certain commodities relative to war, and to trading in them with the belligerent states. A neutral state may carry on ordinary trade with a country at war, except with a port under Blockade (q.v.), but the trading-vessel must carry no C. goods. These are, generally, horses, timber for ships, and implements or stores pertaining to war by land or sea. Whether an article of peaceful commerce, but which is also of importance in war, is C., is a question which has given rise to much discussion, especially relative to coal—a superior supply of which would now often give one power so great an advantage over another. Lord Chelmsford said in the House of Lords (16th May, 1861) that any Englishman fitting a privateer to assist the Southern States of America in the war then going on would be guilty of piracy; but it is not held that this would apply to the crews of vessels carrying goods C. of W.; but were they captured by the belligerent state within its jurisdiction, they might be treated as that state would treat its own subjects in the same circumstances. Every nation at war with another has the right of search consequent upon its right to intercept merchandise, &c., which is C. of W.

Contra-Bass, or **Double Bass,** the lowest stringed instrument. The C.-B. used in this country has three strings tuned in fourths, the lowest of them being tuned to the A on the third ledger-line below the bass staff. The German C.-B. has a fourth string tuned to the E below this A, which gives it some most valuable additional notes.

Con'tract. A C. is defined by Erskine to be 'the voluntary agreement of two or more persons by which something is to be given or performed on one part, for a valuable consideration, either present or future, on the other part.' A C. by which the parties, or any of them, bind themselves to do what is impossible, illegal, or immoral, is null in law; but all facts in themselves legally possible may be made the subject of obligation, and though performance be beyond the power of the contracting party, the fact will not free him from liability in damage for non-performance. In England, contracts put into writing under hand and seal are technically called *deeds* or *specialities*; and those which are merely parole, or in writing not under seal, are called *simple* contracts. In support of an action on simple C., the creditor must prove that it was founded on a *sufficient consideration.* See DEED, COVENANT, CONSIDERATION.

Contract of Marriage.—Under the usual form of C. of M., property settled upon a wife is protected against the creditors of the husband. She has also power to dispose of the principal by will. A man about to be married may secure a provision for his wife 'in consideration' of the marriage; but he cannot defeat the rights of creditors by post-nuptial C. See MARRIED WOMEN, PROPERTY OF.

Contractil'ity is a vital property manifested by certain living substances both in the vegetable and animal kingdoms. By virtue of this property, these substances change their form, push out and retract processes, and they may also move from place to place. It is manifested by all living protoplasm, whether obtained from vegetable or animal living forms. It is seen in many of the humbler forms of life among the protozoa, in the colourless blood corpuscle, in the spermatozoon, in the cilium, in muscular fibre, and in minute capillary vessels. At one time it was supposed that the C. of muscular fibre depended on the nervous system. The old view of Haller, however, is that generally adopted by physiologists—namely, that C. is a property inherent in the ultimate elements of muscular tissue.

Contrac'tions. The great labour of writing out complete copies of ancient works by hand caused the adoption of numerous C. in the manuscripts. These are naturally made in the most frequently-recurring words and combinations of letters, and though for the most part quite evident, they have caused considerable difficulty in the correct interpretation of many passages. These C. were introduced into the earliest printed books, and continued in use for several centuries after the invention of printing, and they appear in those reprints of the books of the Middle Ages that have been so extensively issued. C. have been arranged in various classes, of each of which we give a few examples. A straight line marked above a letter indicates the omission of *m* or *n* following it: thus quā = *quam*, and nō = *non*. A crooked or circumflex line above or through a letter indicates the omission of one or more letters at that part of the word: thus dñs or dŝ = *dominus*, grâ = *gratia*, Đ = *David;* and sometimes a straight line is used in the same way, as in the Latin terminations *unt*, *int*, *erunt*, &c., where regt̄ = *regunt*, and fuer̃t = *fuerunt*. The sign ꝰ above a letter shows that *er* or *re* has been omitted: thus ıñcator = *mercator*. Furthermore, the absence of the final letters of a word is indicated by the marks ꝯ, or ', or . : thus M' = *Manius*, and mag. = *magister*. A vowel written small above a contracted word indicates the omission of a consonant, and a consonant so written the omission of a vowel; thus g^{a}tia = *gratia*, and fig^{r}a = *figura*. One or more letters are frequently run into another, as in the case of the diphthongs. Numerous symbols of an almost arbitrary character are employed to represent various syllables or words: thus quiqꝫ = *quibus*, and ∻ = *est*. A table of the C. in old Greek typography is contained in the Greek Grammar of Professor Geddes.

Contraven'tion, in Scotch law, denotes any act in violation of a legal condition or obligation. The term is specially applied to an act by an heir of entail in opposition to the provisions of the deed, and to acts in violation of Lawburrows (q.v.).

Contrayer'va, a medicine derived from the root-stock of the Dorstenian species of plants, belonging to the Mulberry order (*Moraceæ*). They are natives of S. America, Mexico, and the W. Indies, are dwarf, perennial, and herbaceous, and are generally found growing in high, rocky places. Dorstenias are distinguished by a peculiar inflorescence, having a broad concave receptacle, containing both male and female flowers. The root-stock, which is the part used, is of a reddish-brown colour, with numerous long, yellow fibres. It has an aromatic odour, a warm, pungent taste, and is used chiefly in America as a tonic, stimulant, and diaphoretic.

Contribu'tion, in its legal sense, is applied to contributions made by co-sureties, or for equalising loss incurred by sacrifice made for the common safety in a sea-voyage. C. is, speaking generally, the performance of his share or obligation by each one of two or more parties bound by contract or otherwise. See AVERAGE.

Con'tumacy, a term of Scotch law denoting disobedience to any lawful summons or judicial order. In a civil case the only consequence is that decree will be given against the defender. In a criminal process, C. is punished by sentence of Fugitation (q.v.). The equivalent term in English law is Default (q.v.). See DECREE IN ABSENCE.

Conular'ia, an extinct genus of Pteropodous mollusca, remarkable for its large size as compared with living Pteropods. Specimens of the fossil shells of C., of which eighty-three species are enumerated by Barrande, chiefly from Palæozoic rocks (beginning with Silurian formations), may attain a length of a foot, and a breadth of over an inch. The genus also extends into the Mesozoic rocks, and seems to die out in the Lias. The shell is straight, tapering at the end, of four-sided form, with its surfaces striated. Occasionally its cavity may be divided internally. *C. ornata*, from the Devonian rocks, is a familiar species.

Con'vent. See MONASTERY.

Conven'ticle (Lat. *conventiculum*, dim. of *conventus*) originally meant a secret assembly of the monks of a convent, generally to secure the election of an abbot. In its modern sense, it was originally applied to the meetings of the followers of Wickliffe, but came latterly to mean any assembly for worship of those who departed from the Established Church, and in this sense is associated both in England and Scotland with the tyranny of the Stuarts.

Conven'tion of Estates. In Scotland, before the Union, a C. of E. of the kingdom used to be summoned to impose taxes in any emergency. These conventions were formed by any members of the three Estates of the Kingdom (q.v.) who could be quickly assembled, and without the formal citation required in summoning a regular Parliament. The power of the Convention was limited to the disposal of the special business for which it was convened. Regularly, the Estates could be convened only by royal authority; but, when necessary, they met without it, as in the Convention for settling the government at the Revolution of 1688. See CONVENTION PARLIAMENT.

Convention Parliament. An English Parliament convened without the royal authority is so called. Its acts are, according to the theory of the constitution, invalid without ratification by a Parliament convened by writ of the sovereign. The Parliament which restored Charles II. was a C. P., so also was that which disposed of the crown at the Revolution of 1688. The acts of these Parliaments were subsequently ratified by a Parliament legally convened. See CONVENTION OF ESTATES.

Conven'tional Obliga'tion is, in Scotch law, an obligation resulting from agreement. The term is generally used in contradistinction to *natural* or *legal* obligation, which arises from the operation of law independently of contract.

Conver'gent and Diver'gent Series are infinite series, which, in the former case, however far taken, never reach a certain finite value, though they may be made to differ from it by a quantity less than any given quantity, and which, in the latter case, may be made of greater value than any given quantity by taking a sufficient number of terms. $1 + \frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \ldots$ is a case of a converging series, the limiting value of which is 2; $1 + 2 + 4 + 8 + \ldots$ is an example of a diverging series, which has no limiting value, however great.

Conversa'no, a town in the province of Bari, S. Italy, 19 miles S.E. of the town of Bari, has a trade in the wine, oil, flax, and cotton which the district produces. Pop. 12,370.

Conversion (Lat. *conversio*) is, in logic, the transposition of the subject and predicate of a preposition. Universal negatives and particular affirmatives are converted by *simple C.*—*e.g.*, 'No A is B,' the *converse* of which is 'No B is A,' and 'Some A is B'—*converse*, 'Some B is A.' Universal affirmatives are converted by *C. per accidens*, by changing their quantity—*e.g.*, the *converse* of 'All A's are B's' is 'Some B's are A's,' not 'All B's are A's,' which would not be *necessarily* true. Particular negatives are converted by transferring the negative from the Copula (q.v.) to the predicate—*e.g.*, the *converse* of 'Some A's are not B's' is 'Some not B's are A's.' C., by contraposition, may be applied to universal affirmatives—*e.g.*, 'All A's are B's,' *converse*—'All not B's are not A's.'

Con'vex. See CONCAVE.

Convey'ance is, in law, an instrument by which property is transferred from one party to another; the instrument may be lease, assignment, settlement, appointment, and other assurance, and covenant to surrender, made by deed on a sale, mortgage, demise, or settlement of any property, or on any other dealing with or for any property.

Conveyancer, one whose business it is to prepare deeds of Conveyance (q.v.). In England the C. is generally a barrister. In Scotland it is generally the law-agent who prepares deeds of conveyance; but there the term C. is often used to denote one whose special business it is to prepare deeds, while *agent* denotes one who specially devotes himself to the conduct of lawsuits. Any one may act as a C. who chooses, but so to do he is required by Stamp Act, 1891, to purchase a certificate every year—in London, Edinburgh, and Dublin, £4 10s. for first three years, and £9 afterwards; in other places, £3 for first three years, and £6 afterwards.

Conveyancing is the preparation of deeds for the transference of property. Great legal skill is required for this, there being certain parts in deeds, any error in which is fatal to their validity. No clearness of ordinary language will avail in C.; the terms used, to be effectual, must be legal; but, by Statute 44 and 45 Vict. c. 41, the *common forms* are now taken to be implied, unless the instrument states the contrary. The object of this statute was to shorten the length of conveyances, &c., a material consideration to suitors, seeing that solicitors (conveyancers) were paid by length. The Solicitors Remuneration Order, 1882, however, dealt with the amount of money to be paid to a solicitor, and the skill, responsibility, and labour required from him. Usually the term C. is in England and in Scotland limited to the transference of real (Scotch *heritable*) property.

Con'vict. Any one found guilty on a criminal charge may be so called; but with us the term has come to be restricted in its application to those whose crime is punishable with *penal servitude*; a sentence which was some years ago substituted for that of Transportation (q.v.). There are C. establishments in various parts of England. In these, the C. is generally employed on public works, such as the breakwater, quarries, and fortress at Portland, and the works at Chatham and at Portsmouth. The treatment of the C. has ever been a subject of legislative difficulty; the difficulty being how to make the punishment sufficiently severe for the protection of the community without injuring the mind or body of the C. Without disputing that these are the ends to be sought for in so far as they are consistent with each other, it may seem a little inconsistent that the law should be so careful of the mind and body of the C. sentenced to 'penal servitude for life,' when we consider that that sentence is the most severe but one which the law can give, that one being *Death*. It has been found that the negative object of doing no injury to mind or body was inconsistent with the prison discipline of prolonged solitary confinement. Males, as a general rule, broke down under it at the end of about nine months; females did not succumb usually till the lapse of a few months more. After about nine months of seclusion the convicts are now associated, under careful inspection, in some profitable mechanical work. The Crown appoints persons to administer the property of convicts, as, by Statute 33 and 34 Vict. c. 23, forfeiture has become altogether abolished.

Convoca'tion was at one time applied to any assembly of clergy, as a diocesan synod or a provincial council. It is now confined to the assembly of bishops and clergy of the Anglican Church summoned by the mandate of the archbishop. From the Magna Charta to the Statute 37 Hen. VIII., this body assessed itself and the clergy whom it represented for public aids without parliamentary sanction. By the celebrated *Præmunientes* clause, Edward I. and his successors had endeavoured to convene the proctors of the clergy in Parliament. This failed, but by the Act of Submission (25 Hen. VIII. c. 19) the C. was forbidden to meet, confer, promulgate, or carry into execution (as regards canons) without the royal licence, or to do anything contrary to the prerogative, the common law, statute, or custom. In 1665 the taxation of the clergy was finally transferred by Clarendon to the Commons; hence the right claimed by the clergy to vote in parliamentary elections, although it has been settled since 1553 that no member of C. can sit in Parliament. After preparing the Act of Uniformity the C. gradually fell into disgrace and impotence; and its criticisms on Toland, Burnet, Clarke, Whiston, and chiefly Hoadley (in the Bangorian controversy), led to its being practically suspended from 1717 to 1840. Burke said its function was to pay 'polite ecclesiastical compliments' to the king and then to dissolve. Lately it has shown signs of life and has taken into its consideration all the great questions of the day which seemed to affect the Church directly or indirectly. There are two convocations, one of the province of Canterbury, the other of that of York. Each C. consists of two houses—the Upper, in which the Archbishop and Bishops sits; the Lower, to which are summoned the Deans, Archdeacons, and Proctors (representatives by election of the chapters and beneficed clergy). Only two proctors are allowed for the parochial clergy of each diocese; and only parsons, vicars, and perpetual curates can vote, stipendiary curates, deacons, and the laity being incapable of election. Colonial bishops do not appear in C. The Lower House proceeds to the election of a prolocutor, *organum cleri* or *Referendarius*. Business is brought forward under the name of *Gravamina* or *Reformanda*. Important constitutional demands may be in the form of a petition to the Crown or Parliament, and are called *Articuli cleri*. The deliberations of the Lower House are chiefly conducted through committees, but the Synodical Act requires the presence of the lower clergy in the Upper House. The Lower House has no right of initiative, but it has a final *veto*. Proxies may be used by members who are not proctors. C. generally sits during the same time as Parliament; it is prorogued by a schedule of continuation signed by the archbishop, who presides in the Upper House, and intimated by the prolocutor to the Lower House. The dignity of C. is secured by various penalties of excommunication contained in the canons of 1603. A canon of C., even when approved of by the sovereign, does not bind the laity, who can be bound only by an Act of Parliament; it, however, binds the clergy *in re ecclesiastica*. Formerly an appeal lay to the Upper House from the ecclesiastical courts in matrimonial, testamentary, and tithe causes. In 1864 C. declared *Essays and Reviews* heretical; it has no power to proceed against heretics.

Convolvula'ceæ, the Bindweed order, a natural order of Dicotyledonous plants belonging to the division *Corollifloræ*. Altogether about 700 species, and forty-six genera are known. Jalap is produced from the root of *Exogonium* (*Ipmœa*) *Purga*; *Batatas edulis* is the sweet potato, and the various species of *Convolvulus* (q.v.) yield important medicinal substances. The species of this order are abundant in tropical countries, but rarer in cold ones. Most of them twine around other plants, and are frequently seen among weeds not far from the sea-shore.

Convol'vulus, a large genus of twining or trailing annual and perennial plants, widely distributed, typical of the order *Convolvulaceæ*. Most of them have showy flowers, expanding during the early part of the day, and owing to the presence of a peculiar resin are purgative. *C. Scammonia* furnishes Scammony (q.v.). *C. dissectus* abounds in hydrocyanic acid, and it is believed that it forms one of the species from which the 'liqueur noyau' is prepared. There are many others which possess in a more or less degree the same qualities, and which are cultivated in our gardens for the beauty of their flowers. *C. Scoparius*, a shrubby species of the Canary Islands, is one of those which yield rosewood.

Con'voy (Fr. *convoyer*, 'to conduct'), a naval and military term, meaning, in the former sense, a vessel or fleet appointed to escort merchant ships in the time of war, or, during peace, to protect them on seas infested by pirates. In the military sense, a C. is a detachment of troops appointed to guard provisions, ammunition, or money in the course of transit. The term is also applied to the train of waggons laden with these stores.

Convul'sionaries, an extreme sect of the Jansenists, originating in France about 1730. They met in the outskirts of Paris, at the tomb of one Francis, whose violent asceticism they imitated. The C. pushed fanaticism to frenzy, and finally ruined Jansenism by the absurdity of their excesses. In 1733 their suppression was decreed by law; but it was many years before this could be effected.

Convul'sions, a form of disease common among children. It consists in violent, sudden contortions of certain muscles, occurs in spasms, is quite independent of the will, and is accompanied by insensibility on the part of the sufferer. It may last from a few minutes to some hours. C. may be caused by inflammation of the brain or of its membranes, by a depraved condition of the blood, by disease of the kidneys, or it may be due to irritability of the nervous system, produced by teething, &c. The treatment varies with the cause. In severe cases inhalation of chloroform, administered by a physician, is an excellent application.

Con'way, or **Aberconway,** a picturesque town in the N.E. of Caernarvonshire, N. Wales, at the mouth of the Conway, 12 miles E.N.E. of Bangor. The principal objects of interest are the old wall with its battlements, the splendid old castle, reared in 1283 by Edward I. as a defence against the Welsh; the chain-bridge, constructed by Telford, and the tubular bridge, in 1848, by R. Stevenson for the proprietors of the Chester and Holyhead Railway. C. has some coasting trade, chiefly in slates, and a little shipbuilding; but it owes its recent prosperity mainly to the beauty of its scenery, which makes it a favourite summer resort It unites with Caernarvon, Bangor, Criccieth, Nevin, and Pwellheli in returning one member to Parliament. Pop. reg. sub-dist. 7246; mun. bor. 3442; civ. and ecc. par. 2350.

The river *Conway* (Cymr. *Cyn-wy*, 'chief water,' the *Toisobius* of Ptolemy) rises in a small lake, *Llyn C.*, on the borders of Merioneth, amidst rocky moors, flows in a northerly direction, receiving lesser tributaries from the E. and from the Snowdon range on the W. Its scenery is perhaps the most romantic in Wales. After a course of 30 miles, it falls into Beaumaris Bay, in the Irish Sea. The C. is navigable for ships of 100 tons 10 miles above its mouth.

Co'ny, the scriptural name of a mammal, the *Hyrax Syriacus* of Syria and Palestine, usually included in a distinct order of mammalia—*Hyracoidea*—but sometimes classified with the rhinoceros, on account of similarity in the molar teeth. No canine teeth exist; the lower incisors are sharp, curved, and grow from permanent pulps. The front feet are four-toed, the hinder three-toed, and the toes have hoof-like nails. No clavicles exist. The nose and ears are short, the tail is rudimentary, and the placenta is deciduate and zonary. These animals live in holes in rocks, and are about the same size as rabbits. The *Hyrax Capensis* of South Africa is another species.

Cony'za, a genus of plants of the natural order *Compositæ*, the most familiar of which is well known in England as Fleabane and Ploughman's spikenard. The first name refers to the property, which it is widely believed to possess, of driving away fleas and other insect pests. The second popular name is probably derived from its somewhat aromatic odour. It is a common hedge plant in England and most parts of Europe.

Co-ob'ligants, though each bound to a creditor for the whole of a debt, are liable proportionately among themselves; and any one paying more than his share is entitled to relief from the rest.

Cook, Captain James, the son of an agricultural labourer, was born at Marton, Yorkshire, 27th October, 1728, and apprenticed to a haberdasher at the fishing-town of Straiths. His employment was uncongenial, but the sea was before him. After being employed some time in coasting vessels, he entered the royal navy, in which his progress was rapid. He was employed to survey the coasts of Labrador and Newfoundland, and was afterwards commissioned by the Royal Society to command an expedition to the Pacific. C.'s ship was the *Endeavour*, and setting sail in her on the 26th August, 1768, he successively visited Tahiti or Otaheite, and New Zealand, discovered and took possession of New S. Wales, sailed W. between New Guinea and Australia, and past Java, &c., to the Cape of Good Hope, arriving in British waters 12th June, 1771. This voyage round the world was productive of great scientific results. In July, 1772, he commanded the *Resolution* and *Adventure* on an expedition to the Pacific and Southern Oceans, from which he returned 30th July, 1774. Of this long, successful, and most interesting voyage, C. has himself given an account in his *Voyage towards the S. Pole and Round the World in H.M. Ships 'Resolution' and 'Adventure'* (Dub. 1784). On the 12th July, 1776, C., in the *Resolution*, accompanied by Captain Clerke in the *Discovery*, sailed on a voyage in search of the N.W. Passage. He proposed to discover this passage by making for Behring's Strait, and sailing from the Pacific to the Atlantic. Beaten back by ice, only, however, after making many valuable discoveries, C. was stabbed in the back by the savages on the shores of Hawaii, 14th February, 1779. See Kippis's *Life of C.* (Lond. 1788).

Cook'ery, the art of preparing for use the various articles used as food by the human family. The first object aimed at in cooking operations is to render food more easy of assimilation to the human system, next it is sought to make food more palatable, and C. also is concerned with the presentation of food in an agreeable form. There is an almost endless diversity in the sources from which the food of mankind is drawn, and at first appearance it might be supposed that alimentary substances are so varied as to defy any classification or definition. The art of the cook to appearance further complicates food by combining various substances, and so treating them as to present made dishes under an endless variety of guises. Notwithstanding all this, the number of alimentary principles is very limited, and some knowledge of them tends very much to simplify the essentials of C., and to reduce to order the chaos presented by an ordinary C.-book.

Under the head of FOOD will be found a classification of the alimentary principles which must enter into every perfect human diet. Of these, the cook is concerned with, first, the nitrogenous or albuminoid substances, such as the fibrin of flesh, the albumen of eggs, the casein of cheese, and the gluten of flour and meal, and, secondly, with the non-nitrogenous or carbonaceous elements, as the fat of oils and butter, the starch of flour and other vegetable substances, and sugar derived from various sources. The proportions in which these substances should enter into a proper diet we learn from experience and physiological investigation, and it is the function of the cook to prepare them in view of such knowledge in the manner least wasteful and most nutritious. Food is chiefly prepared by submitting it to high heat, as by boiling, roasting, baking, broiling, stewing, &c. (See these headings, and also BREAD.) The object attained in all cases is much the same, but differences of flavour result from the various methods of preparation, which have considerable influence on the sapidity and relish of food. By the action of heat albuminous substances are coagulated, as in boiling an egg, but if this action is carried too far, the albumen becomes hard, dry, and indigestible. The natural juices within a piece of meat are retained in it by the rapid coagulation by high heat of the albuminates on the surface sealing it up. The action of heat on starchy substances, such as flour, causes the expansion and rupture of the starch granules, and partly changes them into a soluble condition, thereby rendering them fit for assimilation and digestion. Generally tissues, both animal and vegetable, are rendered softer or more easily masticated by the action of heat in cooking, and, being presented to the digestive organs in a state of minute subdivision, are readily dissolved and digested. In the preparation of food, it is necessary to attend to the compatibility of certain substances as to flavour and character. Cleanliness is the first essential of good C.

There is no art on which human health, happiness, and comfort are more dependent than on C., and in no direction can greater economy and saving be exercised than in dealing with food. Public attention has now been prominently drawn to the importance of elementary knowledge of the principles of food and C., and attempts are being made in various directions to supply the want. A National School of C. has been established in London to teach the cooking of meals suitable for all classes of society, and throughout the chief towns affiliated schools have been instituted. The subject of C. is also receiving encouragement in elementary schools, under the code of regulations in operation in connection with the Education Department. With advancing civilisation, and increasingly artificial habits of life, a knowledge of the best methods of treating food becomes daily more indispensable to all classes.

In his primitive state the range of man's food was limited, and his cooking operations necessarily simple. Probably the earliest inhabitants of the world lived on roots, fruits, and the products of the chase, without submitting their food to any cooking process, but at a very early date we find our ancestors cultivated cereals and prepared them for food by roughly bruising the grain and parching it on hot stones. Actual baking of bread was also practised in very early prehistoric times, as is testified by the remains of baked bread found among the relics of ancient Swiss lake-dwellings. The art of C. was carried to considerable perfection among the ancient Egyptians, and generally as nations progressed in civilisation, especially if accompanied by wealth and luxury, C. was studied and carefully regarded in proportion. A great variety of dishes and elaborate banquets of the Athenians are described in *The Deipnosophists* of Athenæus, and costly and extravagant luxuries were also a feature of Roman life under the Empire. Skill and resource in C. has been a strong point in the domestic life of the French ever since the Middle Ages; and it is not only in high, elaborate, and expensive dishes that their *chefs* excel, but also in the carefulness, economy, and resource of their *cuisine bourgeoise*, in which they are especially deserving of praise and imitation. C. is an art that cannot be learned from any C.-book, however practical, and the recipes such books contain are seldom suited to the means of any but the comparatively wealthy. Every housekeeper should learn by experience as much as possible, and at least it is essential that she should be able to cook all plain everyday articles of food exquisitely, after which in a tentative manner she may essay more elaborate dishes.

Cook'ia, a genus of plants of the natural order *Aurantiaceæ*, named in honour of Captain Cook. The fruit of *C. punctata*, the *wampee* of China and the Indian Archipelago, is greatly esteemed.

Cook, Mount, the highest mountain in New Zealand, is situated in the province of Canterbury, and forms the culminating point of the Southern Alps. Its height above the sea-level is 13,200 feet.

Cook's Inlet, a gulf on the N.W. coast of N. America, territory of Alaska, about 60 miles wide at its entrance, and penetrating 200 miles into the interior. It is named after Captain Cook, who explored it in 1778.

Cook's Islands, Cook's Archipelago, Mangaia Archipelago, and later **Hervey Islands**, a group of islands of coral formation in the S. Pacific Ocean, visited by Cook in his first voyage. The parallel 20° S. passes nearly through the centre of the group. The principal islands are Rarotonga (area 53 sq. miles, pop. 3000), Mangaia (pop. 2000), Atui (pop. 1200), the three small Hervey isles, Aitutaki (pop. 2000), Takutea, Mauki, Mitiero, and the Palmerston group. Water is scarce (except in Rarotonga), and the inhabitants are obliged to rely in part on the milk of the coco-palm. Yet the soil is tolerably productive. The bread-fruit-tree and Pisang are particularly abundant. The inhabitants are Polynesian Malays, like those of the Society and Friendly Isles, and are skilled in various manufactures. The islands belong to Great Britain and are useful as coaling stations. Many of the inhabitants have accepted Christianity.

Cooks'town, a town in the county of Tyrone, Ireland, on the left bank of the Ballinderry, 14 miles N. of Dungannon. It consists of a single long broad street, crossed by a shorter one at right angles, and has a small trade in linen. Pop. of township 3841.

Cook Strait divided the N. and South Islands of New Zealand, and is 21 miles wide at its narrowest part. It is named after Captain Cook, who discovered it in 1770.

Coo'lies, or **Coulies**, from being originally the name of one of the hill-tribes of India, passed into use in that country as a generic term for porters, many of the tribe being employed in that capacity in the principal towns, in much the same way as the Gallegos in Spain. Subsequently the word has come to be generally employed to designate labourers sent from India and China to various tropical countries, the chief of which are the Straits Settlements, Mauritius, the W. Indies, and portions of S. and Central America. A warm and prolonged controversy has prevailed on the subject of the exportation of C. On the one hand, it was alleged that the C. were subjected to much cruel treatment or neglect, and were slaves in fact though not in name. On the other hand, it was contended that they were much better off in the countries to which they emigrated than in their native lands—that they were treated with a reasonable amount of consideration, and were on the whole contented and prosperous. The truth probably is, that while grievous wrongs were at one time inflicted upon the coolie, he now improves his circumstances by emigration, at all events to British settlements. The number of C. introduced into British Guiana from India in the season 1873-74 was 8299, besides 388 from China. The number of East Indians in the colony at the last census was 105,463, and that of Chinese, 3714; the majority of these were C. In Dutch and French Guiana C. are imported in considerable numbers, though the importation of C. was suspended for several years. The British Vice-consul at Cayenne reported that the C. there 'are very fairly treated by their French masters.' Most of them embrace the Roman Catholic religion, and many remain in the colony 'as free men, and become French citizens.' C. brought from Jamaica have been introduced into Colombia, and in Costa Rica the importation of Chinese C. commenced in 1873. E. Indian C. are employed in most of the British W. Indian Islands, as well as to a small extent in the islands belonging to France and Denmark. In the census returns for 1891 it appears that there were in Trinidad 45,594 East Indians and 1006 Chinese, most of whom were C.

Sir W. Grey, Governor of Jamaica, in his report for the year 1872-73, states the E. Indian population of the island at 12,455, of whom 5880 were serving under indenture, 1418 had served five years under indenture, but had not completed ten years' residence, and 5157, having completed ten years' residence, had voluntarily become colonists. Regarding the last class, the agent-general for immigration stated that 'everywhere throughout the country the time-expired C. may be found in comparatively affluent circumstances.' The importation of Chinese C. into the W. Indies received a severe check in 1867, through the Chinese Government insisting on a return passage being granted at the end of five years, which was found to render the employment of Chinese C. unremunerative. A Chinese official visited Cuba in 1874 to arrange for the better treatment of Chinese C. employed in that island. In 1891 there were in Jamaica 10,116 East Indians and 481 Chinese, and most of these were C.

It is in Mauritius, however, that C. are most numerous. In August, 1846, out of a total population of 158,462 there were 56,245 East Indians; in 1891, out of a total population of 370,588, there were 255,920 East Indians. Now most of these East Indians were C. It should be stated that the expression C. means the labourers, their wives, and children. Coolie immigration to Mauritius began in 1834, but was suspended in 1838. In January, 1842, it was resumed, inquiry having shown that the immigrants were not grossly ill-treated, as had been alleged. In 1856 the outbreak of cholera caused another suspension of the immigration, which was resumed in April, 1857. Due regard being had to maintaining a balance of the sexes, the coolie population of Mauritius much increased. In 1873, of the engaged labourers on estates, 5501, or about 8·40 per cent., were Indian creoles. The condition of the Indian population was spoken of by the officer administering the government as being 'fairly prosperous,' and as showing a marked improvement on some preceding years.

Steps were taken to introduce Chinese C. into Cape Colony. In January, 1876, an agent was despatched to China to make the necessary arrangements, the Colonial Government engaging to contribute £7 per head towards the expense, but the venture came to nought and the number of Chinese in the colony is very limited.

A system of exportation of Chinese C., which was really nothing but kidnapping, was carried on for a number of years from Macao, until it was finally extinguished by the action of the British, Chinese, and Portuguese Governments in 1872-73. As showing what atrocities were perpetrated in carrying on this traffic, it may be mentioned that in twenty-three out of thirty-eight ships, the C. mutinied, and in thirteen they murdered every European on board. The C. themselves suffered still more heavily, as out of 3552 shipped on board seven vessels, 2449 perished from disease, fire, and shipwreck.

The importation of Polynesian natives into Queensland, to work on the sugar-estates there, has been carried on for some years, and the same practice has more recently been adopted in the Fiji group. In 1891 there were 9428 Polynesians and 8574 Chinese, of whom nearly all were C. The condition of these labourers is identical with that of C., but they are not known by that name. Stringent laws have been enacted to prevent the trade in 'labour,' as it is called, from being abused. The importation of C. into the Straits Settlements and Malay Peninsula has now been carried on for many years; the C. are sent from China and from India. The Chinese immigrants numbered 193,232 in 1891 and those from India 53,691, and the great majority of all these were C. Without Chinese labour the colony could never have reached its present position of importance and wealth. The life of the Chinese coolie in our colony is a hard one, yet it is a long way preferable to the life in China where the labourer can never be certain of his wage and must always be in fear of losing the greater part of his earnings, whatever they may be, through the rapacity of his rulers. Many of the Chinese settle permanently in the colony, and there is now a rapidly increasing portion of the community consisting entirely of Chinese who have been born and bred in the Settlements, have never seen China, and have no intention of visiting their mother-country. These Straits-born Chinese number over thirty thousand; most of them talk and write English, and the youths and boys are showing a keen appreciation of athletic games, such as cricket, football, and bicycling. The girls are permitted to attend the public schools, where they also learn English and mix with the children of other races. In this way the great barrier of Chinese exclusiveness is gradually being worn away. It is but natural that the Chinese C. should be much impressed by these changes in their fellow-countrymen and their families, and that they should on their return to China draw a comparison between their life in our colony and that in China, which must be favourable to the former. A grave responsibility rests on our shoulders in respect of this large importation of Indian, Chinese, and Polynesian labour; nevertheless, it would appear that we do not shirk our duty, and that we deal fairly by these C. who so materially help in promoting the prosperity of our colonies.

There is also a large coolie traffic between China and Sumatra, and between Java and Sumatra, whereby the Dutch colonists are enabled to carry on the cultivation of their various sorts of plantations in the island by means of Chinese and Javanese labour.

Coomass'ie, the capital of the kingdom of Ashanti, W. Africa, 130 miles N.N.W. of Cape Coast Castle. It was formerly walled, had wide streets, an extensive royal palace, furnished with a curiously miscellaneous collection of objects of value and interest, and a strong and vast fortress, named the Bantima. It was taken and burned by British troops under Sir Garnet Wolseley, February, 1874, in the war against King Coffee Calcalli; but since then it has been rebuilt.

Coo'per, Sir Astley Paston, one of the greatest of British surgeons, was the son of the Rev. Samuel C., rector of Brooke, Norfolkshire, and was born at the rectory, 23rd August, 1768. He received his practical training under Cline, and attended the anatomical lectures of John Hunter. He soon became a great authority in anatomy and surgery, and filled in succession the posts of Professor of Anatomy in Surgeons' Hall (1792), and surgeon to Guy's Hospital (1800). In 1804-7, C. published his celebrated work on *Hernia*. His private practice rapidly increased, and in 1813, in which year he received the Professorship of Comparative Anatomy in the College of Surgeons, his income reached the sum of £21,000. A skilful and daring experimenter, he attempted (1817), although unsuccessfully, the tying of the carotid artery and of the aorta. In 1820 C., who had removed a steatomatous tumour from the head of George IV., was made a baronet, and till his death, which took place 12th February, 1841, honours poured in upon him. He filled, besides other posts, those of President of the College of Surgeons (1827), and Vice-President of the Royal Society (1830), while he was made a D.C.L. of Oxford, an LL.D. of Edinburgh, and a member of the French Institute. His writings, in spite of his busy life, were numerous, and many of them, especially his treatise on the *Anatomy and Diseases of the Breast* (1829-40), may be said to have revolutionised the theories on the subjects of which they treat. The school of Hunter was fertile in great surgeons, but none has surpassed, if any has equalled, the brilliant and original C. See *The Life of Sir Astley C.* (Lond. 1842) by B. Cooper.

Cooper, James Fenimore, one of the most popular of American novelists, was born at Burlington, New Jersey, U.S., 15th September, 1789. Educated first privately, and afterwards at Yale College, he entered the navy at the age of thirteen as a midshipman, and served in it for six years. Retiring into private life, he married, and after some years of solitude he took the reading public of the United States by storm with his novel of *The Spy* (1822). This was followed by a large number of other fictions, all like it marked by strong nationality and great powers both of narration and description. The chief are *The Pioneers* (1822), *The Pilot* (1823), *Lionel Lincoln* (1824), *The Prairie* (1825), *The Last of the Mohicans* (1826), *The Red Rover*, and the *Waterwitch* (1828). Some of these, such as *The Pilot* and *The Last of the Mohicans*, were at least as much admired in Europe as in America; but while C. is still much read, especially by boys, he does not stand on the pedestal on which he was placed by his earlier admirers. C. visited England in 1827, and published some sketches of European society. He died at Cooperstown, New York, 14th September, 1851. C.'s daughter, **Susan Fenimore C.,** born 1815, became an authoress of some mark. Her books are chiefly descriptive of country life. The chief are *Rural Hours* (1850), *Country Rambles, &c.* (1852), and *Rhyme and Reason of Country Life* (1854).

Cooper, Peter, an American philanthropist, was born in New York, 12th February, 1791. About 1828 he engaged in the business of glue and isinglass, and in 1845 he erected large mills in Trenton for iron-rolling. The fortune which C. acquired in business he liberally used for the public good. Feeling a deep interest in the welfare of the working classes, he erected the *C. Institute* in a central part of New York city. It cost £100,000, and this building, with all its profits and rents, was devoted to the education of the people. It included a free reading-room, school of design, galleries of art, and evening classes. C. died 4th April, 1883.

Coo'perage, the art of making barrels, casks, and other vessels of wooden staves and headings, banded with hoops. The art early reached a state of perfection, for Pliny states that such vessels were used for storing wine. Although of late years a large number of ingenious machines have been contrived for the production of casks, &c., and are employed in a few establishments, yet the C. industry is practically carried on manually. The manufacture of *tight* or *wet* casks for holding liquids is the most important branch of C. The operations of the cooper consist in shaving and planing the Danzig oak staves to the proper curve, both in the direction of the length and breadth, in shaping them so as to be broadest and bulging at the middle, and gradually tapering to the ends, in bevelling the edges and ends, and in 'chining' the grooves to receive the heads. The staves are then brought together and bound with slightly coned iron hoops, the heads, bevel-edged and slightly ovalled, are driven into the grooves, and the bung-hole bored.

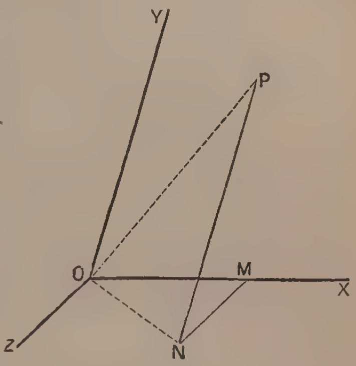
Co-opera′tion. This term has come to be specially applied to an extension of the principles of joint-stock enterprise which has taken place within comparatively recent years. Societies are formed, whose members subscribe a capital with which to work some commercial concern, of a kind formerly left to individual enterprise; the object being to share the profit among the members, without any expenditure of time and thought by the general body of them. There are, of course, co-operative societies whose object does not come within the above definition. (See BENEFIT OR FRIENDLY SOCIETIES, BUILDING SOCIETIES.) Besides supporting about five hundred officials, the profits of the *Civil Service Supply Association* of London have been enormous. In Edinburgh, on a humbler scale, the similar institution—the *Professional and Civil Service Supply Association*—continues to be very prosperous. Such institutions clearly ought to succeed—competent managers and sub-officials being easily obtained. By the ready-money system on which they are conducted, the honest are not taxed on account of the dishonest. Providing their own customers, they are not obliged to increase the price of articles to pay advertising. Some endeavours have been made by members of Trades Unions (q.v.), as opposed to capitalists, to carry on co-operative productive trading. These have not been successful, nor does it seem as if they ever could be, owing to the antagonism of the positions. The aim of trades-unionism is to force up the rate of wages; the success of C., as applied to production, depends on keeping the rate of wages low. As co-operators the workmen are their own employers, and experience has shown that workmen prefer immediate to postponed enjoyment—high wages to profits.

Co-or′dinates, the name of the directed quantities which determine the position of a point, and which constitute the great peculiarity of Descartes' method of analytical geometry. The position of a point in space requires for its determination three numbers, one of which, at least, must be a rectilinear measure. Thus, the summit of a mountain is fixed, if we know the number of points of the compass which it is E. or W. of N., the angle of elevation, and its direct distance from us; or if we know how far it is N., E. (or W.), and its vertical height. This latter is a case of the method in question, these distances being the C. of the summit. It is obvious, however, that it is requisite beforehand to fix three arbitrary directions, which need not be at right angles to each other, but which are usually so taken for convenience. Take then in the plane of the paper the two lines OX, OY, to represent two of these directions, and suppose OZ not in the plane of the paper to be the third. These lines are called the *axes*. Take now *any* point P, whose position is to be determined with respect to these three directions. Through P draw PN parallel to OY, and meeting the plane containing OX and OZ in N. Through N draw NM parallel to OZ, and meeting OX in M. MO, PN, NM, are the C. of the point P with respect to the three axes of X, Y, and Z; and are expressed respectively as x, y, and z. If the axes be mutually rectangular, the C. are so also, and therefore

$$x^2 + y^2 + z^2 = \mathrm{ON}^2 + \mathrm{PN}^2 = \mathrm{OP}^2.$$

If P lie on the surface of a sphere, whose centre is at O, OP is constant $= a$ suppose. Hence $x^2 + y^2 + z^2 = a^2$ represents any point on the sphere, and is, therefore, called the *equation* of the sphere. If $z = 0$, the equation becomes $x^2 + y^2 = a^2$, representing a circle of radius a, centre O, in the plane xy. For any value of y, x has two equal values, one positive, the other negative; and thus the signs $+$ and $-$ undergo an important extension of meaning, representing not merely addition and subtraction, but *direction*. In *plane* analytical geometry only two axes are required, and y and x are known respectively as the *ordinate* and *abscissa* (Lat. 'cut off'). See GEOMETRY, ANALYTICAL.

The method of *Polar C.* has been already hinted at. By it a point is fixed by the length and the *Direction-Cosines* (q.v.) of its radius vector. Its most practical use is in the planetary theory.



Lagrange's *Generalised C.* deserve a word of notice. The C. represent the degrees of freedom possessed by the system whose motion is under consideration, and are wholly determined in each special case by the conditions of the problem. For each co-ordinate there is an equation of motion, and hence there are as many equations as there are C. The combination and integration of these, when possible, give the complete motion of the system. See De Morgan's *Calculus*, and Thomson and Tait's *Natural Philosophy*, vol. i.

Coorg (*Kodagu*, 'steep mountains'), a small inland state in S. India, under permanent British administration, occupying the mountains of the Western Ghâts between Mysore and Malabar district. Area 1583 sq. miles; pop. 173,055. Of these 156,845 are Hindus, 12,665 are Mohammedans, and 3392 are Christians. The whole area is mountainous, and covered with primeval forest or grassy glades. Wild animals abound, including elephants, tigers, bison, and ibex. The chief product is timber—teak, blackwood, *poon*, sandalwood, and bamboo. Rice is industriously cultivated in terraces, along the river valleys. The capital is Mercara or Merkára (q.v.). The climate is very rainy and damp, but cool and healthy for Europeans. The Coorgs are famous throughout India for their physical and moral virtues, and have shown extreme loyalty to the British from the very first. They utterly declined to submit to Hyder Ali and his son Tippoo, and when all the southern part of the peninsula fell beneath the yoke of these conquerors, the Coorgs, in spite of disaster after disaster, valorously resisted the Mohammedans; and when they were on the point of being absolutely exterminated, they again revolted and induced the British to intervene and save them. The native Rajah, with his family, returned from captivity, but gave way to such fiendish cruelty towards his subjects, that the British were forced to take the country from him, promising civil and religious liberty to the masses. The Rajah retired on a pension, and died in England in 1862. His daughter became a Christian, the Queen of England acting as her godmother; she married an English officer, and died two years after her father. The rest of the family are pensioned off by the Government, and live at Benares. Cholera never appears in C., but there are terrible epidemics of small-pox. The Coorgs are possessed of a lively intelligence, and, under the British, have made great advancement in education.

Coo′sy, Koosee, or **Kusi,** a river of Hindustan, which has its source on the southern slope of the Himalayas, and after a course of 325 miles nearly due S., through Nepal and Purneah, falls into the Ganges, about midway between Patna and Murshidabad. The stream is extremely rapid and is liable to floods, which are gradually destroying the country around, and changing the course for navigation, so that the passage up and down is always dangerous.

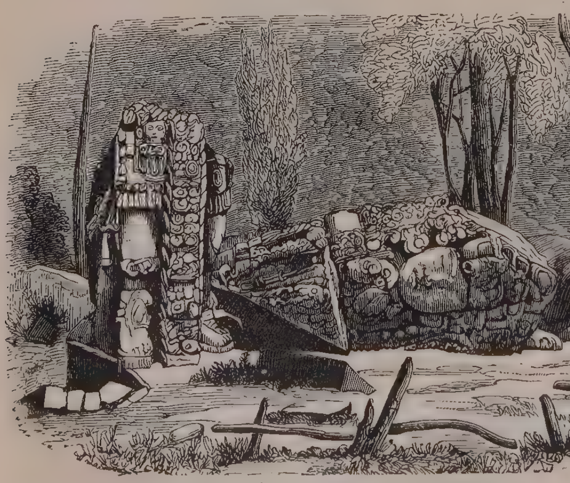
Coot, a genus of Grallatorial birds, included in the Rail family. The toes in the C. are fringed with broad membranous lobes, somewhat similar to those of the Grebes (q.v.). The C. is sometimes placed more intimately in the family of the waterhens. The common C. occurs in Europe, N. Africa, and Asia. It is coloured black; the wings have a white bar, and the forehead is also white. It averages from 13 to 16 inches in length, and has a strong, conical, straight bill. The C. flies southwards in winter. The American C. occurs in N. America.

Coote'hill, a town in Cavan county, Ulster, Ireland, on the river Coragh, 12 miles E.N.E. of Cavan, has a considerable trade in linen. Pop. of township 1789.

Copai'va, or **Copai'ba,** often improperly called *balsam of C.*, is obtained from incisions made in the trunk of *Copaifera multijuga* and other species of Copaifera, trees belonging to the *Leguminosæ*, sub-order *Cæsalpiniæ*, and found chiefly in the valley of the Amazon. It consists of a resin and oil; the latter is used in medicine. C. somewhat resembles olive oil, has a peculiar odour, and an acrid taste. It exudes so abundantly after an incision has been made in the tree, that as much as 12 lbs. is sometimes collected in a few hours.

Co'pal, a resinous substance extensively employed in the arts. It is the general Mexican name for resins and gums. Mexican C. is, however, now derived from a species of *Hymenæa*, a leguminous tree. *Copaifera Guibourtiana* or *Guibourtia copallifera* is the source of most of the recent W. African C., though a great portion of the C. sent from that part of the world is fossil-resin, produced, according to Welwitsch, by trees which are now extinct or only exist in a dwarfed condition. *Trachylobium mossambicense* has been shown by Kirk to be the source of Zanzibar C. The valuable *Animé C.* of the same island is, however, semi-fossil, and was probably derived from the same species of tree, then existing in forests now extinct. The exact source of Brazilian and Angola C. is not known. The so-called Indian C. is the produce of *Vateria Indica*. C. is also obtained from Madagascar, where it is believed to be the produce of *Hymenæa verrucosa*. All are extensively used in making varnishes, lacquer, &c.

Copal'chi Bark, the bark of *Croton pseudo-china* or *niveum*, a Euphorbiaceous plant, a native of the W. Indies and Mexico. It is used as a tonic.

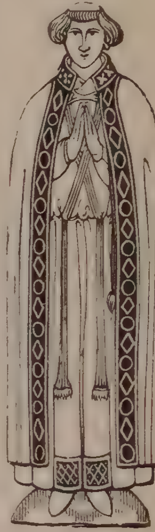


A Fallen Idol at Copan.

Copan', a ruined city of Honduras, on the borders of Guatemala, Central America, on a river of the same name, an affluent of the Motagua. The ruins, which extend for two miles along the banks of the C., and are about 1500 in number, include the remains of a temple 624 feet long, pyramidal structures, and monoliths, with sculptures and hieroglyphs identical with those of Palengue.

Copar'cenery. In England, when an estate of inheritance descends from the ancestor to two or more females, it is said to be an estate in C., and those to whom it descends are coparceners. Each is entitled to her distinct share, though the property remains undivided, and no benefit accrues on survivorship, the right of each descending to heirs. C. does also sometimes occur among males. (See GAVELKIND.) The estate may be dissolved in several ways, such as by deed of partition, by one of the coparceners alienating her or his share, and thus destroying the unity of title; by all but one of the coparceners dying and the survivor inheriting the rest of the estate.

Cope (from the same root as *cap* and *cape*), a semicircular vestment worn during divine service by Roman Catholic priests, reaching from the shoulders nearly to the feet, and open in front, except at the top, where it is fastened by a band, clasp, or morse. This choir, or canonical C., was, prior to the 14th c., distinguished from the *cappa fluvialis*, a large mantle with a pointed hood to it, which was worn out of doors, but which was subsequently disused. In the 12th c. a custom arose of putting sleeves to the C., but Pope Innocent III., in the fourth Lateran Council, forbade these *cappæ manicatæ*.



Cope.

Cope, Sir John, an English commander, who has obtained an unenviable immortality through his surprise and defeat at Prestonpans by Prince Charles Stuart, 21st September, 1745. A clever song in which the defeat is celebrated survives to this day. C.'s 'raw dragoons' were wretched material to oppose to half-savage Highlanders in the first flush of their triumphant march from the N., and C. has perhaps been too severely judged. He died Knight of the Bath and a lieutenant-general, 28th July, 1760.

Co'pec, a Russian copper coin, the hundredth part of a rouble, or of 3s. 2d. in English money. The C. was at first coined of silver. The name is connected with the Russian word for a lance, the C. having anciently borne the effigy of St. George.

Copenha'gen (Dan. *Kjöbenhavn*, *i.e.*, 'merchant's haven'), the capital of Denmark, partly on the island of Zealand (Dan. *Sjaelland*) and partly on the island of Amak or Amager, in the Sound, and situated so low that it has to be defended by embankments against inundation. It is divided into three parts—the Old Town, or W. part; the New Town, or E. part; and Christianshavn on Amak, connected with C. proper by the bridges Langebro and Knippelsbro. The channel between the islands forms a splendid harbour. Pop. 312,859. C. has suffered frequently from fire, the old houses having been for the most part constructed of wood. These have, however, been replaced by structures of brick or Norwegian granite. The city contains numerous squares, of which the finest is Kongens Nyton (the new King's Market). It is central, and is adorned with a colossal leaden statue of Christian V., as the octagonal Frederik's Place is with an equestrian statue of Frederik V. The fortifications, once strong, have, with the exception of the citadel, *Frederikshavn*, been dismantled. The most notable structures are the Frue Kirke (Church of our Lady), the metropolitan church of the kingdom, which suffered during the bombardment of 1807, but has been restored, and contains some of the masterpieces of Thorwaldsen; the Trinitatis Kirke, founded by Christian IV., with a curious round tower; Holmens Kirke, with monuments to the naval heroes Juel and Tordenjold; the palace of Christiansborg, of vast extent, with decorations by Thorwaldsen; and the castle of Rosenborg, designed by Inigo Jones, and in which the regalia are kept. C. is rich in museums of antiquities, natural history, numismatics, &c. That of northern antiquities is peculiarly interesting. It occupies a wing of the palace of Christiansborg, and contains a collection of stone and bronze implements, ranging from the rudest prehistoric times to A.D. 500, also of articles in gold and silver to A.D. 1000, and specimens of Scandinavian art and manufacture to the present time. The Royal Museum of Natural History is rich in zoological and mineralogical specimens. Thorwaldsen's museum, opened in 1846, contains the bequest made by him to the nation of his own works and numerous collections. The university, founded in 1478 by Christian I., but whose constitution was remodelled in 1788, has had among its professors men of European reputation in their several departments. It is well endowed, has forty professors and 1300 students (male and female on equal terms), a library of 200,000 volumes and 4000 MSS., among which are rich collections in Old Persian, Old Indian, and Old Norse. There are besides 28 elementary schools, a veterinary and agricultural college, a college of pharmacy, and several high, technical, and commercial schools. The royal library, founded by Christian III., contains 500,000 volumes and 20,000 MSS., among which are Rask's Sanskrit collection. The manufactures, which are trifling, and chiefly for home consumption, consist of woollens, linens, sailcloth, leather, and porcelain; but C. is still the centre of the foreign commerce of Denmark, which possesses a merchant navy of some 3400 vessels. It has railway communication with Korsör and Helsingör; regular steam communication with Kiel, Lübeck, Stettin, Norway, Sweden, Russia, France, England, and America. About the middle of the 12th c., C. was a small fishing village, in whose neighbourhood Bishop Axel (q.v.) or Absalon built a fortress called Axelhuus, to repress the piracy of the Baltic. In 1254 the village, which Saxo Grammaticus (q.v.) calls *Urbs Absalonica*, then *Portus Mercatorum* and *Castrum de Hafnia*, received municipal privileges, and in 1443 it became the capital of the kingdom. It has suffered much from sieges and bombardments, but its most grievous disaster was its bombardment by the British fleet, 2nd-5th September, 1807. The environs of C. are extremely beautiful. See E. J. Jonas, *K. und Umgebungen.*

Coper′nican System, The, is that system which represents the sun as being in the centre of the solar system, and the planets, of which the earth is one, as revolving round it. It is so called after Copernicus (q.v.), who advocated it in his work *De Revolutionibus Orbium*, but who, it must be observed, was not the first founder of it, that merit being due to Pythagoras (q.v.). The Newtonian system must be carefully distinguished from this, however, which Copernicus merely brought forward as a hypothesis, and tried to establish by much false logic and erroneous conceptions. He imagined the universe to be a sphere, in the centre of which the sun was immovably fixed. Round this central fire the planets revolved in circles, the proof of this being the famous Aristotelian dogma that circular motion was perfect. But this failed to agree with observation, and accordingly Copernicus was compelled to follow the same course as Ptolemy by introducing into his system complex epicycles. Many of the arguments which he used for establishing his hypothesis could have been easily turned against him by an intelligent advocate of the Ptolemaic system. Notwithstanding such defects, the *De Revolutionibus* produced a powerful effect, and prepared the way for the discoveries of Galileo, Kepler, and Newton. It is especially valuable for the generally correct explanation of some astronomical phenomena, mysterious and inexplicable before his time, *e.g.*, the variations of the seasons, the precession of the equinoxes, and the stationary and retrogressive motions of the planets.

Coper′nicus (the Latinised form of *Koppernigk*), **Nikolaus,** a famous astronomer, was born 19th February, 1473, at Thorn, in Prussia. After studying medicine, philosophy, and mathematics, especially the last, in the University of Cracow, he proceeded to Rome in 1496, where he met with the celebrated Regiomontanus, and where, in 1499, he became Professor of Mathematics. On his return to Prussia, he entered holy orders, became a canon at Frauenburg in 1502, and occupied the remainder of his life in his ecclesiastical duties, in giving gratuitous medical advice, and in prosecuting his favourite sciences of astronomy and mathematics. The results of his observations led him to reject the Ptolemaic system of the universe, and to propose the one which goes by his name. (See COPERNICAN SYSTEM.) It was with this end in view that he prepared his great work, *De Orbium Cælestium Revolutionibus*, Libri vi., which was published at Nürnberg in 1543, a few days, it is said, before his death (24th May). C. also wrote a work *De Lateribus et Angulis Triangulorum* (1522), several letters on general subjects, and a treatise on money. The first biography of C., that of Gassendi (1654), of which an English translation is given in Martin's *Biographia Philosophia*, formed for 200 years the groundwork of all other biographies. It is only in quite recent times that researches in archives have enabled us to obtain a clearer conception of C. and his work.

Copiapo′, a name applied in Chili, S. America, to a river, a village, a city and a district. 1. The *river* rises in the Andes, flows in a N. and W. direction, and after a course of 120 miles falls into the Pacific. 2. The *village*, Porto de C., at the mouth of the river, has parted with much of its trade to the flourishing seaport of Caldera. 3. The *city*, capital of the province of Atacama, lies about 30 miles up the river from the sea, and on the railway between Caldera and the mining centre of Juan Godoy. It exports the mineral wealth of the district. Pop. 10,360. 4. The *district* is rich in silver, copper, and cobalt.

Co′ping, in building, the capping or covering course of a wall, which may be flat, or it may be sloping or round, to throw water off. The term *cops* is sometimes applied to the Merlons (q.v.), or rising parts of battlements.

Cop′land, James, an English physician and author, was born at Deerness, in the Orkneys, in 1792, studied at Edinburgh, and, after travelling in Africa to study epidemic diseases, settled in London in 1820. He died 12th July, 1870. C.'s works, including his *Outlines of Pathology*, his *Elements of Physiology*, his essay on *Pestilential Cholera*, and above all his *Dictionary of Practical Medicine*, enjoy a very high reputation both at home and abroad.

Cop′ley, John Singleton, a historical painter, of Irish extraction, was born at Boston, America, 1737, came to England in 1774, was elected R.A. in 1783, and died 1815. His best works are the *Death of Lord Chatham*, in the national collection, and the *Death of Major Pierson*, which was the property of his son, the late Lord Lyndhurst (q.v.).

Copp′er, is an important and widely distributed metal, and has been known from early ages. At one period it was employed in the manufacture of articles and implements now made of iron (see BRONZE AGE)—a fact which is accounted for by the occurrence of C. in the native or uncombined condition, or in ores which yield the metal by very simple processes. C. was called by the ancients *æs* or *chalchos*, its modern title of C. (Lat. *Cuprum*) being derived from Cyprus, an island in which formerly C. was smelted by the Greeks and Romans. C. is found in various minerals, the most important of which are *C. pyrites*, *C. glance* (native sulphide of C.), *malachite*, a basic carbonate of C.; also *Red C. ore* (the red oxide of C.), and black oxide of C. Native C. occurs crystallised or in veins. There is a vein of C. in the neighbourhood of Lake Superior in N. America, which in some places is almost two feet thick. More than one-half of the total C. annually extracted is smelted in Great Britain, and of this about one-third comes from the Cornish mines. The ores raised in Cornwall consist for the greater part of C. pyrites. Owing to the absence of coal from the neighbourhood, they are transported to S. Wales, where that mineral is abundant. The operations of C.-smelting, as practised at Swansea and in the neighbourhood (the seat of C. industry), are complex, though their principle is simple. The ores, after being sorted, are roasted on the bed of a reverberatory furnace. Here much of the sulphur is burnt off as sulphurous acid, and arsenic (also frequently present in the ore) volatilises. The iron by this treatment is converted into ferric oxide, which subsequently becomes changed to ferrous oxide by the reducing gases of the furnace. The ferrous oxide then unites with silica, originally present in the ore, or which has been added to it in the form of sand for the purpose, and forms a fusible slag, whilst a tolerably pure sulphide of C. remains (*coarse metal*). The fused sulphide of C. is drawn off from the slag and again roasted, when it loses the whole of its sulphur as sulphurous acid, and metallic C. remains. C. possesses a peculiar red colour and a bright lustre. It is malleable, ductile, and remarkably soft—a property which enables it to be hammered into various forms at ordinary temperatures. It fuses at a white heat, and at a very high temperature volatilises as a green vapour. In dry air C. remains unchanged, but in presence of moisture and carbonic acid, it becomes covered with a coat of basic carbonate. Heated in the air, its surface becomes covered with a film of black oxide of C. C. is soluble with effervescence in nitric acid, nitrate of C. remaining in solution, and nitric oxide escaping as a gas. Other acids do not act upon it at ordinary temperatures. C. forms two series of compounds called *cupric* and *cuprious ;* these contain respectively one and two atoms of C. united to the same amount of acid or electro-negative radical. The cupric salts are the most important. Cupric sulphate is used by the calico printer, and is called *blue vitriol ;* it has also been employed as a cure for *smut* in wheat, and in medicine as a caustic. Cupric oxychloric, known in the arts as *Brunswick green*, is employed as a pigment. *Scheele's green* is a cupric arsenite; *verdigris*, a basic cupric acetate. C. is largely employed in the arts, both in the pure state and alloyed with other metals. (See ALLOYS.) Its salts are sometimes employed in medicine, and are poisonous. Small quantities of C. appear to be normal constituents of certain organs—the kidneys being one of them. The atomic weight of C. is 63·4.

Copp′eras is the sulphate of iron or ferrous sulphate. See IRON.

Copperhead, a most venomous snake, occurring in N. America. It is of a nut-brown colour, with dark brown bars; the belly is pinkish; and the sides have dark patches at intervals, corresponding to the bars across the back. The head is like a triangle in shape and is thick. Although slow in its movements, it is more feared than the rattlesnake, as it causes no noise as a warning of its approach. It feeds on frogs, lizards, and small birds.

Copperhead.

Copp′ering, in shipbuilding, a term applied to the process of sheathing the bottoms and sides of wooden vessels with copper or an alloy, to protect them from the ravages of sea-worms, and to prevent, by the slow oxidation of the metal, the accumulation of vegetable and animal growths, which, from their abundance, materially impede the progress of ships.

Copp′ermine River, in the N. of the old Hudson's Bay territory, Dominion of Canada, rises in a small lake to the S. of Great Bear Lake, flows N.E. for about 110 miles to Point Lake, after leaving which it takes a northerly direction, entering Coronation Bay at Bloody Fall, after an entire course of some 300 miles. It has only one tributary of any size, and is rendered impassable by its numerous falls and rapids. The C., along with the Indians on its banks and a mountain range to the W., receives its name from the presence of *copper* in the district, and was discovered by Lieutenant Hearne in 1771.

Cop′rolites, the name given to certain fossilised substances, which are presumed to represent certain petrifactions, and occur in Mesozoic and Tertiary deposits. These C. frequently present the remains of scales, teeth, shells, &c., which have resisted the digestive processes. C. are chiefly composed of phosphate of lime, and are therefore valuable as affording a capital manure for the agriculturist. In the chalk system, for example, beds of phosphatic concretions are met with of coprolitic origin. The names 'fossil cones,' 'bezoar stones,' &c., were applied to C. in ignorance of their true nature.

Copros′ma, a genus of shrubs belonging to the natural order *Cinchonaceæ*, deriving their name from their very fetid odours. The leaves of *C. fœtidissima* are used in divining the will of the gods by the New Zealand (Maori) priests. See Bennett's *Gatherings of a Naturalist in Australasia.*

Cop′tis, or **Gold Thread,** a genus of plants of the natural order *Ranunculaceæ*, consisting of a few species found in America, N.E. Asia, and one in Russia. In America the long thread-like underground stems of *C. trifoliata* are used as a tonic and material from which a yellow dye is extracted.

Copts (from *Coptos* in Upper Egypt) are a sect in Egypt professing a corrupt form of Christianity, who are the direct descendants of the Monophysites (q.v.) in Egypt, who seceded from the Catholic Church when their tenets were condemned by the Council of Chalcedon (451). The Arabian conquest rendered the schism irrevocable, and thus the Coptic Church was constituted. The C., however, are much more than the relic of a Christian sect; they are the only living representatives of the ancient Egyptians. In numbers they do not exceed 600,000; they have twelve bishops, a patriarch (of Egypt and Abyssinia, who resides at Cairo), arch-priests, priests, deacons, and monks—the priests must be married before ordination; the monks, arch-priests, and bishops are not permitted to marry at all. They have two versions of the Holy Scriptures—the Memphitic, in the Coptic dialect of Lower Egypt, and the Thebaic, in that of Upper Egypt. The Scriptures are still read from these in their public worship, but as the language is not now understood either by people or priests, they are afterwards explained in the Arabic, which is their vernacular. See Stanley's *Eastern Church*, and Carl Abel's valuable *Koptische Untersuchungen.*

Cop′ula (Lat. 'band'), the logical term for the word which joins the subject and predicate of a proposition—*e.g.*, 'Cæsar is dead.' Here Cæsar is the subject, dead the predicate, and *is* the C. The sign of predication may also be made by an alteration, called an *inflection*, on the predicate—*e.g.*, 'water flows'—*i.e.*, *is* flowing. For the confusion to which a dim conception of the nature of the C. has given rise, see Mill's *Logic*, book i. ch. 4.

Cop′y (Fr. *copie*, Lat. *copia*, 'plenty,' Low Lat. 'a pattern or transcript,' because it could be 'frequently' repeated), in art, a work in painting, sculpture, or engraving, reproduced by one artist from the original design of another. A reproduction of a work of art, executed by the artist himself, is called a *duplicate* or *replica ;* a reproduction in plaster of a work of sculpture is called a Cast (q.v.).

Cop′yhold, in England, is that right of tenure of land constituted by copy of the court-roll of the tenants of the lord of the manor. Copyholders were anciently nothing more than villeins, who by gradual encroachment at last established a customary right to their estates, previously held absolutely at the will of the lord of the manor. No right of C. can now be created, for it is requisite to the tenure that it have been held from immemorial time in virtue of copy of court-roll. In Ireland there are no lands of C. tenure, but in England it is by it that much of the land continues to be held, under relaxation of its more onerous ties and conditions. Services anciently due from them having mostly fallen into desuetude, a C. estate has become nearly equal in value to a freehold. Subsisting manorial rights may be commuted, and copyholds enfranchised under provisions of 4 and 5 Vict. c. 35, amended by 6 and 7 Vict. c. 23, and 7 and 8 Vict. c. 55, and these extended by 15 and 16 Vict. c. 51, which in its turn was amended by 21 and 22 Vict. c. 94, and by 50 and 51 Vict. c. 73, by which the tenant or lord of the C. land may compel its enfranchisement, and the extinction of a claim of Heriots (q.v.). When either lord or tenant requires an enfranchisement, notice is to be given, and unless the sum be agreed upon, the amount is to be ascertained under direction of the C. Commissioners, whose award is to have equal force with a deed of enfranchisement under the C. Acts. The valuation is to be made by a scale obtainable at the office of the Land Commissioners, 3, St. James's Square, London, which scale is, however, to be taken only as a guide.

By becoming enfranchised the C. thenceforth is a freehold, subject, nevertheless, to commonable rights and limitations. An ordinary conveyance is ineffectual with regard to C. land. The mode of transference is symbolical, like that called Resignation (q.v.) in Scotland. The land is symbolically surrendered to the lord of the manor or his steward, who again, in the same way, transfers it to the person to whom the transfer is to be made, and on the desired conditions. See CONVEYANCING.

Copying Machines, a term applied in a restricted sense to machines for producing facsimiles of various writings. In general, the copying machine consists of a heavy metal frame fixed to, or standing upon, a table, and having above it a flat plate of the same size, which can be raised up and pressed down by means of a screw. In connection with the machine, a book full of blank tissue paper is used. A page of this is damped, the letter to be copied inserted underneath it, and the whole placed between the plates of the press. The movable plate is forcibly screwed down upon the fixed one, and by the pressure an exact copy of the letter is impressed upon the damped page. This copy is, of course, reversed, but the paper is so thin that it can be read through the right way without difficulty. Specially thickened ink, called 'copying ink,' must be used in writing the letter in the first instance.

Copying, in photography, is the name given to that branch of the art which deals with the reproduction of pictures, engravings, maps, manuscripts, &c. In employing the camera for C. it is necessary, in order to avoid having a distorted image, to place the instrument in a perfectly horizontal position with the front parallel to the picture. A good diffused light should surround the picture, which should be unglazed and reversed. To secure an image with well-defined edges, a lens provided with a small diaphragm should be used. Engravings with half-tints are not adapted for successful reproduction. To produce a negative with perfect transparency in the shadows, an old collodion, mixed, if necessary, with a little dilute tincture of iodine, that adheres well to the glass, should be selected, and the nitrate bath should be of full strength. A good negative is distinguished by clear delineation of the lights and shades, with great density in the opaque parts. In printing the positives a highly-salted paper will yield good results, free from the gloss which accompanies the use of albumen, and increased intensity and brilliancy will follow the employment of an extra strong 'silver' bath. For rich purple toning, a bath of 30 grains acetate of soda, 5 grains carbonate of soda, and 10 oz. water should be prepared twelve hours beforehand, and just before using add 3 grains chloride of gold in 2 oz. water. The bath works quickly when hot, and slowly when cold.

Copyright, Law of. The intangibility of literary property makes the framing and administration of the laws for its protection peculiarly difficult. Admitting that no one is entitled to sell the book or copy the picture of another without his consent, there still remains the difficulty of determining whether or not one book is essentially the same as another, or whether or not one picture is essentially copied from another. Then questions arise as to the reasonable duration of C. of an author or his heirs, and respecting the rights of others to translate or abridge works.

The L. of C. over the United Kingdom rests partly on common law and partly on statute (the first Act being 8 Anne c. 19, by which the author was protected for 14 years). Under the former it has been decided in England that a *bona fide* abridgment of a book is a new work, and however it may injure the sale of the original, that it does not violate C.; and in the case of Kearsley *v.* Carey, Lord Ellenborough held that a variance in form and manner was a variance in substance. But in all abridgments, histories, chronologies, dictionaries, and the like, it must be left to a jury to determine whether a publication complained of is a *servile* copy and *imitation*, meant to surpersede another, or an original work on the same subject. No one but the author or his assignee has the right to print or publish *original* notes or additions to an old work, though there be no C. in the main work (Carey *v.* Longman, 1 E. R. 358). All translations are C.

An alien author may obtain a British C. by *first* publishing his work in England. This was so decided by Lord Chief Justice Campbell (Boosey *v.* Jeffrey), who thereby reversed the previous L. of C. as declared by the superior courts in the case of Boosey *v.* Purday. It has been decided by the House of Lords (Jeffrey *v.* Boosey) that a foreigner has C. in a work composed and published in England, though he has only been resident in England for a day. C. has been considered by the common law as a right vested in an author or artist. But the duration, modification, and mode of assignment of the right became regulated by the statute 5 and 6 Vict. c. 45. After the passing of the Act, 1st July, 1842, it was provided that in every book published in the lifetime of the author, he and his assignee shall have C. for the term of the author's life, and for seven years after his death; or, if these seven years expire before the end of forty-two years from the date of publication, then for forty-two years. Thus, for any book published since the Act took effect, the C. subsists either for forty-two years certain, or during the author's life, and seven years after his death.

Regarding books published before the Act came into force, and of which the C. then existed, provisions are made by which the benefits of the Act may be secured by the author or his personal representative, or by the proprietor of the C. The C. of a book published after the death of the author is to last for forty-two years from the time of publication, and to belong to the proprietor of the manuscript from which it is first published and his assignee. To prevent the suppression of any book of importance, the Judicial Committee of the Privy Council may, on complaint, license a work to be republished, on such conditions as it may think proper.

The C. in articles in encyclopædias, reviews, magazines, and in periodicals and serial works, is vested in the proprietors who shall have *employed* and *paid* persons to write them; but the right to republish articles published first in periodical works reverts to the author after twenty-eight years, to continue for the remainder of the term given by the Act. During the twenty-eight years the publisher of the periodical has not the right to publish the article separately, without the consent of the author or of his assignee.

A perfect copy of the whole of every book, and of every subsequent edition, with additions or alterations, is to be delivered within one calendar month after publication to the British Museum, and within a month of demand (if made in writing within twelve months of publication) to the officer of the Stationers' Company for the following libraries: the Bodleian, the public Library of Cambridge, the Advocates' Library of Edinburgh, and that of Trinity College, Dublin, or the publishers may send the copies direct to these libraries. Non-compliance with this provision renders the party liable to a penalty of £5. The copy sent to the British Museum must be of the best set issued; those for the other libraries may be of any set. The Commissioners in 1878 recommended the abolition of the gift of books to the libraries save the British Museum.

A book of registry is to be kept at Stationers' Hall; the book to be open to the inspection of all, on payment of one shilling for every entry which shall be searched for or inspected, and a certificate of the same to be given by the clerk, when required, on payment of five shillings; this certificate to be received in all courts as *prima facie* proof of the proprietorship or C. of the work. No one except the proprietor of the C. is allowed to import into the British dominions any copy of the work reprinted abroad, under the penalty of £10, and double the value of every copy imported. C. is declared to be personal property and capable of bequest, and is assignable by a written instrument not under seal. The Act extends to every part of the British dominions.

International Copyright.—The International Copyright Act, 1886, the Berne Convention of 5th September, 1887, and the Order in Council of 28th November, 1887, provide for the protection of foreign authors of the Union in the British dominions, and of British authors in foreign countries which formed the Union, consisting of France, Germany, Belgium, Italy, Spain, Switzerland, Luxembourg, Tunis, Hayti, and Monaco. An Act (51st Congress, Sess. II. c. 345, 1891) came into operation on 1st July, 1891, in the United States of America, which enables foreigners to acquire copyright on certain conditions as to printing. Degeneration of publishing business in America and loss to American authors, both arising from the flooding of the Continent with the best literature of the United Kingdom obtained for nothing, induced the Americans to grant the power of copyright, which had been for so many years sought for by the British author and publisher. The Act is only reciprocal, and this point is left to the President to determine. He has proclaimed that the United Kingdom, France, Belgium, Switzerland, and Germany, fall within the purview of the Act.

Copyright in Lectures, Letters, and the Drama.—The author or assignee of any lecture has the sole right of delivery, printing, or publishing it. Printers or publishers of newspapers publishing lectures without leave are subject to penalties; but the Act does not protect lectures delivered in any university, public school, college, or on any foundation, or by any individual, in virtue of, or according to, any gift, endowment, or foundation. The copyright of a private letter is in the composer and not in the receiver, though possibly the property of the paper, as paper, passes to the latter. The author of any play or opera has the sole right over the acting of it within the British dominions.

Engravings, Prints, Lithographs, Paintings, Drawings, and Photographs are all C. It is an infringement of C. to copy an engraving by photograph (Gambart *v.* Ball in Court of Common Pleas, 1863), and a photograph taken of the original matter may be protected by copyright, yet, if it be, another photograph taken of the original matter does not infringe the copyright, so far as the owner of the former photograph is concerned (Graves's case, L. R. 4 Q. B. 723). The property of designs, prints, and engravings is for twenty-eight years from the date of publication.

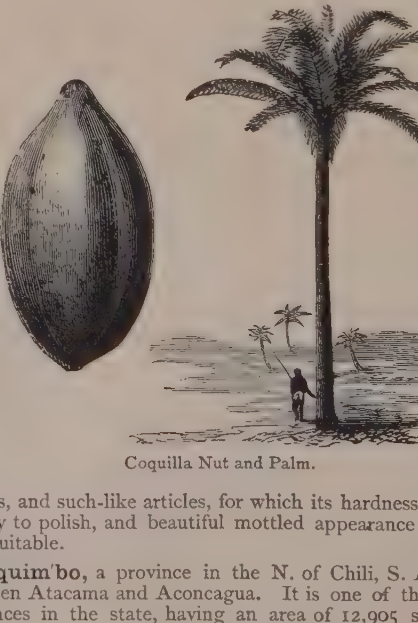
Designs in the Manufacturing Arts are protected by the Patents, Designs, and Trade Marks Act, 1883, by which C. is given to any original design for the ornamenting of any article of manufacture. The term of protection, which formerly varied, is now fixed at five years, though the registration is of no effect unless the design be used in this country within six months of its registration.

Prerogative Copyright.—The C. of certain works is said to be exclusively vested in the crown. The most important of these are the Bible, the Book of Common Prayer, the statutes, the almanacs and the Latin grammar. This right of the crown is also said to be founded on grounds of public policy. The committee of the House of Commons has recommended that the exclusive privilege of publishing the Bible held under letters patent by the Universities of Oxford and Cambridge and the Queen's printer should not be renewed when it expired, so far as the last named was concerned, a short time since. The House, however, *did* nothing, and the crown renewed the patent.

The principle on which the court interferes, by issuing an injunction to restrain the sale of copies of literary or other property under copyright, and by making an order to take an account of all such copies made and sold, being the protection of property, there must be a clear title in the party complaining, and the work must be of such a nature that damages might be recovered in a court of common law for pirating it; that is, the work must not be *immoral*, *blasphemous*, *libellous*, nor *seditious*; that is, it must not be so in its general tenor.

Coq'uerel, the name of two French Protestant pastors, who are likely to have considerable influence upon the destiny and doctrine of their Church. The elder, **Athanase Laurent Charles,** born at Paris, 27th August, 1795, became, after a course of education at Montauban, first, minister of the Reformed Church at Amsterdam, and subsequently (1830) at Paris. He was a singularly eloquent pulpit orator, but the expression of Rationalistic or Unitarian opinions led to the division in the Reformed Church which has not yet been healed, although what is known as the 'Orthodox party' is in the meantime in the ascendant. C., who had been a member of the Corps Législatif, but had not succeeded as a politician, died 10th January, 1868. A collection of his sermons was published in 8 vols. (1819-59). His son, **Athanase Josué,** known till his father's death as *C. fils*, was born at Amsterdam in 1820, and both as a theologian and as editor of various periodicals, particularly the *Nouvelle Revue de Théologie*, expressed opinions similar to those of his father. For his views on Renan's *Vie de Jésus*, he was suspended by the Paris Consistory in 1864. He was, however, enabled to resume preaching, and became the recognised head of the 'Liberal' section of the Reformed Church. He was equally well known as a lecturer, and as an active writer of sermons, theological treatises, and ecclesiastical pamphlets. C. died at Paris, 26th July, 1875.

Coquill'a Nuts, the seeds of *Attalea funifera*, a palm, the wood of which is now exported from S. America for the sake of being cut and polished into buttons, knobs of umbrellas, and such-like articles, for which its hardness, susceptibility to polish, and beautiful mottled appearance make it very suitable.



Coquilla Nut and Palm.

Coquim'bo, a province in the N. of Chili, S. America, between Atacama and Aconcagua. It is one of the largest provinces in the state, having an area of 12,905 sq. miles, and a pop. of 198,432. C. is richly metalliferous, especially in copper, but the soil is barren, and water is scarce, and little grain is produced, though fruit abounds—in particular, grapes and figs. The only rivers of note are the *Rio C.*, which forms at its mouth one of the best harbours in Chili, and the Choapa which divides C. from Aconcagua. The capital is Serena (q.v.). C. is also the name of a small town at the mouth of the Rio C., on a fine bay with secure anchorage and a good depth of water. It is the port of Serena, with which it is connected by railway, and has a pop. of 2116. In the neighbourhood are large copper-smelting works, and about 17,000 tons are exported annually, most of which goes to England. The chief imports are coal, coke, bricks and grain. The value of the imports is estimated at £508,475, that of the exports at £665,245.

Coqui'to, the Chilian name for a palm found in Chili, and the sole representative of its genus. It is one of the most southern American palms, existing in great abundance between latitudes 33° and 35°. The sweet syrup known in Chili as *Miel de Palma* (palm-honey), is made by boiling the sap of this palm to the consistence of treacle. One tree, if carefully drained by cutting off the crown of leaves, will yield, in the course of several months, before it is exhausted, ninety gallons. The nuts are used in the preparation of sweetmeats, and by boys as marbles, while the leaves, trunks, &c., are used for many of the purposes to which all palms are applied.

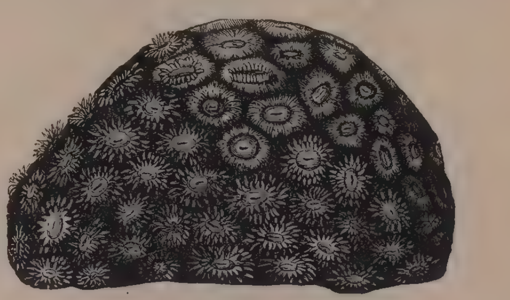
Co'ra, Co're, or **Co'ri,** a town of Central Italy, province of Roma, 30 miles S.E. of Rome, in a region producing wine and oil. It was an ancient possession of the Volscians, and one of the most important cities of Latium. On the hill on which it is built are still the interesting ruins of two temples, the one dedicated to Hercules, and the other to Castor and Pollux. Pop. 6379.

Cor'acle, or **Currach** (Wel. *cwrwgl*, Gael. *curach*, Swed. *karf*, 'a yawl,' claiming affinity to Lat. *carabus*), a small oval row-boat, easily carried by one man, formed of a wicker-work or slender wooden frame covered with leather, hide, or other flexible waterproof material, used in S. Wales and elsewhere. The origin of the C. is unknown, but it is certain that this form of boat has come down to us from primeval times. Herodotus saw skin-clad boats on the Euphrates, and in Chesney's *Expedition to the Euphrates* mention is made that to this day the basket-work is sometimes, though rarely, covered with leather. The ancient Scandinavians are known to have made voyages of discovery in similar boats, and evidence of their use in Scotland is found in Bellenden's *Hystory and Chroniklis of Scotland*, which speaks of a fishing-boat called a 'currok' as 'ane bait of a bull hyd bound with na thing bot wandis.' Less than a century ago the C. was to be seen on the Spey. On the W. coast of Ireland, fishing is carried on in curraghs of a much larger size than usual. They consist of a light skeleton wooden frame, covered over with tarred canvas, measuring 20 feet long by 4 feet broad, and are capable of carrying four men, each of whom plies two short oars.

Cor'acoid Bones, so called from their supposed resemblance to a crow's beak (Gr. *korax*, 'a crow'), in reptiles and birds form the chief support of the shoulder-girdle and arm or fore-limb. In the monotremata or lowest mammals they also exist as distinct structures, but in all other mammalia as mere processes of the *Scapulæ* (q.v.) or shoulder-blades, under the name of *C. processes*. In most vertebrates below mammals, and in monotremata, the C. B. extend to and articulate with the *sternum* or breastbone directly. In birds they are the great support of the wing, and form, with the scapulæ, the cavity (*glenoid cavity*), or the head of the *humerus* or bone of the upper arm.

Cor'aïs, Adaman'tios, or **Diamant Coray,** as he wrote his name in French, the first Hellenist of his day, was born at Smyrna, 27th April, 1748. Having studied medicine, he settled in Paris in 1788. The French Revolution fired him with the idea of emancipating Greece from the Turkish yoke, and he set himself to inspire his countrymen with an emulation of the glory of their ancestors. He published annotated editions of many ancient Greek writers, and translated into modern Greek Beccaria's *Dei Delitti e delle Pene* (1802). C. died at Paris, 6th April, 1833. Two volumes of his correspondence were published at Athens in 1839.

Cor'al and **Coral Islands.** C., or *corallum*, is the name given to the hard structures developed in the tissues of *Actinozoa*, the highest class of Cœlenterate animals, and of which the Sea-Anemone (q.v.) or *Actinia* may be taken as the type. C. may be of two kinds, *sclerobasic* and *sclerodermic*. The latter is the more typical kind, and exists as an external covering, containing the polypes or animals that secrete it. This variety of C. structure is truly secreted within the tissues of the polypes, being formed by the *enderon* or inner layer of the ectoderm (the outer tissue of the body). Each polype thus manufactures a little cup of C., the wall of which is known as the *theca*, whilst internally the cavity bounded by the *theca* is divided into chambers or *loculi* by vertical partitions or *septa*. Sometimes horizontal partitions or *tabulæ* are developed, and others known as *dissepiments* may also exist. A sclerodermic C. may readily be known on looking at it, by noticing the separate little cups of C. structure, which the individuals of the C. colony fabricate. Of the sclerodermic corals, which are the chief *reef-building* forms, the madrepore, star-C., brain-C., organ-pipe C., &c., are familiar examples. The *sclerobasic* or second variety of C. structure exists *within* the organisms, and appears as a more or less *solid* central rod or axis, coated by the living polypes as by a bark. Of this kind the red C., mare's-tail C., sea-shrubs, &c., are good examples. The sclerobasic C. is secreted by the *outer* surface of the polypes and not *within* their bodies. It is thus named by Dana *foot-secretion*. The *outer* surface of the polypes that form the *sclerobasic* C. is in fact inverted and turned *inwards*, and hence the C. formed by the inverted outer surface comes to exist in the *centre* or *interior* of the living tissues. This C. forms branching, tree-like organisms, and from its nature bears little or no share in reef-building. No cups or separate C. structures for each of the polypes can be seen on inspecting a sclerobasic C. C. is not always, however, represented by such definite structures as denoted by the preceding remarks. Sometimes, as in *Alcyonaria*—of which *Alcyonium* is a good example—a sclerodermic corallum exists in the form of detached, tusiform, calcareous spicula or needle-like bodies, and the same may be said of the C. secretion of forms allied to our Sea-Anemones (q.v.). C. may also be of horny consistence, as in sea-shrubs, or partly horny and partly limy, as in mare's-tail C.



Coral Animals.

Corals require for their life two great conditions—a temperature of sea not less than 66° Fahr., and a depth not greater than from 15 to 30 fathoms. A belt of about 1800 miles on each side of the equator marks the zone of distribution of corals. The red C. is found in the Mediterranean Sea, in depths of from 25 to 50 feet and lower. It appears as a branching sclerobasic organism, each of the little polypes which comprise it having eight fringed tentacles. It is fished for by means of nets, and fetches high prices for its finer qualities. Its susceptibility of a high polish, its hardness, and red colour, are the chief characters which give red C. its high value.

No C. reefs exist on the W. African or American (N. of 30° N. lat.) coast, but on the Australian and E. African coasts, Red Sea, Persian Gulf, Indian Ocean, all Polynesia, W. Indies, and Florida, they occur in immense numbers. The theory of C. reefs put forward in 1845 by Darwin is that now universally accepted as explanatory of the erection of C. islands. A *fringing reef* is the first stage of erection, this reef fringing the shores of the land at a depth (15 to 30 fathoms) suitable for the polypes. If the land begins to sink or subside, the lower corals are carried out of their depth and die, whilst those at the top build upwards at a rate corresponding to the subsidence. Thus a *barrier reef* is formed, which encloses a sheet or belt of water between it and the original land. If the barrier reef sinks in its turn, an *atoll* or *lagoon reef* (the perfect form of C. island) is produced—this latter appearing as a circular ring of C., enclosing a lake or lagoon which communicates with the outer sea by a break in the C. ring. Darwin's theory is thus wholly dependent on the phenomena of the subsidence of land; and his views have gradually and surely supplanted the old ideas that the C. polypes began at the bottom of the ocean and built upwards, since it has been shown that they can live in *limited* depths of sea only. A depth of 200 feet is about the maximum depth at which reef-building corals can live. Some C. reefs are of large size. The great barrier reef on the N.E. coast of Australia runs uninterruptedly for a length of more than 1000 miles, and other reefs and atolls are proportionately large. Different corals inhabit different parts of a reef. The foundation appears to be formed by star-C., which lives at about 6 fathoms depth. To this succeed brain-C. and pipe-C.; the upper parts and summit of the reef being formed by *Madrepore*, *Millepore*, and sea-shrub. The reader may with advantage consult Darwin's work on *C. Reefs*, and also James D. Dana's *Corals and Coral Islands*.

Branching Coral.

Cor'allin, a red colouring matter, first obtained in 1861 by the German chemists Kolbe and Schmitt, by heating phenol with sulphuric and oxalic acids, and now extensively prepared as a commercial product, under the names of *Aurin* or yellow C., and *Peonin* or red C. The constitution of these dyes is complex and slightly different. Aurin yields peonin on being heated with alcoholic ammonia. Yellow C. forms a stable lime-lake with excess of lime, and is employed largely by paperstainers. Red C. is much used for printing fabrics and dyeing wool, but the colour fades into yellow in contact with acids, unless an alkaline body be mixed with the dye. By the use of calcined magnesia in an alcoholic or aqueous solution of red C., a rich and durable Turkey red is obtained.

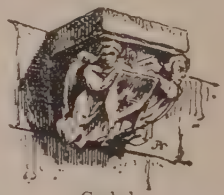
Cor'alline and **Coralline Crag.** The name *C.*, often erroneously supposed to denote *Coral* (q.v.), is now restricted, and applied in zoology to indicate various kinds of *Polyzoa*, or lower molluscan animals. Of these forms, the bull's-horn C., the snake-head C., the coat-of-mail C., the shepherd's-purse C., and the bird's-head C., are familiar examples. The C. C. is a deposit belonging to the Pliocene period, averaging from 20 to 50 feet in thickness, and deriving its name from the abundance of its fossil 'corallines' or Polyzoa (q.v.). This deposit is well developed in Suffolk, and of its polyzoa the genera *Cellepora*, *Theonoa*, and *Fascicularia* are familiar examples. Many marine molluscs (about 350 species) and echinoderms also occur in the C. C.

Coral Rag, a formation belonging to the middle Oolite or Juras series (*Mesozoic*) of rocks, and consisting of from 150 to 250 feet of limestone, lying above the Oxford clay. It derives its name from the number of fossil corals found in it, these fossils belonging to such genera as *Isastræa*, *Thamnastræa*, *Stylina*, and *Thecosmilia*. In Oxfordshire and Wiltshire this deposit may be typically seen. Abundant mollusca, echinoderms, and a few fish remains occur in the C. R.

Coral Sea is that portion of the S. Pacific included between Australia, New Guinea, the New Hebrides, and the 29th parallel of S. latitude. It derives its name from the coral reefs with which it abounds, and which, in the opinion of Dana (*Corals and Coral Islands*), indicate a subsidence of the land of more than 2000 feet.

Cor Anglais, a species of bass oboe, not now used in the orchestra.

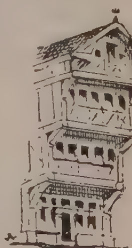
Cora'to, a town in the S. of Italy, province of Bari, 25 miles W. of Bari. It has some fine churches and convents, and a trade in wine, oil, and southern fruits. Pop. 33,258.



Corbel.

Cor'bel (Fr. *corbeille*, 'a basket'), in Gothic architecture, a projecting bracket, sometimes in the form of a basket, but often variously sculptured, which supports a superincumbent weight or receives the spring of an arch. A row of corbels supporting a battlement, parapet, or cornice is called a *C.-table*.

Corbelling, any construction which projects beyond the wall of a house and is supported by corbels or beams that rest upon the wall. The frontage of many Gothic houses affords examples of C. where each story projects beyond the one immediately below it; in this way the top stories almost reach across the street when it happens to be narrow.



Corbelling.

Cor'bie, Corby, or **Corbeau** (Lat. *corvus*, 'a raven'), in heraldry, bears its etymological meaning.

Corbie-Steps, or **Crow-Steps** (Fr. *corbeau*, Lat. *corvus*), in architecture, steps up the sides of a gable. This picturesque finish to the end wall, as it narrows along with the slope of the roof, is frequently to be met with in old houses, especially in Flanders, Holland, Germany, and Scotland. The popular notion is that the steps are meant for the crows. The top step is called the crow-stone.

Cor'chorus, a genus of plants of the lime-tree order (*Tiliaceæ*), containing between forty and fifty species, inhabitants of both hemispheres, but generally not found far from the tropics. *C. capsularis*, an annual Asiatic plant, and *C. olitorius*, a closely allied species, both much cultivated in India, yield the fibre so well known as Jute (q.v.), and the fibre used in making Gunny Bags (q.v.). *C. olitorius*—the *Corette potagère* of the French gardens, now naturalised in all parts of the tropics, and as far N. as the Mediterranean—is sometimes called the *Jew's mallow*, from being much cultivated for the sake of its tender shoots as a potherb by the Jews of Syria and the East generally. *C. capsularis* (sometimes also called *Chinese hemp*, owing to its being extensively cultivated in China) is used also for the same purpose. The leaves of *C. siliquosus* of the W. Indies and tropical America are used by the negroes in the former islands and by the inhabitants of the Isthmus of Panama for making an infused beverage called *te*, and, as the name would indicate, used as a substitute for tea.

Cor'dage, a nautical term applied to the running rigging of a ship, as distinguished from the standing rigging, and also to the store of ropes kept in reserve.

Cor'day d'Armans, Marie Anne Charlotte, born at St. Saturnin in 1768, the second daughter of a poor nobleman, passed much of her youth in a monastery at Caen. She studied Rousseau and Plutarch incessantly. Caen became a retreat for the Girondists when they were expelled from the Convention. Excited by their tales of blood, and by the murder of Colonel de Belzunce, C. took the resolution of striking a blow for the peace of her country, and, with an introduction from Barbaroux, went to Paris alone. After several days' watching, she was admitted to an audience with Marat, whom she killed by a stroke of her knife as he sat in his bath. She confessed, and justified her crime on grounds of patriotism, and died on the scaffold, with great courage and serenity, on 17th July, 1793.

Corde'liers ('wearers of the knotted cord') was the French name for the strictest branch of the Franciscans. The name received a new significance during the Revolution in 1790, when it was given to the club of Danton, Camille Desmoulins, Marat, and Hébert, which met in a Franciscan monastery.

Cord-Grass, a genus of grasses; of which one species, a native of the muddy salt marshes of the E. and S.E. coasts of England, is used for making ropes. Elsewhere it is rare.

Cor'dia, a genus of plants comprising nearly all of the *Cordiaceæ* (q.v.), and containing upwards of 180 species, mostly trees or shrubs. The fruits of *C. latifolia* and *C. Myxa* of India are succulent, mucilaginous, and emollient, and are accordingly eaten. Under the name of *Sebestens* or *Sebesten-plum* they have been employed in chest complaints as pectoral medicines, a use to which those of *C. Abyssinica* (Wanzey) are also applied in Abyssinia. Those of *C.* (*Varronia*) *rotundifolia* are used to fatten cattle. The bark of *C. Myxa* is used in India as a tonic, and for making astringent gargles. Its wood is said to have been that employed by the Egyptians to make their mummy-cases. That of *C. Rumphii* is brown veined with black, and smells of musk. From *C. Gerascanthus* is obtained the dark brown-veined and fine-grained timber known in commerce as Spanish elm, Prince wood, or *Bois de Chypre* of the W. Indies. Anacuhuite wood, imported a few years ago as a tonic, &c., is obtained from *C. Boissieri.*

Cordia'ceæ, a tribe or sub-order of *Boraginaceæ*, though sometimes described as a separate order of plants. There are about 200 species known, natives chiefly of the tropics of the Old and New Worlds, and distributed over about twelve genera, but most of these have been delegated to the genus *Cordia* (q.v.).

Cor'diceps, a genus of Fungi (q.v.) which grows on dead leaves, decaying branches, ergoted seeds, and upon the pupæ and larvæ of insects. *C. Robertsii* grows upon the caterpillars of a species of New Zealand *Hepialus*. One species attacks wasps in the W. Indies, and attains a considerable size before the insect dies. The Chinese sell *C. Sinensis* in little bundles, under the belief that it is a drug possessing medicinal properties. See ERGOT.

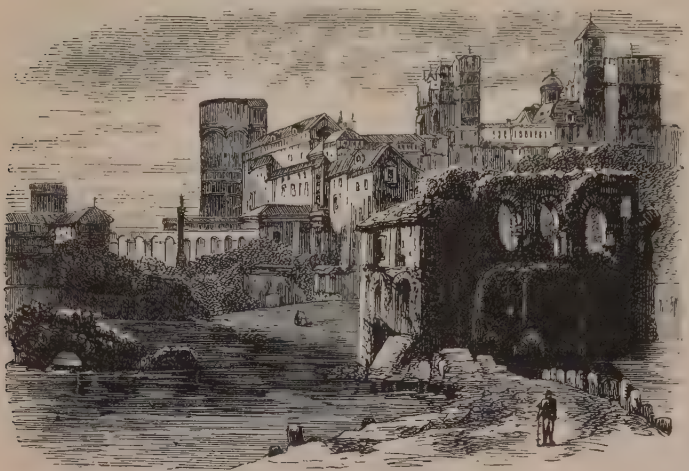
Cordille'ras, a word applied by the Spaniards of America to mountain chains, and formed from a root meaning a string or rope. The C. of S. America form part of the Andes (q.v.), and those of Central America extend from the Isthmus of Panama northward through Mexico to the borders of the United States.

Cordite, an explosive substance composed principally of gun-cotton and nitro-glycerine. It is, in fact, the explosive called 'Abel-Dewar,' granulated in a special way. C. is manufactured in the following manner:—Take equal weights of nitro-glycerine and dry gun-cotton; either add to the nitro-glycerine $\frac{1}{6}$th of its weight of acetic ether or acetone; mix, then add the gun-cotton, and, if there be room in the mixing vessel, some pulverulent substance; mix up well until the whole mass attains the consistency of a thick jelly; or reduce the gun-cotton to a jelly first and then add the nitro-glycerine and mix up as before stated. After this, the mass is thrust into a compressing machine, forced through a mould, and cut into the desired lengths. These pieces are converted into pliant threads by means of a machine consisting of a strong cylinder, fixed to a frame, in which a piston works and pushes the C. through a small orifice, of the size required, made for the purpose at the bottom of the cylinder. The threads so obtained are wound upon a bobbin and dried by placing the bobbin in a cylinder, surrounded by circulating warm water or vapour, where a continual current of air is kept up around it. When perfectly dry the C. is ready for the cartridge. In appearance and consistency C. resembles hoof-horn. Its density is 1·60, and it becomes inflammable before its temperature reaches 180°. C. may be smashed up by a hammer; but, after many blows, the part hit becomes alight. Neither a moist atmosphere, nor even water for a time, affects C. injuriously, and C. remains uninfluenced by a temperature ranging from 0° to 93° Centigrade.

Captain Sir A. Noble thus gives some of his experiences in reference to C.:—'With both C. and gun-cotton I have developed enormous pressure, close upon 100 tons per sq. inch (about 15,000 atmospheres), but the former explosive I have not succeeded in detonating, while gun-cotton can be detonated with the utmost ease. The erosive effect of C., if considered in the relation to the energy generated by the two explosives, is very slightly greater than that of brown prismatic; but very much higher effects can, if it be so desired, be obtained with C., and if the highest energy be demanded, the erosion will be proportionately greater. Erosion produced by ordinary gunpowder has the most singular effect on the metal of the gun, eating out large holes, and forming long rough grooves resembling a ploughed field in miniature; and these grooves have, moreover, the unpleasant habit of being very apt to develop into cracks; but with C. the erosion is of a very different character. The eddy holes and long grooves are absent, and the erosion appears to consist of a simple washing away of the surface of the steel barrel.'—See *Nature*, 26th July, 1894.

Cor'doba, or **Cor'dova,** the capital of the province of C. (pop. 420,728; area 5190 sq. miles), Spain, on the right bank of the Guadalquivir, which is here crossed by a Moorish bridge of fifteen arches, 65 miles N.E. of Seville. Its wall, also Moorish, is pierced by thirteen gates, of which that named *Puente* consists of a fine arch supported by four Doric pillars. There are numerous large squares, and many of the houses possess marble porches, and have sparkling fountains in their courts. The streets, however, are narrow and filthy. The cathedral, originally a mosque, and occupying the site of a Roman temple of Janus, is the finest in Spain, and is famous for its 'forest' of marble, jasper, and porphyry pillars, of which there are still 850. The bishop's palace, now degraded into stables, the churches of San Hipolito, of Santa Marina, of San Salvador, with some monastic buildings, are the other most remarkable structures. The manufactures, once important, have much fallen off. They consist of paper, silk-stuffs, hats, silver-work, and the leather known from C. as *Cordovan*. Since the opening of the railway, however, to Seville and Cadiz, the commerce of the city has begun to increase. Pop. 55,614. C. was founded by the Consul Marcellus (B.C. 152). Under the Romans it was the greatest and most flourishing city in Spain, and the seat of the supreme tribunal for Bætica. In the 6th c. it became the see of a Visigothic bishop, and from 716 was the capital of the

Moslem power in the Peninsula. It reached the height of its prosperity in the time of the Caliphs Abd-ur-Rahman III. and IV., when it is said (doubtless with exaggeration) to have been upwards of 20 miles in circumference, to have had 200,000 houses, and 1,000,000 inhabitants. At that time it possessed a famous Moslem university, 80 public schools, a library of 600,000 vols., 600 mosques, 900 public baths, and many splendid palaces. Its greatness gradually declined after its conquest by Ferdinand III. of Castile in 1236. The Senecas, father and son, Lucan the poet, and Averroes were all natives of C.



Prison of the Inquisition, Cordoba.

Cor'doba, or **Cor'dova**, the capital of the province of C., Argentine Republic, lies in a beautiful valley on the Primero, an affluent of the Paraña. It has a cathedral, a trade in hides and wool, and was long the residence of a bishop. Pop. 67,200. The *province* of C., in the heart of the republic, has an area of 54,000 sq. miles; pop. 377,200. It abounds in excellent pasturage, and cattle and sheep are reared in great numbers.

Cor'don (Fr. *cordon*, 'a line, a girdle'), in military language is a line of troops drawn round a town or district, sufficient to prevent ingress or egress, if requisite. If the sentries so placed are intended as a precaution against some contagious disease, they are called a *C. sanitaire*. In fortification, the term means the coping of the escarp or inner wall of a ditch, which is usually rounded in front, and projects about a foot over the masonry.

Cor'dovan, or **Cordoban**, Spanish leather, or cordwain, made of goatskins tanned and dressed, and used in the finer kinds of boot and shoe making, as well as in bookbinding. It was originally manufactured by the Moors at Cordoba, hence the name. The same fact explains why shoemakers are called *cordwainers*.

Core'a (called by the natives *Ch'ao Hsien*, by the Chinese *Kaoli*, whence the Japanese *Korai*, the origin of our form, *Corea*), a kingdom of Eastern Asia, under the suzerainty of China, bounded N. by Manchuria, E. by the Sea of Japan, S. by the Strait of Corea, and W. by the Yellow Sea, and a neutral uninhabited mountainous district, separating it on the N.W. from the Chinese districts of Shing-king and Liaotong. It is peninsular in form, and has numerous groups of islands belonging to it in the Yellow Sea and the Strait of Corea, of which the largest is Quelpaert. Area estimated at 81,901 sq. miles; and population at 8,758,937. C. is divided into eight provinces; its capital is Seoul (pop. 248,000). A mountain chain traverses the peninsula through its entire length, covered in part with dense forests, and fairly fertile, especially on its western slope, which is well watered. The rivers, from the conformation of the land, are small, the chief of them being the P'ing Jang and the Han. The climate is excessively hot in summer and cold in winter, and the rainfall is excessive. Agriculture is not in an advanced condition; but the S. produces in abundance wheat, cotton, rice, millet, and hemp, and barley is grown in the N. The rice, which forms the principal food of the inhabitants, is inferior to that of Japan. Paper and ginseng are exchanged with the Chinese. The former manufacture is important, paper entering into the construction of hats, umbrellas, clothing, &c. Corean sabres and poniards are much prized in Eastern Asia, the natives being skilled workers in metals.

In 1892 (the last returns) the export trade was estimated at $3,296,490, of which $852,721 represented gold in the rough; and the imports were understood to be $4,598,485, although that is probably half, as commerce proceeds all along the coast, of which no return is made.

The monarchy is an hereditary despotism, similar to that of China. Li-Hi, who succeeded in 1864, is now King of C. There are two chief offices of state, the Home and the Foreign, by which the affairs of the kingdom are carried on, subject to the control of the Crown.

The Coreans are of the Turanian stock, and speak a polysyllabic language of great purity, but becoming gradually corrupted by an infusion of Chinese words. The Chinese character is generally used in writing. The religion resembles that of China, but there are numerous Buddhists. C. studiously prohibited intercourse with other nations, with the exception of the Chinese and Japanese, till 1882, when treaties of intercourse were signed between C., Germany, America, and Great Britain. The intercourse with the Chinese had been limited to the annual embassy, and to periodical fairs at the 'Gate-town,' near Fêng-hwang, in Manchuria, while the Japanese were allowed to trade only at the single port of Futschan. In 1592 Christianity was introduced into C. through Christian converts from Japan. These, both princes and people, were enrolled in the army which Fidejosi, Tycoon of Japan, sent to chastise China. He thus got rid of his Christian subjects without incurring the odium of doing so by persecution, but his expedition was a failure. C. was taken and lay at the feet of the Japanese conquerors, but these could effect nothing against China, and a treaty of peace was signed in 1615 by which China gave up to Japan a small island which the latter occupied for 260 years. Ever since then C. has suffered from repeated Japanese invasions, but this was the last serious one until the recent inroad in 1894, the result of the assassination of a *protégé* of the Japanese with the connivance of the King of C. C. fell an easy prey to the invaders, and the country was held by them until the treaty was signed between the two empires of China and Japan, which guaranteed the autonomy of C. Jesuit missionaries established themselves in 1784; some French missionaries obtained a footing in 1835, and continued to proselytise with much success till 1866, when nine of them were massacred. A French retaliatory invasion, and two American expeditions, did not succeed in removing the opposition of the Coreans to intercourse with outside nations. See Williamson's *Journeys in N. China* (1870), and R. S. Gundry's *China and her Neighbours* (London 1895).

Coreg'onus, a genus of Teleostean fishes, included in the Salmon family (*Salmonidæ*), and distinguished by the height and forward position of the first dorsal fin. The scales are large, the teeth very small or rudimentary. The *pollan* (*C. Pollan*), occurring in Irish loughs, such as Loughs Derg, Erne, and Neagh, is an example of this genus; so are the *powan* of Loch Lomond and Lochmaben, and the *gwyniad* of Welsh and Cumberland lakes. These fishes frequently get the names of 'fresh-water herrings' and 'herring salmon.' The white fish of N. America is the *C. albus*.

Corell'i, Arcangelo, an Italian musician, was born at

Fusignano in 1653, educated under Simonelli and Bassani, travelled much through Europe, where he himself and his compositions were everywhere popular, and settled in Rome in 1681. He died 18th January, 1713. C. has been justly called the father of instrumental music; his trios, for violins and bass, with organ accompaniment, although written just two centuries ago, are as fresh and bright as if composed yesterday, and are probably even more familiar to violin-players now than they were in the time of their composer.

Corentyn', a river of S. America, dividing Dutch from British Guiana, rises in the Tumuchamac Mountains, which form the southern boundary of the country, flows in a general northerly direction, and after a course, with at least five formidable cataracts, of 300 miles, falls into the Atlantic 120 miles E.S.E. of Georgetown. Its estuary at its mouth is 25 miles broad. The C. is navigable for boats to where it is joined by the Cabalaba, 150 miles from the sea.

Coreop'sis (Gr. 'maiden's eye'), a genus of American Herbaceous plants, belonging to the order *Compositæ*, containing several species. The flowers of *C. verticillata*, a shrubby perennial species, are used in N. America to dye cloth red.

Corfe Castle (the *Corfes-geat* of the *Chronicle*, in allusion to the 'gate' or 'gap' in the ridge that runs along the peninsula), a village in the 'isle' of Purbeck, Dorsetshire, 24 miles E.S.E. of Dorchester. There are quarries of Purbeck marble in the vicinity, where also immense quantities of potter's clay are dug for the Staffordshire potteries. From the reign of Elizabeth to the Reform Bill of 1832 it sent two members to Parliament. The village grew up round the ancient castle, which seems to have been founded in the 10th c., though it is not entered in the Survey of William I. Here Edward the Martyr was murdered in 979, and King John starved to death twenty-two of Arthur's supporters in 1202. Here also Henry of Montfort was imprisoned in 1275. Lady Bankes in 1642 held the castle for six weeks against the forces of the Parliament, and Fairfax dismantled it in 1645. Pop. reg. sub-dist. 2289; civ. par. 1708.

Cor'fu (anc. *Corcyra*), the most northerly of the Ionian islands, is about 40 miles long, with a breadth varying from 3 or 4 to about 18 miles. Area of the nomarchy of C., which embraces the islands of C., Orthonus, Erikusi, Salmastraki, Pazo, and adjacent islets, is estimated at 431 sq. miles; pop. at 118,730. It is rocky and mountainous—one peak, Pandokratora, rising more than 3000 feet above the sea. The valleys and level tracts are fertile, yielding oil, wine, fruit, honey, and some corn. More than half of the island is covered with olive groves. Salt produced from the marshes communicating with the sea, and oil, are the chief articles of export. The *town* of C. is finely situated on an elevation overlooking a safe and spacious bay on the E. side of the island. It is the seat of a Greek and of a Roman Catholic archbishop, has considerable ship-building, and a large trade. Pop. 21,670. The University of Corfu was suppressed in 1864, when the Septinsular Republic was annexed to Greece.

Coriander.

Corian'der, an annual plant of the natural order *Umbelliferæ*, is a native of Southern Europe and the Levant, and cultivated in this and other countries. The seeds or fruits are carminative and aromatic, and are accordingly used for flavouring curries and spirits, and in making comfits, &c.

Coriar'ia, a genus of shrubs, by some considered the type of a separate order (*Coriariaceæ*), consisting of eight species. It is most nearly allied to *Ochnaceæ* (q.v.), but its affinities are by no means well understood. They are natives of the S. of Europe, Chili, Peru, New Zealand, and one is found in Nepal. The fruits of the latter species, as well as those of *C. sarmentosa* of New Zealand, are eaten, but the genus generally is regarded with suspicion, the seeds of *C. sarmentosa* (the 'wine-berry' shrub) being poisonous, though the pericarp of the fruit is wholesome. An agreeable 'wine' is made from it, which tastes like that made from elderberries. The seeds, however, cause convulsions and delirium, which often end fatally. Sheep are frequently poisoned by eating the plant. The fruit of *C. myrtifolia*, a European species, is said to have proved fatal to some French soldiers who partook of it in Catalonia. The leaves have been used to adulterate senna, and have caused tetanic convulsions in those who have partaken of the adulterated drug. They owe their poisonous properties to a glucoside called *coriamyrtine*. C. is also used in dyeing black.

Coriglia'no (anc. *Coriolanum*), a town of Italy, province of Cosenza, overlooking the Gulf of Taranto, from which it is about 4 miles distant. It has a citadel, custom house, hospital, and several churches and convents, and a trade in wine, oranges, olives, and lemons. Pop. 13,878.

Corin'ga, a seaport and town of British India, province of Madras, district of Godavari, at the mouth of the river C., a branch of the Godavari, and 290 miles N.N.E. of Madras. Its harbour is one of the finest on the coast. The inhabitants are principally engaged in the building and repairing of coasting vessels. Pop. 4397, of whom 4255 are Hindus. The trade has been declining for many years, and the ship-building business, which was the chief employment of the inhabitants, has almost disappeared except for the small native craft. A bar has formed at the entrance to the port. Tidal waves have twice destroyed the place, and a hurricane in 1839 caused great loss of life and property.

Corinn'a, a Greek poetess, a native of Tanagra in Bœotia, flourished about the beginning of the 5th c. B.C., and was a contemporary of Pindar, from whom she wrested at least one victory at the public games at Thebes. Her poems, chiefly lyrical, were composed in the Æolic dialect. They were collected in five books, but only a few fragments remain, which may be found in Bergk's *Lyrici Poetæ Græci* (Leipz. 1843). Statues were erected to her in several towns of Greece. She is often spoken of under the surname of *Muia* ('the fly').

Cor'inth (originally *Ephyra*), one of the most famous cities of ancient Greece, stood at the S.W. extremity of the isthmus which connected Hellas with the Peloponnesus. Its citadel, the Acrocorinthus, an isolated rock 1886 feet high, together with the walls which connected the city with its port, enabled C. to command the three passes which led from the isthmus to the Peloponnesus. The city, lying at the base of this natural fortress, and between two important seas, soon became a great commercial centre. The earliest established fact in the history of C. is its conquest by the Dorians led by Aletes, who with his descendants exercised regal sway for twelve generations. The Bacchiad oligarchy succeeded, under whom the city began to enlarge its commerce with the West, establishing colonies in Corcyra and Syracuse; but after lasting ninety years, this oligarchy was overthrown by Cypselus, aided by the general body of the populace, B.C. 657, and a democratic 'tyranny' followed and lasted for seventy-seven years, during which C. rapidly prospered. Under Cypselus and his son Periander (B.C. 625-585) it formed a chain of trading stations on the coasts of Ætolia, Acarnania, Epirus, and Myria, and spread its authority over the whole western sea; while by its colony of Potidæa in Thrace, and its alliances with the Greek towns of Asia Minor and with the kings of Lydia and Egypt, it established its influence in the East. On the expulsion of Periander's son a moderately aristocratic system was again introduced, and C. became a member of the Peloponnesian league under the leadership of Sparta, and as such took part in the great Peloponnesian War. Becoming jealous of the growing power of Sparta, C. united (B.C. 395) with other Grecian states against it, and in the 'Corinthian War' that followed (B.C. 394-387) suffered greatly. After the battle of Chæroneia (B.C. 338), C. was held by the Macedonian kings, but as a consequence of the battle of Cynoscephalæ (B.C. 197), obtained its freedom, entered the Achæan League, of which it became the centre, and was totally destroyed by Mummius, who carried to Rome its priceless works of art (B.C. 146). A century later it was rebuilt by Julius Cæsar, but during the Empire was merely the shadow of its former self. St. Paul founded here a church, to which he addressed two epistles. In A.D. 1458 it was captured by the Turks, who held it, with the exception of a few years when it was in the possession of Venice, till 1823. In 1858 it was destroyed by an earthquake, but it is now being rebuilt. It is in the nomarchy of Argolis and C., and has now a pop. of 4150.

Ancient C. was famous as a seat of art. Here painting is said to have been invented, and statuary, especially in works of bronze, reached especial excellence. Hence statuary metal was known as Corinthian brass. As a result of its wealth, and from its being a resort of traders and mariners, it acquired an evil fame for licentiousness.

The Gulf of Corinth, or Gulf of Lepanto (anc. *Corinthiacus Sinus*), an inlet of the Ionian Sea, 75 miles long, with an average breadth of 15 miles, extending eastward through the centre of Greece, which it almost divides into two parts, and forming the N. boundary of the Morea. It is separated from the Gulf of Egina by the Isthmus of C., which is in places not more than 5 miles broad. Nero attempted to unite the Ionian and Ægean seas by cutting through the isthmus, but he found the engineering difficulties insuperable. A canal has now been constructed through the isthmus and was opened for traffic in 1893. The length is about 4 miles.

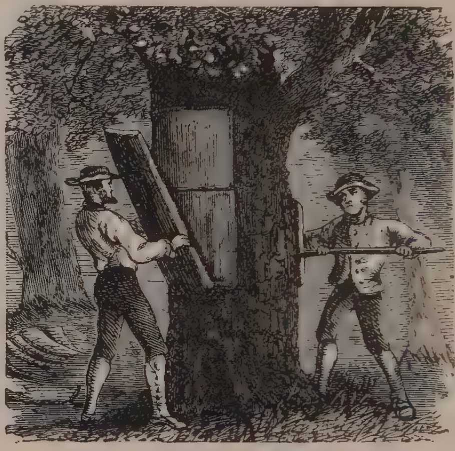
Corinth'ians, Epistles to the. Two were written by the Apostle Paul, as is commonly supposed, in A.D. 57-59, during the period in which, after leaving Corinth (Acts xviii. 18), he took up his residence at Ephesus (Acts xix. 1). The scope of the epistles is to 'rebuke party contentions and other fanatical disorders, incidentally defending Paul, as teacher of an all-embracing spiritual religion, in opposition to those who assailed his authority on carnal grounds.' It is also supposed, from 1 Cor. v. 9, that he had previously written to the Corinthians, but nothing further is known of the epistle. There is also an epistle to the C. by Clemens of Rome (q.v.).

Coriola'nus, Caius or **Cnæus Marcius,** was a legendary hero of early Rome, whose surname was conferred from the bravery with which 'he charged the Volscian home' at the capture of their chief city, Corioli. He was a proud and implacable enemy of the commons, and for having advised, during a famine, that corn should not be distributed to them unless the tribunes were discharged, he was condemned to exile. He joined the Volscii, and at the head of their army made successful war on Rome, and advanced to the Cluilian dyke. He turned a deaf ear to the entreaties of the citizens, till his mother Veturia and his wife Volumnia, accompanied by the noblest matrons of Rome, went to plead with him, when he withdrew his army. He died in exile. The date of the legend is B.C. 490.

Corium.

Corium, leathern body armour which was frequently made to resemble in appearance scale armour. Roman soldiers wore it, as may be seen from Trajan's column, and the Saxons also are represented on the Bayeux tapestry as protecting their bodies with a kind of C., which continued in use even as late as the Middle Ages. See also article SKIN.

Cork (Span. *corcho*, from the Lat. *cortex*) is the outer bark of a species of oak (*Quercus suber*), a native of Southern Europe and of Northern Africa, and specially abundant in Portugal, Spain, the South of France, and the islands of Sardinia and Corsica. The cork-tree grows from 30 to 40 feet high, measures 2 or 3 feet in diameter, and surpasses all other trees in the remarkable development of soft cellular tissue in its bark, which thereby possesses a degree of compressibility and elasticity that renders it peculiarly fitted for many common uses. The C., of which the great mass of the bark is composed, is systematically removed every six or ten years—an operation which, singularly enough, promotes a hardier and more vigorous growth of the tree, and leads to the production of C. of a finer and closer texture. The first crop, taken when the tree is from fifteen to twenty years old, is of an inferior quality, being cracked, woody, and hard, and suitable for making floats for fishermen's nets or for rustic garden-work. The usual mode of barking is to make two longitudinal cuts on opposite sides of the tree, under the main branches, and then a number of tranverse incisions, which admit of the C. being removed in semi-cylindrical pieces not less than 1¼ inch thick, with the aid of a curved implement. While incising the C., great care is taken not to injure the inner bark. The detached pieces are soaked in water and flattened by heavy weights, and to give a closer texture the C. is slightly charred on the surface over a fire. The imperviousness of C. to liquids, and its compressibility and elasticity, render it extremely suitable for stoppers to bottles and for bungs to barrels, &c.; its other uses are mainly as inside soles for boots, hat frames, life-preservers, false limbs, mattresses, and the construction of lifeboats. With caoutchouc it constitutes the kind of floorcloth called Kamptulicon, and C. chips when burned form *Spanish black*. In Spain, walls are lined with C. to overcome dampness. In the Maritime Exposition held in Paris in 1875, a novelty in the shape of 'C. leather' was exhibited. It simply consisted of thin sheet-C. covered on both sides with linen, and its suitability, as advocated by its inventor, De Berski, for tent-coverings and military accoutrements has been tested. Corks for bottles are mainly made by hand, being cut into the cylindrical or tapering shape from small square blocks by means of a broad-bladed knife, very thin and fine-edged. Cork-cutting is an important industry in many Spanish and French districts, and the corks manufactured in these countries excel those of English make. Cork-cutting is a most wasteful process, the clippings and trimmings constituting 70 per cent. by weight. A use has recently been found for this waste, as experiments at Bordeaux have demonstrated that good illuminating gas may be obtained from it on distillation in close retorts.



Cork Tree.—Cutting bark.

Cork, Korker, or **Korkalett,** a name applied in the

Highlands of Scotland and in Shetland to a Lichen (q.v.), *Lecanora tartarea*, which, according to Lindsay, is made into a domestic dye 'by macerating the powdered lichen for some weeks in putrid wine, with the addition of kelp or salt, and when the requisite crimson or purple tint is obtained, forming the paste into balls or lumps with lime or burnt shells, and hanging it in bags to dry. When used, it is powdered, and then boiled in water with a little alum' (Berkeley).

Cork, a city in the S. of Ireland, province of Munster, and capital of the county of the same name, built partly on an island on the Lee, and partly on the N. and S. banks of the river, is distant from Dublin 165 miles by the Great Southern and Western Railway. The site was originally a swamp, and known as *Corcach-mor-Mumhan*, 'the great marsh of Munster,' and C. is still called *Corcach* by the Irish-speaking population. The city has spacious streets, handsome public buildings and bridges, a public park, a fine cemetery (after the plan of Père-la-Chaise), and the Mardyke, a splendid promenade, a mile long, and shaded on each side by a double row of noble elms. Among the principal buildings are St. Anne Shandon's Church, with a tower 170 feet high, Queen's College, the Chamber of Commerce, Corn Exchange, Customhouse, County Club, &c. The harbour of C. is distinguished into the upper and lower, the former of which has quays extending nearly 5 miles, and can accommodate vessels of 600 tons. The lower harbour, formed by the estuary of the Lee, is one of the safest and most capacious in the empire. It contains several islands, on the largest of which, Great Island, is the town of Cove, now Queenstown (q.v.). The other islands are occupied by convict and ordnance depots, powder magazines, and a bomb-proof artillery barrack. A considerable shipping trade is done at the port, and steamers ply regularly thence to London, Dublin, Bristol, Liverpool, and Glasgow. The principal manufactures are leather, iron, glass, gloves, malt liquors, and whisky. C. exports grain, live stock, linen, butter, and bacon. It returns two members to Parliament. The city dates from about the year 600, when St. Barr or Finbarr founded an abbey here. It was long held by the Danes, received an English garrison and governor in 1172, but was twice recovered by the Irish before the close of the century, when it finally came under English authority. It was faithful to Elizabeth during the insurrection of Desmond, was taken by Cromwell, and again by William III.; and since then has not been the scene of any important historical incident. C. is the birthplace of many notable men—the painters Barry, Butts, and Maclise, the sculptor Hogan, the antiquary Wood, and the travellers Hastie, Murphy, O'Leary, &c. Charles Parnell represented C., but after his death, at the bye-election in November, 1891, an Anti-Parnellite was returned. Pop. 75,345.

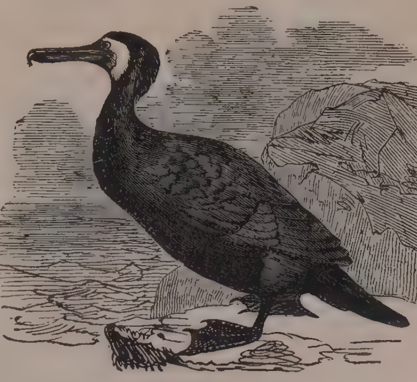
Cork, a maritime county in the province of Munster, and the largest in Ireland, having an area of 1,838,921 acres, of which 228,992 are under tillage, 169,726 under meadow and clover, 988,396 under pasture, 29,870 under plantation, 25,220 under turf bog, 68,900 under marsh, and 245,988 under barren mountain. It is bounded N. by Limerick, E. by Tipperary and Waterford, S. by St. George's Channel, and W. by Kerry; has an extreme length of 110 miles, and a breadth of 70. The W. part is rugged and mountainous; the S. and E. extremely fertile. The coast, bold and rocky, has numerous indentations, which furnish excellent harbours and roadsteads; and many islands lie along it, of which Cape Clear is reckoned the most southerly point in Ireland. The Bandon, Lee, and Blackwater, the principal rivers, flow eastward in parallel courses, separated by offshoots from the mountain range in the W; there are several lakes, but of no great size. The climate, though moist, is mild and salubrious. The soils vary much; dairy farming is carried on extensively, and the butter of C. is of superior excellence. The cattle are small, but yield milk in abundance. The principal minerals are coal, occupying an area of 400 sq. miles, in the N.W. of the county, iron, copper, manganese, limestone, and brick clay. The copper-mines are the most valuable in Ireland. The principal manufacture is linen; there are also numerous distilleries and breweries, and fishing is carried on to a considerable extent. The antiquities of the county are stone circles, cromlechs, raths, caves, and religious houses. There are also some remains of those strong fortresses and towers by which the English overawed the natives in olden times; but perhaps the place of most pleasant and abiding interest to a stranger is Blarney Castle, the ancient seat of the M'Carthys, and famous for its 'stone,' whose virtues are deliciously described in Father Prout's *Groves of Blarney*. Pop. 438,432 (including city of C.). The county of C. contains seven parl. divisions, each of which returns one member:—N. C. 49,248; N. E. C. 49,873; Mid. C. 49,462; E. C. 49,700; W. C. 48,623; S. C. 47,215; and S. E. C. 47,030. Of the above number of pop. of the whole county and city of C. 396,174 are of the Roman Catholic religion.

Corleo'ne, an old town of Sicily, province of Palermo, on a hill near the source of the Belici, 20 miles S.E. of Alcamo. Convents and churches are the principal public buildings. Pop. 16,391.

Corm is a fleshy underground stem, distinguished from a bulb by not being scaly, but only covered with thin membranes. It may be described as a bulb in which the scales are all solidified into one mass, or it may be regarded as 'a much shortened rhizome, consisting of a few undeveloped internodes.' Examples are afforded by the crocus, arum, tulip, &c.

Cor'menin, Louis Marie de la Haye, Vicomte de, a French statesman and jurist, was born at Paris, 6th January, 1788. He acquired very considerable influence during the reign of Louis Philippe by his knowledge of jurisprudence, and the strong common sense which he brought to bear upon the work of practical administration. After the Revolution of 1848, C., who was an advocate of universal suffrage, was made president of the commission which was appointed to remodel the constitution. Subsequently to the *coup d'état* he was made a member of the Council of State and also of the Institute. He wrote many pamphlets, and is the author of a work on the administrative law of France (*Droit Administratif*) which has been very popular. C. died at Paris, 6th May, 1868.

Cor'morant, a genus of Natatorial birds, belonging to the family *Totipalmatæ*, in which the hinder-toe is directed inwards, and united to the innermost of the three front toes by a web or membrane. The skin of the throat in the C. is distensible. The nail of the middle toe is serrated. The bill is compressed and rounded above, the upper mandible being strongly hooked at its tips. The nostrils are of linear shape. These birds are widely distributed throughout the world, the common C., and the green C., or Shag, being found in Britain. The common C. has black plumage, the feathers of the head and neck being whitish. It is about 33 inches long, and is a bird of powerful flight, and exceedingly voracious, feeding on fishes, which it catches with great dexterity, often throwing the prey into the air and catching it in



Common Cormorant.

its bill so as to swallow it in a convenient manner. The green C. is of a green colour, and the fishing-C., an inhabitant of China, is trained to catch fish for its masters. The brown C. is found off the coast of Sumatra. It is a very beautiful bird, and its sky-blue eyes give it a remarkable appearance when seen at close quarters. The name, which means 'sea-crow,' is partly of Latin, and partly of Celtic origin, *cor* being the Lat. *corvus*, and *mor* the Welsh and Armoric for 'sea,' allied to the Lat. *mare* and the Ger. *meer*.

Corn (Ger. *korn*, Goth. *kaurn*, allied to the Lat. *granum*), a term applicable to any grain, but usually applied to the seeds of Cereals (q.v.), used in making bread. In different countries it has, however, specific meanings, chiefly determined by the more prevalent use of the grain to which it is applied—*e.g.*, in America, by 'C.' is universally understood Indian-C. or maize, while in Scotland oats, and in England wheat, are more generally understood when the term C. is used. In the Bible it is usually applied to wheat—*e.g.*, when Joseph's brethren went down into Egypt 'to buy C.' Broom-C. is *Sorghum Dora;* Kafir-C., probably *Sorghum saccharatum;* goose-C., *Juncus squarrosus;* Guinea-C., *Sorghum vulgare*, a name applied in the West Indies to several species of *panicum*-bearing edible grain, &c.

Corna'ceæ, the Cornel or Dogwood order, a family of Dicotyledonous trees or shrubs, rarely herbs, natives of temperate Europe, Asia, and America, containing in all about forty species and new genera. The order is remarkable for its tonic, febrifuge, and astringent properties. The bark of 'dogwood bark' and other species of C., is esteemed in the United States and Canada as a substitute for Cinchona (q.v.), and contains a similar principle, called *cornine*. The astringent fruit of the Cornelian cherry is known to the Turks as *krania*, who use the juice in their sherbets, and for other purposes in which an agreeable acid flavour is valued. The fruits of *C. suecica* are eaten, and also possess tonic properties. The seeds of *C. sanguinea* yield a fixed oil burnt in lamps. Charcoal is prepared from the wood, though the 'dogwood' from which most of the charcoal of the gunpowder-makers is made is *Rhammes Frangula* (Buckthorn, q.v.). *Cornus Nuttalii* of N.W. America is a very handsome shrub. There are numerous other minor uses to which the species of C. are applied. See *Cornus*, in *Treas. of Botany*, and Blackie in *Canadian Naturalist*.

Corn Aphis, a species of aphides or plantlice, so named from its habit of feeding on the ears of corn, wheat, and barley, and of thus destroying the grain. The male of this insect is of a dull-green colour, the female of a yellowish hue.

Corna'ro, the name of a distinguished patrician family of Venice, members of which were more or less notable for four centuries.—**Marco C.,** celebrated for his eloquence, was elected Doge in 1368, and completed the conquest of Candia. His great-granddaughter, **Caterina C.,** born in 1454, married Jacques Lusignan, King of Cyprus, and after the death of her husband handed over the government of the island to her countrymen, and withdrew into private life. She died in 1510. But perhaps the most singular member of the family was **Lodovico C.,** born in 1467. He had so impaired a naturally feeble constitution by excess, that at forty death seemed inevitable. But by entirely changing his course of life, and adopting a regimen of rigid temperance and of judiciously-regulated exercise, he lived till about 100, dying in 1566 or 1569. When very old he published, in four successive parts, his *Discorsi della Vita Sobria* (Pad. 1558; Ven. 1866), which has been translated into many languages, and even into Latin. An English translation was published in 1779. Other Cornari who merit notice are **Giovanni I.,** Doge of Venice from 1625 to 1629; **Lucrezia Elena C. Piscopia** (died 1684), famous for her knowledge of classics, theology, and philosophy, and whose writings were edited by Bacchini (Parm. 1688); and **Giovanni II.,** elected Doge in 1709.

Corn Beetle, a genus of Beetles or Coleoptera (q.v.) of small size, the larvæ of which feed on wheat and other kinds of grain, and consequently do much harm in granaries.

Cornbrash, a group of rock formations belonging to the Bath or Lower Oolitic series, and averaging in Dorsetshire about 40 or 50 feet in thickness, whilst in Mid-England it is never more than 15 feet thick. It is a rubbly iron or ferruginous limestone, and lies in thin beds. It is full of fossils, the *Avicula echinata* (Lamellibranchiata) and *Nucleolites clunicularis* (Echinoderm) being the most typical forms.

Corn Bruiser, a machine for bruising oats and other grain for horses, cattle, sheep, and pigs, consisting of an iron frame, underneath which encased is a fluted barrel, the edges of whose grooves are sharp. These, when turned, press the corn against a resisting iron surface, and speedily bruise it to any form desired.

Corneille', Pierre, the first great dramatist of France, was the son of an inspector of waters and forests, and was born at Rouen, 6th June, 1606. He was educated by the Jesuits, and began business at the local bar. An incident in his own life suggested to him the plot of his first comedy, *Mélite*, which he wrote in 1625, and brought out in Paris when he came there, deserting the bar, in 1629. *Mélite*, and the plays which immediately followed it, such as *Clitandre*, *La Veuve*, &c., had a great run at both the Marais and the Hôtel de Bourgogne. They were marked by simplicity and neatness of style, impossible ingenuity of plot, and complete absence of humour, but they formed a pleasing contrast to the pedantic conceits of Scudéry and Viaud, and the rough melodrama which Hardy, Mairet, Tristan, Rotrou, and others manufactured, chiefly from Spanish materials. With some of the latter C. for a time co-operated at Richelieu's Palais-Cardinal, but quarrelling with his patron, he withdrew, and in 1635 produced his first tragedy, *Médée*, which was followed in 1636 by his masterpiece, *Le Cid*, founded on De Castro's play *Las Mocedades del Cid*. In Spain, however, the story of Campeador's love and conquests had taken the form of an historico-romantic pageant. C. treated the subject with originality, preserving unity of action, and fixing the interest on the moral struggles of the principal actors. Its success was immense; *beau comme le Cid* becoming a popular proverb. Next came *Horace* (founded on Livy's story of the Horatii), *Cinna* (which develops Seneca's brief account of the conspiracy against Augustus by the grandson of Pompey A.D. 4), and *Polyeucte*, a story of Christian conversion in Armenia during the persecution of Decius. In *Pompée*, C. has followed and improved upon a portion of the *Pharsalia* of Lucanus; while *Le Menteur* (1642), the most successful of his comedies, was based upon the plays of Lope de Vega and Alarcon, from the former of whom C.'s *Don Sanche d'Aragon* (1650) was also imitated. C. has been called the father of French tragedy, but his genius was very unequal, and among his later tragedies, *Œdipe* (1659) was the only striking success. His translation of the *Imitation of Christ* of À Kempis was much used by the Jesuits of the 17th c. C. died, after a peaceful domestic life, on the 1st October, 1684. The most interesting edition of C. is that by Voltaire (Par. 1762); the most complete, those by Renouard (Par. 1817), Lefèvre (Par. 1824), Didot (Par. 1854-55), and Taschereau (Par. 1857-62).

Corne'lius, Peter von, founder of a German school of art, was born 16th September, 1787, at Düsseldorf, of the picture gallery of which his father was inspector. He was carefully educated in art, and at the age of nineteen was employed to paint the cupola of the old church of Neuss with colossal figures in chiaroscuro, in which he displayed considerable grandeur of conception. In 1810 he removed to Frankfurt, where he executed a famous series of designs in illustration of Goethe's *Faust*, and in 1811 went to Rome, where, in alliance with his friends Overbeck, Schadow, Schnorr, and others, he devoted himself to the regeneration of German art, an object which he saw accomplished in his own day, and in great part through his own instrumentality. The young artists specially cultivated fresco-painting, and C.'s frescoes, the 'Interpretation of the Dream' and the 'Recognition of the Brethren,' from the history of Joseph, won for him the favour of King Ludwig of Bavaria, and a commission to decorate the Glyptothek at Munich. He left Rome in 1819, but his frescoes in the Glyptothek were not completed till 1830. They consist mainly of two series of designs—one, 'The Heroes,' illustrating the chief events of the Iliad; the other, 'The Gods,' the subjects for which were supplied by the Greek mythology. A 'Last Judgment' in the *Ludwigs Kirche*, Munich, 64 feet high and 30 wide, is remarkable at once for its size, its grandeur of conception, and the severity of its style. Other works are his designs in illustration of the *Nibelungenlied*, and the *Gerusalemme Liberata* of Tasso, the frescoes in the corridors of the Pinakothek, Munich, illustrating the history of Christian art, and those of the Campo Santo, Berlin. His later years were spent chiefly in Berlin, where he died, 6th March, 1867.

Cor'nell Univer'sity, one of the most vigorous of the newly endowed colleges of the United States, was founded by Ezra Cornell in 1868, at a cost of about £152,000. It also received Government grants as a state agricultural college, amounting to 990,000 acres of land. C. U. is situated in Ithaca, a small town in the western part of New York state. The institution is undenominational, and aims at being *national*. The students to some extent combine industrial pursuits with study. Goldwin Smith, a brilliant English scholar and political critic, expatriated himself to become the Professor of History here, which post he resigned in 1871, when he was appointed a member of the Senate of the University of Toronto.—**Ezra Cornell,** founder of the university, was born at Westchester, New York, 11th January, 1807, and received but a slender education—a circumstance which adds to the greatness of his generosity. Devoting himself to mechanical pursuits, he eventually became deeply interested in telegraph stock and Western land speculations, and acquired a large fortune. C. died 1874. His son was elected governor of New York in 1879.

Cor'net, or **Cornet-a-Piston,** a brass wind instrument (with three pistons or valves) of the trumpet class. It is much used in military bands, and to some extent also in the orchestra, where it can generally play the trumpet parts.

Cornet (from the Span. *corneta*, 'a standard') was formerly the lowest rank of commissioned officer in the cavalry, equivalent to *ensign* in the infantry. The special duty of the C. was to carry the standard. He also assisted the captain in his daily military duties. The rank was abolished in 1871, that of sub-lieutenant taking its place.

Corne'to, a fortified town of Italy, province of Roma, on the left bank of the Marta, 4 miles from its mouth, and 11 N. of Civita Vecchia. It is built from the neighbouring ruins of the ancient Tarquinii—a place peculiarly interesting to the ethnological and antiquarian student, as the source of almost all our knowledge of Etruscan life and art. From its tombs many treasures have been removed to the British Museum. C. is the seat of a bishop, and has a Gothic cathedral of the 9th c., and a palace of the 15th c., now an inn. Pop. 6323.

Corn-Fly, a name applied generally to various flies or *Diptera*, from their habit of producing in the larval state much disease and injury in corn plants. The *Chlorops tæniopus* is a familiar example. It is of minute size, and coloured yellow with black stripes. The larvæ deposited in the young plants cause the swelling popularly known as the *gout*. The species of the genus *Oscinis* are also named 'corn-flies.'

Corn Ground-Beetle, a Pentamerous Coleopteran or beetle, the larvæ of which burrow in the ground and feed on the roots and stems of corn. The perfect insect is about half an inch in length, and is of a black colour. The beetle itself lives on the ears of corn, barley, &c. The larvæ is white with a brown head and chest, and possesses tufts of hair along the sides of the abdomen.

Cor'nice (Gr. *koronis*, 'a curved line,' 'a flourish'), in classical architecture, the uppermost of the three members of an entablature—the architrave, the frieze, and the C. It is a horizontal moulded projection, and is characteristically distinguishable in each of the orders. In Gothic architecture, a plain face of parapet projecting slightly from the wall, with under it a row of blocks, sometimes plain, at other times variously ornamented, over which there is usually a row of small arches, frequently serves as a C. In the Decorated style, it chiefly consists of a slope above, then a deep sunk hollow, with beneath it an Astragal (q.v.). Several small mouldings often compose the C. in the Perpendicular style; but details of ornamentation exercised largely the fancy and ingenuity of workmen in all these later styles.

Corn-Laws. The early English statutes relating to the corn trade took the shape of general prohibitions to export except under royal licence, special prohibitions to export by royal proclamation, prohibitions to import or export, except as above, at certain prices. An Act of 1670 prohibited importation while home-corn was selling at less than 53s. 4d., and imposed a duty on the imports at a higher figure. A bounty was given during the 18th c. to the exporter, but in 1773 this was discontinued, exportation was prohibited except at prices below 44s., and importation was allowed above 48s. at a fixed duty of 6d. The figure at which importation was allowed was gradually raised to 80s. for wheat, 40s. for barley, and 26s. for oats; and in 1814 the sliding scale, in which the duties diminished as the price of importation rose, was introduced. The intention of this arrangement was the benevolent one of making the pressure of taxation lightest when corn was least plentiful. The result was to destroy the regularity of trade, and to make the people's food the subject of speculative and often ruinous contracts. The sliding scale not only hurt the import trade more than a fixed duty would have done, but it seriously affected domestic agriculture and manufactures. From 1821 to 1830 the annual average of British exports fell from forty-one to thirty-six millions. In 1840 agricultural wages simply meant starvation; in some districts estates were given up by the owners to the parish, because the poor-rates exceeded the rents. The system of protecting home agriculture was supported by many absurd arguments, inspired partly by the recollections of the French war, partly by the stupidity and selfishness of the landlord class. These arguments are still employed in the United States and in the Colonies; but although so late as 1852 Disraeli declined to admit that the repeal of the C.-L. was 'wise, just, or beneficial,' they have been generally abandoned in this country. In truth, the interests of the landlord class happened to be the same as those of the great mass of the nation. The rise of rents has been caused by the growth of manufactures, which implies a vast additional demand for agricultural produce. Manufactures have further enormously increased the value of land by introducing a spirit of improvement, and stimulating mechanical invention. By protection, therefore, the landlords were destroying their own customers, and latterly also their own labourers. In 1834 and 1838 Hume and Villiers made gallant efforts at least to secure inquiry into the evil. In 1841 Lord Melbourne's Government proposed, in lieu of the sliding scale, a fixed duty of 8s. per quarter on wheat, 4s. 6d. on barley, 3s. 6d. on oats. The ministry were defeated, and Peel came in pledged to protection. In 1842 he introduced the modified sliding scale of 1s. per quarter. In the meantime the majority against Villiers' annual motion for total repeal had sunk from 303 in 1842 to 132 in 1845. This was owing to the activity of the Anti-Corn-Law League, formed in 1839. It was only, however, under the pressure of the corn-famine and potato-disease of 1845 and 1846, which produced very great distress, that Sir Robert Peel was able to carry, on 25th June, 1846, his bill abolishing the corn-duties as at 1st February, 1849, and in the meantime fixing the duty of 10s. per quarter when the price was 48s., to fall by 1s. with every rise of 1s. in price, till on reaching 53s. it was fixed at 4s. All colonial grain was admitted at once at a duty of 1s. The Free-trade majority consisted of 112 Conservatives and 227 Liberals. Corn-taxes were, however, not finally abolished in 1846. There remained a duty of 1s. per quarter, which was intended by Sir Robert Peel as a registration duty, and was converted in 1863 by Mr. Gladstone into a duty of 3d. per cwt. Its importance will be seen from the following table of its produce:—

	1864.	1865.	1866.	1867.	1868.	1869.
Corn-meal and flour	£746,000	£562,000	£743,000	£797,000	£869,000	£897,000

It of course produced the largest revenue when the home harvest failed; it involved a collateral duty on arrow-root, potato-flour, sago, and other farinaceous substances, and it raised the price of home corn. Every one therefore applauded Lowe when he abolished it on 12th April, 1869, although in 1871 Disraeli, who had always opposed remissions of indirect taxation, denounced this measure as a wanton sacrifice of revenue. By statute 45 and 46 Vict. c. 37, which consolidated two former statutes, certain towns, to be named by an Order in Council from time to time, were ordered to supply weekly returns of the purchases of British corn within their town limits. Dealers and cornfactors in these towns are now bound to supply full information to the inspectors who collect the information—the penalty of £20 may be inflicted, should the party applied to refuse to inform. The Board of Trade, from these collected weekly particulars, publishes an average list which appears in the *London Gazette*. It may be explained that from 1834 to 1843 the average *Gazette* price of British wheat was 56s. 3d. (the highest being 70s. 8d. in 1839, the lowest 39s. 4d. in 1835); from 1844 to 1853 the average was 49s. 4d. (the highest being 69s. 9d. in 1847, the lowest 38s. 6d. in 1851); from 1854 to 1863 the average was 56s. 11d. (the highest being 74s. 8d. in 1855, the lowest 43s. 9d. in 1859); from 1864 to 1873 the average was 52s. 8d. (the highest being 64s. 5d. in 1867, the lowest 40s. 2d. in 1864).

The following table gives the prices per quarter of wheat, barley, and oats for 1874, 1879, 1884, 1889, and 1894:—

Year.	Wheat.		Barley.		Oats.	
	s.	d.	s.	d.	s.	d.
1874	55	9	44	11	28	10
1879	43	10	34	0	21	9
1884	35	8	30	8	20	3
1889	29	9	25	10	17	9
1894	22	10	24	6	17	1

We will now give a table showing the quantities of wheat and wheat-flour, barley, and oats imported into the United Kingdom at triennial periods from 1840 to 1870 inclusive, and in 1871, 1872, 1873, 1883, and 1893:—

	Wheat and Wheat-Flour.	Barley.	Oats.
	Cwts.	Cwts.	Cwts.
1840	10,560,290	2,333,707	1,487,024
1843	4,619,917	640,286	231,888
1846	10,195,930	1,324,432	2,170,682
1849	20,850,604	4,932,172	3,484,541
1852	18,092,627	2,234,071	2,720,539
1855	13,940,322	1,246,882	2,842,749
1858	23,200,941	5,933,543	5,104,773
1861	37,646,705	5,001,432	5,114,398
1864	28,837,203	4,921,362	5,562,959
1867	39,136,780	5,683,721	9,407,136
1870	36,906,115	7,217,327	10,830,630
1871	44,362,227	8,569,012	10,912,204
1872	47,612,896	15,046,566	11,537,325
1873	51,620,000	9,240,000	11,908,000
1883	85,074,000	16,460,000	15,138,000
1893	93,806,000	22,844,000	13,954,000

From these tables we perceive that, with the exception of the rise between the years 1854 and 1863, the average price of wheat has gradually declined since the first period mentioned (1834-43), when it stood at 56s. 3d. down to the year 1894, when it was gazetted at 22s. 10d. Nor is this decline to be wondered at, when the increase in the amount of wheat and wheat-flour imported is taken into consideration. In 1849, the year of the abolishment of the corn-duties, 20,850,604 cwts. were imported into the United Kingdom, and this was more than double the amount imported in 1846; but in 1873 the import had risen to 51,620,000 cwts., and in 1893 it reached the high figure of 93,806,000 cwts. It is true that the price has fallen to nearly a third of what it was in 1834-43; yet, low though it may be, the wheat and wheat-flour bill to be paid every year to the outside creditor is very large, and is one, moreover, which would seem likely to go on increasing. However, so long as the nation at large makes money enough to pay the bill without embarrassment, and so long as peace lasts, and the country is able to obtain the necessary supplies, every one, except those directly interested in agriculture, will be satisfied; but should war at any time put a stop to the import, and should the inhabitants of this country have to depend entirely upon British wheat, then they will probably discover the effects of the reduction, which has taken place in the wheat-producing acreage in consequence of the competition of foreign growers, to be more serious than they at present imagine. The whole question of the corn supply cannot fail to be a matter for grave reflection to any thoughtful citizen of these islands.

Corn-Moth, a species of moth belonging to the genus *Tinea*, which also includes the Clothes Moths (q.v.). Its larvæ is known as the 'C. worm,' and destroys grain stored in granaries. The moth itself is of a yellowish-white colour, the front wings being variegated with grey, brown, and black colours. The larvæ also attack books, pasteboard, and similar substances.

Corns are generally produced by tight boots or shoes, and consist of hard portions of the cuticle, the result of alternate pressure and freedom. They are generally described as *hard C.* and *soft C.* The latter are situated generally between the toes. C. are very painful, and are more easily prevented than cured. Boots and shoes should never be tight, but should always be large enough to contain the foot easy. For *hard C.* the best treatment is carefully to remove with a knife the hardened part of the skin, and then apply some substance which will dissolve the C., as glacial acetic acid. *Soft C.* are best treated with strong nitric acid.

Corn Salad, or **Lamb's Lettuce,** a genus of plants belonging to the natural order *Valerianaceæ*, common in Britain and on the continent of Europe. The common C. S. is often cultivated as a salad, more because it is in perfection early in spring, than because of its taste, which is insipid. The vineyard salad and the Italian C. S. are also similarly used on the Continent.

Corn Sawfly, a species of Sawflies (q.v.), the females of which, by means of their peculiar Ovipositors (q.v.), insert the eggs in or near the ears of wheat and other cereals. The larva consumes the substance of the grain, and passes its chrysalis stage in the stem. This fly is about half an inch long, and of a black colour, with yellow marks.

Corn Snake, occurring in N. America, between N. Carolina and Mexico. The body is long, the head narrow, and the tail small and tapering. The back is of a reddish-brown colour, and marked with reddish and dark brown spots; the sides are of a light brown, and the belly is silver-

Corn Snake.

white, with black marks of different sizes, but all of rectangular shape. The length varies from 4 to 6 feet. One of its least agreeable characteristics is a habit of making its way into, and of concealing itself in, dwelling-houses.

Cornstone is an arenaceous limestone, in which, however, there is a predominance of calcareous matter. It is a grade in the passage from calcareous sandstone to a good limestone, and its weathered surfaces are frequently of a dark brown colour, due to the presence of peroxide of iron.

Corn Thrips, a genus of insects variously regarded as belonging to the *Orthoptera* (q.v.), and included in a special group, *Physopoda*. The C. T. does great injury to wheat crops, both by eating the ears and stems of the plants. The tarsi consist of two joints, and the foot is sucker-like. The colour is black. The males are wingless; the females have four wings.

Cornuco'pia (Lat. *cornu*, 'horn,' and *copia*, 'plenty'), in classical mythology, the horn of the goat Amalthea, who suckled the infant Jove, and which he afterwards through gratitude raised to be a star, is now referred to as the emblem of fruitfulness and abundance. In architecture and heraldry the word denotes an ornament representing a horn, from which issue flowers, fruits, corn, &c. The C. is frequently found on ancient coins, especially those of Sicily.

Corn'wall, an English county, forming the S.W. extremity of Great Britain, bounded on all sides by the sea, except on the E., where it is separated from Devonshire by the Tamar. In form it somewhat resembles a right-angled triangle. On the side stretching from N.E. to S.W. are numerous shallow bays, of which the principal is that of St. Ives, while Trevose Head is the most commanding promontory. The S. coast has much deeper indentations and bolder promontories. Among the former are the harbours of Plymouth and Falmouth and Mount's Bay, and among the latter are Lizard Point and Land's End, off which are the Scilly Isles (q.v.). Through the centre of the county from N.E. to S.W. extends the S.W. continuation of the Devonian range of hills, forming the principal watershed, and from which the land slopes seaward on each side. The grey granite occurring in this range is rapidly decomposed when exposed to the air, and has formed valuable beds of kaolin, or porcelain clay, largely used in the manufacture of the finer kinds of ware. The old red sandstone strata occupy about three-fourths of C. The hills nowhere rise much above 1300 feet, and the rivers, numerous but short, are accessible to the tide, and their mouths form valuable harbours. The principal river, the Tamar, has a course of 56 miles. The climate is mild but variable, with frequent rain, from the almost insular situation of the county. The soil in the elevated districts is almost barren; on the coast and in the valleys it is comparatively fertile, but to produce abundantly it requires to be heavily manured. A favourite crop is potatoes, for raising which the soil is so well adapted that in some places two crops are produced in the year. In 1894 there were 603,121 acres under cultivation, and of these 128,800 were under corn crops; 50,086 under green crops; 176,253 under clover, grasses, &c.; 241,612 under permanent pasture; 1719 under small fruit; and 47 under nursery grounds. Mountain and heath occupied 40,265 acres; and woods and plantations covered 30,321. The principal corn crops are wheat, barley, and oats; green crops, turnips, mangold-wurzel, and potatoes. The fisheries of C. are of great extent and importance; the distinctive kinds of fish being mackerel and pilchard, the latter of which are exported in vast quantities, and the take is sometimes so great that they are sold for manure. But its mineral wealth is what mainly distinguishes the county, which abounds in iron, copper, lead, and tin ores.

C. is the *Cassiterides* ('tin islands') of the Phœnicians, who traded for tin with C. and the Scilly Isles, and probably formed the word from the Sanskrit *Kastîra*, much tin being found in the islands off the coasts of India (Lassen, in Ritter's *Erdkunde*). At the time of the Roman invasion, C. was inhabited by the *Damnonii* and *Cornabii*, from the latter of whom its name was Latinised into *Cornubia*. The English invaders called the people *Corn-wealhas* ('the strangers of the "Corn" or "horn" (Wel. *Kernou*) of the island'), whence the modern C. The county is rich in British and Roman antiquities, stone-circles, sepulchral tumuli, remains of camps, amphitheatres, &c.; and has, besides, some singular natural curiosities, of which the most notable are the Logan stones and Cheesewring. From its remote position, C. was naturally the last part of the S. of England to yield to the English, nor was it finally conquered by them till the reign of Æthelstan, in the 10th c. In 1329 C. was raised to a duchy, which is hereditary in the Princes of Wales. In the Wars of the Roses the Cornish men were Lancastrians; in the civil war they were Royalists. A Cymric dialect (see CYMRIC LANGUAGE AND LITERATURE) continued to be spoken down to the middle of the 18th c., and has given some words to the English tongue.

The area of C. is 868,208 acres. Pop. adm. and anc. county (each), 322,571; reg. county, 318,583. C. is divided into six parl. divisions, each of which returns one member: Mid, or St. Austell, 49,624; N.E., or Launceston, 48,084; N.W., or Camborne, 54,192; S.E., or Bodmin, 52,288; Truro, 50,742; and W., or St. Ives, 50,187.

Cornwall'is, Charles, Marquess, an English general and governor, son of the first Earl Cornwallis, was born 31st December, 1738, and was educated at Eton and Cambridge. After serving in the Seven Years' War, and holding several appointments, including that of Governor of the Tower of London, he was sent to the United States to command against the colonists in the War of Independence. He gained some successes over the American troops in 1780 and 1781, but was compelled to surrender, with all his troops, at York Town, in Virginia. Although this disaster precipitated the ruin of the British cause in America, C. was not censured when he returned to England, but, from 1786 to 1793, held the office of Governor-General in India and commander-in-chief of the troops there, signalising his term of office by crushing Tippoo Saib, and by a series of administrative reforms, which have conferred on him a still more lasting renown. To C. is owing the famous 'permanent settlement' of the land question in Bengal and Behar, by which the zemindars were invested with a permanent tenure of the land at a fixed and unalterable assessment. He also introduced great changes into the judicial system of the Bengal Presidency, confining the collector of revenue to his fiscal duties, and establishing a civil court in each district, with a judge, a registrar, and one or more 'covenanted' assistants. Returning to England, he was raised to the rank of marquess. The position he next obtained was that of Lord-Lieutenant of Ireland, and during his occupancy of it he succeeded in putting down the Irish Rebellion of 1798. After this he negotiated the Treaty of Amiens (1802) with France. Appointed a second time, in 1804, Governor-General of India, C. died at Ghazipore, in the division of Benares, in the same year (5th October). He was an able, honest, industrious ruler, and a general of superior capacity. See his *Correspondence*, by Ross (1859).

Corn Weevil, a genus of beetles belonging to the Tetramerous group of *Rhynchophora*, in which the tarsi are four-jointed, and the head prolonged to form a *rostrum* or beak. This beetle is about a quarter of an inch in length. It is of a dark-red colour. The front wings or wing-cases are alone present. The larva feeds on the corn grains, and the eggs deposited by the female insects are usually very numerous. The remedy for the attack of these insects is to frequently stir and shift the grain. The rice weevil feeds on rice; whilst the larva of C. W. of S. America lives in the stems of palms.

Coroll'a ('a little garland or crown'), the innermost or second floral envelope which in a perfect flower intervenes between the calyx and the stamens. In monocotyledons it is believed to be wanting, as well as frequently in the *Apetalæ* or *Monochlamydeæ* of Dicotyledons. The pieces of which it is made up are modified leaves, and are called petals. They may be either wholly or in part united (*Gamopetalous* or *Mono-*

petalous), or entirely separate from one another (*Dialypetalous, Polypetalous*). The shape of the C. has given rise to various descriptive terms, such as bell-shaped, salver-shaped, rosaceous, &c., and according as the petals are all of the same size, or of different sizes, *regular* or *irregular*. The C. may have also appendages in the form of *scales, spurs*, &c., or those vaguely-defined glandular or other appendages at the base called *nectaries*. Each petal consists of the *limb* or blade, and the *unguis* or claw, the former corresponding to the blade of a Leaf (q.v.), the latter to the petiole or stalk, and, like the petiole of a leaf, may be present or absent, long or short. The shape of the C. generally determines the form of the flower, and as it is usually the most brightly coloured part, the beauty of the flower is also to a great extent dependent on it. See CALYX and PERIANTH.

Coro'llary, in mathematics, is an immediate deduction from a demonstrated proposition, and many of Euclid's propositions might be proved as corollaries of some foregoing proposition.

Corolliflo'ræ, a subdivision of Dicotyledonous plants, in which the stamens are usually inserted (or seem to be inserted) in the corolla, and in which the Corolla (q.v.) is gamopetalous, and inserted below the ovary. The heaths, *Labiatæ*, &c., are examples.

Coroman'del, a peninsula and county in the N. island of New Zealand, 30 miles E. of the town of Auckland; pop. 2846. It is traversed by a rocky range of hills in which gold is found, and has been worked for a number of years. The yield is fluctuating, but has reached 16,000 oz., worth £50,000, in a year. Kapanga, the principal township, is a thriving little place.

Coromandel Coast (Ind. *Chola Mandalam, i.e.*, 'the land of Chola,' an ancient ruler of the region) is the name of the E. shore of the Indian peninsula, province of Madras, from Calymere (*Kalamari*) Point to the mouth of the Kistna, or from about lat. 10° 17′ to 15° 20′ N. The coast, from the shallowness of the water and the violence of the N.E. monsoon, is so dangerous that ships of any considerable size are obliged to anchor several miles from shore, and debarkation is effected by means of native boats.

Coro'na, or **Crown,** in botany, a rather indefinite term, usually applied to any appendage that intervenes between the corolla and the stamens, as the cup of a daffodil, or the rays of a passion-flower.

Corona, in classical architecture, the lower member, or drip, of the projecting part of the Cornice (q.v.). In the language of ecclesiastical writers, the apse of a church is called the C.—as 'Becket's Crown' in Canterbury; so also is a large circle containing tapers which depends from the roof of a church, or in some cases stands on the floor.

Corona Borea'lis, a northern constellation between Hercules and Bootes, with one bright star of the second magnitude.

Cor'onach, properly *Coranaich* (Gael. *Co-ranaich*, 'roaring or howling together'), a term now applied almost exclusively to a wild lament, consisting partly of inarticulate wailing, with which the Irish and the Scottish Highlanders gave expression to their sorrow for the death of a friend. It was chanted, like the Latin *ululatus*, over the dead body, but the custom is now abandoned. Among many races this custom has prevailed, and to this day the death of the father or mother of a Chinese family is announced to the neighbours by the wild and discordant howling of a party of mourners who are usually hired for the occasion.

Corona'tion. The ceremony of C., and the use of the crown as an emblem of sovereignty, are of great antiquity. From the Bible we learn that Solomon and Ahaziah were crowned. Among the Greeks a kind of crown was awarded to the victors in public games; and to citizens of especial merit, C., with substantial privileges, was a frequent reward of valour among the ancient Romans. In Westminster Abbey, against the altar screen, stand the two C.-chairs of the sovereigns of England. One, the king's chair, covers the 'Stone of Destiny,' carried off from Scone, in Scotland, by Edward I., in 1296. The other, the consort's chair, was constructed for the C. of Mary, wife of William III. Both are still used at coronations. In the Cottonian MSS. is a copy of the Gospels, believed to be that on which the Saxon kings were sworn. (See CROWN.) Consult *Chapters on Coronations* (Lond. 1838), and Bohn's *Cyclopædia of Political Knowledge*.

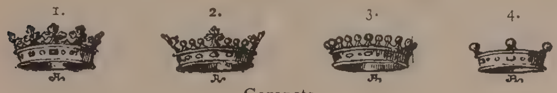
Coronation Gulf, an arm of sea, to the E. of Dease Strait, opening into the mainland of N. America, opposite Victoria Land. It is studded with small islands.

Coronation Oath. Previous to the Revolution of 1688 the form of this oath was variable. At least, if there was a regular form, it was liable to be tampered with, a copy of the oath taken by Henry VIII. being in the Cottonian MSS., with alterations in his own writing. The present form of C. O. was fixed by a statute of William and Mary (1 W. and M. c. 6), which form was afterwards altered to suit the terms of the Union between England and Scotland, and Great Britain and Ireland. The sovereign swears to 'maintain the laws of God, the true profession of the gospel, and the Protestant reformed religion established by law,' also to 'maintain and preserve inviolably the settlement of the united Church of England and Ireland, and the doctrine, worship, discipline, and government thereof, as by law established, within England and Ireland, and the territories thereunto belonging;' also to 'preserve to the bishops and clergy of England [and Ireland], and to the church [es] there committed to their charge, all such rights and privileges as do or shall appertain unto them.'

The security of the Church of Scotland is provided for by a passage in an Act of Parliament ratifying the Treaty of Union. It is thereby enacted that 'after the decease of her present Majesty (whom God long preserve), the sovereign succeeding to her in the royal government of this kingdom shall in all time coming (not at the coronation), *at his or her accession to the crown, swear and subscribe* that they shall maintain and preserve the foresaid settlement of the true Protestant religion, with the government, discipline, and worship of this Church, as above established,' that is, as established by Act 1 Will. and Mary, c. 5. The C. O. is to be regarded as the ratification by the sovereign of a compact with Parliament, the terms of which compact may be altered at the will of the contracting parties.

Cor'oner (lit. 'a *crown*-officer'). In England the C. is an officer possessing both judicial and ministerial authority. In his judicial capacity he holds inquisitions in cases of violent, unnatural, sudden (cause unknown) deaths, or where the deceased has died in prison, or where and how a statute requires an inquest, whether the cause of death sprang within his jurisdiction or not. It is part of his duty to inquire after and take care of treasure-trove, wreck of the sea, &c. The C. acts ministerially in the execution of writs of the crown when the sheriff is disqualified. Coroners are chosen for life for the county by the County Council under the Local Government Act of 1888; as franchise coroners by the Crown, Cinque Ports, Mayor and Commonalty of London, Dean and Chapter of Westminster, the Universities of Oxford and Cambridge, &c; as borough coroners by the council of a borough having a separate court of quarter sessions; and as deputy coroners by nomination of coroner and approval of Lord Chancellor, or by appointment of franchise coroner, or by certificate in writing (backed by mayor or two justices) of borough coroner when the appointment can be only temporary, and through necessity, but they are removable for incapacity or misbehaviour. The number for each county is not fixed. The Municipal Corporations Act of 1882, and the Local Government Act of 1888, are the principal statutes which deal with the appointment of the C., his jurisdiction, &c. The court of a C. is a *close court* for the purpose of the inquisition, and he may exclude any one who is present merely as a spectator or reporter, and, being a court of record, the coroner may commit for any contempt in his court, but he cannot, as a judge of a superior court can, commit for contempt outside his court; thus his power does not extend to cases of publication or writing of articles which reflect on his conduct as coroner. The C. may order the disinterment of a corpse. It is a misdemeanour to obstruct in any way (by burying, burning, or otherwise getting rid of the body) the holding of the inquest in due course, where such inquest is held to be necessary by the coroner. The office does not now exist in Scotland, but it is said to have existed.

Coronet, in heraldry, is an ornamental fillet of gold worn above the coats-of-arms of peers and peeresses. In a *duke's* C. (1), here shown, the circlet of gold is chased, and is surmounted by eight strawberry leaves. The C. of a *marquess* (2) has four strawberry leaves, separated by pearls. A *viscount's* C. (3) is a rim of gold surmounted by sixteen pearls, while a *baron's* C. (4) has only six or four pearls, and is otherwise plain. See *Art Dictionary*.



Coronets.

Cor'poral (Fr. *caporale*, Ital. *caporale*, from *capo* (Lat. *caput*), 'the head') is in the British army the rank immediately below that of a non-commissioned officer. The special function of the C. is to maintain discipline among the private soldiers in barracks or in camp. The pay of the C. is from 1s. 8d. to 2s. 8d. per day. He has an assistant called a lance-C., who receives no extra pay. In the navy there is a ship's-C., who is under the Master-at-Arms (q.v.).

Corporal (Lat. *corpus*, 'the body'), a linen cloth placed over the consecrated bread and wine after the celebration of the Lord's supper. In England the term is applied also to the linen cloth, or rather, according to old usage, two cloths, spread on the altar while the sacrament is being consecrated. This cloth is also called *palla*, *Chrismale*, *anti-mensia*, *sindon*, *thronus*.

Corpora'tion is a legally fictitious person or body politic, created by royal charter, under special or general Act of Parliament, or prescription. It holds its property, rights, and immunities in perpetuity. A C. or body corporate may be either *lay* or *ecclesiastical*. In an ecclesiastical C. the members are the holders of spiritual office; and the object of such corporations is mainly the holding of ecclesiastical property. *Lay* corporations are either civil or eleemosynary, the former are established for the government of towns, for public improvements, or for the advancement of commerce and learning. Eleemosynary corporations exist for the administration of funds devoted to charitable or educational purposes. Corporations are either *sole* or *aggregate*, that is, of one, or of more than one. The Queen or a bishop is a C. *sole*. Corporations *aggregate* are commonly the Mayor (q.v.) (in Scotland, the Provost, q.v.) and burgesses of a town, the head and fellows of a college, the dean and chapter of a cathedral church. A name is essential to every C. The powers usually bestowed on corporate bodies are,—to have by descent, election, or otherwise, perpetual succession, to sue and be sued in their corporate capacity, to purchase lands and have a common seal, to make bye-laws for the better government of the C. But they can make no bye-laws contrary to the laws of the country. A C. cannot commit felony or treason. It can only appear in legal proceedings by attorney or other officers authorised to act for it.

Under recent Acts of Parliament any society of persons having a legal purpose may acquire the character of a C. See BENEFIT FRIENDLY SOCIETIES, BUILDING (BENEFIT) SOCIETIES, JOINT-STOCK COMPANIES, PARTNERSHIP. See also MUNICIPALITY, BURGESS ROLL, TOWN COUNCIL.

Corps d'Armée, a term formerly confined to the organisation of the military forces of the more powerful nations of Continental Europe in times of peace. Each C. d'A., consisting usually of not less than 50,000 men, had the staff, artillery park, and all the equipments of a complete army. The term is now generally used, in England, as elsewhere, for the largest division of an army in the field, which is subdivided into brigades, and these into regiments and battalions.

Cor'pus Chris'ti, or **Benet College, Cambridge,** was founded in 1352 by the two united guilds of C. C. and of the Blessed Virgin, on the intercession of Duke Henry of Lancaster, an alderman of the guilds, who obtained a licence from King Edward III. to that effect. Archbishop Parker increased the endowments of the college, and left to it his manuscripts, including the only authentic manuscript copies of the Thirty-Nine Articles. There are now a master and twelve fellows, each of the fellowships being open to all subjects of the Queen. There are besides the following scholarships:—2 of £60 per annum, 1 of £40, 3 of £30, 3 of £25, 3 of £20, all being tenable by students of the college for one or two years; also 5 of £30—80, as entrance scholarships, and tenable for one or two years. In addition, there are 7 exhibitions, varying in value from £18 to £36 per annum. There now are 257 belonging to the college members of the Senate, 100 undergraduates, and 456 members on the boards. The patronage consists of 10 livings in Cambs, Dorset, Essex, Middlesex, and Norfolk.

Corpus Christi, Oxford, founded in 1516 by Richard Fox, Bishop of Winchester, was at first characterised by stringent discipline, and was the first foundation in which Greek was made imperative in an academic course. According to the provisions of the statutes of 1881 there should be a president, 28 fellows, and 36 scholars, but at present there are, besides the president, 15 fellows, and 28 scholars. The latter are competed for by candidates under 19 years of age, are of the annual value of £80, and are tenable for four or five years. There are also two exhibitions. The college now has 229 members of Convocation, 375 members on the books, and 91 undergraduates.

Cor'pus Chris'ti Fes'tival, a festival called in France the *Fête Dieu*, the most splendid in the Roman Catholic Church, was instituted by Pope Urban IV. in 1264 in honour of the consecrated host, and ordered to be kept on Thursday after the festival of the Trinity, otherwise called the Octave of Pentecost. Grand processions are its chief features.

Cor'pus Delic'ti, a Scotch criminal law-term denoting the leading fact specified in a criminal charge. Thus, if a person be charged with murder, it must be proved that there has been a murder, otherwise C. D. is not established.

Corr'ea, a genus of Rutaceous shrubs, natives of Southern and Eastern Australia, where they are known as 'native fuchsias.' The leaves of some of them are used as a substitute for tea.

Correction of the Press. The functionary of a printing establishment whose business is to detect and correct the errors of the compositor is called the 'Reader.' To be a good *reader* requires more natural aptitude and more practice than the uninitiated would expect. Besides the errors of the compositor, there are certain kinds of errors of the author which must be looked to—faulty spelling or punctuation, misquotation, &c. The form or scheme of a work, that is, the arrangement of chapters, paragraphs, notes, or tabular matter, is also more or less troublesome. After the reader's revision, the writer or author usually revises. An author should write his work as legibly as his skill in penmanship enables him to do. He should then revise and correct with the utmost care. In his *proof*, if he be particular regarding his composition, he will surely, despite his own care and that of the reader, find many blunders. If he wish to save expense, corrections should be made so as to cause as little derangement of space as possible. The author should revise a second proof, to see that the corrections made in the first have been carried out. There should be no fresh corrections in a second proof, if the author has been duly careful; but the fastidious writer will probably find that correction is an endless task.

Besides familiarity with typography, a good reader must have an eye to note each word and letter, while at the same time he takes in the meaning and connection of the whole. In printing a volume it is usual to correct one sheet at a time, but sometimes it is more convenient to take a proof on long slips before dividing into pages. Corrections are marked on the margin by established signs understood by all printers; but it is not necessary that the author should use these signs in correcting. He should mark the margin where a change or correction is to be made, write very legibly, and be careful to avoid confusion.

Correg′gio, an old town in the province of Reggio, N. Italy, in the Val de Molini, 12 miles to the S. of the Po, and 5 E. of Carpi. It has a fine cathedral and a rare old castle, was formerly a barony of the princely family of C., but is best known as the birthplace of the great colourist, Antonio Allegri, who hence derives his famous surname. Pop. 13,075.

Correg′gio, Anto′nio Alle′gri, derives his surname from Correggio, a town in Reggio, near which he was born in 1494. To this great painter history has been unkind. His career and condition in life were at first misrepresented and encrusted with unfounded tradition by his contemporary, Vasari; and recent investigation has but tended to overthrow traditionary evidence, without replacing it with much of verified fact. Vasari's narrative has been proved to be fabulous with respect to most of his statements, and all the traditionary matter in connection with the name of C., including the famous *Anch' io sono pittore* ('I also am a painter'), is now regarded as without foundation. The facts recently established concerning him are few. His father, Pellegrini Allegri, was a merchant of Correggio in good circumstances; his mother was Bernardina Piazzoli, of the Aromani family. C. commenced to paint in boyhood, but from whom he received tuition is unknown. He removed to Mantua in 1511, and there spent some time studying the works of Mantegna, an artist of fair ability. He returned to Correggio in 1514, and in that year he produced his first authenticated picture, 'The Madonna with St. Francis,' a work admirable in composition and expression. In 1518 he was invited to Parma, and there he painted the frescoes in the convent of San Paolo, and many pictures. He became heir to all his uncle's property in 1519, and in the same year married Girolama Mertini, who brought him a small dowry. After residing for a number of years in Parma, where his wife is supposed to have died about 1528, C. returned to his native town, and died there, 5th March, 1534, aged forty. His pictures are characterised by perfect chiaroscuro, luscious and splendid colour, and a bright and joyous grace of style. There seems to have been perpetual sunshine in his mind. His children, round and plump of limb, roguish in expression, and perfectly graceful and beautiful in drawing, are beyond criticism. The Carracci were overwhelmed and delighted with the loveliness of his Madonnas and his children, and studied his works to good purpose; while Titian is reported to have said if he 'were not Titian he should wish to be C.' In modern times Sir Joshua Reynolds studied him with a too slavish assiduity, and in the luminous eyes of his cherub faces we see the design and the expression of the old master. C. was the father of Reynolds' children. Among the great works of C. are the 'School of Love,' and the 'Ecce Homo,' in the National Gallery, London; the 'Madonna Enthroned,' 'La Notte,' the 'Holy Night,' and the 'Madonna in Glory,' in the Dresden Gallery; the 'Sleeping Venus,' and the 'Mystic Marriage of St. Catherine,' in the Louvre; the 'Vine Arbour,' the two 'Angelic Choirs,' and the 'Madonna della Seodilla,' or the 'Rest after the Flight into Egypt,' in Parma. See *A. A. la C.*, from the German of Julius Meyer, edited by Mrs. Heaton, and the splendid volume, *The Works of C. at Parma*, reproduced in photography from the engravings of Paolo Toschi, with biographical and descriptive notices by Louis Fagan, Prints Department, British Museum.

Correg′idor, the chief magistrate of a Spanish town, appointed by the king. In Portugal, the name is nearly synonymous with our *judge*, an administrator of justice.

Corrèze′, a mountainous department of Central France, part of the old province of Limousin, and traversed by the river C., from which it takes its name. It is in part richly wooded, though barren in the higher districts. Its rivers are the C., the Dordogne, and the Vezère. C. has considerable mineral riches, but the inhabitants are chiefly engaged in agriculture, the manufactures being almost confined to the making of firearms at Tulle. The department is divided into the arrondissements of Tulle, Brive, and Ussel. Area, 2265 sq. miles; pop. 328,119.

Corr′ib, Lough, a lake in the county of Galway, Ireland, next in size to Lough Neagh, being 27 miles long and from 2 to 6 broad, with an area of 68 sq. miles. C. is only a few feet elevated above the sea-level. It has numerous small islands, with some fine ruins; and its northern and western shores are remarkable for their beautiful scenery. Through subterranean channels it receives the waters of Lough Mask, and discharges its own superfluous waters into Galway Bay, 3 miles distant.

Corr′idor (Span. *corredor*, 'a runner,' from *correr*, Lat. *currere*, 'to run'), in architecture, a gallery, or open communication to the different apartments of a house or public building, each of which has a door opening into it. C. railway trains are now running on some of our principal lines, and are so called because the carriages are not shut off in compartments as others are, but have a passage through their entire length, which enables the passenger easily to proceed from his own to any other compartment, while the train is in motion.

Corrien′tes (Span. *corrientes*, Lat. *currentes*, 'currents, rapids'), the name of a province, and of its capital, in the Argentine Republic, S. America.—The *capital*, at the confluence of the rivers Paraña and Paraguay, is a well-built town, and possesses admirable facilities for inland and foreign commerce. It has a fine church (San Francisco), and a natural history museum, of which Bonpland (q.v.) was director from 1854 till his death. The harbour is good, and the town has an important trade in timber. Pop. 14,200.—The *province* embraces the northern portion of the peninsula formed by the rivers Paraña and Uruguay, the southern portion being occupied by the province of Entre Rios. The greater part of the surface is low and swampy, but the S. and E. are hilly. Cotton, tobacco, rice, sugar, indigo, maize, barley, arrowroot, sweet potatoes, and various tropical fruits are raised. Area, 54,000 sq. miles; pop. 291,325.

Corro′sive Sub′limate is a compound of chlorine and mercury or quicksilver, and is called by chemists bichloride of mercury, or mercuric chloride. C. S. is prepared by heating a mixture of 2½ parts of mercuric sulphate (obtained by the action of sulphuric acid on mercury) with 1 part of common salt in a subliming apparatus. C. S. rises in vapour, and condenses in needle-shaped crystals in the cool part of the vessel, whilst sulphate of soda remains. C. S. is a colourless crystalline body, much more readily soluble in boiling than in cold water; it dissolves also with ease in alcohol or ether. It differs from mercurous chloride or calomel, not only in chemical composition, but also in its physiological action, it being a most deadly poison, even if swallowed in small quantities. The best antidote is white of egg. C. S. is a preservative, and has been used in embalming.

Corr′ugated Iron is made by passing thin sheet-iron between revolving fluted rollers, so arranged that each projection upon one roller coincides with a hollow upon the other. The iron thus corrugated is dipped into a bath of molten zinc, and so covered with a thin coating of that metal, or, as it is called, galvanised. The corrugations add very greatly to the strength of the iron, and enable it to be used for walls and roofs in places where, as mere sheet-iron, it would be impossible to employ it. The zinc is used to prevent rust, which, if it be once allowed to commence, very rapidly eats away thin iron plates. A good coating of oil-paint, renewed at intervals, helps very much also to prevent the destruction of the iron from the same cause.

Corryvrech′an, or **Corrievrek′in** (Gael. 'Brecan's cauldron'), a strait between the islands of Scarba and Jura, Argyllshire, Scotland. The tides—running sometimes 13 miles an hour—round a pyramidal rock which rises with a rapid slope from a great depth to within a few fathoms of the surface, cause a whirlpool very dangerous to small vessels in stormy weather and at flood tide. The name was first applied to another whirlpool in the sound between Rathlin Island and the coast of Antrim, and was probably transferred to the Scotch locality by the monks of Iona. See Joyce's *Irish Names and Places*, Second Series, pp. 408-410 (Dubl. 1875).

Cor'sac, the name given to some species of dogs or *Canidæ*, the best known being the *Cynalopex C.*, found in Hindustan and in Central Asia. The body and head are fox-like, the ears long and pointed, the tail bushy, and the limbs slender. It is gregarious in habits, and lives in burrows, feeding on small mammals, birds, and even insects.

Cor'sair (Span. *corsario*, from the Lat. *cursor*, 'a runner,' *i.e.*, one who scours the sea), a term applied in the S. of Europe to a pirate or his ship from the N. of Africa. The corsairs of Barbary were privateers rather than pirates, being commissioned by their princes to prey upon the ships of countries with which they were at war.

Cor'sica ('the woody'), an island in the Mediterranean belonging to France, and forming the department of *Corse*; area, 3377 sq. miles; pop. 288,596. A mountain chain traverses the interior from N. to S., the culminating point of which, Monte Rotondo, has a height of 9068 feet. Other summits exceed 7000 feet, and for the greater part of the year they are covered with snow. C. is watered by numerous small streams, of which the chief are the Golo and the Tavignano. The mountains are extensively covered with forests of oak, pine, cork, larch, and chestnut, or afford excellent pasture. The valleys and plains yield the ordinary cereals in abundance, fruit is largely raised, and the less elevated slopes are clad with vines. Corsican wine has, however, never had a high character. One of the principal industries is fishing—tunny, pilchard, and sardines abounding along the coast. The mineral wealth of the island, which is considerable, has not been much developed. C. has many fine natural harbours on its W. coast. The capital is Ajaccio; Bastia, Calvi, Corte, and Sartene being next in importance. The Corsicans are in speech and character Italian. The Vendetta (q.v.) is one of the most notable of Corsican institutions.

The original inhabitants of the island were of the Ligurian stock. After the conquest of the seaboard by the Etruscans, a considerable trade was developed. At a later period the Carthaginians became masters of C., but were forced to surrender it to the Romans after the close of the first Punic War (3rd c. B.C.). Roman colonies were established here by Marius and Sulla, and under the Empire it was extremely prosperous, possessing thirty-three cities. It suffered severely from the devastations of the Vandals, and was successively subject to the Greeks, Goths, Longobards, Franks, and Saracens. About the 11th c. it passed under the dominion of the Pisans, and, after repeatedly changing its rulers, became a possession of France in 1768.

Corsican Moss, a name applied to a species of seaweed which has been used as a vermifuge, though it is dubious whether its virtues have not been over-estimated. According to Berkeley, *Laurencia obtusa*, another seaweed, forms the greater part of what is sold in the shops as C. M.

Cor'slet (Fr. *corselet*, dim. of *corps*, 'the body'), a cuirass, or leathern piece of defensive armour formerly worn by pikemen. It was considered pistol-proof. In entomology the term is applied to that part—otherwise called the *thorax*—of a winged insect's body to which the wings and legs are attached.

Cor'sned was a piece of bread, or sometimes cheese, used in early times in England in a form of trial by Ordeal (q.v.). Blackstone says it 'was consecrated with a form of exorcism, desiring of the Almighty that it might cause convulsions and paleness, and find no passage, if the man was really guilty, but might turn to health and nourishment if he was innocent.'

Cor'so (Ital. 'running' and 'racecourse,' from Lat. *cursus*), applied to the running of horses without riders; to the procession in ranks through the principal street of an Italian town, especially at the Carnival; and to the street through which the race or procession is wont to pass. Hence many streets in Italy are named C., the most famous of which is the C. at Rome, 3500 paces long, from the Porta del Popolo to the foot of the Capitol.

Cort, Corne'lis, a famous Dutch designer and engraver, born at Horn, 1536, and after studying his art in Holland, went to Venice, was received into the house of Titian, and executed copperplate engravings of a number of the works of that master. Later C. removed to Rome, where he founded a famous school of engraving, and where he died in 1578. His works are chiefly remarkable for accuracy of design and refinement. He worked with rapidity, and executed in all over 150 plates.

Cortes' (Span.), from *corte* (*curia*), *i.e.*, a court or residence, is in Spain (q.v.) and Portugal (q.v.) the name given to the Legislative Assembly, or House of Representatives.

The Spanish C. is composed of a senate and congress, the authority of each being equal. Senators are members of the senate by their own right (80), or are nominated for life by the crown (100), or are elected by the state corporations (180). The first class consists of the sons of full age of the king or of his immediate heir, grandees of the kingdom, admirals and captain-generals, archbishops and patriarch of the Indies, presidents of the state council, of the tribunal of Cuentas del Reino, of the supreme tribunal, and of the chief council on war and marine, after serving for two years. Half the elected senators must retire after five years' tenure; they can be re-elected. Every 50,000 of the population elects for five years one member for congress. At present there are 431 of such deputies. Both houses sit every year, but the king may dissolve them, in which case a fresh Cortes must assemble within three months.

The Portuguese C. is composed of a house of peers and a house of commons. Until 1885 the right to sit in the former was hereditary. It is so no longer. Now, the members are princes of the royal family, 12 bishops, and 100 life peers appointed by the Crown; hereditary peers and their immediate heirs only are, however, permitted to retain their seats, and until these be weeded out the crown can appoint only one out of every three of the life peers; the remaining two being selected by certain corporations and districts. The other house consists of 149 delegates chosen by the electoral districts.

Cortes (or **Cortez**) **Fernan'do,** or **Hernando,** a Spanish *conquistador*, was born at Medellin, in Estremadura, in 1485. After a short stay at Salamanca, and a turbulent and licentious youth, he joined the expedition of Ovando to Haiti in 1504, where he obtained an estate, and amused himself by fighting with the natives till 1511, when he rendered important help to Velasquez in the conquest of Cuba. Here also he practised agriculture, and wrought gold with the *repartimiento* of Indians then commonly assigned to the conquering strangers. In 1518 C. took the command of the *Armada* fitted out by Velasquez and himself for the conquest of Mexico, or rather for obtaining a recognition of Spanish supremacy, and as much gold and precious stones as possible. Against the orders of Velasquez, who suspected C.'s ambition, the latter sailed on the 10th February, 1519, from Havanna. At his final muster at Cape Antonio, he had only 110 marines and 550 soldiers, with a few Indians. After establishing himself in Tabasco (where he first met with Marina), C. proceeded to a point near Vera Cruz, and entering into friendly relations with the natives, demanded permission to visit Montezuma, the Emperor of the Aztecs, in his capital, Mexico, which was refused. After burning his ships, and allying himself with the Totonac tribe, and with the republic of Ilascale (which, however, at first resisted the Spaniards), C. advanced to Cholula, where he was well received, but where Marina soon discovered a plot which led to a massacre of the inhabitants. On 8th November, 1519, C., with 400 Spaniards and 6000 natives, entered the capital, and by a bold, menacing attitude contrived to get the meek and superstitious Emperor into his custody at the palace of Axayacatl. Montezuma declared himself a vassal of Karl V., gave up enormous treasures, and assigned a native temple (part of the Teocalli) for Christian worship. Leaving Alvarado in command, C. was now obliged to descend to the coast, and encounter the force which Velasquez had sent out against him under Narvaez. This was successfully done, but on his return to Mexico he found that the slaughter of 600 Caciques had at last provoked open war. A long struggle was ended by the *Noche Triste*, when the Spaniards were driven out of the capital, but the desperate engagement at Otumba (8th July, 1520), in which the Aztecs fled, encouraged C. to prepare at Tezcuco a second expedition, in which a large number of natives became his allies. After a terrible siege of nearly three months, marked by the loftiest heroism on the part of the new Emperor, Guatemogin, and his people, Mexico fell (13th August, 1521) amid the most frightful carnage and destruction of property. Appointed Captain-General of the conquered territory, C. energetically set about the work of reconstruction; he rebuilt the capital, founded and conferred municipal privileges upon the colonies of Zacatula, Coliman, San Esteban, and Medellin, introduced the Franciscan mission, which in twenty years secured at least a nominal acceptance of the Christian religion throughout the country. The regulated slavery which he sanctioned in the system of *encomenduro* and *repartimiento* was not unsuited to the Aztec character. In 1526, partly because, without apparent reason, he had put Guatemogin to death, C. was recalled to Spain, where he was received with great honour. Returning to America as military governor, but without civil authority, he spent ten years in exploring the Darien isthmus and the coast up to California. The arrival of the Viceroy Mendoza, in 1540, disgusted him with Mexico, and he again withdrew to Spain, where, after a decided rebuff at court, he died near Seville on the 2nd December, 1547. His great wealth was devoted partly to the erection of an hospital, a college, and a convent in Mexico. The despatches of C. to Karl V. have been published in English (New York, 1843). See Helps' *Life of C.* and Prescott's *Conquest of Mexico*.

Corti, Organ of, one of the delicate apparatuses found in the internal ear in connection with the terminations of the auditory nerve, discovered by the Marquise di Corti, an Italian nobleman, and hence named after him. See EAR.

Corto'na, a town in the province of Arezzo, Italy, 52 miles E.S.E. of Florence. It was one of the most ancient cities of Etruria, and possesses the massive remains of masonry known as *Cyclopean walls*. The Romans founded a colony here in the time of Sulla, but it is not mentioned by any ancient author subsequent to Pliny and Ptolemy. C. decayed for a time, but revived after the 11th c. Its cathedral has some fine paintings, and its museum has numerous relics of antiquity, especially bronzes. Excellent marble is worked in the vicinity. Pop. 26,996.

Coru'ña, a fortified seaport at the extremity of a small peninsula at the mouth of the C. river, on the N.W. coast of Spain, province of C. (part of the former Galicia). It consists of two towns, the upper and lower (called also Pescaderia), the former of which is walled, and has a citadel which protects the harbour. This is commodious and well frequented by ships, which makes C. one of the most prosperous towns in Spain. It has manufactures of cigars, soap, starch, and cotton, and its sardine fishery is extensive and valuable. Its commerce with England, France, and America is considerable, and it has steamboat communication with Ferrol and the N. coast of Spain. Pop. 37,251. C. is said to have been founded by the Phœnicians. It was known to the Romans under the name of *Caronium* (whence the modern C.). From its bay the Armada set sail in 1588. Ten years later it was captured and burned by the English, and here Sir John Moore fell after a glorious repulse of the French, 16th January, 1809. The *province* abounds in copper and iron ore. Area 3079 sq. miles and pop. 613,881.

Coruña.

Corun'dum (Hind. *karund*), a mineral species which includes under its varieties the most precious stones—the ruby, the sapphire, oriental topaz, and oriental amethyst, as well as that commonly recognised as C. and emery. Commercially the name C. is restricted to the crystalline forms of emery forming hexagonal dingy-coloured crystals. It is composed essentially of pure alumina, and next to the diamond is the hardest of all known substances. It is found abundantly in Asia Minor, the Carnatic, Ava, and near Canton, besides many places in the United States. It is used as Emery (q.v.).

Cor'vei, or **Korvei** (*Corbeia nova* or *Saxonica*), formerly a Benedictine abbey of princely rank, on the Weser, near Höxter, in Westphalia. It dates from the year 816, and its first monks were a colony from a monastery of the same name in Picardy. Acquiring large possessions and important privileges, C. became in the Middle Ages a centre of Christian civilisation in Northern Germany. In 1794 it was erected into a bishopric by Pope Pius VI., and at that time it owned land 22 sq. miles in extent, with 10,000 inhabitants. This territory came into the possession of the House of Orange in 1802, and of Prussia in 1815. It now belongs to the House of Hohenlohe-Schillingsfürst. The magnificent Gothic church contains numerous interesting monuments, but the library and all reliable records of the history of the abbey have been destroyed.

Corvette', a ship of war ranging next to a frigate. It is flush-decked and ship-rigged, and has one tier of guns only.

Cor'vidæ, the Crow family, included in the Conirostral (q.v.) section or sub-order of the order Insessores or Perching birds. The members of this group are recognised by their strong, compressed, and conical bills, covered with small stiff feathers at the base; by the ridge of the upper mandible being curved and its top notched, and by the tarsi being 'plated' in front. The food consists of both animal and plant matters. Various sub-families exist, including the true crows, tree crows, jays, magpies, choughs, nut-crackers, &c.

Corvo, one of the Azores, the most north-westerly of the group, 6 miles long by 3 broad, is of volcanic origin. It is fertile and well-wooded, and exports hogs, wood, and wheat to the other islands. Pop. 806.

Cor′wen ('the white choir'), a town in Merioneth, N. Wales, on a height overlooking the Dee, 10 miles W. of Llangollen. It is said to be the spot to which Owen Glendower retreated when Henry IV. invaded and overran Wales, and tradition points out his sepulchre in the parish churchyard. Pop. reg. sub-dist. 7479; civ. par. 2680.

Corygaum′, or **Korigaum,** a small town in the district of Poona, province of Bombay, 16 miles N.E. of Poona, memorable for the defeat, on 1st January, 1818, of the Peshwa (Baji Ráo) of the Mahrattas, whose forces (25,000 in number) were repulsed with immense loss, after a protracted struggle, by Captain Staunton with a mere handful of sepoys and some twenty-four European artillerymen, of whom twenty were killed. A stone obelisk commemorates this exploit, remarkable from the fact, apart from any others, that there were only twenty-five Europeans in the field on the side of the British and yet their presence enabled the 800 or so natives to defeat their opponents.

Corym′bus (Gr. *korumbos*, 'the top,' 'the head'), a mode of dressing the hair among the Greeks by tying it in a cluster or knot on the top of the head. The name was also given to the cluster of ivy leaves, garlands, or berries, with which Greek vases were encircled, and to the high sterns of ships.

Corynocar′pus, a genus of New Zealand trees belonging to the natural order *Myrsinaceæ*, one of which, *C. lævigatus*, is cultivated in this country. The fruits and seeds of this tree are valued as articles of food by the natives. The seeds contain a farinaceous substance which renders them nutritious, but if eaten before being steamed for at least twenty-four hours, and then being either buried in the ground or allowed to soak in water for some days, they are poisonous, producing partial paralysis, spasmodic pains, and giddiness.

Coryphæ′us (from Gr. *koruphē*, 'a summit'), lit. the head man or leader, but specially applied in the Attic drama to the leader of the chorus. Hence any one of admitted pre-eminence in his art is called a C.

Cor′phene, a genus of Teleostean fishes, family *Coryphænidæ*, having a compressed body, with the dorsal fin running from head to tail, and the head as if abruptly truncated. The Dorado, found in the Mediterranean Sea and elsewhere, is best known of the family. They are remarkable for their iridescent metallic tints, which pass through a series of changes when the fish is dying, giving rise to many poetical allusions. The Dorado is also, but erroneously, styled 'Dolphin' (q.v.).

Cos, or **Kos,** known in more ancient times by the names of Meropis and Nymphæa, is an island on the western shore of Asia Minor, nearly opposite Halicarnassus. Its modern name is Stanko or Stanchio. It is about 23 geographical miles in length, and about 65 in circumference. It is mountainous in the S. and W., but level and fruitful in the N. and E. The great fertility of C. gave rise to the proverb, applied to an insatiable person, 'Quem Cos non nutrit, hunc neque Ægyptus.' C. was famed for its ointment and purple dye, and specially so for its wine, and also for its silk and cotton manufactures. It was the birthplace of Ptolemy Philadelphus, of the painter Apelles, and of the physician Hippocrates. The chief town, C., near which stood a magnificent temple of Æsculapius, was in the N.E. The island now belongs to Turkey.

Coscin′ium, a small genus of plants belonging to the natural order *Menispermaceæ*. The wood, bark, and roots of *C. fenestratum* of Ceylon are valued as stomachics and tonics. The wood has been imported and sold as the true Calumba-root (Bentley): it contains *berberia*, and yields a yellow dye.

Coscinoman′cy (Gr. *koskinon*, *manteia*), practice of divination by means of a sieve, was chiefly used for the discovery of thieves. The sieve having been suspended by a pair of shears, and mystical words spoken, on the mention of the thief's name the sieve turned round.

Cosen′za (anc. *Consentia*), the capital of the province of the same name in Italy, stands in a valley at the junction of the Crati and Busento. C. has manufactures of silk, pottery, and cutlery, and a trade in wine, fruits, and flax. It was the ancient capital of the Bruttii, and was an important town during the Middle Ages. Alaric the Visigoth died here in 410. Pop. 15,149.

Cos′mas, commonly called *Indicopleustes* ('Indian voyager'), in early life a merchant and traveller, afterwards a monk, was an Egyptian who flourished in the 6th c. A.D. His chief work, the *Topographia Christiana*, in twelve books, was written to prove that the earth is a vast plain. It contains much, and in general accurate, historical and geographical information, and is specially noted for its description of the *Monumentum Adulitanum*.

Cosmet′ics (Gr. *kosmetikos*, 'skilled in adorning') are, broadly speaking, preparations applied to the human frame with the view of beautifying it, but the word is commonly limited to powders, salves, &c., designed to improve and preserve the complexion. Many of the preparations, containing bismuth, &c., are noxious.

Cosmog′ony (Gr. *kosmos*, 'the universe,' and *gonē*, 'generation') is an account of the genesis or creation of the universe, or the science which treats of its origin. Every nation possessed of an antique literature has also a C., held by those who believe in it to have been committed to the writer by divine inspiration, and to differ from all other cosmogonies exactly as truth differs from fiction or human speculation. The germs of all these cosmogonies and theogonies are to be found in the Vedas and Zend-Avesta, the most primitive extant literature of the Aryans. In the first chapter of the Laws of Manu (q.v.) we find the ancient Hindu C. The universe existed at first only in the divine idea, as if involved in darkness. Then first God created the waters, called *nara*, because the product of God's breath or spirit (of his nostrils, *nara*); hence he is called Narayana (moving on the waters, cf. Gen. i. 2). He then created the heavens and the earth. The creation of mankind was by God drawing forth from the supreme soul *mind*, then consciousness, then all vital forms endowed with the qualities of goodness and darkness (sin), and the five senses. He gave names to all creatures, and being to time and its divisions, to the stars, planets, mountains, oceans, rivers, valleys, &c. That the human race might multiply, he made them half male and half female. In the C. of the Zend-Avesta, Ormuzd (q.v.) created the visible world by his word in six periods or thousands of years. A remarkable analogy exists between the cosmogonies of the Phœnicians, Hebrews, and Babylonians, which are all evidently derived from the primitive Chaldean or Accadian trinity of Na or Anu ('the sky'), Ea or Enci ('the earth'), and Mulge ('the lord of the under world'). In the beginning all was darkness and water; this was followed by the division of day and night; then came the making of the sun and the moon, followed by that of animals and man. The Accadian mythology, being based on a rude astronomy, was very fond of the number *seven*, every seventh day being a 'day of rest.' The basis of the Phœnician C. is the Trinity Baau ('chaos'), Spirit, and Mot ('slime'); of the Babylonians, Sige ('the sky, or the primitive substance of the universe'), Aos ('the earth'), and Bel ('the Demiurge, or Creator'). Sige bore Moumi (Heb. *mami*, 'waters'); the spirit of Aos brooded over the abysmal deep, and was married to Davke (Phœn. *bahu*, Heb. *bohu*, Gen. i. 2, 'emptiness').

Cosmora′ma (Gr. *kosmos*, 'order,' 'ornament,' and *horaō*, 'I see'), an exhibition of pictures of different parts of the world, which are placed horizontally on a table, reflected by mirrors leaning diagonally opposite them, and looked at through a convex lens in front of each mirror. The pictures are illuminated by lights so placed as not to be reflected by the mirrors.

Cos′mos. See COSMOGONY.

Cosne, a town of France, department of Nièvre, at the confluence of the Loire and Nohain, 33 miles N.N.W. of

Nevers, with which it has railway communication. The ruins of its fortifications and castle show it to have been a place of great importance and strength in the Middle Ages. It has several old churches, a suspension bridge over the Loire, manufactures of chains, anchors, cutlery, &c., and a trade in vegetables, grains, wood, wine, and cattle. Pop. commune 8672; arrond. 76,029.

Coss′acks (Russ. *Kasak*), a warlike Slav-people of S. Russia, who formerly played a considerable *rôle* in the progress of Russian conquests, from their efficiency as light cavalry. They still constitute an important part of the Russian army, and are settled or stationed in different parts of the kingdom. The principal branches of this race are (1) the *Malo-C.*, or C. of Little Russia, of whom the *Zaporovian* sub-division, on the Dnieper, are a predatory and unruly class; and (2) the C. of the Don, nearly 1,000,000 in number, who hold 60,000 sq. miles of steppe-lands, and form a distinct government, military in its organisation, and under the rule of a Hetman, holding the rank of general. Their chief town is Novo-Tscherkask. There are also several Cossack tribes who, from the localities in which they are stationed, are serviceable as frontier guards—as the Siberian C. on the S. border of Siberia, the C. of the Caucasian line (254,000 divided into twelve regiments), &c. See Wallace's *Russia*.

Cossimbazar′ (*Kásimbázár*, 'market of Kasim'), a ruined town in Murshidabad district, Bengal, British India, on the left bank of the Bhagirathi offshoot of the Ganges, the chief industrial and commercial depot of Bengal during the 18th c., being the political capital of Murshidabad and residence of European merchants. In 1811, C. was well known as a seat of manufacture of silk and ivory work, while the neighbourhood was a pestilential swamp and jungle. Within two years the town was deserted, owing to the sudden and inexplicable change of the course of the river which left no communication with the outer world by water. Now C. is only known as the home of the Rani Swarnamayi, a noble and charitable Hindu lady.

Cos′ta, Isaac da, a poet and theologian, was born of Jewish parents at Amsterdam, 14th January, 1798. After receiving a liberal education, and graduating in his twentieth year as Doctor at Law, he renounced Judaism and received Christian baptism, a change which subjected him for a time to persecution. Among his best-known works are his version of Byron's *Cain*; his *Israel and the Gentiles*, and *Harmony of the Gospels*, which have been translated into English; and the *Battle of Nieuwpoort*, a poem of much excellence. He died at Amsterdam, 28th April, 1860.

Costa, Sir Michael, a musical composer and conductor, was born in February, 1810, at Naples, and educated there. He came to England in 1828, and his reception was such as to induce him to settle in this country. He was the conductor of the Royal Italian Opera (Covent Garden), and also of the Sacred Harmonic Society, for many years, and received the honour of knighthood in 1869. His reputation as a composer rests chiefly upon two oratorios of considerable merit—*Eli* (produced 1855) and *Naaman* (produced 1864). Died 3rd January, 1885.

Costa Rica, the most southerly of the republics of Central America, bounded on the N. by Nicaragua, on the S. by the United States of Colombia, and extending E. and W. from the Caribbean Sea to the Pacific. Area 22,484 sq. miles; pop. estimated at 268,300, of whom about 4000 are descendants of aboriginal inhabitants. C. R. is intersected diagonally by a mountain range. There are numerous volcanoes, and earthquakes are frequent. The low grounds along the coasts are very unhealthy. The soil is fertile, the principal products being bananas and coffee; sugar, cocoa, tobacco, potatoes, maize, rice, and wheat are also grown. Railway communication connects Limond and Alajuela, and Punta Arenas and Esparza, distances of 147 and 14 miles respectively. Both lines are being continued to meet one another so as to provide in that way a quick means of transit from the Atlantic coast to the Pacific. The capital is San José, and the principal port is Punta Arenas ('Sandy Point'), on the Gulf of Nicoya. The value of the exports is estimated at £1,737,916, and that of the imports at £1,057,083. The value of coffee exported is put at £1,494,833. There is a growing export of cattle, horses, and sheep. The principal imports are cotton goods, iron, silk, cloth, hardware, flour, salt, provisions, and wines. Gold, silver, and copper are found, but mining industry has greatly decreased. There is no manufacturing industry. The revenue is £860,000, and is derived mainly from customs, the spirit monopoly, and the tobacco monopoly. The expenditure is £850,290. By January, 1887, the country had borrowed largely, and still owed £2,691,300, besides £2,119,512 as interest. This debt now stands by conversion at £2,000,000 at 5 per cent. and has been taken over by the C. R. Railway. The internal debt is £505,250. The government is republican, its constitution dating from 1882. The President is elected for four years, and the National Congress is composed of a chamber of 26 Representatives—one for every 10,000 citizens—elected for 4 years.

Cos′tello, Louisa Stuart, an English authoress, was born 1815. She became known to the literary world by her *Specimens of the Early Poetry of France*, published in 1835. From that time almost to her death, in 1870, she wrote incessantly, her works being chiefly accounts of travelling, tours, histories, and novels. Her style, especially in the description of scenery, is very pleasing.

Cos′ter, Laurens Janszoon, claimed by the Dutch as the inventor of printing, was born at Haarlem about 1370, and must have commenced to practise the art at some period between 1420 and 1426. His invention, said at first to have been used by him only to print verses of the Bible and moral precepts for the instruction of his children, was afterwards practised for gain, but in secret. The assistants he was compelled to employ were sworn not to divulge his secret; but on his death in 1439, one of them, Johann Gänsfleisch, stole some of his tools and types, and set up a press at Mayence. C. at first used wooden types, but afterwards metal ones, cast in sand. His *Speculum Humanæ Salvationis*, commenced with wooden blocks, was finished with the movable metal types, and presents a singular mixture of pages in fixed and movable characters. Before he availed himself of cast types, his impressions were produced by rubbing, and the page was printed only on one side; afterwards he used the press, and printed both sides of the page. Such is the account given by the Dutch, which is pressed with much cogency by Auguste Bernard in his *Histoire de l'Origine de l'Imprimerie*, and by many others, among whom is Ottley in his *Inquiry into the Origin of Engraving*. C. died about 1440. For the arguments in favour of the German claim to the invention, see GUTENBERG. In July, 1856, the people of Haarlem erected a bronze statue to C. in the market-place.

Costs is the technical name in English law for expenses in legal proceedings. Generally the C. of the successful party are mainly paid by the loser, although at common law neither party can claim costs as his right. The statute of Gloucester, passed in the reign of Edward I., however, allowed costs to a successful plaintiff, but in suits where the Crown and a subject were concerned this rule did not hold good, and no costs could be obtained against the Crown, until the passing of statutes 18 and 19 Vict. c. 90, and 23 and 24 Vict. c. 34, by which the judgment in causes where the Crown is a party, and in petitions of right, carries costs. There are in all lawsuits extra-judicial expenses incurred on both sides which each party will have to pay for itself, whatever be the issue. Then, while one gains on the main point, it may be found to have been wrong on minor points, which will cause a modification of C. The Judicature Act, 1890, provides that costs incurred before the Supreme Court and in administering estates and trusts shall be payable by the party determined upon by the Court or judge, provided, of course, such determination infringes no statute or statutory rules of Court. C. are 'taxed'—that is, the items are allowed or disallowed—by an officer of the court, called *the master*. The equivalent legal term in Scotland is *Expenses* (q.v.). (See also AUDITOR OF THE COURT OF SESSION.) In actions for libel and some others, the smallest award of damage usually carries full C., unless the judge certifies *in favour of the defendant*, which deprives a plaintiff of C.

Any one suing *in forma pauperis* does not pay C., but he is entitled to receive them if successful. To entitle one so to sue, he must prove that he does not possess the value of £25, beyond his clothes and the matter under dispute, and obtain counsel's opinion that his grounds for proceeding are reasonable—opinion and affidavit of pauper or his solicitor as to the facts must be produced in court.

Costume' (Old Fr. *coustume*, Mid. Lat. *costuma*, from Lat. *consuetudinem*, by contraction, 'custom or habit'), dress or clothing, in its historical relations, and regarded as connected with dignities, official position, and functions. C. is thus spoken of as characteristic of particular periods of time, of distinct tribes and nationalities, of certain stages of civilisation, and as indicative of rank, position, and power. In modern days, the incessant fluctuations of fashion, and the tendency of our civilisation to produce a level uniformity among nations as well as individuals, have greatly interfered with the continuance and development of the characteristic costumes of different peoples. But as the so-called leaders of fashion operate only within certain very narrow bounds, and fundamental changes in dress are slowly effected, we are warranted in saying that, so far as regards male attire at least, the C. of the 19th c. is as characteristic as that of any preceding age. The costumes of classes, however, such as that of the peasantry, and of small isolated communities, are rapidly disappearing, and, indeed, in the most advanced countries, have almost entirely vanished. In the Middle Ages, and down to comparatively recent times, the costumes of various social grades were strictly prescribed by sumptuary laws; and even had freedom of choice existed, far less variety of materials was available than can be commanded by the very humblest of the present day. Costumes indicative of rank and position still exist, as in the case of the robes, crowns, and coronets of royalty and nobility, and many professional, academic, and official positions are indicated by peculiarities of C. A characteristic class of C. is still rigidly adhered to by the 'fishwives' along the E. coast of Scotland, the agricultural labourers of Lincolnshire, the costermongers of London, &c.

It is only in recent times that the study of C. in its historical relations has come to be pursued with care and painstaking. Artists of the 16th c., in their treatment of all Scriptural subjects, from the Creation down to the Christian era, did not hesitate to employ the C., architecture, and formal gardens of the Renaissance period, and similar anachronisms were the rule on the stage. For the study of ancient C., it therefore becomes necessary to obtain contemporary representations of the period or people under investigation; and for this end illuminated MSS., coins, medals, carvings, and painted pottery are of the utmost value. Such remains of the principal nations of antiquity are fortunately still largely available, and they yield abundant stores of information regarding the C. and other ethnographic relations of the periods to which they belong. With such sources of information laid open by the labours of archæologists, fidelity in the representation of C. is a modern essential in all delineations, both literary and artistic. The artistic treatment of the C. of the present day is a matter of no small difficulty, especially to the sculptor, and by many artists the difficulty is avoided by resorting to the more graceful flowing robes of antique models. This, however, is as indefensible as the representation of the Virgin in the guise of an Italian *contadina* by Renaissance artists. The unpromising task of the faithful and artistic management of modern C. in statuary was very fairly and successfully grappled with by the late J. H. Foley, R.A.

Cos'way, Richard, R.A., of Flemish extraction, was born at Tiverton, Devonshire, in 1740, studied art to such purpose that between his fourteenth and twenty-fourth year he obtained five premiums from the Society of Arts. He was patronised by Sir Joshua Reynolds, elected a member of the Royal Academy in 1771, and rapidly acquired fame and fortune as a painter of miniature portraits. His wife, Maria Hadfield, was a most accomplished musician and artist, and the receptions he gave at his house were among the most brilliant of his era. C. died 4th July, 1820.

Cot (Old Eng. *cote*, *cyte*, 'a bed,' 'a cottage'), in nautical language, an officer's bed, as distinguished from a seaman's hammock. It is made of canvas in the form of a chest, and is kept stretched by a wooden frame. The mattress is placed within the C., and, like the hammock, it is suspended from the roof of the cabin. The term C. is also applied generally to a child's bed, especially the swinging cradle.

Côte-d'Or, a department in the E. of France, and part of the old province of Burgundy, named from the chain of the Côte-d'Or ('hill of gold,' so called from the excellence of its vintages) which traverses it from N. to S. C. is watered by the Seine, the Saône, and the Aube, and is intersected by the Burgundy Canal. It is one of the most fertile districts of France. The surface is in general elevated and covered with coppice, and the climate salubrious. Iron and coal, anthracite, and marble are abundant; there is a large trade in lithographic and mill stones and also in wine. C. is divided into four arrondissements. The chief towns are Dijon (the capital), Beaune, and Châtillon-sur-Seine. Area, 3383 sq. miles; pop. 376,866.

Côtes-du-Nord ('coast of the North'), a department in the N. of France, part of the old province of Bretagne. From E. to W. it is traversed by the Montagnes Noires, of granitic and Silurian formation, the highest point of which, Menez Haut, is 1112 feet above the level of the sea. The largest rivers are the Rance, Arguenar, Blavet, and Oust. Flax, hemp, pulse, beetroot, and even maize are cultivated; the hills afford excellent pasture; the cattle and horses, especially the latter, are famed; and along the coast are valuable fisheries. The chief manufacture is that of linen. C. contains five arrondissements. The principal towns are St. Brieuc (the capital), Dinan, Lannion, Loudéac, and Guingamp. Area 2659 sq. miles; pop. 618,652.

Cotes', Roger, a mathematician, was born 10th July, 1682, at Burbage, Leicestershire, studied at Trinity College, Cambridge, where he took his degree in 1706, and was appointed Plumian Professor of Experimental Philosophy. In 1713 he published a new edition of Newton's *Principia*, the characteristic feature of which is the preface. The high expectations which were entertained of this promising genius were blighted by his premature death on 5th June, 1716. He published a few papers in the *Philosophical Transactions*, and his principal works are *Harmonia Mensurarum* (1722) and his *Lectures on Hydrostatics* (1737), both posthumous publications.

Cotes'wold or **Cots'wold Hills** (Welsh, *coed*, 'wood,' and Eng. *wold* (earlier *weald*), the same, hence 'woody hills'), a range in Gloucestershire, extending from N. to S. upwards of fifty miles. The highest point is Cleare Hill, 1134 feet. Turnips and clover are cultivated on these hills, and coarse-haired sheep are fed there. The forests from which they derive their name have disappeared.

Coti'llon (from the Old Fr. *cote*, Lat. *cottus*), literally a gown or petticoat, was figuratively applied to a French dance extremely popular in the beginning of the 17th c. It combined the diverse qualities of the polonaise and the minuet, greatly resembling the quadrille, by which it was eventually eclipsed. In Burns' *Tam O'Shanter* occurs the line—

> 'Nae *cotillons* brent-new frae France.'

On the Continent, however, it retained its position of being the leading feature of an evening's entertainment, and has been revived in England. The leader of the C., as it is now danced, is chosen not only for his knowledge of the different figures, but also for his skill in varying their character, and, when possible, in adding to their number. The prizes or presents awarded during the dance are usually offered by the giver of the ball, and are often very costly.

Cotin'ga, a genus of Insessorial birds belonging to the family *Ampelidæ*, or 'Chatterers,' and section *Dentirostres*.

It is S. American in its distribution, and the bill, which is of feeble conformation, is deeply cleft. The plumage exhibits very brilliant hues.

Cotise′, or **Cotice** (Fr. *côté*, 'a side'), in heraldry, a diminutive of the Bend (q.v.), being a fourth of its width. The other diminutive is the *bendlet*, which is twice as wide as the C. Couped at its extremities, the C. becomes a *riband*. C. describes a bend between two cotises, a fesse or bar between two barrulets, or any heraldic object sided or accompanied by another.

Cotoneas′ter, a genus of plants consisting of trees or small trailing shrubs, belonging to Northern Europe and the mountains of India, cultivated for the beauty of their foliage, flowers, and fruit, the latter being (especially in the case of *C. frigida* and *C. affinis*) of an intense scarlet colour, and remaining on the trees for the greater part of the winter. *C. Vulgaris* is believed to be a native British species. In addition to those mentioned, *C. microphylla*, *C. marginata*, *C. rotundifolia*, and *C. buxifolia* are among the most valued cultivated species.

Cotopaxi, viewed from Salto.

Cotopax′i, a volcano in the Cordilleras of the Andes, 18,811 feet above the sea-level, with a cone rising in perfect regularity 4400 feet above the plateau of Quito, and covered with snow almost to the verge of the crater. Its flame is said to have risen in 1738 to the height of 3000 feet. In 1803 its internal heat was great enough to melt the snow on the exterior walls of the cone, and Humboldt, who was at the time at Guayaquil, 130 miles distant, heard day and night the awful explosions of the volcano, as though heavy artillery were at practice in the neighbourhood. A great eruption of C. took place 26th June, 1877.

Cotro′ne, the ancient *Croton* or *Crotona*, a town in the province of Catanzaro, Italy, on a projection at the mouth of the Esaro. Its streets are narrow, and its harbour, protected by a mole, admits only vessels of light draught. C. has a cathedral, and corn, wine, oil, and silk are produced in the vicinity. The ancient C., founded by a colony of Achæans in 710 B.C., was one of the wealthiest and most famous cities of S. Italy. The inhabitants excelled in athletic exercises, and the celebrated Milo was a native of the place. Pythagoras founded here a school of philosophy. The city was so exhausted by the ravages of the second Punic War that the Romans sent a colony to recruit its population in 194 B.C. Some ruins are still visible in the neighbourhood of the modern town. Pop. 9662.

Cott′a, the name of an old and still flourishing German publishing house. The first publisher of the name was **Joh. Georg C.,** the descendant of a family which had removed in the beginning of the 15th c. from the Milanese to Germany. He acquired by marriage in 1642 the book trade established in Tübingen by Brunn. His son, **Joh. Friedr. C.,** a distinguished theologian, was born at Tübingen, 12th May, 1701, and died there, 31st December, 1779, chancellor of the university. The grandson of the last mentioned was **Joh. Friedr., Freiherr von C.,** born at Stuttgart, 27th April, 1764. After serving some time in the Austrian army, and subsequently practising as an advocate, he undertook in December, 1787, to conduct the family publishing business, and soon distinguished himself by his judgment and enterprise. In 1798 he established the still influential *Allgemeine Zeitung*. Other periodicals followed, as the *Almanach für Damen*, the *Morgenblatt*, and *Literaturblatt*. He also published the works of such authors as Goethe, Schiller, Herder, Fichte, Jean Paul, Tieck, Voss, the brothers Humboldt, and Johann von Müller. Johann Friedrich retired to Stuttgart in 1810. The ancient nobility of the family was restored in his person, his title being Freiherr C. von Cottendorf. He died 29th December, 1832. He was a man of fine character—liberal, pure, and unselfish in all his actions. The business of the firm is widespread.

Cott′age, the general name for the rural dwellings, small and isolated, of the poorer classes. Adjoining each C. there is usually an allotment of ground which is cultivated by the occupants. The cottages of the agricultural labourers were, till a few years ago, in a very neglected condition, and the recent improvements in their construction with regard to ventilation, general convenience and comfort, and economy in erection, are in a great measure due to the deliberations of the Society of Arts, in whose *Journal* much valuable information may be obtained. A neat detached house for persons in better circumstances, in town or country, is called a *C. orné*.

Cottin, Sophie, a favourite French novelist, born at Tonneins (Lot-et-Garonne) in 1773. She married a banker of Bordeaux, and being left a widow at the age of twenty, thenceforth followed literature. Her chief works are *Claire d'Albe* (1798), *Malvina*, *Amélie Mansfield*, *Mathilde*, and (greatest of all) *Elisabeth, ou les Exilés de Sibérie*, published in 1806. The many translations of this book attest its popularity. Madame C. died at Paris, 25th August, 1807. A collected edition of her works was published at Paris in 1817.

Cott′on, the hairs which surround the seeds of various species of *Gossypium*, a genus of plants belonging to the natural order *Malvaceæ* (mallows, hollyhocks, &c.), and

Shrub Cotton.

which constitute the well-known textile material of that name. Between twenty and thirty species of *Gossypium* are imperfectly described, but the real number of distinct forms is probably much less. The genus is indigenous to Asia and America, but it is now almost universally cultivated in all parts of the world 36° N. and S. of the equator. They are herbaceous, or shrubby perennial plants, varying from 2 to 15 feet in height. The flowers are generally large and showy, and the seeds, which are covered with the long filaments called 'C.' (and each of which consists simply of long Cells, q.v.), contain a bland oil, used for various purposes in the arts. From the seeds is also formed a cake used in feeding cattle. Of Shrub C., the species cultivated in the United States, there are two well-marked varieties—the long-staple or Sea Island C., and the short-staple Upland, Georgian, or bowed C., which forms the bulk of the C. crops in America. Egyptian and Bourbon C. also belong to this variety. In the United States the harvest commences in August, and lasts until December. *G. herbaceum* is a native of India, and is grown in Persia, the Mediterranean countries, &c. *G. Peruvianum*, or kidney-C., is indigenous to Peru, Bahia, and other parts of Brazil, &c. *G. arboreum* is a tree-like plant of India, China, &c., but commercially is of little importance. The term 'C.' is, however, applied to various other plants—*e.g.*, French C., lavender C., New Zealand C., silk C., the fibre from *Bombax*, &c., wild Australian C., wild Natal C., &c., and the C.-plant of Otago.

Production and Commerce.—The cultivation of C. takes rank in extent and value above all other crops, wheat and rice only excepted. The enormous demand for C. manufactures may be well conceived when it is borne in mind that almost every individual human being uses C. largely for dress purposes; besides which it is employed for a vast variety of domestic purposes. Although C. now occupies this preeminent position among manufactures, it is only within comparatively recent times that it has risen into importance. It is known to have been cultivated and used in India and China at least 500 years B.C., but it did not rank as a great European staple till about the beginning of the present century. In 1700 the amount of C.-wool consumed in Great Britain did not exceed 1,000,000 lbs., yielding employment to 25,000 operatives. By 1775 the consumption had risen to 4,800,000, after which, owing chiefly to the inventions of Hargreaves, Arkwright, and Crompton, the industry rapidly developed, and we find that in 1800 the imports of C. fibre into Great Britain were 56,010,732 lbs., and the consumption about 50,000,000 lbs.

The table, setting forth the import of Raw C., C. Yarn, and C. Waste (of Raw and Yarn), in the year 1894 is now given. The value of the materials imported from each country is placed beside the weight. These statistics furnish very conclusive evidence of our dependence upon foreign countries, especially the U.S. of America and Egypt, in spite of the import from Canada and our possessions in the East.

IMPORT OF COTTON DURING THE YEAR 1894.

Raw Cotton from—	Cwts.	£
Russia	9,851	22,566
Denmark	9,130	16,520

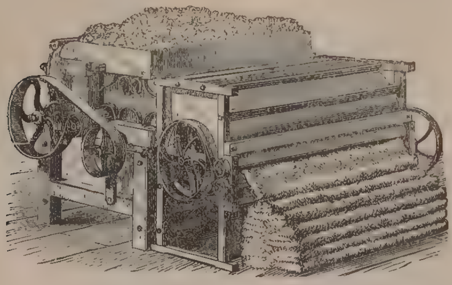
Total	6,585,061	54,918

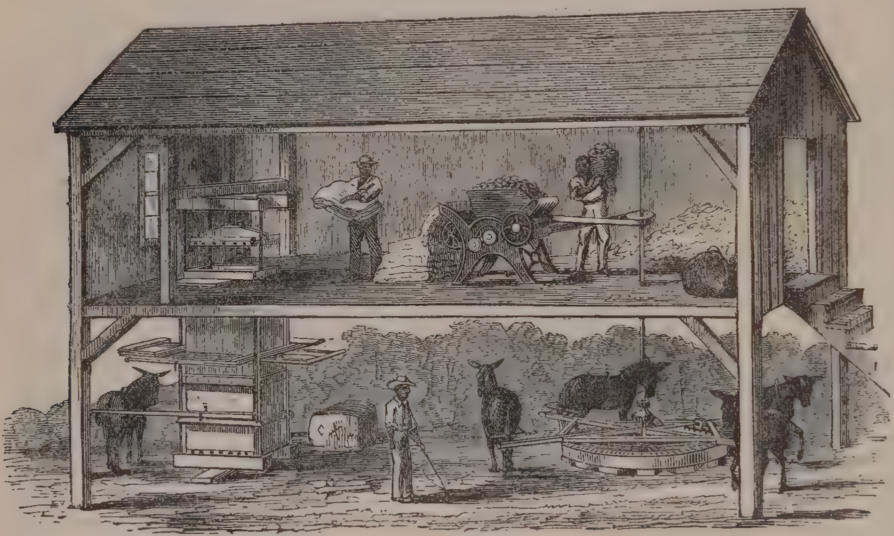
C., as a crop, is cultivated in tropical and sub-tropical regions, its widest range being 40° on each side of the equator. Humboldt states that the three species, *Gossypium barbadense*, *G. hirsutum*, and *G. religiosum*, flourish best from the equator to 34° in a mean annual temperature ranging from 68° to 82°, while *G. herbaceum* is best suited for more temperate climates, with a summer heat of 73° to 75°, and a winter temperature of not less than 46° to 48°. The great C.-growing region of the world is the Southern (formerly slaveholding) States of the United States, after which range in productiveness the E. Indies, Brazil, various countries bordering on the Mediterranean, Peru, and China. It is from these regions that the European demand is at present principally supplied, but in Japan and other localities a great amount of C. is grown for native use.

In the United States the C.-seed is sown in March or early in April. The ground is prepared in ridges, and the seeds are placed in small clumps about 18 inches apart. After about a week the young plants are seen above ground, and when they have shot out their third or fourth leaf, they are gone over and thinned out. Later on they are subjected to further thinning, only a single strong plant being then left in each place. In from ten to eleven weeks after sowing, the plants blossom, and the bolls continue to form and develop till the autumn frosts nip the plants. In India the sowing takes place in June, and the harvest is picked from February to April of the ensuing year. C. is a very delicate crop, easily affected as to bulk of yield and quality by climatic conditions, nature of soil, method of culture, and other influences, and the plants are also peculiarly liable to suffer from the attacks of various insects. When fully ripe the capsule containing the fibre and seed bursts, exposing the C. in a snow-like mass, which may then be readily detached from the husk by hand-picking.

The seeds are removed from the C. fibre which envelops them by a process called *ginning*, or by other mechanical agency. The C. *gin* consists of a cylinder about 4½ feet in diameter on which are fixed circular saws projecting about 2 inches above the cylinder. As the mass of C. is pushed towards the cylinder, the teeth of the saws catch the C. and drag it between the bars which stop the seeds from passing through with the lint. Another cylinder below, furnished with brushes, removes the C. from the teeth of the saws. A revolving fan then wafts the lint out of reach of saws and brushes. These are the main features of a gin, but there are numerous modifications and improvements. The C. is then compressed, either by a powerful screw-press or by a hydraulic press, into bales, which are secured by iron hoops, and it is then ready for the market. Bales from different countries vary in weight, Americans averaging 440 lbs.; Brazils, 160; Egyptians, 560 to 600; W. Indians, 200 to 220; Surats, 380 to 400; and Bengals, 300 lbs. C. is sampled, or its quality tested, by drawing out the fibres of a small tuft between the fingers and thumb, so as to lay them parallel and show their length and strength. A good sample should be bright, clear, smooth, firm, elastic, and strong. The fibre varies in natural colour from a pure silky white into slightly bluish and reddish tints, and in the case of the Nankin C. of China it has a strong yellowish-brown colour. The filaments vary in length from about half an inch to fully two inches; when not more than an inch in length it is denominated 'short-staple,' and when more than an inch, it is known as 'long-staple.' C. ordinarily contains about 6 per cent. of moisture; but exposure of bales in damp situations may cause it to absorb as much as 25 per cent. of water without feeling obviously wet. Damp C. is extremely subject to spontaneous combustion, and when any portion is soaked with oil it spontaneously ignites with very great readiness.



Exterior view of the Gin.



The Gin House.

In the C. trade a standard graduated scale of qualities is recognised, that for Americans being, in descending series, 'fine,' 'good,' 'good fair,' 'fully fair,' 'middling fair,' 'good middling,' 'middling,' 'low middling,' 'good ordinary,' 'ordinary,' 'inferior.' According to the great geographical divisions from which the fibre is derived, stocks are classified and statistics are compiled; and under each of these divisions various qualities are recognised and prices quoted in trade lists. The Liverpool Cotton Brokers' Association arrange their returns under these six heads:—(1) *American.* This includes the whole produce of the United States, the principal varieties of which are Sea Island or Long Georgia (the famous long-staple C., which is the finest and costliest grown), Upland Georgia, New Orleans, Mobile, Alabama, &c. (2) *Brazilian*, including such varieties as Pernambuco, Santos, Bahia, Maceió, Maranhão, and Parahyba. (3) *Egyptian.* (4) *Turkey and Greece*, a division which includes the Mediterranean region, Egypt excepted. (5) *West Indies, Peru*, and other South American localities. (6) *East Indian*, under which are ranged Bengal, Tinnevelly, Surat or Bombay, Dhollerah, Dharwhar, Broach, and Rangoon, &c.

The following table exhibits the imports and consumption of C. in Great Britain for the years 1860-67, and points out the effect of the American civil war on the trade. It also exhibits the average price per lb. each year of three standard qualities of C. The imports from various countries are stated in thousands of bales, and the total imports, as well as the consumption, is given in millions of lbs. The difference between the imports and consumption roughly represent the amount exported from Great Britain, and fluctuations in stocks held.

Year.	In thousands of Bales.					In millions of lbs.		Mid Upland. Pence per lb.	Fair Pernambuco. Pence per lb.	Fair Surat. Pence per lb.
	American.	Brazil.	Egyptian, &c.	West Indian, &c.	East Indian.	Total Imports.	Total Consumption.			
1860	2,518	103	109	10	563	1,427·1	1,083·6	6¼	8 3/16	5
1861	1,841	100	98	10	987	1,259·9	1,007·4	8 9/16	9¾	6 5/16
1862	72	134	147	20	1,072	533·2	451·7	17¼	18⅛	12⅛
1863	132	138	248	23	1,391	691·6	508·4	23¼	24¼	19¼
1864	198	212	319	60	1,798	895·1	553·6	27½	28¾	21½
1865	462	340	414	131	1,408	983·5	723·2	19	19¼	14½
1866	1,163	407	200	112	1,867	1,355·3	881·1	15½	17⅜	12
1867	1,226	437	198	129	1,511	1,274·3	966·7	10⅞	11⅝	8¾

The subjoined statement exhibits the annual export and import in reference to the C. trade of the United Kingdom from 1890 to 1894. The annual bill is certainly a heavy one, which the country has to pay for the raw material, &c.; yet the receipts for the exported merchandise, although in each succeeding year less than in 1890, have since 1891 shown an upward tendency in proportion to the disbursements, so that in 1894 the balance in favour of this country was over 21 millions, the highest balance in the period treated of. That so large a balance may, or may not, necessarily mean a proportionately large profit to the capitalists engaged in the British C. business is a question which is impossible to discuss within the limits of this article. It must be allowed, at all events, that the country at large profits vastly by reason of its C. manufactures, and that, should the policy of the government ever happen to be antagonistic to the interests of the British C. trade, the country will be in danger of losing the command of the world's market owing to such an interference with one of the chief sources of its commercial wealth.

	1890.	1891.	1892.	1893.	1894.
	£	£	£	£	£
Export .	62,089,442	60,230,256	56,265,468	54,699,367	57,278,884
Import .	45,559,422	49,284,617	41,175,143	33,727,964	36,163,789
Balance in favour of the United Kingdom	16,530,020	10,945,639	15,090,325	20,971,403	21,115,095

Under *exports* are included—C. yarn and twist (grey, bleached, and dyed)—C. manufactures (piece goods—grey, unbleached; white, bleached; printed; dyed; mixed materials with C. predominating—lace and patent net—stockings and socks—thread for sewing—hosiery and small wares).

Under *imports* are included—C., raw and yarn—C. manufactures (piece goods and other sorts).

Cotton-Grass, or **Cotton-Rush** (a genus of plants belonging to the natural order *Cyperaceæ* (tribe *Scirpeæ*), so called from the fine silky hairs or bristles which spring from the base of the ovary, and give the plants the appearance of being topped by cottony tufts, especially when seen waving in the wind on the bleak moors on which they grow. This 'cotton' has been used for stuffing pillows, making candlewicks, &c., and it has even been proposed to utilise it for textile purposes. The stem of the Himalayan species called *Bhabhur* yields a fibre of which strong ropes are made. There are several British species the leaves of which were at one time employed as a remedy for diarrhœa, and the pith as a vermifuge for tapeworm.

Cotton, Sir Robert Bruce, an eminent antiquary, was born at Denton, in Huntingdonshire, 22nd January, 1570. He was educated at Cambridge, and afterwards resided at London, where he devoted himself to archæology, and collected a number of charters, deeds, manuscripts, &c. (in many cases obtaining them from the monasteries, which had been dissolved half a century before), of the greatest value for their bearing upon the history and constitution of Britain. C. was knighted by King James, who employed him to defend Mary Queen of Scots against the shameful attack of Buchanan (q.v.), and published a pamphlet on the question of precedency between England and Spain, and another on the antiquity and dignity of Parliaments. Latterly, however, he lost the royal favour, and was even shut out from his own library. He died 6th May, 1631.

The *Cottonian Library* is the library of Sir R. B. C., considerably increased by his son and grandson, which was vested in trustees for the benefit of the public. Besides coins and antiquities, it consists of about 900 volumes, a large number of which are state papers of the highest value, including diplomatic correspondence between England and the Continental states, from the reign of Edward III. to that of James I. The library was placed in 1730 in Ashburnham House, Westminster, where a fire partially destroyed some of the volumes. Among the MSS. that suffered severely on this occasion was that of the Old English poem of Beówulf (q.v.). As the work had not then been printed, and no other MS. existed, it is singular to reflect that the most ancient, the most poetic, and the most picturesque product of the early Teutonic muse, was within an ace of absolutely vanishing from human knowledge. The Cottonian Library was removed in 1757 to the British Museum. See Edwards' *Memoirs of Libraries.*

Cotton-Seed Oil, a secondary product of the cultivation of cotton, of considerable value, is found in the oil obtained by expression from the seeds. The seeds are treated in the same manner as linseed, and yield a brownish fluid oil used for general purposes. The oil-cake of cotton-seed is a valuable cattle-feeding substance.

Cotton-Spinning. The various industries connected with the preparation of cotton for use constitute the most extensive and important of all textile manufactures. In Great Britain, cotton is indeed the staple of the leading industry, giving direct employment to more persons than any other, and absorbing the largest amount of capital. Though it is only in recent times, and principally within the present century that cotton has attained a pre-eminent position in manufacturing industries, the fibre has been utilised in India, China, and other Oriental countries from the most remote period, and the indigenous cotton of America was employed as a textile material before the discovery of that continent by European explorers. The manufacture of cotton embraces spinning, weaving, bleaching, calico printing and dyeing; but only C.-S. will be here dealt with, the others being noticed under their respective heads.

The first operation in the preparation of cotton for spinning, after the fibre has been gathered, consists of *ginning*, or separating the fibre from the seeds which are enclosed within it. This is chiefly performed at the place of growth of the fibre, previous to packing it in bales for exportation. A variety of mechanism has been adapted for the operation, the most common being the saw-gin, in which a kind of revolving circular-saw apparatus tears the fibre away from the seed. Cotton, as imported, requires frequently to be freed from the grosser impurities mixed up with it by means of the *willow*, an apparatus so named from having being originally a cylindrical box or basket of plaited willows. It now consists of a box in which a series of iron spikes revolve with enormous rapidity over a gird-bottom, and in their revolution they toss about and open the cotton fibre fed into the apparatus, the impurities falling through the bottom. From the willow the fibre passes to the *opener* or *scutching machine*, which, in the case of clean staples, is the first apparatus through which the raw cotton passes. In this machine all the matted lumps of the cotton are teased out by means of a revolving beater, which strikes against the fibre with great violence. The impurities from the cotton fall through a gird-bottom under the beater, and the fibre is carried forward by the suction of a fan-blast. From the first opener the cotton passes to a second machine of the same nature called the *spreading frame* or *lap machine*, where, in addition to undergoing an additional opening and blowing, it is formed into a *spread lap*, or continuous roll of uniform breadth and thickness. The material is now ready for *carding*, the purpose of which is to disentangle the separate filaments, and lay them all parallel to each other. The carding engine is a complex apparatus, the principal feature of which consists of a series of cylinders revolving in opposite directions, such cylinders being covered with leather or vulcanised cloth studded with wire teeth or hooks, bent forward in the direction in which the cylinders are intended to revolve when in operation. Commonly the main cylinder of the carding engine is arched over by a series of flat top-cards or *flats*, which are toothed and stationary, and act against the main cylinder revolving under them. For fine C.-S. the fibre is passed through two such engines:—1st, the *breaker card*, which delivers the material in a broad thin fleece; and 2nd, the *finisher card*, from which the cotton issues in a loose riband or *sliver*, ready for the drawing frame. Instead of the finisher card, a combing machine is sometimes used for the finer qualities of yarn, by which the short fibres are combed out, and the long fibres arranged in a beautiful uniform sliver. Still further to render the fibres parallel with each other, and to produce a uniformity in the sliver, the material next passes to the *drawing frame.* This apparatus consists of three pairs of rollers, placed behind each other, and caused to rotate at different rates of rapidity, so that the material fed into the first pair, when caught by the more rapidly moving second pair, is drawn out lengthwise in proportion to the different rate of motion. Between the second and the third pair the same difference holds, and generally the drawing frame is so arranged that six slivers fed together into the first pair are passed out of the third elongated six times, and having consequently the thickness of one of the original slivers. The slivers are repeatedly subjected to this operation, till by doubling and drawing, the sliver, as delivered by the carding engine, is drawn out to one thousand times its original length. The drawn sliver is next passed to the *slubbing frame*, where it is further drawn out, receives a slight twist, sufficient to hold it together as a thin, loose rope, and is wound on a bobbin. In the *roving frame* the coils from two bobbins of slubbing are united, drawn out to still greater tenuity, twisted, and wound on a bobbin, and at this point the fibre is ready for the final operation of *spinning*. For this operation two kinds of machine are employed:—(1) the *throstle*, in which the roving is drawn out to a sufficient tenuity, twisted, and wound on bobbins in a series of continuous operations; and (2) the *mule*, in which a certain length of roving is first drawn out, which portion is then twisted and wound on cops. When two strands of yarn are subsequently twisted together, the product is called doubled yarn or thread.

A perusal of the following tables cannot fail to be of interest to the reader, who may be watching the competitive struggle for employment which is in progress between the sexes, and which is one of the characteristics of the age.

The plan adopted for table A differs slightly from that afterwards followed in tables B and C; but as the difference is slight, there can be no difficulty in comparing the statistics contained in the first with those in the others.

In the first place we may note, amongst other things, the gradual decrease in the number of factories in England and Wales (2542—2481—2406); and the fluctuations in Scotland (105—147—124); and in Ireland (8—7—8). And yet, although the total number of factories was less in 1885 than in 1875 and less in 1890 than in 1885, the total number of employed (male and female) gradually increased by 24,554 in 1885 and by 49,280 in 1890, as compared with that in 1875.

In the next place, we may consider the employment of children and half-timers as set forth in these tables. We find that in 1875 (Table A) the boys were more numerous than

TABLE A.

August, 1875.	Number of Factories.	Number of Carding Machines.	Number of Combing Machines.	Total Number of Spinning Spindles.	Total Number of Doubling Spindles.	Total Number of Power-Looms.	Number of Power-Loom Weavers.	Number of Persons Employed.					Total Number of Persons Employed.

the girls by 705 in England and Wales, and by 261 in Scotland. The advantage was not long retained, as we find that the boys in 1885 (Table B) were in the minority by 1591 in England and Wales, and by 591 in Scotland, and that in 1890 (Table C) the difference had increased to 2121 in England and Wales, and to 611 in Scotland. The numbers of the boys and girls in Ireland were even in 1875; in 1885 the boys were in the minority by 2, and in 1890 in the majority by 1. It would appear, therefore, that, unless the capitalists prefer to employ girls, the boys are slower to avail themselves of the advantages conferred by the half-time clauses.

When we consider the total numbers of male and female hands and compare those relating to England and Wales with those concerning Scotland and Ireland, we note a somewhat curious dissimilarity. In England and Wales, the number of hands of each sex has gradually increased; and the balance in favour of the females has also increased—(Table A) 79,122; (Table B) 87,080; (Table C) 89,607. In Scotland the number of each sex had increased in 1885, but fell again in 1890, that of the female hands being, indeed, lower than in 1875. In Ireland there would appear to have been a very considerable decrease in the number of each sex in 1885, and only a slight rebound in 1890. In Scotland the balance in favour of the females has been gradually shrinking —(Table A) 24,444; (Table B) 23,869; (Table C) 22,361; while in Ireland it has fluctuated—(Table A) 709; (Table B) 364; (Table C) 453. According to the grand totals, the majority in favour of the females over the males employed in the Cotton Factories in the United Kingdom was 104,275 in 1875; 111,313 in 1885; and 112,421 in 1890.

These tables deal with only one industry out of the many in progress in Great Britain and Ireland; nevertheless, this industry employs over half a million of hands, and for that reason any preference of female labour to that of the more expensive male must be not only a matter of some importance to the capitalists, but also of vital interest to those who are dependent on the wage-earners. In the article Cotton the reader may see how the gross profits in the export trade have been steadily growing since 1891 (£21,115,095 in 1894) and he may very reasonably conclude that the net profits of the capitalists have proportionately increased. If that conclusion be correct, the result has been obtained owing to a proportionate reduction in the aggregate wages paid by the capitalists, who, in spite of a slight increase in the individual wage and a considerable increase in the number of hands, may have really paid less wages seeing that they continue to use the cheaper labour of the female hands, wherever it is possible. May we understand that *home* trade pays the wages, &c., and *export* trade ranks as profits?

It is impossible at present to form any definite opinion as to the effect which Indian and Japanese competition is said to have had upon our Cotton trade during the last five years, and until some honourable member of Parliament may move for and obtain a more recent return under the Workshops and Factories Acts, we must remain equally uncertain concerning the present statistics of matters treated of in these tables.

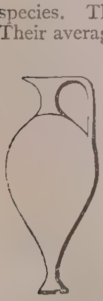
Cotton-Weed, a plant belonging to the natural order *Compositæ*, a native of the S.E. shores of Europe and of N. Africa. It gets its name from its leaves being clothed with dense greyish hairs, which look like wool.

Cott'us, a genus of Teleostean fishes, including the species known as 'Bullhead' (q.v.), some of which are marine, whilst others inhabit fresh water. They belong to the Gurnard family, and are remarkable for the large size of the head, which is provided with formidable-looking spines and processes. The sea-scorpion and the father-lasher are common British species. They can live out of water for considerable periods. Their average size is from 6 to 10 inches.



Cotyliscus.

Cotyle'don (Gr. 'cup or hollow-shaped'), a part of the embryo of Plants (q.v.); also a genus of shrubs and herbaceous plants belonging to the natural order *Crassulaceæ*. The C., called pennywort, or pennypies, is a common plant in the W. of England, and in some parts of Wales. Several species, especially those of the Cape of Good Hope, are frequently cultivated.

Cotyliscus, a small one-handled vase used by the Greeks for holding wine or water. In shape the C. resembled the amphora, which, however, was rather larger and had two handles.

Couch'ant (Fr. *coucher*, 'to lie down'), in heraldry, a lion, or other beast, lying down with his head erect. See DORMANT.

Couch-Grass.

Couch-Grass, Wheat-Grass, Dog-Grass, Quickens, Squitch, or **Quitch,** the two latter names being also given to other grasses, a perennial species of grass, belonging to the same genus as wheat, common in Europe and N. America. Being from its long, spreading roots difficult to be eradicated, it is a troublesome weed in cultivated grounds. C. is useful in binding sandy soils together, but though the roots are sweet and mucilaginous, and used in Naples for feeding horses, and even for making into bread in times of scarcity, and for brewing a domestic beer valued as a diuretic and diaphoretic, the foliage is not greatly esteemed as a feeding material. Its leaves, probably owing to a volatile oil, have a pungent flavour, and act upon dogs, at least, as a powerful emetic.

Cou'cy, Renaud, Castell'an of, a *trouvère* of the N. of France, of whose life nothing more is definitely known than that he lived about the 12th c., and was a crusader, probably with Richard Cœur-de-Lion and Philippe Auguste. He is known for his extremely passionate and beautiful love-poems or *Chansons*, an admirable edition of which was published by Michel (Paris), in 1830.

Coue'pia, a genus of plants of the natural order *Chrysobalanaceæ*, comprising about a dozen species, all natives of S. America. The fruits of many of them are eaten—*e.g.*, that of *C. Chrysocalyx*, planted near the villages of the Amazonian Indians. The Indians use the bark of C. of Guiana in the manufacture of pottery.

Cou'gar. See PUMA.

Cough'ing is a symptom of irritation in the respiratory passages, or in the respiratory organs themselves. This irritation may depend upon a variety of causes, and it is a symptom of several diseases entirely distinct from each other. C. may be spasmodic, depending on a state of nervous irritability, without any obvious exciting cause; or it may be occasioned by pressure on the lungs from obesity, enlargement of the liver and spleen, &c. C. may also be caused by the inhalation of irritant matters, brought into contact with the fauces, trachea, or bronchial tubes. Severe and prolonged C., not unfrequently simulating the symptoms of organic disease of the lungs, is often caused by enlargement and elongation of the uvula, the result of inflammation of that organ, the irritation being caused by the uvula tickling the adjacent parts. C. may also depend upon the absence of the normal amount of mucous secretion in the respiratory passages, and when such is the case, it is not followed by expectoration; or it may be caused by an excess of mucous secretion, as in ordinary catarrh and bronchitis. C. is also a symptom of such diseases of the lungs as pneumonia and phthisis; and of such local affections as croup, diphtheria, and whooping-cough. The C. of asthma is usually accompanied with distressing dyspnœa. In many diseases C. is a secondary symptom, owing to the respiratory organs being affected in connection with the general constitutional derangement. When it depends on acute or sub-acute inflammation, it is accompanied with febrile symptoms, as in bronchitis, pneumonia, and frequently in phthisis; but when chronic, or depending on local irritation only, there may be no pyrexia. By stethoscopic and other means of diagnosis, the nature of the disease, the seat thereof, and the extent to which the lungs are implicated, can always be determined. C., in all cases, is an effort of nature to relieve itself from a source of irritation.

Coulomb', Charles Augustin de, a well-known French physicist, was born at Angoulême, 24th June, 1736. His fame rests upon his experimental researches in electricity and magnetism, especially his discovery of the law of the inverse square. (See TORSION BALANCE.) Through the influence of the projectors of a canal in Bretagne, C. was imprisoned for a time on account of his unfavourable report of the scheme. In 1786 he became a member of the Academy of Sciences, and in 1806 of the Institute. C. died 23rd August, 1806. His principal literary productions are his memoirs *Sur les Aiguilles Aimantées* (1779), *Sur la Statique des Voûtes* (1779), and *Sur la Chaleur* (1804).

Cou'marin is a crystalline substance contained in the Tonka bean, in woodruff, and in several other plants. It may be obtained by extracting Tonka beans with boiling alcohol, and evaporating the solution till it crystallises. C. has a pleasant aromatic odour; its taste is burning. When heated it melts, and may be volatilised unchanged. C. has been prepared artificially.

Coun'cil, in the New Testament, signifies the Jewish Sanhedrim (q.v.). The clergy of a city or district, presided over by one of their own number as moderator, formed a consistorial court or C. of one Church. Of this nature was the meeting of the Church at Jerusalem recorded in Acts xv., which is sometimes called the first Christian C. In the 3rd c. the moderator was developed into a Bishop (q.v.), who presided over the councils of the presbyters of his diocese. An ecclesiastical C. proper, however, is a meeting of delegates from a number of confederate Churches. The custom of holding such councils began among the Greeks, who were accustomed to hold similar assemblies (synods) in connection with a political confederation of cities; and from them it was extended throughout the whole Church, the meeting receiving in the West the Latin name of C. At first the councils were merely provincial, and had very limited powers; the bishops and presbyters came as the representatives of their churches, and were presided over by a Metropolitan (q.v.). The earliest councils of this kind of which there is authentic notice were those which met concerning the Montanists, about 170. These councils having thus come to be regarded as the highest ecclesiastical tribunal in the several provinces, when the Church was established and consolidated under Constantine, it was easy to extend the idea to the whole Roman Empire, and the Emperor summoned a general or Œcumenical C. (q.v.) to discuss matters affecting the whole Church or the general principles of Christianity. The authority of convening general councils in the East was exercised by the Emperors; the Popes afterwards exercised the same power in the West.

The four general councils recognised by all Churches are those of Nicæa (325), of Constantinople (381), of Ephesus (431), and of Chalcedon (451). The chief subject discussed at these four was the doctrine regarding the person of Christ. The first condemned Arius (q.v.), who denied the proper divinity of Christ, and decreed his *true* Godhead. The second condemned Apollinaris (q.v.), who gave to Christ only an incomplete human nature, and decreed his *perfect* manhood. The third condemned Nestorius (q.v.), who separated Christ's two natures, and decreed that he was God and man *indivisibly*. The fourth condemned Eutyches (q.v.), who confounded Christ's two natures, and decreed that he was God and man *distinctly*. The Greek Church recognises other three in addition to the above; II. Constantinople (553), at which Origen was condemned; III. Constantinople (680), at which the Monothelites (q.v.) were condemned; II. Nicæa (787), at which image-worship was established. The Church of Rome recognises in addition to these seven, other eleven; IV. Constantinople (869); I. Lateran (1122), II. (1139), III. (1179), IV. (1215), at which Pope Innocent III. forbade the formation of new orders of monks; I. Lyon (1245), at which Innocent IV. declared Friedrich II. unworthy of the imperial throne of Germany; II. Lyon (1274), remarkable for the new regulations it enacted for the election of the Popes, including the shutting up of the cardinals in conclave; Vienne (1311), at which the Beghards and Beguines (q.v.) were condemned, and the Knights Templars suppressed; Florence (1439), which was chiefly occupied in settling the disputes between the Greeks and Latins; V. Lateran (1512), called by Pope Julius II. in opposition to that of Pisa; Trent (1545), convened to settle the controversies with the Protestants. The French divines, however, substitute for the Councils of Lyon, Florence, and V. Lateran, those of Pisa (1409), by which the *two* contending Popes were excommunicated; Constance (1414), at which the discord between the *three* contending Popes was extinguished; and Basel (1431), which discussed the union of the Greeks and Latins, and the reformation of the Church.

Besides these general councils, called by the Emperors and the Popes, many local councils were held, at which the bishops freely expressed their opinion, and often gave decisions opposed to those of the Popes; for it was long till the Church of the West especially could be brought to regard the decisions of the Roman Bishop as final. Of these local councils the chief are: Constantinople (754), called by Constantine (son of Leo the Isaurian) against image-worship; Frankfurt (794), called by Charlemagne against image-worship; Constantinople (842), which restored image-worship; Constantinople (861), called by some of the Greeks a general C.; Constantinople (879), which confirmed image-worship, and is held by some of the Greeks to be the eighth general C.; Placentia and Clermont (both 1095), at which Urban II. recommended the first crusade; Pisa and Milan (1511), called by Louis XII. of France to oppose Pope Julius II. The most important Protestant councils have been the Synod of

Dort (q.v.) in 1618, which condemned Arminianism, and the Westminster Assembly, which met in 1643 to aid the English Parliament in settling the government, worship, and doctrines of the Church of England. See Whately's *Kingdom of Christ*, Guericke's *Manual of Church Hist.*, Walcot's *Sacred Archæology*, and Michaud's *Discussions sur les Sept Conciles Œcumeniques* (Bern 1878).

Council of War, is a conference during war of general officers, or of the superior officers of a detachment, to advise with the commander. The British military code leaves the taking of this advice to the discretion of a commander; but the French code makes special provision for it, especially as regards the defence of a garrison. In the navy, flag-officers only are considered qualified to take part in a C. of W.; but officers of a lower rank are sometimes invited.

Count, or **County** (Lat. *comes*, Fr. *comte*), formerly an official, but now merely an honorary title, used on the Continent, and corresponding to the English Earl (q.v.) and the German Graf (q.v.). On the breaking up of the Roman Empire, the title *Comes* (q.v.) was retained in the new European kingdom, and under Charlemagne was applied both to military and civil officials. In France, where the C. of the palace ranked next to the mayor of the palace, the various Counts or governors of provinces were enabled, as the Karoling dynasty grew weaker, to acquire jurisdictions independent of the crown, and to make their titles, which they took from their respective possessions, hereditary. Thus arose the powerful Counts of Champagne and Toulouse, independent sovereigns, who appointed Counts under them, who are known as *Counts-palatine*. After the 12th c. the power of the French Counts decreased, the division of the country into counties was destroyed, and since the French Revolution C. has been merely an honorary title. In England, the Norman successors to the possessions of the English Earls were, for a time, known as Counts. Hence the wife of an Earl is still called a *Countess*. C. Palatine was, in England, applied to the noble or churchman (such as the Earl of Chester and the Bishop of Durham) who exercised royal prerogatives within his county. To this day there exists the C. Palatine of Durham, having its own staff of legal officers, just as the royal Duchy of Lancaster.

Count and Reck'oning is the name given in Scotch law to a form of process by which one party may compel another to account with him judicially, and to pay the balance which may be found due. In these actions, a remit is usually made to an accountant. The form of summons is called one of Count, Reckoning, and Payment, and is issued in accordance with a decree of the Lords of Council and Session.

Coun'ter-Approach', in defensive military engineering, a trench leading towards the besiegers from the covered way of the fortified place, and frequently ending in a small redoubt or battery. Its object is to get a point from which to enfilade the trenches of the enemy, and thus keep the fighting farther away from the besieged fortress.

Counter-Changed, in heraldry, describes a field divided in such a manner that it is tinctured in part with metal, in part with colour, the charges being reciprocally of the same colour and metal.

Coun'terforts, in fortification, are buttresses of brick or stone, built against the revêtment wall, to resist the outward pressure of the rampart, or the natural ground on the opposite side of the ditch. Their depth is usually equal to the mean thickness of the revêtment, and they are placed about 18 feet apart.

Coun'terguards, in fortifications, are small outworks, with parapets and ditches, occasionally constructed to cover the bastions and ravelins of a fortress. They run parallel to the faces of these interior works, and their crest is 3 or 4 feet lower than theirs, so as not to obstruct the defence, when the enemy has made a lodgment on the counterguard. The rear parapet never exceeds 18 feet, that there may not be space to establish a battery there when a lodgment has been made.

Counter-Irr'itants are medicinal agents having the property of irritating that part of the body to which they are applied, and of thereby exerting a curative influence on diseased parts or organs. They are chiefly used to modify the vascularity and nutrition of diseased parts; and to control congestion and inflammation, on the hypothesis that the production of artificial irritation on a sound part of the body affords relief to a part or organ previously diseased. Such agents have been employed by physicians from the earliest times. They are divided into three classes, viz., *rubefacients*, *epispastics*, and *caustics* or *escharotics*. The more prominent effects of C.-I. are purely mechanical, an artificial inflammation being produced which, when duly regulated, palliates or cures those which arise primarily or idiopathically, the blood being withdrawn from the congested or inflamed part, and accumulated in that to which the irritant is applied. C.-I. are applicable chiefly to cases of pain, congestion, or inflammation, the cause of which is confined chiefly to the affected parts, and they have but little influence upon the local developments of idiopathic general diseases, as fevers. They are of advantage at the early stage of diseases, when there is local determination of blood, but not during the stage of febrile action. When the intensity of the febrile action has subsided, as indicated by the pulse being softer and less frequent, the appropriate time has arrived for the application of C.-I. to obviate the effects of inflammation, and the less the extent of the disease the more amenable it is to this mode of treatment. The principal C.-I. are acid sulphuricum, ammonia, tartar emetic, aqua fervens, cantharides, capsicum, croton oil, moxa, sabina, setons and issues, mustard, succini oleum, turpentine. By the application of irritant ointments to a blistered surface, the counter-irritant action may be kept up for any length of time desired.

Coun'termines, in military engineering, are chambers or galleries excavated by the defenders of a fortified place to intercept the mines, discover the mining, or destroy the works of the besiegers. Listening galleries are effective means of defence, since the sound of a pickaxe can be heard 60 feet through the ground, and are always provided in a large fortress; so also are envelope and counterscarp galleries, and passages for communication. The countermining was a remarkable feature of Inglis's heroic defence of Lucknow in 1857.

Coun'ter-Pas'sant, in heraldry, describes two lions, or other beasts, passing each other in contrary directions.

Coun'terpoint ('point against point') is, in music, the accompanying of one melody or theme with others. Originally this was the only form in which any melody was harmonised, while in modern music (except in church-music and oratorios) it has been to a great extent superseded by harmony, which relies for its effect rather upon the construction and progression of the whole chords than upon the movement of the different separate notes of which each consists. There are many treatises on C., the authors of most of which seem to have taken as great delight in devising combinations possessing no merit but ingenuity, as in fostering the beauty of their art. The art of C., as described in these works, is highly complex and artificial, hemming the composer round with all sorts of restrictions, but at the same time its study is an essential part of a musician's education, just as in many other branches of knowledge the learner is compelled to work under strict rules at first, in order to give him greater freedom in his original work afterwards.

Coun'ter-Proof, in engraving, an impression obtained from a proof, while it is still wet from the plate, by laying it on a sheet of paper, and passing them through a press. The design on the C.-P. being the reverse of the proof, is in the same direction as that on the plate, and is made chiefly as a means of judging of the success of the engraver's work.

Coun'terscarp, in fortification, is the wall of a ditch on the besiegers' side, the wall next the body of the fortress being the escarp or scarp.

Coun'tersign, in military language, is a watchword given daily by the commander of an army during actual warfare or manœuvres, the pronouncing of which is a warrant for being allowed to pass the sentinels as a friend. It is generally some simple word. In diplomatic language, the C. is the signature of a secretary to the charter of a king, prelate, or other superior, as a certificate of its authenticity. In the Middle Ages, common additions to the C. are *obtulit, recognovit, relegit et subscripsit.*

Coun'ter-Ten'or, a male voice singing—mostly in *falsetto*—the alto part. The C.-T. takes the upper part in male-voice music, and sometimes the alto in mixed choruses. For this latter purpose it must be entirely condemned, for it is artificial, hard, and quite wanting in that freshness which characterises the true alto voice of women and boys.

Coun'ter-Vair, in heraldry, is one of the Furs (q.v.). Vair exhibits azure and argent shields or bells in horizontal rows, with the bases or points of the tinctures touching on each other. C.-V. shows the same objects with azure touching on azure and argent on argent.

Countervalla'tion, in siege operations, is a chain of redoubts all round a fortified place to hinder the sorties of the garrison. The redoubts are either isolated or connected by earthworks. A similar chain of redoubts to protect the besiegers from external attack is a Circumvallation (q.v.).

Coun'ties in England and Scotland are the same as shires. (See SHIRE.) C. are districts into which the country is divided for purposes of government and administration of justice. Each county in England is ruled by its Sheriff (q.v.). Lancaster and Durham are *C.-palatine*, which were invested with an independent jurisdiction. Certain cities and towns, with land and territory annexed, having liberties and jurisdiction by grant from the crown, are called *C. corporate.*

County Councils are popularly elected bodies, instituted by the Local Government Act, 1888, for taking over all duties connected with matters of local government in England and Wales, hitherto performed by justices of the peace, relating to county finance, rating and assessment, county buildings, bridges, lunatic asylums, reformatories, licensing for races, dancing and music, theatres, registration and polling of parliamentary electors, contagious diseases (animals), appointment, fees, district, and salary of coroners, pollution of rivers, and other minor matters named in the Act. The control of the county police is vested in them jointly with the quarter sessions, except in London, where the Government retain the control of the Metropolitan Police. They are empowered to make and levy county and other rates, and also receive a share of certain license duties, and of the probate duty collected by the Imperial Government. They are elected every three years by electors (men and women) who are qualified the same as borough burgesses, and have been enrolled for the purpose as 'county electors.' In addition to the C. Councillors elected there are aldermen, elected by the C. Councillors, either from their own body or from those persons qualified to be councillors. The aldermen are elected for six years, half the number retiring every three years. The chairman is elected by the aldermen and councillors from their own body or from persons qualified to be so placed on the Council. Qualification for a seat on the C. C. is similar to that for a seat on the borough council, and includes ministers of religion, peers possessing property in the county, county parliamentary electors, and military officers. There are altogether 62 C. C.'s in England and Wales, including those of London, Isle of Ely, the three Ridings of Yorkshire, and the Isle of Wight.

County Courts. The dilatory and expensive proceedings necessary for the recovery of small debts in the old courts led to the establishment in 1846 of the present C. C.'s with more efficient and definite powers for the hearing of cases of a minor importance in civil matters only, and an extensive jurisdiction in questions of law and equity.

If a cause involve more than £5, or be one in equity, a jury may be demanded by either party, or if it do not exceed £5, the judge may grant a jury trial. Under order of the judge, and with the consent of both parties, the issue may be settled by arbitration. Judgment in the C. C. is final, except on a point of law, equity, or the hearing or non-hearing of evidence, in which case, when either party is dissatisfied, appeal may be made to the High Court, but only with leave of the C. Court judge, if the claim be no more than £20. Certain provisions serve as a deterrent to persons contemplating bringing small actions before the High Court, in place of the C. C. The judges of C. C. are appointed by the Lord Chancellor from barristers of seven years' standing at least, who are no longer permitted to practise or act as arbitrators. The size of each district is fixed from time to time by the Order in Council. There may not be more than 60 C. Court judges. When the action is one concerning libel, slander, breach of promise of marriage, seduction, ejectment, title to corporeal or incorporeal hereditament, fair, toll, franchise, or market, the fact of the claim being more than £50 does not take the case out of the jurisdiction of C. C., and the C. Court judge may also adjudicate in cases where the subject matter does not exceed £500 in certain actions, brought by the creditors or legatees of a deceased person, or relating to relief against mistake or fraud, the maintenance of infants, or the dissolution of partnerships.

Important enlargements were made in the powers of the County Courts by various Acts and amendments from 1846 to 1875, and all these statutes were in 1888 consolidated and amended by the amending County Courts Act of that year.

County Rates are assessments in each parish in a county, assessed by the justices on the annual value of lands and tenements rateable for relief of the poor. They are applicable to payment of the county police, maintenance of prisons and county buildings, prosecution of felons and vagrants, and other county matters. By the Local Government Act, 1888, the assessing and expenditure of C. R. were vested in the County Councils.

Coup, a French word meaning 'a blow,' 'a stroke,' (old Fr. *colp*, from Low Lat. *colpus*, a contraction of *colapus*, from the classic Lat. *colaphus*), is known as the first word of certain expressive phrases which have become universally current. *C. d'état* signifies a stroke of policy; *C. de grâce*, the stroke of mercy by which an executioner ends a condemned wretch's sufferings; *C. de main*, a military phrase, meaning a rapid, successful attack—literally a stroke of the hand; *C. d'œil*, a glance of the eye—quick, comprehensive observation; *C. de soleil*, sunstroke; and *C. de théâtre*, a stage trick—surprising effects in real life as well as on the stage.

Couped (Fr. *couper*, 'to cut off'), in heraldry, describes the head or any limb of a lion or any beast cut off smoothly, not torn off with a ragged edge, or, as the heraldists say, *erased*. *C. close* is applied to the same kind of charge when no part of the neck or trunk is left. The term C. describes also a cross, bar, bend, or other similar charge when it does not extend in any direction to the border lines of the shield.

Coup'le (Lat. *copula*), the name given by Poinsot to a pair of equal forces acting in dissimilar directions in parallel lines. Such a system has a zero resultant acting at an infinite distance, yet it does not balance, the motion generated being one of rotation. The shortest distance between the directions of the forces is termed the *arm*, and the product of either force into the arm the *moment*. The *axis* is a straight line drawn from a convenient point of reference, perpendicular to the plane of the C., and representing by its length and direction the magnitude of the moment and the direction of rotation. If the rotation be positive, the axis is drawn towards the side from which the C. is viewed; if negative, towards the other side. Hence a C. regarded from the direction in which the axis points, is one which produces a positive rotation, and thus the axis completely determines the C. both in direction and magnitude. The resultant C. of two given couples is that C. whose axis is the diagonal of the parallelogram formed by the axis of the two given couples in precisely the same manner as in the Composition of Velocities and Forces (q.v.). It is evident, then, that the forces acting upon a material system may be all reduced to a force, a C., or a force and C.; and the reduction may be so ordered that the resultant force acts perpendicular to the plane of the resultant C., in which circumstances each will produce the respective effects of translation and rotation as if the other were not present. For the investigation and demonstration of the fundamental propositions in the theory of couples, see Thomson and Tait's *Elements of Natural Philosophy*, Todhunter's *Analytical Statics*, Pratt's *Mechanics*, and Duhamel's *Cours de Mécanique*.

Coup'ler, a piece of mechanism in an organ, by means of which two keyboards, or one manual and the pedals, can be connected together.

Coup'let is the name given to any couple of consecutive rhyming verses, but is more strictly used to denote two rhyming verses of equal length and rhythm, embodying an idea usually of the nature of a proverb or aphorism—

> 'Great wits are sure to madness near allied,
> And thin partitions do their bounds divide.'

The C. is very frequently used by the old dramatists as the 'tag' or concluding passage of a speech, in which a train of thought is rounded off with rhetorical completion—

> 'I go, and it is done; the bell invites me.
> Hear it not, Duncan, for it is a knell
> That summons thee to heaven or to hell.'

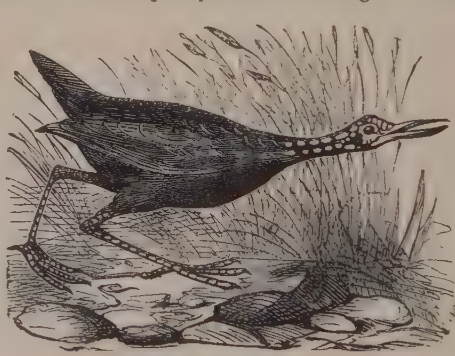
Cou'pon (Fr. *couper*, 'to cut off'), a certificate or warrant of interest or dividend due, printed at the bottom of transferable bonds given for a term of years, and cut off and presented for payment by the holder. In Great Britain a C. must be stamped.

Courante', a lively dance in triple time. The C. frequently occurs as one of the movements in the Suites (q.v.) of the older composers.

Courbevoie', a town in the department of the Seine, France, on the left bank of the Seine, 5 miles N.W. of Paris, with manufactures of white lead and brandy, and a trade in wine, brandy, and wood. Pop. commune 17,597; canton 98,407.

Cou'rier (Fr. *coureur*, from *courir*, Lat. *currere*, 'to run'), as a servant of a Government, is the bearer of important despatches to and from ambassadors at foreign courts. The employment of such messengers is of great antiquity. The Persian *angaros*, or mounted C., was kept always in readiness at certain stages throughout the country, to carry the king's despatches. Among the Greeks the C. was *hemerodromos*, a man who could run all day. The Romans styled him *cursor*, 'runner.' The duties were performed chiefly on horseback. In the Middle Ages couriers were known as *trotarii*, 'trotters.' In the 17th and 18th centuries they were called *running footmen* in England. Couriers now proceed by steamer, rail, or hired carriage, as well as on horseback; generally speak several languages; are acquainted with routes and officials, and are furnished with credentials and money by their Government. The C. in the Queen's Foreign Service is called Queen's Messenger. The appointment is one of those exempted from open competition, but a nominated candidate must be between the ages 25 to 35, must be a British subject, must pass an examination in French, German, or Italian, and in the first four rules of arithmetic, must be able to ride and perform journeys on horseback, and must possess sound bodily health. There are now nine Queen's Foreign Service Messengers, and eight Queen's Home Service Messengers, who are, however, on quite a different footing. The term C. is also applied to a private attendant on travellers, who arranges for his employer's convenience on journeys. He usually speaks several languages, knows the best routes, hotels, and places and objects of curious interest. The wages of this kind of C. are from £8 to £10 a month, independently of travelling expenses, out of which he is supposed to pay his own bill at hotels.

Courier, Paul Louis, was born at Paris, 4th January, 1773, of rich *bourgeois* parents, and after a successful study of Greek and mathematics, entered the artillery as scholar in the Camp of Châlons (1792). While serving in the army of the Moselle (1794-95), the 'army of England' (1798), and in the French occupation of Rome, C. found time to keep up his classical studies. He superintended the ordnance of Paris till 1801, translating in that period the chief orations of Cicero. In 1803 his *Éloge d'Hélène* (a work of Isocrates) was published. In 1805 he served in Italy, and took part in the conquest of the Two Sicilies, which gave an insecure throne to Joseph Bonaparte. In the midst of the guerilla warfare of the Sicilian peasants against the French general, Reynier, C. continued his studies and translations of Xenophon (the works upon Cavalry and Equitation). Misunderstandings with his superiors at various Italian stations caused him in 1809 to resign, although he returned to serve for a short time in the concluding campaign on the Danube. Soon after he made at San Lorenzo, Florence, the discovery of the manuscript of Longus, which he was afterwards stupidly accused of mutilating. In 1812 he settled in Paris, published his translation of the *Daphnis and Chloe* of Longus, and married in 1814. The management of his estate in Touraine brought him into contact with the absurd pretensions of the restored aristocrats. C. began his political writings by his famous *Pétition aux Deux Chambres*, and soon afterwards attached himself to the opposition journal, the *Censeur*. In 1821 his *Simple Discours* involved him in a political trial for insulting the court, resulting in a sentence of imprisonment. His *Pétition des Villageois qu'on empêche de danser* had nearly the same fate. On 10th April, 1825, C. was assassinated on his estate of Veretz, in circumstances which have never been rightly explained. His exact and extensive learning, fine taste, powerful satire, and simplicity and directness of style, give him a high place among French literary men. In some respects he has been likened to Swift. His *Livret*, or memorandum-book, gives a valuable and humorous picture of French politics and society after the Bourbon restoration. His complete works were published by Armand Carrel, with an essay on his life (Par. 1834).



South American Courlan.

Cour'lan, a large wading bird belonging to the order *Rallidæ* or Rails. The N. American C. has a depressed bill, broad rounded wings, and long hind toe; is of chocolate colour with a white throat and most of the feathers streaked with white. It runs quickly but is slow in flight. Its length of body is rather over 2 feet. It occurs in the W. Indies and in Florida, where it feeds upon a large green snail. The nest is fastened to water-reeds, and the number of eggs is either five or six. The S. American C. resembles that of N. America, though it is larger and only the feathers on the head and neck have white streaks. Both species are excellent eating.

Cour'land (Slav. *Kars*, Ger. *Kurland*), a Russian Baltic government, S. of Gulf of Riga, has an area of 10,535 sq. miles, and a pop. of 693,300. It is mostly covered with wood, consisting of beech, pine, alder, birch, and oak, and is in general level and full of lakes and marshes, the highest eminence being Silberberg, in the vicinity of Mittau, the capital, only 500 feet high. Distilleries and tilling form the most important sources of industry. The wealthiest and most intelligent of the inhabitants are Germans; the peasantry are for the most part Letts. The territory of C., taken under the protection of Poland in 1561, was merged in Russia in 1795. At one time it formed two duchies, the property of the Teutonic knights.

Cour'ses, in a ship, are the whole of the lower sails—*e.g.*, foresail, mainsail, mainstay-sail, &c.

Cour'sing is a mode of hunting hares by greyhounds. When a hare is started, it is allowed to get about 100 yards in advance of the dogs, which are then let loose from the 'slips,' or cords, held by the 'slipper,' and fastened to the dogs' collars. The judge keeps his eye on the dogs, and notes when either one makes what is called 'a point,' that is, causes the hare to turn or 'double,' as it is called, or otherwise gets a decided advantage over the other. The victory is not *necessarily* adjudged to the dog which kills the hare, but to the one which makes most 'points.'

Court (Fr. *cour*, Old Fr. *court*, from Lat. *cohortem*, 'a yard,' also in peasant speech *cortem*, according to Varro; allied to the Teutonic *garden*, *garten*, and *yard*), among the Franks and other Germanic tribes the country-house of a lord or chief, where also he administered justice. Later on it denoted the space enclosed by the buildings of a feudal castle; hence it came to be applied to those persons immediately surrounding the chief. In England, when we speak of 'the C.' we denote the family and household of the sovereign.

Court, Presentation at, or introduction to the sovereign, can in England only be obtained by means of some one who has been already introduced. The distinction is valued as a stamp of character and social status, though not usually cared for by those who have distinguished themselves in science, literature, or art. The 'C.-dress,' which must be worn on the occasion, probably forms to some an objection to going through the ceremony. It is antiquated, fantastic, and expensive. There are special days, advertised in the newspapers, on which the Queen holds levées and drawing-rooms. The former is for the reception of men only; the latter chiefly for the reception of women. The names of those who wish to be presented must be sent in to the office of the Lord Chamberlain some days previously, that they may be submitted to the Queen. No man or woman of doubtful reputation will be received. Lists of presentations appear on the following day in the principal London newspapers. Any British subject who has been presented at the C. of his own sovereign has a right to be presented at any foreign C. by the British Ambassador.

Court of Judicature, Supreme, Acts, 1873 and 1875 (England). The statute of 1875 amended and extended the Act of 1873, and is to be construed along with it, the Acts together totally changing the constitution of the supreme law courts of England. By the Act of 1873 the Courts of Chancery, Queen's Bench, Common Pleas, Exchequer, Admiralty, and Probate and Divorce, were consolidated as one Supreme Court, in two divisions, Her Majesty's High Court of Justice, and H.M. Court of Appeal, the appellate jurisdiction of the House of Lords being regulated by the Acts of 1876 and 1887. (See COMMON LAW.) All actions which had hitherto been commenced in the superior courts of Common Law at Westminster, or in the C. of Common Pleas at Lancaster, or in the C. of Common Pleas at Durham, and all suits which had hitherto been begun by a bill or information in the High C. of Chancery, or by a cause *in rem* or *in personam* in the High C. of Admiralty, or by citation or otherwise in the C. of Probate, were now by these Acts to be instituted in the High C. of Justice by a proceeding to be called an *action*. There were to be five divisions of the C., called the Queen's Bench, the Common Pleas, the Exchequer, the Chancery, and the Probate, Divorce, and Admiralty Divisions. The numbers of divisions and of judges were to be increased or decreased by the Queen in Council, and an Order in Council, issued in 1881, joined together the three first-named divisions and made them one division, the Queen's Bench division, so there are now three divisions. Her Majesty's C. of Appeal was also constituted by the Acts. (See APPEAL.) The most important change effected by these Acts was the power given to each divisional judge to administer law and equity concurrently with power to prefer the latter when opposed to the former. Registrars were appointed to several districts to hear the proceedings up to the trial. Rules of Practice were put forward and these have been amended from time to time, and at length consolidated in 1883. The Act of 1883 united the London C. of Bankruptcy to the High C. of Justice. No appeal on a final decree is to be pleaded before fewer than three judges. If the subject of appeal is an interlocutory decree or order, it may be pleaded before two judges, but not before fewer. New regulations are made respecting circuits, and the fixing and collection of fees in the High C. and C. of Appeal.

Court of Session is the supreme civil court of Scotland. It was instituted in 1532 by James V. Formerly it consisted of fifteen judges, 7 churchmen, 7 laymen, and a president, who sat in one court; but by 48 Geo. III. c. 151, the judges were required to sit in two divisions, and by 1 Will. IV. c. 69, their number was reduced to thirteen—the Lord President, the Lord Justice Clerk, and eleven ordinary Lords. The Lord President and three Ordinary Lords form the First Division, and the Lord Justice Clerk and the other three Ordinary Lords form the Second Division; five judges being left in the Outer House not attached to either division.

The First and Second Division form what is called the *Inner House*. There are five permanent Lords Ordinary, each of whom holds a court; the courts of the Lords Ordinary forming collectively what is called the *Outer House*. The judgments of the Outer House are subject to the review of either division of the Inner House. The junior Lord Ordinary officiates in the Bill Chamber (q.v.) during session (15th October—20th March and 12th May—20th July, except certain holidays and recesses at the end of the year and in February). The C. of S. is the only court in Scotland which has jurisdiction over heritage, or in questions affecting it. With a few exceptions, no action respecting Movables (q.v.), where the interest of the Pursuer (q.v.) is under £25, can originate in the C. of S. The judgments of inferior courts, except that of the small-debt courts (see SHERIFF), are mostly subject to the review of the C. of S.; and even when this power is excluded, it may interfere when the inferior courts deviate from statutory regulation. The judges hold their office *ad vitam aut culpam*. Their appointment is from the crown. No one can be appointed who has not served as an advocate or principal clerk of session for five years, or as a writer to the signet for ten. Either division of the court may call in the aid of the three judges of the other division, when equally divided in opinion. In cases of extreme difficulty the Lords Ordinary are also called in, and pleadings are heard before the whole court, or *in presence*, as it is called. Judgments of the C. of S. may, in all ordinary cases, be appealed against to the House of Lords within two years, and the appeal is in the form of a petition. See Professor Mackay's *Treatise on the Practice of the C. of S.*

Courtall'um (*Kútt'alam*), a village in the district of Tinnevelly, province of Madras, 700 feet above the sea-level, near the junction of the Eastern and Western Ghâts. From the salubrity of the atmosphere and the picturesqueness of the scenery, it is much frequented by invalids. Its flora is singularly rich.

Cour'tesy or **Cur'tesy of England.** When a wife dies seized in fee (simple or tail) of an estate, having or having had living issue, her husband holds the estate during his life, and is called *tenant by the C. of E.*

Courtesy or Curialty of Scotland is the same right of a husband in Scotland, and dependent on essentially the same conditions.

In both countries the child must be the mother's heir; it consequently appears that C. falls to the husband as the father of the heir. In Scotland, the test of the child being born alive has been decided to be that it shall have been heard to cry, and this rule is still adhered to. It is an error to suppose that the right is peculiar to either nation.

Courtesy Titles are titles accorded by society to individuals who have no legal right to them. The term is chiefly used in connection with the titles assigned to the children of peers in Great Britain and in Ireland. The eldest son usually bears the second highest title belonging to his father, unless the inferior title is of the same name as the first, in which case, to prevent confusion, some other title belonging to the father is assumed, or the family surname with the prefix of 'Lord.' When there is no secondary title, as must be the case with barons, the eldest son has the courtesy title of 'Honourable.' In Scotland he is known as the 'Master of——.' The younger sons and daughters of dukes and marquesses have the courtesy title of 'Lord' or 'Lady' prefixed to their Christian name and surname. The younger sons and daughters of earls are entitled 'Honourable' and 'Lady' respectively. The younger sons and daughters of viscounts and barons are entitled 'Honourable.' Wives of baronets have the courtesy title of 'Lady,' but their sons and daughters bear no title. Members of the Queen's Privy Council are by courtesy 'Right Honourable.' Judges of the Court of Session in Scotland are addressed as 'Lord' on and off the bench. 'Esquire' (q.v.), though properly applicable to only a limited class, is now almost universally assumed. Ladies, who have acquired a title by a first marriage retain it by courtesy after a second marriage, though the husband have no title. No courtesy title raises the bearer above the rank of a commoner. The eldest son of a duke, marquess, or earl, or any son of a peer, may therefore sit in the House of Commons; so may an Irish peer, but a Scotch peer cannot.

Court Fool, a jester formerly attached to a court or royal household, whose business it was to help to make the time pass agreeably by facetious or extravagant remarks, which often pleased in proportion as they were personal. The institution of the office is of very ancient date, but the palmy period of the C. F. was during the Middle Ages. He was distinguished by the shaven head, the peaked cap of divers brilliant colours, generally having bells attached to it, the cockscomb, the ass's ears, and a sceptre of some fantastic shape. He also wore a collar of extravagant dimensions, and a dress which varied with the taste or the caprice of his master. Some of these officials have obtained a name in history, and many of their facetiæ, which sometimes expressed shrewd practical counsel, and even considerable political sagacity, have been preserved. Of court fools who have become historical, among the best known are Triboulet, the jester to François I. of France, and his successor, Brusquet; Scogan, jester to Edward IV. of England; and Archie Armstrong, the last of his order at the English court, who flourished in the reigns of James I. and Charles I. Court fools survived longest in Russia, but are now extinct even there.

Court'hand, the old English style of handwriting, as distinguished from the modern or Italian style. It is so named because it was used in courts of law after it had been generally superseded.

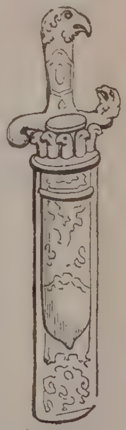
Court-Martial is a court for trying naval and military officers for breach of naval or military law. No capital punishment can be passed by a military general or district C.-M. unless two-thirds at least of the judges concur, or by a naval C.-M. unless four at least of the judges where the number does not exceed five, or in other cases unless two-thirds concur. When the court does not exceed its power, there is no appeal against its sentence; but it requires to be ratified by the crown. Every military general C.-M. is attended by the Judge Advocate-General, Judge Advocate, or representative, who advises the court on points of law, procedure, &c., swears and summons the witnesses, takes notes, and if necessary, assists the prisoner. Should the Judge Advocate-General be not present, his representative transmits the notes to him and his opinion may quash the verdict; when the C.-M. is held abroad, the proceedings are notified to the Judge Advocate-General, who files the notes. In the naval C.-M. the president appoints an officiating judge advocate whose duties are similar to those of the official in the military C.-M. The Army Act, 1881, which is renewed by an annual Act of Parliament, provides for the military C.-M., while the Naval Discipline Act, 1866, deals with the naval C.-M.

Cour'trai (Flem. *Kortryk*, the Lat. *Cortoriacum* of the *Notitia*, afterwards *Curtricum*), a fortified town in the province of W. Flanders, Belgium, on the Lys, 28 miles S. of Bruges. It is connected with Ghent, Lille, and Tournay by railway, has fine churches and a splendid Gothic town-hall, manufactures of linen, lace, thread, tablecloths, also extensive bleaching and soap-boiling works, sugar-refineries, &c.; and the finest flax in Flanders is grown in the neighbourhood. Pop. 31,319. The Battle of the Gold Spurs, so called from 700 gilt spurs being stripped from the French knights slaughtered by the Flemings, was fought at C., 11th July, 1302.

Cousin, Victor, an illustrious French author, was born at Paris, 28th November, 1792, of poor parents. He was educated at the École Normale, where he subsequently taught classics, till the inspiration received from Laromiguière decided him to teach philosophy at the Sorbonne under Royer-Collard. The retrograde policy of the Government of Louis XVIII. drove him into Germany, where he met Hegel and studied Plato and Proclus. He recommenced his lectures in 1828, and the courses delivered during that and the two following years were probably unequalled in popularity in modern times. To this his handsome figure and splendid eloquence greatly contributed. After the Revolution of July he entered the Council of Public Instruction, to which he presented his valuable reports on education (chiefly primary) in Germany, Prussia, and Holland. Created a peer of France, he did not cease to lecture on Aristotle at the École Normale, of which he was now director. He was Minister of Public Instruction in the Thiers ministry of 1840. His speeches in the Chamber of Peers, especially that on philosophy in the universities, earned for him a high reputation as a public orator. At the same time the amount of his literary work was enormous. His editions of Proclus, Plato, Descartes, De Biron, Abelard, his works on the philosophy of the 18th c., on the scholastic philosophy, on Kant, on Aristotle's metaphysics, his book upon Mme. de Longueville, and his edition of Pascal's *Pensées*, all contain valuable material. His most popular work in Great Britain is the *Discours du Vrai, du Beau, et du Bien*. C.'s theory that there are in every act of consciousness three fundamental elements, viz., an element of plurality, compounded of finite self and finite not-self, an element of absolute, infinite substance, and an element of relation between the finite and God, or effect and cause, has been criticised by Sir William Hamilton in the *Edinburgh Review*, and is of course rejected by all who think that the knowledge of God comes by inference from experience. C.'s report on German education, and his *Projet de Loi* of 2nd January, 1833, have been ably discussed by Sir William Hamilton (*Discussions*). C., who died at Cannes, 13th January, 1867, left a considerable school among the younger French thinkers, of whom Janet may be taken as a specimen. Jules Simon and Jouffroi have also been called his disciples, but the latter had much greater scientific capacity than his master, who was less a philosopher than an eloquent and learned *littérateur*, with a taste for philosophical subjects, and an unusual power of impressing his enthusiasm on his pupils. C.'s works were published in a collected edition (Par. 1846-47).

Coutances', a town in the department of La Manche, France, at the confluence of the Soulle and Bulsard, with a fine cathedral, one of the towers of which has been fitted up as a beacon to ships in the English Channel. It has manufactures of drugget, muslin, and thread, with a good trade in grain and cattle. C. is the *Civitas Constantia* of the Romans, and was the see of a bishop in the 5th c. In the vicinity are the ruins of an ancient aqueduct. Pop. 8145.

Coutar'ea, a genus of Cinchonaceous trees of Guiana, &c., the bark of one of which, *C. speciosa*, is used as a substitute for cinchona.



Couteau de Chasse.

Couteau de Chasse, or hunting knife, was in the 16th and 17th centuries an elaborate piece of workmanship. Both sheath and hilt were richly carved and ornamented, and the former was fitted with fork, bodkin, &c., which might be required by the hunter in the field.

Cou'thon, Georges, born at Orcet, Auvergne, in 1756, became an advocate in the local court at Clermont, where, by his charitable and courteous character, he grew very popular. In 1789 he was president of the tribunal, and in 1791 was sent by his fellow-citizens to the *Assemblée Législatif.* After the flight to Varennes, his opinions changed; he demanded the deposition of the King, and in 1791 became one of the most revolutionary members of the Assembly, and afterwards of the Convention, in which he gradually attached himself to Robespierre. He presided at the Lyon massacres, and established in Auvergne the system of requisitions, levy *en masse*, and revolutionary committees. At last, in 1794, he was comprehended with St. Just and Robespierre in the same decree of arrest, and was executed 28th July of that year. Although lame through paralysis, C. was a powerful speaker from the 'Mountain.' He proposed the famous test of purgation for the Jacobin Club, and passed the terrible decree of the 22nd Prairial (June, 1794), extending the law of the *suspect*.

Cou'tras, a town in the department of Gironde, France, on the left bank of the Dronne, 27 miles N.E. of Bordeaux, which it supplies with flour, and with which it is connected by railway. Henri of Navarre, subsequently Henri IV. of France, defeated the army of the League before the walls of C., 20th October, 1587. The red wine of C. is of considerable excellence. Pop. 4231.

Cov'enant (Heb. *berith*, Gr. *diathēkē*) is applied in Scripture to contracts both between man and man and between God and man, although it could only be applied properly to the former, since mutual obligations or conditions, and mutual advantages, were implied. 1. The manner in which two parties entered into a C. was by taking an oath (Gen. xxi. 31, 32), in witness whereof was set up a memorial stone or a heap of stones (Gen. xxxi. 45, 46); they feasted together; or, the most solemn ratification of all, they cut one or more beasts into halves, laid the pieces opposite each other, and passed between them, as much as to say, 'May the fate of these animals fall upon him who breaks this C.' (Jer. xxxiv. 18-20; cf. Gen. xv. 8-10). 2. According to the anthropomorphic ideas of the Old Testament, covenants are also spoken of as made between God and man, as in Gen. xv. 8-18, and xxviii. 20-22; in the first of which passages, Jehovah is represented as passing between the pieces in the form of a flame of fire. On another occasion, when making a C. with Abram, He gave him the rite of circumcision for a sign, as He gave to Noah the rainbow. 3. In the New Testament (Epistles to Galatians and Hebrews), the Old C. or testament between God and His chosen people at Sinai, with Moses as mediator, is opposed to the new C. between God and His elect people, with Jesus Christ as mediator. 4. Some theologians distinguish three covenants:—(1) The C. of works, entered into between God and Adam when the latter was in a state of innocence, and representing all his posterity; the condition on the part of man being perfect obedience—the promise, life, and the penalty, death. (2) The C. of grace, corresponding exactly with the new C. of the New Testament, to which the parties are God and—not mankind generally, but—the elect. (3) The C. of redemption (deduced from Gal. iii.) between the first and second persons of the Trinity, the former engaging to give the latter a certain number of redeemed sinners for His Church; the latter, to be their surety and substitute.

Covenant, in the law of England, is the agreement of two or more persons to do, or not to do, some specified act. It is created by Deed (q.v.). In a C. to do something, the action stipulated for must be lawful; and if the thing to be done be legally impossible, the C. is void. A man may bind himself not to exercise a special trade or profession within a particular place, but a general obligation in restraint of occupation is contrary to law, and void. Covenants for title are (1) that the vendor is seised in fee; (2) that he has power to convey; (3) quiet enjoyment (purchaser, his heirs and assigns); (4) free from incumbrances; (5) further assurance. A C. real is when a person covenants for himself and his heirs, who are bound to perform it, provided they obtain sufficient assets by descent.

Covenant, National, the name of the religious protest, binding its subscribers to support the Scottish Presbyterian Church, drawn up by the Scottish clergy in 1630. It embodied the Scottish Confession of Faith of 1581, and arose from the effort of Charles I. to introduce an episcopal liturgy into Scotland. It was signed by all ranks of the community—nobles, gentry, clergy, and commissioners from burghs and towns—in the Greyfriars' Churchyard, Edinburgh. Copies were also sent to different parts of the country for subscription. The N. C. was ratified by Parliament in 1640, the first signatures having been appended on 28th February, 1638. See Davidson's *Historical Sketch Illustrative of the National Confession of Faith* (Edinb. 1849).—**Solemn League and Covenant** was a modification of the N. C., and bound the English Parliament in alliance with the Scottish Presbyterians. It guaranteed the preservation of the Scottish Reformed Church, and was adopted by the Parliament, 15th July, 1644. Charles II. signed it, 16th August, 1650, but repudiated it in 1661, when it was ordered to be burnt. The Scottish supporters of these covenants were known as Covenanters, and were engaged in various risings against the crown in the period between the Restoration (1660) and the Revolution of 1688. In 1712 the Cameronians, a section of the Covenanters, renewed the signing of the covenants; but the Church of Scotland does not require adherence to these documents from her members.

Cov'ent Gar'den, a corruption of *Convent Garden*, so called from being formerly the garden of Westminster Abbey, is the great fruit, flower, and vegetable market of London. The most interesting days for inspecting it are Tuesdays, Thursdays, and Saturdays, and especially on summer mornings as early as three o'clock. The market had a humble origin about 1656, in a few wooden stalls. C. G. gave name to the famous theatre (opened 7th December, 1732) in the vicinity.

Coventry (the 'convent dwelling'; the termination *try* being the Cymric *tre*, 'a dwelling or town,' common in Cornwall and Wales), a town in Warwickshire, on the Sherbourne, a tributary of the Avon, about 18½ miles from Birmingham, and 6 from Kenilworth. Its churches of St. Michael's, St. John's, and Trinity are among the most beautiful in England. Many of the streets are built with oaken beams and projecting stories; in one the house is shown where Richard Baxter spent two years during the civil war. St. Mary's Hall, built by Henry VI. for the Merchants' Guild, is a marvel for quaint carving in black oak, and has one of the few pieces of historical tapestry in England. At one time C. had a great woollen manufacture of 'yarn white stuffs,' which was ruined by the French calico trade. The silk and ribbon manufacture and watchmaking then became the local industries; both suffered greatly about 1817, when the repeal of the Statute of Apprentices introduced the sweating system and half-pay apprentices, and the workmen were as yet unable to secure the observance of their 'statement lists' of wages and prices. The ribbon trade now flourishes, greatly extended by steam machinery. In 1874 new sewage works were constructed. The most interesting antiquities are the old charitable mortifications and chantries, such as Bablalie's Hospital, Ford's Hospital, Bond's School, White's Trust, &c. The ancient walls of C. were demolished by the Royalists in 1662, the town having sent 200 men to Lord Brooke. The story of Godiva, the wife of Leofric, riding through the streets, though still preserved in the wooden figure of Peeping Tom and an annual procession of people covered with ribbons, has no foundation in fact, being told for the first time by Matthew of Westminster 200 years after its alleged occurrence; it is probably a repetition of a similar Herefordshire legend. Leofric built the monastery which long formed the glory of C., its population falling from 15,000 to 3000 upon the dissolution of the monasteries. Before that, it was called the Chamber of Princes, being a favourite residence of English kings. The *Parliamentum Indoctorum* (1404), so called because lawyers were excluded, and the *Parliamentum Diabolicum* (1459), for the attainder of Yorkists, were held in C. The bishopric of C., founded in 656, was in 1121 united with the see of Lichfield. St. Katherine's, one of the oldest English guilds, belonged to C. Its purposes were to maintain a chaplain, to make loans, and to give alms in deserving cases, to help all the members generally, and to hold four feasts in the year; those committing any offence to be expelled. Many of the old trusts are quaintly expressed, as in *Bond's*, where lands, &c., are left 'for the maintenance of ten poor men, as long as the world shall endure, and a woman to look to them.' At the end of the 18th c. there was a burst of revolutionary enthusiasm at C., and a society for constitutional reformation was formed, which gave to Burke the title of 'Don Quixote of Despotism.' Pop. parl. bor. (consisting of the city of C. and par. of Stoke, and returning one member) 54,755; county bor. 52,724; and reg. dist. 53,004.

Coventry, Sir John, a member of the Long Parliament, and of Parliament in the reign of Charles II., who, having fearlessly opposed the policy of the King, and having in a speech seemed to reflect on his conduct, was assaulted by a band of bravoes from Whitehall, commissioned by the Duke of Monmouth, and had his nose cut to the bone, 21st December, 1670. This outrage led to the passing of the Coventry Act, which rendered cutting and maiming a capital crime. The Act was repealed in 1828. C. died about 1682.

Cov'erdale, Miles, one of the earliest and most distinguished English Reformers, was born at Coverham, Yorkshire, in 1488. He was educated at Cambridge, and became an Augustine monk, but adopted the Reformation doctrines, and devoted himself to translating the Bible. C.'s translation of the whole Bible was published in 1535, where, is not quite certain, but probably at Zürich. This was the first complete version of the Scriptures printed in English. He also superintended the edition known as the *Great Bible*, or *Cranmer's Bible*, produced in 1539. In 1551, C., who had been almoner to Queen Catharine, was promoted to the see of Exeter. Imprisoned on the accession of Queen Mary, but released through the intercession of the King of Denmark, he went to the Continent, where he assisted in the preparation of the celebrated Geneva translation (1557-60). (See BREECHES BIBLE.) After the accession of Elizabeth, C. was appointed to the rectory of St. Magnus, London. He died 20th May, 1567. The tricentenary of the issue of C.'s Bible was celebrated 4th October, 1835.

Cov'erture is a term of English law denoting the legal status of a woman during her marriage. The law, as regards the disabilities of a married woman in respect of property, has been materially altered; by the Married Women's Property Act, 1870, her earnings are deemed to be her own separate property, and by the M. W. P. Act, 1882, her own property was entirely freed from the control of her husband, and she became possessed of equal power over it, as her husband had over his.

Covilha', a fortified town in the district of Castello Branco, province of Beira, Portugal, with manufactures of cloth, and hot springs, and built in the form of an amphitheatre. Pop. 10,809.

Cov'ington, a town of Kentucky, U.S., on the river Ohio, opposite to Cincinnati (q.v.), with which it is connected by a suspension bridge and ferries. It has manufactures of cotton, hemp, silk, tobacco, and iron; and large establishments for packing pork, &c. Pop. 37,371.

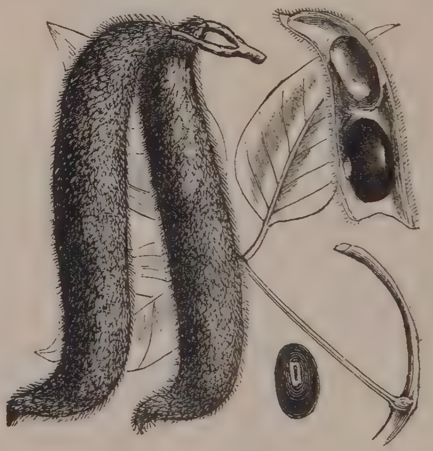
Cowbird, also called the American yellow-billed cuckoo, belongs to the family *Cuculidæ*, of the order Scansores, and gets its name from its note, which resembles the word *cow*. It is found in the United States, and migrates northwards in spring. Stragglers have been found in Britain. It feeds chiefly on caterpillars, but also eats various berries. The colour of this bird is dark brown, with green hues. The quills of its wings are cinnamon colour, and the under parts pure white. Its average length is 12 inches.

Cowbird.

Cowbridge, a borough in Glamorganshire, 11½ miles W. by S. of Cardiff, unites with Cardiff and Llantrissant in returning one member to Parliament. One gate of its ancient wall, built at the close of the 11th c., still remains. Pop. reg. sub-dist. 7456; mun. bor. and civ. par. (each) 1377.

Cowes ('coves,' Old Eng. *cofan*), **West,** a seaport in the Isle of Wight, 10½ miles S.S.E. of Southampton, attractive from its picturesque appearance, its fine houses, and its being the rendezvous of the Royal Yacht Squadron. It has brass and iron foundries, roperies, and sail-making establishments.—**East Cowes** is on the E. side of the estuary of the Medina, as W. C. is on the W. In the neighbourhood is Osborne House, a residence of Her Majesty. Pop. Cowes reg. sub-dist. 14,704; E. C. urb. san. dist. 2872; W. C. urb. san. dist. 7690.

Cowhage, Cowage, or **Cowitch,** the short brittle hairs which grow on the pods of *Mucuna*, a genus of plants of the order *Leguminosæ* (sub-order *Papilionaceæ*), natives of tropical Asia, Africa, America, and the Fiji Islands. C., when it sticks to the skin, causes great itching. The pods of M., called the ox-eye bean of the W. Indies, and of another M., a native of the E. Indies, are eaten in an unripe state. The itching M. is the chief source of C.



Mucuna Bean.

Cow'ley, Abraham, son of a London grocer, was born in 1618. He wrote verses before he was twelve years old, and published his *Poetical Blossoms* on entering Westminster School, at the age of fifteen. When an undergraduate at Cambridge, he wrote the most of his *Davideis*. On the breaking out of the great civil war, C., a devoted Royalist, was driven from England, and served for some time as secretary to the banished royal family. In 1656 he returned to England, and studied medicine. After the Restoration he was rewarded by the free lease of a farm at Chertsey, worth about £300 per annum. He died at the age of forty-nine, 28th July, 1667. Dr. Johnson considered C. the best of the 'metaphysical poets,' as he named those poets who substituted fantastic analogies, intricate conceits, and misplaced learning for genuine poetic beauties. In this class of writers, however, Donne, rather than C., deserves the first place. C. possessed considerable, although perverted, poetic powers, as is proved by his delightful translations from Anacreon. C.'s essays are pleasanter reading than his poems, being full of learning, sound reflection, wit and humour, and written in a fresh and animated style. He wrote also a comedy, *The Cutter of Coleman Street*, and a *Discourse on the Government of Cromwell*. His works were edited by Hurd (Lond. 1772). See Johnson's *Life of C.*

Cowley, Henry Richard Wellesley, first Earl, the only son of the first Baron Cowley, who was a younger brother of the great Duke of Wellington, was born 17th June, 1804. His career was entirely that of a diplomatist. Beginning as attaché at Venice in 1824, he filled various important posts until he became, first, British ambassador to the Germanic Confederation, and in 1852 ambassador at Paris. Along with Lord Clarendon, he represented Britain at the Paris Congress of 1856, and was created, in 1857, Viscount Dangan and Earl C. In 1865 he was made a K.G. Two years later he retired from his post at Paris. In 1870 C. was made D.C.L. of Oxford. Died 1884.

Cow-Parsnip, a genus of plants of the natural order *Umbelliferæ*, of which a number of species, widely diffused through India, Europe, and America, but rather difficult to distinguish, are known. Some are cultivated; but except that of Siberia, which attains a height of 10 or 12 feet, not one is in any way very remarkable. The common British species, the hogweed, or *Kiesh*, of Scotland, is used for feeding pigs, and in Scania, in Sweden, in former times at least, was used as a domestic remedy. The leaf-stalks of a Kamtchatkan species yield a sweet exudation, which is used in the preparation of a spirit. The roots and stems of another are eaten by some of the American tribes, and the young shoots of the hairy C. are valued in the Caucasus as an article of food for the sweet and aromatic juice (Dickie). Siberian species have been recommended for cultivation on account of the quantity of herbage which they yield early in the season.

Cow′pen Bird, a member of the Insessorial family *Sturnidæ*, is a native of the United States, and migrates N. and S. according to the season. Like the cuckoo, it deposits its eggs in the nests of other birds, the young C. B. being found by itself in the nest, as with the former parasite. It lives on the insects, &c., which it finds associated with cattle, and takes its name from this circumstance. The colour is dark drab, with green tints, the upper part of the breast being violet. The average length is 7 inches.

Cow′per, William, one of the most familiar English poets, was born on the 26th November, 1731, at Great Berkhampstead, in Hertford. He was of highly-connected family, his father, chaplain to George II., being nephew of the first Earl Cowper, Lord Chancellor. When six years old, C. was sent to a school at Market Street, where his shrinking sensitiveness exposed him to much suffering; but his life at Westminster School, from 1741 to 1748, proved more happy. Law having been chosen for him as his profession, C. was articled to an attorney for three years, and afterwards, in 1754, called to the Bar. He eschewed legal studies, however, and his Temple life was occupied with lighter literature. His father being dead, and his income scanty, he accepted, in 1763, the offered post of reading-clerk to the House of Lords; but nervousness prevented him from appearing at the bar of the House for examination, and so he lost it. Reduced by this to despair, even insanity, he attempted suicide, and only moral cowardice hindered his purpose. After eighteen months passed in a private asylum at St. Albans, C. went to live at Huntingdon, where he formed his friendship with the Unwins—a fortunate one for him. On the death of the Rev. Mr. Unwin (1767), his widow removed to Olney, Buckinghamshire, and C. went with her, feeling that his happiness depended on this intimacy. Less beneficial was his intercourse with John Newton, whose stern influence actually led, in 1773, to a renewal of the poet's mental trouble. Shortly before this he had begun the composition of his *Olney Hymns*. C.'s convalescence was occupied in gardening and the rearing of tame hares; while the cheerful society of Lady Austen—who suggested to him the inimitable *John Gilpin*, *The Task*, and the *Translation of Homer*—had a healthy effect on his mind. John Newton, besides, left Olney in 1779, in which year the *Olney Hymns* were published. The success of *The Task* (1785) was very great, and the *Homer* (1791) sustained its author's reputation, besides obtaining for him the sum of £1000. But his constitutional malady again returned. Seeking more cheerful scenes, he left Olney for Tuddenham, in Norfolk, accompanied by Mrs. Unwin. This lady died in 1796, and C. being attacked by dropsy, expired at Dereham, Norfolk, 25th April, 1800.

In English poetry C. was leader of a reaction against the brilliant, artificial school of Pope. He had neither deep passion nor imagination, but has won and kept his place by his purity of sentiment, his graceful and truthful handling of simple themes, his lucid and vigorous style, and especially by his earnest religious vein. Not excepting Milton, he is our truest religious poet. *The Task* is his greatest work; *Conversation* perhaps his cleverest. In one he shows exquisite feeling; in the other, polished wit. *John Gilpin* has always been and must ever remain popular; while his *Letters*, with their charming *naïveté* and sparkling clearness, display an acute and cultured intellect, and entitle him to be considered one of the most charming letter-writers in the English language.

Southey has edited C.'s works. The best Life is that by Southey (1835).

Cowplant, a native plant of Ceylon, of the natural order *Asclepiadaceæ*, gets its name from a belief that its juice supplied the place of milk to the natives; but in reality the juice is only *like* milk, not used as a substitute for it (Emerson Tennant).

Cow′ry, a genus of Gasteropodous mollusca, forming the type of the family *Cypræidæ*, in which the shell is convolute and enamelled; the spire is concealed; the shell-aperture narrow, and channelled at either end. The outer lip is thick and inflected in old shells. The foot is broad, and the mantle lobes meet over the back of the shell. The shells form typical examples of the kind of shells to which the name *Porcellanous* or 'Porcelain' is applied. A few species are British, but most are tropical. The money-C. is so named from its being used as a substitute for coins in many parts of Asia and Africa. It is of yellowish colour, and averages an inch in length. In Bengal one C. = $\frac{1}{38}$ of a farthing in value. The orange C. is found in the Friendly Islands, and is worn by the chiefs as a badge of their rank. The ring C. is found among the islands off the S. coasts of Asia, and is worn by the natives as an ornament, or is used as a net-sinker, or as money. The tiger C. is common on the American shores, and, when polished, is placed as an ornament on the tables, &c.

Tiger Cowry.

Cow′slip, a common plant in many parts of England, though rarer in Scotland, belonging to the natural order *Primulaceæ*. The flowers are believed to possess sedative and diaphoretic properties, and are therefore sometimes used as an anodyne and antispasmodic, and when fermented as *C.-wine*, employed to produce sleep. The Virginian C., a member of the same order, is cultivated in our gardens for the beauty of its flowers, which is indeed the main recommendation of its genus.

Cow-Tree, a name applied to various trees, the bland milky juice of which is used instead of milk. For instance, the Arbol de Leche, Palo de Vaca, of Caraccas and other parts of S. America, is one of the natural order *Arctocarpaceæ*. The name is also applied to the Hya-hya, one of the *Apocynaceæ*, as well as to some species of figs. The 'milk' of the Arbol de Leche is said to be of as good quality as that from the cow. The tree forms large forests on the sea-coast of Venezuela. The milk is obtained by making incisions in the trunk, and is perfectly wholesome and very nourishing, having an agreeable taste like cream, with a balsamic odour. Its composition is different from that of animal milk, containing, as it does, wax and fibrin, a little sugar, a salt of magnesia, and water. After a few days' exposure to the air it sours and putrifies. It contains upwards of 30 per cent. of the resinous substance called *Galactin*.

Cow-Tree.—Leaves and Fruit.

Cow-Wheat, a genus of plants of the order *Scrophulariaceæ*, of which several are common in English woods, pastures, cornfields, &c. They get their name from a belief that they fatten cattle, and give a yellow tinge to butter made from the milk of cattle fed on pastures in which they abound. There are four British species.

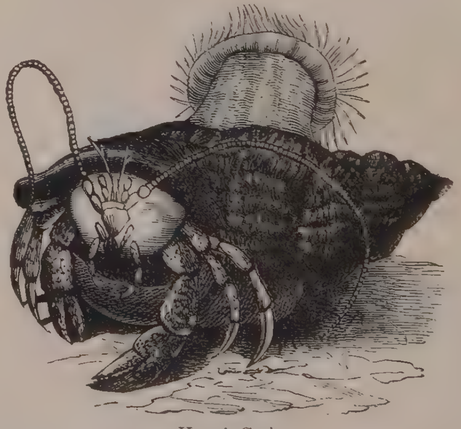
Cox, David, after Turner, the greatest of English landscape painters in water-colours, was the son of a Birmingham blacksmith, and was born in 1793. At the age of fifteen he was employed by a locket and miniature painter, afterwards became scene-painter in the theatre at Birmingham belonging to Macready, father of the tragedian. In 1811 he went to London, where he struggled along industriously, giving lessons and occasionally selling a picture for a few shillings. At the age of thirty he became a teacher of drawing at a ladies' school at Hereford, with a salary of £100 a year; but nevertheless he found leisure in a single year to send twenty-two contributions to the Old Water-Colour Society. In all he exhibited 800 works at the Society of Painters in Water Colours. At last fortune veered, and C., raised above immediate want, was at liberty to roam in search of the picturesque. He died, 7th June, 1859. Since his death there has been a rise in the price of his drawings, unequalled, perhaps, except in the single case of Turner. The strength of C. lies in his honest, downright English character. A master of space and aërial perspective, he paints the heaths and hedgerows of England under shifting aspects of shower and sunshine, wind and fog. He aims at depicting certain hours of the day, and such is his attention to atmospheric effect, that it has been said his drawings might be labelled 'stormy,' 'change,' 'fair.' If his art lacks imagination or passion, it raises no unsatisfied longings, for it fulfils its every promise. See *Life of D. C., with Selections from his Correspondence, &c.*, by N. Neal Solly (Lond. 1873).

Coxe, William, a heavy but painstaking historical writer, was born in London, 7th March, 1747; became fellow of King's College, Cambridge, 1768, curate of Denham, near Uxbridge, 1771, rector of Bemerton, 1788, and archdeacon of Wilts, 1805. He died 8th June, 1828. His best-known works are his *History of the House of Austria* (Lond. 1807), and *Memoirs of John, Duke of Marlborough* (1817-19). He also wrote *Memoirs of Sir Robert Walpole* and *Memoirs of the Pelham Administration.*

Coy′pu, or **Nu′tria,** a genus of Rodentia, included in the Beaver family, *Castoridæ*, and largely hunted for its fur. It inhabits burrows made in the banks of rivers in Chili and elsewhere in S. America. The hind-feet are webbed, the tail being long and rounded, scaly, and provided with scattered hairs. It averages the size of the beaver—that is, from 2 to 3 feet. The muzzle is pointed and the ears small. The fur is of a general yellowish tint, and known by the name 'Racoondah.' In some years 1,000,000 of C. skins have been imported into Britain from S. America.

Coypu.

Crab (Old Eng. *crabba*, Sansk. *grabh*, 'to seize or grab'). The name applied popularly as well as scientifically to many genera of *Crustacea* (q.v.), included in the order *Decapoda* (q.v.) ('ten-limbed') of that class, and for the most part in the section *Brachyura*. In the true crabs, represented thus by the edible C. or 'partan,' and the smaller or shore-C., the abdomen is rudimentary, and is tucked up under the broadened-out body, which consists of the *cephalothorax*, or united head and chest segments. The gills are contained within special cavities existing in the sides of the body. The nervous system in the crabs consists of a single large ganglion, placed ventrally, or on the floor of the body, and from which nerves radiate throughout the body. During their development, crabs undergo a metamorphosis, the first stage being free-swimming, possessing a tail, and known as *Zoea*. The second stage, named *Megalopa*, is also tailed; whilst after several moults the *Megalopa* loses its tail and assumes the form of the perfect C. The antennæ are never of great length, and the front pair of legs form *chelæ* or nipping-claws. The eggs are attached to the rudimentary tail of the female.



Hermit Crab.

The sub-order *Brachyura*, including the true crabs, are represented by the families *Canceridæ* (edible and other crabs, belonging to the genera *Cancer*, &c.), *Maiadæ*, or Spider

Crabs (q.v.), and *Oxystomidæ* (genera *Dorippe*, &c.). *Ocypodidæ* (genera *Pinno-theres*, sea-crabs, and *Gecarcinidæ*, or land-crabs, &c.) contains the representative groups of crabs. The sub-order *Anomura*, in which the abdomen is developed to a greater or less extent, but not so perfectly as in the *Macrura*, includes the well-known Hermit or Soldier Crabs (q.v.), the *Porcellanidæ*, or porcelain crabs, and other groups. The abdomen in *Anomura*, whatever its development, does not bear the *feet* seen in the *Macrura* (lobsters, shrimps, prawns, &c.). The three front pairs of feet are well developed, and the first claws are generally chelete. See also CRUSTACEA, DECAPODA, and articles (such as PEA-CRABS, SPIDER-CRABS, &c.) descriptive of the various kinds of these crustaceans.

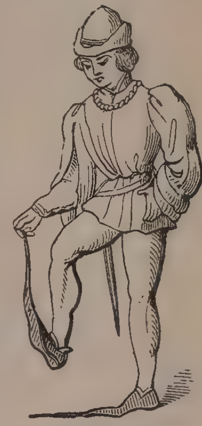
Crabbe, George, an English poet, was born at Aldborough, Suffolk, 24th December, 1754. His father, a collector of salt-duties, encouraged his early poetic proclivities, and strove to procure him a good education. When fourteen years of age C. was apprenticed to a surgeon, but finding the profession distasteful, abandoned it and went to seek his fortune as an author in London. At the end of a year, being in danger of imprisonment for debt, he wrote asking help from Burke, who extended to C. his friendship, enabled him to issue his poem, *The Library* (1781), and persuaded him to enter the Church. After being curate of Aldborough, C. received two livings in Dorsetshire, and removed in 1785 to Strathern Parsonage, where he remained until 1813. He spent the rest of his life at Trowbridge, Wiltshire, published his *Tales of the Hall* in 1819, and died 8th February, 1832. C.'s poetry describes commonplace themes with intense and sometimes painful realism. His characters belong to the humblest ranks—smugglers, poachers, paupers, vagrants—whose natures are analysed with startling, unsparing accuracy. He depicts scenes with tedious minuteness. Hazlitt said that C. described the interior of a cottage 'like a person sent there to distrain for rent.' C. has been called a Pope in worsted stockings. He has Pope's correctness without his nimble wit, fancy, and glittering delicacies of language. As he grew older, his verse became more passionate, touching, and forcible; it forms a link between the school of Pope and the school of Wordsworth. C.'s principal works are *The Library*, *The Village*, *The Borough*, *Tales in Verse*, *Tales of the Hall*, *Sir Eustace Grey*, *The Hall of Justice*. See *Life of C.*, by his son (1838).

Crab'eth, Dirk and **Wouter,** famous masters in the art of glass-painting, were brothers, and flourished during the latter half of the 16th c. They appear to have been born at Gouda, in S. Holland. Wouter died in 1581, and Dirk in 1601. The most splendid examples of their skill are the painted windows in St. Janskirche, at Gouda, of which seven were executed by Dirk and four by Wouter. Other churches in Belgium and France possess excellent examples of their art. Although friends, these brothers were so jealous of their reputation, that each concealed from the other the processes by which he achieved his effects.

Crackle.

Crackle, a term in pottery signifying a kind of ware having its enamelled surface covered with a network of irregular cracks. The Japanese C. is of much value, especially the sort which resembles the scales of the trout. The Chinese use colouring matter in much variety for filling up the interstices between the crackles.

Cra'cow (Pol. *Krakov*, Ger. *Krakan*), capital of a circle in the crown-land of Galicia, on the Vistula, about 70 miles N.E. of Vienna by rail. It contains numerous churches, four public squares, a castle called the Königsberg, and a Gothic cathedral, with the tombs of the Polish kings. The University of C., founded in 1364, and for a time a famous seat of learning, was destroyed by the influence of the Jesuits, but was re-opened in 1817, and at the present time has an attendance of 1196 students, under 122 professors, &c. It has a valuable library, a botanic garden, and a museum. C. has a theological seminary, a normal school, two gymnasia, a polytechnic school, a literary and musical association, and the national theatre. The streets are generally dark and narrow, but the thoroughfares in the suburbs—of which there are fourteen—are much wider and cleaner. The old walls have been converted into a promenade. There are no important manufactures, and the trade, formerly very extensive, became very insignificant till a transit trade with Russia, Germany, and Austria, carried on by the Jews, revived while C. was a republic. The railway, which now connects the city with Vienna, Berlin, Warsaw, and Lemberg, has increased trade. Since C. came into the possession of Austria it has been surrounded by extensive and formidable fortifications. C. was founded about 760 by Krak, Duke of Poland, whence its name; was the capital of Poland from 1320 to 1609, and in it the monarchs were crowned until 1764. It was taken by Karl XII. of Sweden in 1702, by the Russians in 1768, added to Austria in 1795, formed into a republic in 1815, and finally united to Austria in 1846. Pop. 72,472, with 5471 soldiers. At least a fourth of the inhabitants are Jews.



Cracowes.

Cracowes, so called because they were first worn at Cracow, were long-toed shoes, the tips of which turned up and were often connected with the knee by a slender chain. In England, extravagantly long toes became so much the rage that a statute was passed restricting the length within reasonable limits, whereupon the fashion rushed to the opposite extreme by reducing the length of the toe to the minimum, and increasing the breadth out of all proportion to the size of the shoe. The legislature again intervened, and, in due course, also suppressed this folly.

Craft, in naval language, is a term applied to any collection of decked vessels. It is a general designation for barges, lighters, hoys, and other keels employed in loading and unloading large ships. In the royal navy, cutters, schooners, gunboats, and other vessels commanded by lieutenants, are styled *small C.*

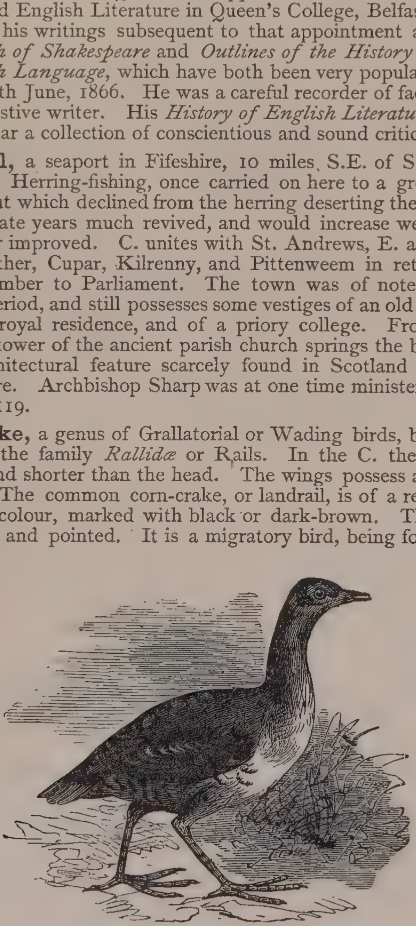
Crag, a local name given to certain Pliocene deposits in Norfolk and Suffolk, consisting of shelly sands and gravels. The Norwich or mammaliferous C. is used to fertilise soils which are poor in lime. See PLIOCENE.

Craig, John, a Scottish Reformer, was born in Scotland in 1512. Trained to be a Dominican friar, he was intrusted with the education of the novices of that order at Boulogne, when the reading of Calvin's *Institutes* converted him to Protestantism. Openly avowing his opinions, he was condemned to be burnt by the Inquisition, and was only saved by the riots consequent on the death of Pope Paul IV., in the course of which the prisons at Boulogne were thrown open. After many narrow escapes on the Continent, C. returned to Scotland, and became Knox's colleague in the parish church of Edinburgh. Even in that time and country he was distinguished for boldness of speech and action. He refused to proclaim the banns between Queen Mary and Bothwell, and when he was made minister to James VI., never refrained from saying to the 'anointed pedant' what he thought of his conduct. He aided in drawing up the *Second Book of Discipline*, and wrote the National Covenant, signed by the King in 1580. C. died 4th December, 1600.—**Thomas C.,** a Scotch advocate, was born at Edinburgh about 1548, educated at St. Andrews and Paris, filled various posts of distinction, including those of Justice-depute to Archibald Earl of Argyll, Justice-general of Scotland, and advocate for the Church of Scotland. He was at the same time a favourite of James VI., who offered him the honour of knighthood, which, however, he declined. C. is best known for his *Jus Feudale.* He also wrote respectable verses, and was an ardent champion of the claims of Scotland to be independent of England. T. C. died at Edinburgh, 26th February, 1608. See Tytler's *Life of C.* (Edinb. 1823).

Craik, George Lillie, an English author, was born in Fifeshire in 1799. Educated at St. Andrew's University for the Church, he betook himself at an early age to London and to literature. Among the works he produced at this period of his life were his *Pursuit of Knowledge under Difficulties,* his *History of British Commerce,* and, above all, his *History of Literature and Learning in England from the Norman Conquest to the Present Time* (1844). He also edited the *Pictorial History of England,* and contributed to the *Penny Cyclopædia.* In 1849 C. was appointed Professor of History and English Literature in Queen's College, Belfast, and among his writings subsequent to that appointment are his *English of Shakespeare* and *Outlines of the History of the English Language,* which have both been very popular. C. died 25th June, 1866. He was a careful recorder of facts and a suggestive writer. His *History of English Literature* is in particular a collection of conscientious and sound criticisms.

Crail, a seaport in Fifeshire, 10 miles S.E. of St. Andrews. Herring-fishing, once carried on here to a great extent, but which declined from the herring deserting the coast, has of late years much revived, and would increase were the harbour improved. C. unites with St. Andrews, E. and W. Anstruther, Cupar, Kilrenny, and Pittenweem in returning one member to Parliament. The town was of note at an early period, and still possesses some vestiges of an old castle, once a royal residence, and of a priory college. From the square tower of the ancient parish church springs the broach, an architectural feature scarcely found in Scotland out of Fifeshire. Archbishop Sharp was at one time minister of C. Pop. 1119.

Crake, a genus of Grallatorial or Wading birds, belonging to the family *Rallidæ* or Rails. In the C. the bill is thick and shorter than the head. The wings possess a small spur. The common corn-crake, or landrail, is of a reddish-brown colour, marked with black or dark-brown. The tail is short and pointed. It is a migratory bird, being found in Britain only in summer, and inhabits cornfields and marshy lands, its harsh cry of *crek, crek,* being very familiar. It winters in S. Europe, N. Africa, and Asia. An analogous species is the Carolina rail of N. America, which inhabits marshes, and migrates northwards from the Gulf of Mexico in summer. In size and colour it resembles the corn-crake, its plumage being streaked with white.



Corn-crake.

Crambe, a genus of plants of the natural order *Cruciferæ* (q.v.), of which one is well known as Sea-Kale (q.v.), found wild on our coasts, and also cultivated in gardens for use. When blanched as a potherb, it is eaten in the same way as asparagus. *C. tartarica* is the Tartar *kenyes* or Tartarian bread. It is not cultivated, but the root is eaten, either boiled or sliced, with oil, vinegar, and salt, in the countries of which it is a native. See Loudon's *Encyclopædia of Plants,* p. 557.

Cramps are a variety of spasms or hypercenisis, and are caused by the contraction or tension of a voluntary or involuntary muscular structure, independently of volition, and accompanied with pain. They are called *symptomatic* when they depend upon disease in other parts of the body than in the muscular tissues affected, as in affections of the brain and spinal marrow; and *idiopathic* when the disturbance is functional, depending on transient lesion of the nerves and their sheaths, or on hyperæmia with œdema of the neurilemma. C. are described as *tonic* when the muscular contraction is continuous, and as *clonic* when intermittent. They are caused—(1) by irritation at or near the seat of morbid action, such as from sudden change of temperature in bathing, exposure to cold, over-exertion of the muscles, or from bringing muscles long disused into action; (2) by irritation of the nerves supplying the affected muscles; (3) by irritation or lesion of the spinal marrow at or near the origin of the nerves supplying the muscles; (4) by lesion of parts of the brain; (5) by irritation of the digestive viscera, the action being transmitted to the external muscles; (6) by irritation of any of the senses, transmitted to their nervous centres, and thence reflected on parts connected with them. C. forms a prominent symptom in many diseases of infancy, in diarrhœa, dysentery, and especially in Asiatic cholera. They also occur during and after convalescence from certain acute and chronic disorders, as typhus, enteric, and malarious fevers, &c. C. are relieved by friction combined with emollient, stimulant, or opietic liniments.

Cran'ach or **Kron'ach** (originally *Sunder* or *Sünder*), **Lukas,** a famous German painter, born at Kronach, near Bamberg (Bavaria), in 1472, was appointed court-painter to Friedrich the Wise of Saxony in 1504, and was employed later by the House of Brandenburg and other great families. His versatility was shown by his buying an apothecary's business at Wittenberg, where he became Burgomaster, and afterwards engaging in the book and paper trade. C. allied himself to the cause of the Reformation, and painted with affectionate conscientiousness the portraits of his friends Luther and Melancthon. He died, 16th October, 1553, at Weimar. Of his numerous works, which nearly all remain in Germany, the principal are altarpieces. His designs were Gothic, wanting in unity of idea and effect, and in his historical pictures it was his custom to introduce his own portrait, and those of his family and acquaintances. For colour, however, power of characterisation, and laborious execution, C. was one of the greatest artists of his time, though Dürer and Holbein were among his contemporaries. His chief work is the *Crucifixion* in Weimar church. His engravings on wood and copper are much sought after by amateurs. His son, **Lukas,** known as 'the Younger C.,' an excellent colourist and famous portrait-painter, died Burgomaster of Wittenberg in 1586.

Cran'berry, a genus of plants of the natural order *Vacciniaceæ,* consisting of small, slender, or creeping evergreen shrubs. There are three species. *O. palustris,* common C., is frequent in peaty bogs and marshy ground of Britain, as well as in similar or mountainous localities in Europe, Siberia, and N. America. It is largely used in tarts, preserves, &c. Before the Lincolnshire bogs were drained, the berries were sold by the cartload in Norwich market. In the market of Langton, in Cumberland, as much as £20 to £30 worth of the fruit was sold for five or six weeks in succession, as long as the season lasted. In Sweden, silver plate is boiled in them, that the acid in the fruit may clean it.

The large-fruited or American C. is common in sandy soils from Canada to Virginia. Large quantities are used in the country and exported to Britain. It can be cultivated to advantage both in Europe and America, low coarse meadows planted with it yielding an average crop of 80 to 100 bushels of berries per acre.

A 'wine' is made from the C. in Siberia, and a beverage made from it is sold in St. Petersburg. Another C., a small shrub, is a native of the Virginian and Carolinian mountains, producing a fine fruit. The red whortleberry is sold in Aberdeen and other places under the name of 'cranberries.' The so-called Tasmanian C. is a shrub belonging to the natural order *Epacridaceæ*. The name is also given to a small Australian shrub of the same order, and in New South Wales to another Epacridaceous shrub which produces red acid berries. The name is apparently derived from the idea that the berries are eaten by *cranes*.

Cran'brook, a small town in Kent, England, on the Crane, 28 miles S.W. of Canterbury, and the principal place in the Weald. It was formerly a seat of the woollen trade, introduced by the Flemings, but that has long disappeared, and the prosperity of C. now depends on the hop trade. Pop. reg. sub-dist. 6616; and civ. par. 4046.

Crane (Old Eng. *cran*, from its *creaking* sound), a machine for raising heavy weights. In general, a chain is fixed to the object to be lifted, carried over a pulley, and brought down to, and wound upon, a barrel forming part of the C. Motion is given to this barrel by means of suitably proportioned toothed wheels ('spur gearing'), and the whole is set in motion either by men working handles or by a steam or other engine. Cranes vary much in shape and arrangement. In the common jib-C., the mechanism just described is attached to the lower part of a vertical C.-post, and the chain-pulley is suspended from the upper end of a long inclined post or jib, of which the lower end is connected with the framing of the C.-post, and the upper end secured by chains to the upper part of the same. In a complete travelling jib-C. the whole is placed upon a low truck running on rails, along with a small steam-engine and boiler. The jib and lifting apparatus can be turned round the post so as to lift an object situated on either side of the truck, while the upper end of the jib itself can be raised and lowered so as to suit the distance at which the object happens to be.

Crane (Old. Eng. *cran*, from the sound made by the bird), the representative of a family of birds—the *Gruidæ*—belonging to the order *Grallatores*, having affinities with the *Ardeidæ* or herons, and also with the *Otidæ* or bustards. The bill is strong, with sharp edges, and the nostrils lie in hollow sinuses. The legs are long and slender, with a considerable portion of the tibiæ bare, and the toes are long, except the hind one, which is also more elevated, and distinguishes the family from the herons and bitterns. The two outer toes are connected by a small web. The cranes are all large, with long necks and powerful flight, are migratory, and fly at a great height in the air, with a steady motion. The common C. breeds in Northern Europe and Asia, and migrates in the winter towards the tropics. It is of an ash-grey colour, the face and throat nearly black, and the wing-primaries black. The whooping C. is pure white in the adult state, with the tips of the wings black. The demoiselles C. and the crowned C., which are among the most beautiful of the family, inhabit the N. of Africa.

Common Crane.

Crane-Fly, a genus of Dipterous insects or flies, belonging to the *Nemocera*, which possess antennæ of long, thread-like character. The crane-flies form types of the family *Tipulidæ*, in which the proboscis is short, and terminated by two fleshy lips enclosing bristles. The common C.-F. is the typical example. Its popular name is 'Daddy longlegs.' The larvæ, living in moist ground, do great harm by attacking the roots of grasses and cereals. The Hessian fly of the United States is nearly allied to the C.-F.

Cranganore' (*Kranganúr*, *Kodungalúr*), a town on the W. coast of the district of Malabar, in the state of Cochin, province of Madras, India, on the island Chetwai, in an opening of the great Cochin backwater, and 18 miles N.N.W. from Cochin. It is said that St. Thomas visited C. in A.D. 52, but there is no proof of this. Anyhow, before the 9th c. the Syrian Christian Church was firmly established here, and also a colony of the Jews. The Roman Catholic Portuguese, with most unchristian cruelty, exterminated or drove off the Jews to Cochin; but the former received their reward, as all persecutors do, and were themselves driven out by the Dutch, who ceded it to Tippoo in 1784, and he destroyed and left it. The town, such as it is, consists of two small villages, Metthala and Lakamaleshwara.

Cra'nia. A genus of Brachiopodous mollusca, forming the type of the family *Craniadæ*, exemplified by many extinct and by some existing species. In this family, the animal is fixed to submarine objects by the ventral or lower valve of the shell. The arms are fleshy, and coiled spirally. No hinge or articulating processes exist. The upper valve is limpet-shaped. The shell may be smooth or striped or spinous. The genus C. is first represented in a fossil state in the Silurian rocks. *C. personata* is a living species, while *C. Ignabergensis*, of the Chalk rocks, is a typical fossil form.

Cra'nial Nerves. These nerves, nine in number on each side, originate in some part of the base of the brain or upper portion of the spinal cord, and pass through apertures in the floor of the skull, to be distributed to the organs of sense and other structures in the head. They are named numerically from the front backwards, but certain of them have additional names, given on account of their supposed functions. They are as follow:—1st pair. *The olfactory*, distributed to the nose, and connected with the special sense of smell. 2nd pair. *The optic*, passing to the eyeballs, and connected with the special sense of sight. 3rd pair. Sometimes termed *motores oculorum*, nerves of motion, distributed to all the muscles which move the eyeballs, with the exception of the external rectus and superior oblique muscles. 4th pair. Termed the *pathetici*, nerves of motion, distributed to the superior oblique muscles of the eyeball. When these muscles act, the eyeball is rotated upwards and outwards, so as to give a pathetic expression; hence the name. 5th pair. *Trifacial* or *trigeminal* nerves, both motor and sensory, conferring sensibility on the skin of the face and side of the head, mouth, lips, cheeks, and teeth; also sending a special branch, the *lingual* of the 5th, to the anterior part of the tongue (connected probably both with taste and tactile sensibility), and, lastly, supplying the muscles of mastication. 6th pair. *Abducens*, a motor nerve supplying the external rectus muscle of the eyeball. 7th pair. Divided into two portions—(1) *The facial* or *portio dura* of the 7th, being the motor nerve of the muscles of expression; and (2) *The auditory*, or *portio mollis* of the 7th, being the nerve of the special sense of hearing, distributed to the ear. 8th pair. This consists of three nerves—(1) *The glosso-pharyngeal*, the special nerve of taste, distributed to the posterior third of the back of the tongue. (2) *The pneumogastric*, or *par vagum*, so termed on account of its wide distribution in the neck, chest, and abdomen. This important nerve supplies both motor and sensory branches to the pharynx, motor and sensory branches to the larynx, branches to the heart, which exhibit an inhibitory or restraining action over the contractions of that organ, sensory branches to the lungs, motor and sensory branches to the œsophagus, and motor and sensory branches to the stomach. (3) *The spinal accessory*, a motor nerve, distributed to the sterno-cleido, mastoid, and trapezius muscles in the neck. 9th pair. *The hypoglossal*, a motor nerve, supplying motor power to the muscles of the tongue both intrinsic and extrinsic. Each cranial nerve has an *apparent* origin from the base of the brain, and a *deep* or real origin from grey matter in the substance of the organ. The *deep* origins of the C. N. are still imperfectly known. Details regarding these may be found in *Gray's Anatomy*, p. 495 *et seq.*

Cra'nium. Anatomists divide the skull into two portions—the C. and the face. The C. is formed of eight bones—the occipital, two parietal, frontal, two temporal, sphenoid, and ethmoid. The C. contains the brain, and the base is perforated by numerous apertures for the passage of nerves. See SKELETON.

Crank, in machinery, an arm or lever connected with a shaft, and having a rotative motion about its axis. A. C. at the end of a rotating shaft is, in general, simply an arm of wrought-iron keyed upon the shaft, and having a pin called a C.-pin at its outer end. At the centre of a length of shaft the C. becomes a pair of arms (or 'throws'), joined by the C.-pin at their outer ends. In this case the C. is formed either by bending the shaft, or (more commonly) by forging a large projection upon it, and subsequently working this into the required form by suitable tools.

Cran'mer, Thomas, an English statesman and ecclesiastic, was born at Aslacton, Nottinghamshire, 2nd July, 1489, and educated at Cambridge, where he distinguished himself in Greek and divinity, and obtained a fellowship, which was re-granted to him after the premature death of his wife in 1513. Refusing an office at Oxford which Wolsey pressed on him, he remained at Cambridge and Waltham Abbey till 1529, when his suggestion of the invalidity of the papal dispensation in the matter of the King's marriage brought him into notice. Along with other divines, he was sent to Rome to challenge the marriage as against the Scriptures, the Councils, and the Fathers, and to collect similar opinions from the foreign universities. Clement was of course unconvinced by his arguments, but gave C. the honorary title of 'Supreme Penitentiary.' C. also attended the Emperor at Bologna on the same business, wrote a book on it, and was a leading member of the Cambridge committee which considered it. Henry made him a royal chaplain, and after the marriage of Anne Boleyn, C. (in spite of his own second marriage) was consecrated Archbishop of Canterbury on 30th March, 1533, qualifying his oath of submission to Rome by an exception of his duty to God and the laws of the country. He immediately obtained from the two Houses of Convocation a declaration that the licence of Pope Julius was null as dealing with divine, not with canonical law, and that the previous marriage with Arthur had been consummated; and then, under licence from the crown, opened a court at Dunstable, which Catharine refused to attend, but in which final judgment of divorce was pronounced, 23rd May, 1533. C. assisted in the statutory abolition of papal authority in England, but generously tried to save More and Fisher when they declined to take the oath of supremacy and to acknowledge the Statute of Succession in 1534. The issue of a second edition of the *King's Primer* and the revision of *Tyndal's New Testament* were now set on foot by C., who also vigorously supported, against Latimer and the Vicar-General Cromwell, the first Act of Dissolution of the small monasteries (1536). He even said that cathedral chapters and all clerical corporations should be suppressed. The same year he was obliged to pronounce null the marriage of his friend Anne Boleyn, whom he had regarded as a support of Reformed religion, which in the Articles and the Bishop's Book he was gradually introducing into the Church. He was, however, in 1539, defeated by the conservative party on the 'Six Bloody Acts.' (See ARTICLES, THE SIX.) In 1540 he had formally to dissolve Henry's marriage with Anne of Cleves, and the next year to initiate the proceedings which led to the death of Catherine Howard. As before, he generously interceded for Cromwell. In spite of the intrigues of Gardiner, Norfolk, and the Catholic party, C. managed to keep the helm of ecclesiastical affairs till Henry's death, vigorously promoting Reformed doctrine even when, perhaps, as in the King's book, he did not personally accept it. His Litany was an important contribution to the Church, to which he afterwards added the First Communion Book, the Prayer-book of 1549, and lastly, the complete Liturgy. On the accession of Edward VI., C. continued by his Homilies and the circulation of Erasmus' Paraphrase, and through the Liturgy Commission, to press on reform. The Forty-two Articles were completed by him before Edward's death. He was unwillingly forced to sign the letters patent, extorted by Northumberland's conspiracy, and altering the succession in favour of Lady Jane Grey. Accordingly, on Mary's accession, when mass took the place of communion service, and altars and images were restored, when Gardiner became Chancellor, and a Catholic Commission was created to try Protestants for treason, heresy, and marriage, C., along with Latimer and Ridley, was thrown into the Tower. After a first trial, which was said to be irregular because the country was then unreconciled to Rome, C. was tried at Oxford in September, 1555, for 'blasphemy, incontinence, and heresy.' It was not till February, 1556, long after the execution of Latimer and Ridley, that the final sentence of Paul IV., anathematising C., degrading him and handing him over to the secular arm, arrived in England. Immediately after, C. received the celebrated letter from Cardinal Pole, and, exhausted by the anxieties of two and a half years' imprisonment, he issued his submission to the papal authority and his confession of Catholic dogma. In spite of this, he was publicly burnt at Oxford, 21st March, 1556, surprising the Catholics by recanting his recantation at the last moment. Froude strongly insists on the general purity and uprightness of C.'s character (see vol. v. of his *History of England*). There are special Lives of C. by Gilpin, Lebas, and Todd, and many documents under his hand are preserved in Strype's *Memorials* and Jenkyn's *Remains*. C. published in 1550 in Latin *A Defence of the True and Catholic Doctrine of the Sacrament of the Body and Blood of Christ*. His *Catechism* was republished at Oxford by Burton in 1829.

Crannoges, the name given in Ireland and Scotland to artificial islauds in lakes, formerly used as habitations and strongholds by the Celtic tribes. The meaning of the term is uncertain, but it is believed to refer to the timber employed in the construction of these remarkable settlements. The *Pfahlbauten* or pile-buildings of Switzerland will be treated of under LAKE DWELLINGS, and the present article is restricted to the C. proper, or *Packwerkbauten*. The difference between the two is that the former consists of dwellings on wooden platforms placed upon piles driven into the bed of a lake, and allowing the water free course beneath, while, in the latter, the huts were placed upon islands constructed in the manner described below.

Although C. are mentioned in the Irish annals so early as the 9th c., they were unnoticed by archæologists until 1839. In that year drainage operations were being carried on at the Lake of Lagore, near Dunshaughlin, County Meath, and while a trench was being cut close to a mound which had formerly been an island in the lake, great quantities of bones were discovered, no less than 150 cartloads of them being taken away. Further examination showed that the mound, whose circumference was 520 feet, was formed by posts of black oak, from 6 to 8 feet in length, mortised into beams of the same wood. These lay flat upon the marl and sand below the bog, at a depth of 16 feet from the surface. The upright posts were connected by cross-beams, and portions of a second tier of posts were resting on the lower ones. The enclosed space was subdivided by oaken beams, the sides of which were in some cases grooved or rabbeted to admit panels, driven down between them. The interior of the chambers thus formed was filled up with black moory earth and with bones, chiefly of cattle, deer, and swine, though those of goats, sheep, horses, foxes, dogs, and asses were also found. There were also many weapons, ornaments, and household utensils, made of stone, bone, wood, bronze, and iron. These remains have been fully described by their discoverer, Sir W. R. Wilde, then one of the secretaries of the Royal Irish Academy.

In succeeding years many more C. were discovered in Ireland, especially in the N. and the valley of the Shannon. As a rule, they were built upon a small islet in a lake, or on a shoal not far from the surface. The settlement was either circular or oval in shape, and was marked out by a stockade of piles. Sometimes there was a double ring of these. They were from 4 to 9 inches in diameter, and for the most part were young oak-trees, though alder-trees were also employed. They projected above the water several feet, and probably were interlaced with branches, so as to form a breastwork. The bottom of the enclosure was covered with round logs from 4 to 6 feet long, and on the top of them was piled a mass of clay, gravel, and boulders, to a height of about a foot above the surface of the water. On the island thus formed a platform was placed, covering the whole, or a portion of its area. Flat stones, which had apparently been used as hearths, were found in nearly all cases near the centre of the platform, together with at least one pair of querns. Occasionally the C. were connected with the mainland by a causeway or a bridge of planks, but more frequently they could only be reached in a boat or canoe.

From the middle of the 9th to the beginning of the 17th c. C. are mentioned in the Irish annals. They were originally intended for defence, and speedily became the strongholds of robber chiefs, who carried off to them the spoils gathered in their raids, and, favoured by the situation of their fortresses, were frequently enabled to offer a successful resistance when efforts were made to root them out.

In 1857 the existence of C. in Scotland, at Banchory, in Loch Cannor, and other places, was first brought under the notice of archæologists by Joseph Robertson. In 1863 a group of similar structures was discovered in the Loch of Dowalton, in Wigtownshire. Since then many other C. have been discovered in various parts of Scotland. Their construction is exactly similar to that of the Irish C., and a like similarity exists with respect to the antiquarian remains found in them. The Scotch C. are frequently mentioned in history down to the end of the 18th c. Several of them were fortresses of considerable importance. That of Lochindorb, in Moray, for instance, was regarded of so much importance by Edward III., that in 1336 he marched with an army to its relief; while that of Loch Cannor, or Kinord, in Aberdeenshire, was in 1648 dismantled by order of the Estates of Parliament. In September, 1875, two large canoes, in an excellent state of preservation, were drawn out of the bed of this loch.

C. have also been discovered in some of the smaller lakes of Switzerland, but in the larger lakes their place was taken by the pile-buildings, whose construction was better adapted to withstand the waves of extensive sheets of water. Remains of C. also exist in the northern island of New Zealand, and Cameron reported, in 1876, the existence of similar structures in the interior of Africa.

See Wilde's *Catalogue of the Museum of the Royal Irish Academy*; *Proceedings of the Royal Irish Academy*, vols. i. v. and vii.; *Proceedings of the Society of Antiquaries of Scotland*, vol. iii.; Keller's *Lake Dwellings of Switzerland and other Parts of Europe*, translated and arranged by J. E. Lee (Lond. 1878); and Lubbock's *Prehistoric Times* (Lond. 1872).

Crape (Fr. *crêpe*), a gauze-like fabric made of raw silk, woven without crossing, stiffened with gum, and twisted at the mill, which gives the crispy appearance when taken from the loom. It is usually dyed black, and is much used in mourning.

Cra'shaw, Richard, 'the idol of Cowley,' a minor poet, was born in London about 1616, and educated at the Charterhouse and at Cambridge, where he took his degree in 1638. He was for a time a popular preacher in the English Church, but becoming a Roman Catholic, he went to Paris, and thence to Italy, where he became canon of the Church of Loretto. He died about 1650. C.'s poems are devout and earnest, but inferior to those of Herbert, whom he imitated. His chief works are *Steps to the Temple* and *The Delights of the Muses*. Pope borrows frequently from C., especially in *Eloisa*. See Turnbull's edition (Lond. 1858).

Crassatell'a, a genus of molluscs, the shells of which are thick, solid, and bulging, attenuated behind, and with a surface concentrically furrowed. An internal ligament exists. C. is well represented by living species, and in a fossil state begins in the Cretaceous rocks. *C. ponderosa* (Tertiary Eocene) is a familiar species. The genus belongs to the family *Cyprinidæ*, of the class Lamellibranchiata.

Crassula'ceæ, the Houseleek or Stonecrop order, a natural order of Dicotyledonous succulent herbs or shrubs. There are in all about forty-six species described, included under twenty-four genera, found in dry situations in all parts of the world, but chiefly at the Cape of Good Hope. Astringent, refrigerant, and acid properties are characteristic of the whole order, none of which are of much importance. C. of the Cape of Good Hope is said to be efficacious against epilepsy. The stonecrop possesses, according to popular belief, emetic and purgative properties. It is very acrid, and hence called 'wall pepper.'

Crass'us, Lu'cius Licin'ius, one of the greatest orators that Rome ever produced, was born B.C. 140. From a very early age onwards he displayed pre-eminent oratorical ability in judicial proceedings, in senatorial orations, and in popular addresses. With Q. Scævola he became consul, B.C. 95, and during their term of office was passed the *Lex Licinia Mucia de Civibus regundis*, compelling all who were not citizens to leave Rome, a law which aided in provoking the Social War. C. was fond of luxurious living, and, in allusion to his fine house and effeminate manners, he was called by Brutus 'the Palatine Venus.' He died, B.C. 91, from a fever brought on by a violent contention in the senate with Philippus, the consul. C. is introduced by Cicero as one of the chief interlocutors in the *De Oratore*.—**Mar'cus Licinius Di'ves C.,** the triumvir, was born about 105 B.C. He escaped to Spain in dread of the enmity of Marius, for resistance to whom his father and brother had lost their lives. After various adventures C. joined Sulla, B.C. 83. At a battle in Lucania, 71 B.C., C. defeated with great slaughter Spartacus, the rebel hero of the Servile War. In 70, C. and his envied rival Pompey were elected consuls. To gain public favour during his consulship, C. gave the populace a banquet of 10,000 tables, and distributed corn sufficient to supply the family of every citizen for three months. About 60, what is known as the first *triumvirate* was formed by Cæsar, Pompey, and C., his position in which C. owed to his enormous wealth, amassed by rapacious avarice, and to a reputation among the well-to-do citizens for practical talent, which his acquisition of this wealth had obtained for him. According to the compact of the *triumvirs*, Pompey and C. were reelected consuls, B.C. 55, and on the distribution of consular provinces, C. chose Syria. From a vain ambition for military fame, he wantonly made war on the Parthians, but his insatiable cupidity proved his ruin, by leading him to neglect his military duties for the plunder of temples. He was betrayed first by Ariamnes, and afterwards by Andromachus, and after suffering defeat at Carrhæ, fell by an unknown hand in a treacherous interview with Surenas, the Parthian general, B.C. 53. In the Parthian expedition C. is said to have lost 20,000 men by slaughter and 10,000 by capture. Orodes, the Parthian king, caused melted gold to be poured into the mouth of the lifeless C., saying, 'Sate thyself now with the metal of which thou wert so greedy in life.'

Cratæ'gus (the hawthorn), a genus of Dicotyledonous plants belonging to the natural order *Rosaceæ* (sub-order *Pomeæ*), natives of Europe, N. America, and temperate Asia and Africa. The best-known species is the common Hawthorn (q.v.), so familiar a material of our hedgerows, found in nearly every part of Europe, and in N. Africa and Western Asia. It is sometimes called the 'May-tree,' from blossoming in May, a month also in which most of the other species of C. also appear in bloom. With the exception of the species named, none are natives of Britain. The cockspur thorn is a native of N. America. The Azorole and the Aronia, the 'haws' of which are sometimes used for dessert or tarts, are natives of the S. of Europe and the Levant. Among the other cultivated species may be mentioned *C. Pyracantha*, which is a native of the Caucasus and the S. of Europe, and known to gardeners, who value it as a wall-tree, as the *Pyracantha*.

Cratæ'va, a genus of tropical shrubs or trees of the Cape order (*Capparidaceæ*). *C.* of the Malabar and Society Islands is planted in burial-grounds as a sacred tree. Its leaves and other parts of the tree are aromatic, bitter, and stomachic. The bark of the root of the garlic pear, so called on account of its strong smell of garlic, blisters the skin like Spanish flies.

Cra′ter (Gr. *kratēr*, 'a bowl'), the funnel-shaped cavity on the summit of a Volcano (q.v.), through which the volcanic products are mostly ejected. The largest C. on our earth is that of Kilauea, in the island of Hawaii, forming a large lake of molten lava about 2 miles in circumference. On the surface of the moon numerous large cavities are observed, which, from their position and general appearance, are probably the craters of extinct volcanoes. Of these, the most interesting are the craters of Copernicus and Tycho, 55 and 50 miles in diameter respectively.

Crati′nus, a representative poet of the old Athenian comedy, was born at Athens, B.C. 519. He wrote twenty-one comedies, none of which are extant, and he gained nine victories, one of them over the *Clouds* of Aristophanes. He made changes in the outward form of comedy, as, for example, by fixing the number of actors at three. He was the first to introduce into comedy reproachful attacks on public men and unsparing satire of vice. C.'s imagination was fervid, and his style impetuous and somewhat grandiloquent. In the *Knights*, Aristophanes (as translated by Mitchell) says of him—

> 'His step was as the tread of a flood that leaves its bed,
> And his march it was rude desolation.'

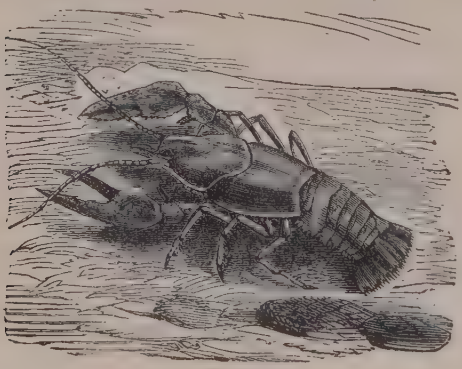
C. died, B.C. 422.—**C. the Younger**, an Athenian poet of the Middle Comedy, flourished during the middle of the 4th c. B.C.

Cratipp′us was an eminent Peripatetic philosopher of Mytilene, and an instructor of Marcellus and Cicero. For many years he lectured on philosophy in Athens, where Cicero the Younger, and subsequently Brutus, were among his auditors. Cicero entertained a very high opinion of him, and procured for him from Cæsar the Roman franchise. After the battle of Pharsalia, C. accompanied Pompey, and soothed the spirit of the defeated triumvir with the consolations of philosophy. He does not seem to have written any philosophical works.

Cratox′ylon, a genus of bushes or small trees of the St. John's wort order, natives of China, the Malaya Peninsula, Java, and neighbouring islands. About ten species are described, but only the C. of Java, which is slightly astringent and diuretic, is known to have medicinal properties.

Cray′er, Gaspar de, a Flemish historical painter, born at Antwerp, 1582, died at Ghent, 27th January, 1669. He won the admiration of Rubens and the friendship of Van Dyck, whom he rivalled in portraiture. His pictures, lofty in style and subject and large in size, are correct and vigorous in design, and full of dignity though somewhat cold. About forty of them are in the churches and the Museum of Ghent. His *Virgin and Infant Jesus Enthroned*, now at Düsseldorf, was purchased by the Elector Palatine for 80,000 frs.

Cray′fish, a species of Decapodous crustaceæ belonging to the division *Macrura*, including the lobsters, shrimps, &c., is found in British rivers. The family *Astacidæ*, to which the C. belongs, has the anterior pair of feet very large, the appendage at the base of the outer antennæ very small, and the middle segment of the tail-fin divided transversely by a suture. C. is chiefly nocturnal in habits, and, like the lobster, turns red on being boiled.



Crayfish.

Cray′on, a French word, meaning a pencil (from the Lat. *creta*, 'chalk'), is applied especially to a small cylinder employed in drawing on paper. It is usually made of fine pipe-clay, coloured with metallic pigments and carmine. Delicate softness rather than vigour generally characterises drawings in C.

Cream (lit. 'froth,' Fr. *crême*), the rich, fatty part of Milk (q.v.), which forms a yellowish-white layer on the surface of milk when suffered to remain at rest. Butter is made from it by churning.

Cream of Tartar is the acid or bitartrate of potash. It is obtained from Argol (q.v.), or crude tartar—the very impure bitartrate of potash which is deposited from the juice of the grape during fermentation. The argol is dissolved in boiling water; the solution thus obtained is digested with animal charcoal to remove the colouring matter, and then allowed to cool, when C. of T. separates in white crystals. C. of T. is comparatively insoluble in cold water, but is tolerably soluble in boiling water. It is used in medicine as a diuretic and purgative.

Cre′atine (Gr. *kreas*, 'flesh') is a crystalline substance contained in muscular fibre, and hence is found in the extract of meat. It also occurs in blood and in the substance of the brain, &c. In order to extract the C. from meat, the latter is mashed and digested for some time with cold water; the clear, aqueous extract thus obtained is boiled to coagulate albumen, filtered, mixed with baryta water, again filtered, and evaporated to a syrup, when C. crystallises out after some time.

C. has been prepared synthetically. Although neutral to test-paper, it forms crystalline salts with several acids.

Cré′billon, Prosper Jolyot de, a French dramatist, born at Dijon, 13th January, 1674, of middle-class parents, was intended for the law, which, however, he very soon left for a literary career at Paris. After a failure, he was encouraged by his master and friend, Prieur, to produce his first successful tragedy, *Idoménée*, which was played in the winter of 1705-6. In 1707 his taste for the gloomy and horrible was shown in *Atrée et Thyeste*, which was performed eighteen times. Considerable skill in dramatic situation and in striking, though often inflated, description marks this play. In the same year C. married Charlotte Péaget, and the death of his father in embarrassed circumstances compelled him to devote all his time to the drama. The tragedy of *Électre* (1709), founded on the play of Sophocles, has been bitterly criticised by Voltaire in his *Éloge de C.* (vol. lxi. of collected works), because it makes the inspired servant of destiny the subject of an insipid affection for Itys. In 1711 appeared his best tragedy, *Rhadamiste*, founded on the old romance *Bérénice*. The character of *Zénobie* is admitted, in spite of the sarcasm of Boileau, to be very powerfully drawn; the play is also peculiar from the hatred of the Roman Empire which it shows. The remaining plays of *Xerxes*, *Semiramis*, *Pyrrhus*, *Catilina*, *Le Triumvirat*, following at considerable intervals, have no lasting merit. *Catilina*, completed on the suggestion of Madame de Pompadour, and produced at the King's expense in 1748, had a brilliant success for one season. In spite of his extravagant social indulgence, followed after his bankruptcy by the most morose eccentricity, C. was elected a member of the Academy, afterwards royal censor, and finally one of the royal librarians. He died 17th June, 1762. He is still ranked among the classical tragedians of France, and has been called the French Æschylus, but he is quite singular in his want of literary education and taste. His genius resembles that of Marlowe. Besides the splendid edition of C.'s works, published by order of Louis XV. (Par. 1750), there are editions by Didot the Elder (Par. 1812 and 1818), and by Perelle (Par. 1828). He left a son, **Claude Prosper Jolyot de C.,** born at Paris, 14th February, 1707, and educated at the Jesuit College 'Louis le Grand.' C. began his literary life by writing opera-bouffe for the theatres, then formed a connection with the 'Académie de ces Messieurs,' a half-literary, half-social club of aristocrats, to whom his talent for epigrammatic versification was useful, but soon sank to the manufacture of licentious novels, with which his name is chiefly associated. In 1734 appeared *Tanzai;* in 1736 *Les Égarements du Cœur et de l'Esprit.* In 1740 he married an Englishwoman, Lady Stafford. His worst book, *Le Sopha,* was condemned by Madame de Pompadour, and C. was banished from Paris for five years. On his return, however, in 1755, he was appointed censor. C. died 12th April, 1777. There was a certain independence in his writings which made the social and political allusions very effective. His *Œuvres Complètes* appeared at Paris in 1779.

Cré'cy, or **Cress'y,** a small French town in the department of Somme, 12 miles N.N.E. of Abbeville. It is celebrated in history as the scene of the inglorious defeat suffered by Philippe VI. of France, 26th August, 1346, at the hand of Edward III. of England. Froissart numbers the English force at 16,000, which is probably under-estimated, and the French at 68,000. The flower of the French chivalry was destroyed, Philippe escaping with only four of his barons. Pop. 1614.

Cre'dence (Ital. *credenza*), is a table near the altar in churches, called also the *prothesis, oblationarium,* and *ministerium,* on which the bread and wine to be used in the eucharist are placed previously to consecration. It takes the form of a little table, sometimes of stone, of an aumbrey in the wall, or, as with the Cistercians, of a bracket or recess; and is sometimes on the N. side of the altar, sometimes on the S. When there is one on both sides, as is sometimes the case, the one on the epistle-side has a drain and a shelf to hold the basin and the cruets; the one on the gospel-side holds the books, candles, and ornaments of the altar. The first use of the C. in the Roman ritual occurs in the time of Leo X. in 1516, when the custom of personal offering fell into disuse. The name is derived from the ceremony of tasting the elements in the pontifical mass (Ital. *credenzare,* 'to taste before presenting to another'). When the Pope celebrates on Easter Day there are three credences. Of the two on the epistle-side, one holds the deacon's plate; the other, two candles and the necessaries required by the sacristan. On the third, which is on the gospel-side, the sacristan washes the sacred vessels at the end of the creed; he also drinks of the wine and water; and finally, at the offertory, tastes of the particles from which the hosts are prepared, as a precaution against poison.

Creden'tials are letters given to an ambassador or other official sent by one Government to another, to entitle him to its confidence.

Cred'it. The meanings of this word are in political economy various yet closely related, and having nearly the same import as they have in ordinary and commercial language. Suppose a retail dealer, seeing his way to selling £100 prime cost of goods during the next three months for £130, but not possessing £100 with which to make the purchase. Then, on the question of whether or not he can induce the wholesale merchant to entrust him with the goods with three months' C. depends his profit of £30, and also the wholesale dealer's profit. The principle here involved is of universal application; but that C. may work to the advantage of the community, it must rest on a solid basis of capital. In commercial ventures, the capital at command and the nature and extent of the business must be prudently regarded in taking C. The giving of C. is often the most difficult and important question which a commercial man has to consider.

Credit, Cash. See BANK, BANKING, and BOND.

Credit, Letter of.—The letter is so called by which the writer requests the person or firm which he addresses to pay money to the bearer or some other party mentioned in the letter. Business may be transacted by means of a L. of C. between any two persons or firms, but usually it only passes between bankers resident in different places. It enables a person paying in money to a bank at one place to draw it at another, and so to avoid the risk and trouble of carrying it. For the convenience so afforded, the bank issuing the letter charges a percentage on the value of the C., the rate of the percentage varying according to the rate of exchange between the places. A L. of C. is a great convenience to any one going to a foreign place. It is not necessary to draw the full value at once. You present your letter, say for £100, to the banker to whom it is addressed, and request him to give you the foreign equivalent of £20. This is endorsed on the letter, and there remains £80 at your C. Even in a place where the granter of the letter has no correspondent, little or no difficulty is usually found in drawing upon it. But any one intending to go from place to place abroad will find the best form of carrying pecuniary C. to be Circular Notes (q.v.). See also EXCHANGE.

Crédit Foncier is the French term for a loan on the security of land. Three companies have been established by the French Government with certain privileges having the title of C. F. The loans are repayable so that principal and interest are extinguished at the same time. The same system of repayment of loan has been adopted by various building and property investment companies in this country.

Cred'iton, or **Kirkton** (Old Eng. *Cridian-tun,* 'the town on the Creedy'), a town of Devonshire, 8 miles N.W. of Exeter. The church of the Holy Cross is a fine structure. Shoemaking forms its chief industry, though formerly it had manufactures of woollens and serges. Cider is also made. C. is the birthplace of St. Boniface (q.v.). Pop. reg. subdist. 6526; and civ. par. 5821.

Creeds are formal statements of the doctrines believed by the Church, concisely expressed for the purpose of being conveniently recited. 1. The Latin *credo* ('I believe,' whence the English *creed*) was not the only name given to such a production. The most usual name was Lat. *symbolum,* Gr. *sumbolon,* which was a token by which the initiated were admitted into the mysteries of the heathen gods; and when we know how much the early Christians borrowed from the heathen (see Middleton's *Letter from Rome*), and remember that the holy mysteries of the Church were also concealed from the uninitiated, we need be at no loss to account for the name, considering the use made of the C. Another usual name was Lat. *regula,* Gr. *kasiōn,* 'the rule,' so called because it was the authorised standard or rule of faith. Other names were Gr. *mathēma,* 'the lesson,' *graphē* and *gramma,* 'letters or learning,' so called from the Catechumens (q.v.) having to learn it. 2. The first use of the creed was—(*a*) in the preparations of catechumens for baptism. They had to repeat it privately to the catechist, then publicly in the church, and, lastly, to make a more solemn profession of it at the time of baptism, and to answer questions put by the minister relative to the several articles of it. From this it came naturally to be used (*b*) as a test of church-membership; then (*c*) as a test of orthodoxy, and (*d*) in a liturgical character. 3. The earliest creed made use of for the purpose was a very short and simple one, namely, 'I believe that Jesus Christ is the son of God' (Acts viii. 37); but article after article was added to this as the doctrine of the Church was gradually developed. The idea that what is called the Apostles' Creed was composed, as some say, by the apostles at a council held before leaving Jerusalem, some going so far even as to assign a particular article to each apostle, is simply absurd, as no one who knows anything about the development of Christian doctrine needs to be told; for several of the articles in it were not in any Greek or Latin creed for the first three or four centuries. It was most probably compiled from various C. used by the primitive Church, several of which are preserved in the writings of the early fathers. There are fragments in the writings of Irenæus, Origen, Tertullian, Cyprian, Gregory Thaumaturgus, and Lucian the Martyr, and in the Apostolic Constitutions, and more perfect forms under the names of the C. of Jerusalem, of Cæsarea, of Alexandria, and of

Antioch, in none of which are the articles of the Communion of Saints and Descent into Hell mentioned; nor were they originally in the Apostles' or Roman Creed. The article of the Descent into Hell was almost peculiar to the creed of Aquileia, and was only introduced into the Apostles' Creed about 600. The Nicene Creed (q.v.) was drawn up at the Council of Nicæa (325), with special reference to the Arian heresy (see ARIUS) that the Son was not equal in all respects to the Father. But the creed, as we have it, is that of the council as it was afterwards enlarged by the Council of Constantinople (381), and with the word *filioque* (‘and from the Son,’ in reference to the Procession of the Holy Spirit—q.v.), which was afterwards added by the Latin Church, and caused the inveterate schism between the Eastern and Western Churches which has continued till the present day. The so-called Athanasian Creed (q.v.), attempted to be fathered on the great opponent of Arius, is unquestionably a forgery of a much later time. These three are the C. proper of the Catholic Church, and all that existed till the Reformation. After the doctrine of the Church of Rome had been defined by the Council of Trent (q.v.), an embodiment of it was published under the name of the Creed of Pope Pius IV.

Cree′per, the type of a family (*Certhidæ*) of the Insessorial sub-order *Dentirostres*. In these birds the toes are very long and slender, the outer toe being longer than the inner one, and united to the middle toe beyond the first joint, and to the inner toe up to the latter joint. The hind-toe is long and slender, and the claws are long and curved. The bill is also curved and slender. The hinder toe is very mobile, and all the toes may be twisted so as to make the claws available for holding on to the bark of trees. The creepers occur in both Old and New Worlds. The British species is the brown C., averaging about $5\frac{1}{2}$ inches in length. It also occurs in Europe and N. America. The wall-C. of S. Europe is another species. The food consists of insects, and the tail-feathers assist in climbing the trees.

Creeper.

Creek (Old Eng. *crecca*, Dutch, *kreek*, ‘a bend or corner’) is a small inlet on a low coast. In America the word is synonymous with *brook*.

Cre′ma, a walled town in the province of Cremona, N. Italy, on the Serio, 23 miles N.W. of Cremona. It dates from the 6th c., has an old castle and cathedral, and some silk and lace manufactures. Pop. 8818.

Cremo′na (anciently *Cremonensis-ager*, a Gallic tribal name), the capital of a province of the same name in Lombardy, N. Italy, on the Po, 46 miles S.E. of Milan. It has some fine buildings, notably a splendid cathedral, which has a clock-tower (built from 754 to 1284) 357 feet high, and a great baptistery with a marble vase of the year 900. C. received a Roman colony B.C. 219; soon after it became a place of great trade, and had the largest amphitheatre in Upper Italy. Destroyed by Vespasian, it did not regain importance till the Middle Ages, and in modern times it has again declined. It has manufactures of silk, cotton, and earthenware, and was formerly famous for its violin and violin-strings. Hence the name C. became a general name for violins made at C. Pop. 30,202.

Crenel′, or **Crenelle′** (Fr. *créneler*, ‘to indent;’ from the Lat. *crena*, ‘a notch’), in the fortification of the Middle Ages, an embrasure in the battlements of a castle or other building, to shelter a man with a bow and arrows, or some other weapon of offence. Buildings so provided are said to be *crenellated*.

Crenellé or *Crenellated*, in heraldry, a term used to describe a charge embattled, or drawn like the battlements of a wall.

Cren′ic Acid is a substance occurring in certain mineral springs, and was discovered by Berzelius. Crenate of ammonia is a frequent ingredient of vegetable mould. C. A. is a pale-yellow amorphous substance.

Cre′ole (Span. *criollo*, from *criar*, Lat. *creare*, ‘to create’), a word used in S. America, Mexico, or the W. Indies, to denote one born in any of those countries but of European extraction. It is sometimes loosely applied to a mulatto or mestizo, *i.e.*, to one of mixed blood; but this is not its proper use.

Cre′osote, or **Kre′osote** (Gr. *kreas*, ‘flesh,’ and *sōtēr*, ‘a preserver’), is a substance much used as an antiseptic and preservative. It is obtained by a series of operations from wood-tar, similar to those by which Carbolic Acid (q.v.) is separated from coal-tar. Considerable doubt exists as to the true composition of C., and indeed it is not certain whether it is a distinct substance or a mixture. Much of the C. employed in commerce is simply impure carbolic acid. The smoke of burning wood owes its preservative qualities to the presence of C.

Crescen′do (Ital. ‘growing’), a mark of expression used in music to indicate a gradual increase of loudness unaccompanied by any alteration in speed.

Cres′cent (Lat. *crescere*, ‘to increase’), a representation of the moon in her first quarter, or as defined with a concave and a convex edge. The *C. montant*, that is, with the horns upwards, which is the symbol of the Turkish Empire, was originally the arms of the Byzantine Empire, and the Turks, when they overthrew that empire, adopted it as their chief bearing.

Crescent, in heraldry, is the symbol described above, and is represented as *montant*, *increscent*, or *decrescent*, as the horns are respectively towards the chief, the dexter side or the sinister. It is used both as a bearing or charge, and as a mark of cadency or difference.

Crescent, Orders of the. There have been three O. of the C. The first was instituted by Carlo I., King of Naples and Sicily, in 1268; the second, by René, Duc d'Anjou, in 1448, the badge of the latter being a gold C., with the words *Los en croissant* (‘Praise by increase’) enamelled on it; the third, which is still in existence, was established by the Sultan Selim III. in 1801, two years after the battle of Aboukir. He had sent a C. of gold, richly mounted with diamonds, to Lord Nelson, which the English admiral wore, calling himself occasionally the Knight of the C. This induced the Sultan to found the order. It can only be conferred on Christians, since Mohammedans are forbidden by the Koran to wear such decorations.

Crescent City, a small town in the central part of California, in Tuolumne county, on the banks of the Tuolumne river, a branch of the San Joaquin, and navigable for steamboats 10 miles above the town. C. C. is also the name of another small town in California, which is situated on the Pacific. It is also the popular name of New Orleans.

Crescentia′ceæ, the Calabash order, a natural order of Corollifloral Dicotyledonous plants, closely allied to the *Bignoniaceæ*, natives of tropical and sub-tropical regions, abounding in Madagascar, the Mauritius, the Seychelles, and other islands of Eastern Africa, between 30° S. and 30° N. The order is also represented in America and Asia, but is unknown in Europe and Australia. Altogether thirty-four species and eleven genera are described. The properties and uses of the order are unimportant. The fruit of one species, called Quauhxilotl, is eaten by the Mexicans, and that of another (which yields wax, and from the fruit being shaped like a candle is called the ‘candle-tree’) by cattle in the Isthmus of Panama.

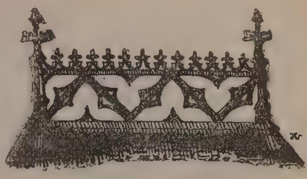
Cress, a name given to many plants, the pungent, mustard-like taste of which makes them valued as salads. The name is sometimes limited to the genus *Lepidium* (natural order

Cruciferæ). The garden-C. or town-C. is a native of Persia, but has been cultivated in this country since 1548. It is much used for giving a warm flavour to salads. It is easily raised, and, like the rest of the order, powerfully antiscorbutic. The pepper-wort, dittander, or poor man's pepper is even more pungent, and is also used as a condiment. One species is used in N. America and the W. Indies, not only as a salad, but as a diaphoretic. Another of New Zealand (the *Eketera* of the Maories) is eagerly sought by the crews of ships as an antiscorbutic. A Sandwich Island species has the property of intoxicating fishes, so that they float in helpless condition near the surface of the water, and are then easily captured. It is also pungent and antiscorbutic. The latter properties are also possessed by the winter-C., or herb St. Barbara, species of which are common in Britain and other parts of Europe and N. America, as well as the water-C., and Scurvy-Grass (q.v.).

Cress'et (Fr. *croisette*, dim. of *croix*, 'a cross'), an open lamp, filled with combustible material, and placed on a watch-tower, beacon, or lighthouse, or carried on a pole. It is so called because beacons had formerly crosses on their tops.

Crest (Lat. *crista*, 'a tuft,' perhaps connected with *crescere*, 'to grow'), the ornament which was placed highest on a helmet. Herodotus says the Carians were the first who wore tufts and feathers in this manner. In classical mythology the shield of Minerva bore an owl, that of Mars a lion or tiger, and that of Jupiter Ammon a ram's head. Diodorus Siculus asserts that the kings of Egypt bore the head of a lion, a bull, or a dragon. Homer describes the C. as made of horse-hair, in which he is followed by Virgil. Æschylus, in the *Seven against Thebes*, speaks of three crests on one helmet; and Suidas is of opinion that Geryon passed for having three heads because he wore a triple C. Alexander the Great bore a ram's head to support his pretence of descent from Jupiter Ammon, Julius Cæsar a star to indicate his relationship to Venus, and Pyrrhus a plume between the horns of a goat. In the Roman army the C. served to distinguish the various centurions. In the Middle Ages knights bore a plume of feathers, generally those of the ostrich, the peacock, or the heron. Richard I. (*Cœur de Lion*) rendered the lion renowned during his crusade. About the time of Henry III. the C. began to be used generally as a mark of distinction; hence it came to be called a *cognizance*. It was at first made of light material, frequently of boiled leather, but by-and-by wood and metal were employed, and the C. became smaller.

In mediæval heraldry the C. is a figure or device used as an adjunct to the shield, and represented as standing on a coronet, a wreath, or a cap of maintenance. Though sometimes identical with, it is generally distinct from, the principal charge on the shield. The dragon and the wyvern are among the earliest figures borne in this country. The lion crowned, now the C. of the royal family, was first assumed by King Edward III., who also bore an eagle or raven. The Panache (q.v.) alone, and with the heads of various animals, appeared early. Fantastic emblems soon began to be used as crests. That of the Duke of Hamilton is said to commemorate the escape of Sir Gilbert Hamilton, in 1323, in the disguise of a woodcutter. The C. of the Earls of Warwick of the Beauchamp family—the last of whom died in 1445—is a bear, muzzled and collared, with a ragged staff in its forepaws. In the 14th c. the coronet, the wreath, and the cap began to be emblazoned under the C; but the C.-coronet must be distinguished from one indicating princely or royal rank. The earliest wreath known to heraldists is engraved on the memorial brass to Sir Hugh Hastings at Elsyng, Norfolk, and dated 1347. The wreath which is now generally used consists of two strips of ribbon twisted into a cord, and tinctured with the principal metal and colour of the arms—the first coil being metal and the second colour. Heraldists regard the significance of a bearing on the shield as complete without the C.; and it has even been asserted that the latter is a personal bearing only, and not hereditary. Early and general usage, however, pronounce the C. to be hereditary, like the coat-of-arms; the inventions of seal-engravers and coach-painters being disregarded. See Fairbairn's *Crest of the Families of Great Britain and Ireland*.



Creste.

Creste, or **Crest**, in architecture, an ornamental finishing, such as a battlement or a row of Tudor flowers, surmounting a screen, canopy, or other similarly subordinate part of a building. The term is sometimes applied to the finial of a gable or pinnacle, or to an open-work ornament of lead placed vertically on the apex of a roof, as shown in the illustration.

Crest'ed, in heraldry, indicates that the comb of a cock, or other bird, is of a different tincture from the body. See BARBED AND CRESTED, WATTLED AND COMBED.

Cres'wick, Thomas, R.A., an English landscape-painter, was born at Sheffield, 1811, manifested in early youth a feeling for art, to gratify which he removed to London in 1828, and in the same year exhibited two landscapes in the Royal Academy, of which he was elected to the Associateship in 1842, and to the full honours in 1851. Sweetness of association and suggestion, together with an almost rigid fidelity to nature—from which he invariably painted direct—are the characteristics of his works, among the chief of which are 'The Course of the Greta,' 'The London Road a Century Ago,' 'Home by the Sands,' and 'The Weald of Kent.' C. died 28th December, 1869.

Creta'ceous or **Chalk Rocks**, a group or series of rocks belonging to the Secondary, Mesozoic or 'middle life' period, lying above the Oolite or Jurassic system, and being topped in its turn by the Eocene rocks, or earliest formations belonging to the Kainozoic or Tertiary rocks. The name 'C.' is given to these rocks from the very general occurrence of chalk in them. The following are the leading divisions of this system, as recognised in Europe and America:—

Upper C.	1. Maestricht beds.
	2. Chalk.
	3. Upper Greensand.
	4. Gault.
Lower C.	5 Lower Greensand or Neocomian.
	6. Wealden.

The Wealden beds derive their name in England from their special development in the Wealds of Surrey, Sussex, and Kent. Their lower portion is known as the Hastings Sands, and attains a thickness of from 500 to 1000 feet. The upper portion is argillaceous or clayey, with sand and limestone layers, and is from 150 to 300 feet thick. The Lower Greensand or Neocomian in Britain is about 850 feet thick, and consists of sandstones and clays, the former sometimes of green colour from the presence of iron silicate. The *fossils* of the Wealden are fluviatile in nature, and consist of fresh-water mussels, paludinæ or river snails, and the like. Those of the Greensand are of marine origin, and consist of shell and cuttlefish remains. The Gault occurs in the S.E. of England, and never exceeds 100 feet in thickness. The Upper Greensand varies in thickness from 3 to 100 feet, and consists of sands and clays. The true *Chalk*, composed of chalk-marl, white chalk without flints, and C. with flints, is well developed in the S. of England particularly, and is an extensive rock series. The Maestricht beds occur in Holland, and consist of yellowish limestone about 100 feet in thickness. In N. America the Lower C. R. are hardly represented. The Upper C. R. occur in the United States. *Foraminifera* (q.v.) are largely represented in the Chalk, the true Chalk containing those shells especially. *Corals*, *Echinoderms*, a few crustacea, many molluscs, fishes, reptiles, and birds, also occur, but no mammals whatever are found.

Crete (Gr. *Kreta*, Mod. Gr. *Kriti*, Turk. *Kirid*, Ital. *Candia*, from Arab. *Khandai*, 'a trench'), an island and vilayet of Turkey, in the Mediterranean, to the S. of the

Ægean Sea, has an area of 2949 sq. miles, and a pop. of 294,192 of whom nearly two-thirds are Greeks and Jews. It is 160 miles long from E. to W., and has a breadth of from 6 to 35 miles, while the coast, especially along the N., is indented by many deep bays. A mountain range traverses the island, culminating in the three groups of Sphakia (8100 feet) in the W., Pseloriti (8060 feet) in the centre, and Lasithi (7100 feet) in the E., and receiving in part the name *Leuci* from the ancients on account of the formation being of a whitish-tinted marble. There are few rivers of any size, but the island contains innumerable springs. The climate is mild and healthy. One-half of the soil is cultivated, yielding olives, Valonea nuts, locust beans, wine, tobacco, cotton, silk, &c. Canea (q.v.) is the capital, and the only other places of note are the seaports Candia and Retimo, the former of which had a pop. of some 15,000 previous to 1866, when it was in great part destroyed by storming. Besides the zaptiês or police, there are some 4000 regular troops, the support of which, together with the fortifying of Sudra Bay and the maintenance of a few forts, have swallowed up the public funds. The mule roads of the interior are at times almost impassable, and no attempt is now made to replace bridges destroyed by the winter torrents. Modern Greek is the prevailing language. In early times this island was called *Idæa*, and in the mythic age it was said to have been ruled by Saturn, Jupiter, Minos, &c. The birthplace and tomb of Jupiter were shown by 'the lying Cretans.' During the heroic period the island was visited by Dorian invaders, who later made it the headquarters of the worship of Apollo. The Homeric poems speak of the 'ninety cities' of C., and long subsequently the inhabitants were still gathered into independent and often hostile towns. Afterwards Cnossus, Gortyna, and Cydonia (Kanea) became centres of states. C. held aloof from Greece during the historic period, was conquered by the Romans (B.C. 67), attached to the eastern portion of the empire on its division (A.D. 364), came into the possession of the Arabs in 823, of the Byzantine Greeks once more in 961, of the Venetians, by purchase, in 1204, of the Turks, after twenty-four years' fighting, in 1668. Various unsuccessful attempts have been made to throw off the Turkish yoke and to unite C. to Greece.

Creuse, a central department of France, in the basin of the Loire, has an area of 2150 sq. miles, and a pop. of 284,660. The country is hilly in the S., where it adjoins the mountain-land of Auvergne. The chief products are rye, buckwheat, oats, potatoes; but the soil in many parts is best fitted for pasturage, and cattle rearing is the chief employment of the inhabitants, numbers of whom migrate to other parts of France in search of work. C. is divided into the arrondissements of Aubusson, Bourganeuf, Boussac, and Guéret. The chief town is Guéret.

The river C., rising in the S.E. of the department of the same name, pursues a N.W. direction for 148 miles, and joins the Vienne about 30 miles above the confluence of the latter with the Loire.

Creuz'er, Georg Friedrich, a German antiquary, born at Marburg, 10th March, 1771, and studied at Jena. He became Professor of Rhetoric at Marburg in 1802, of Philology and Ancient History at Heidelberg from 1804 to 1848, and died 15th February, 1858. His greatest work, *Symbolik und Mythologie der alten Völker, besonders der Griechen* (Leipz. 1810-12), of which an enlarged edition appeared at Leipzig (1820-23), involved him in a controversy with G. Hermann. To the grossly personal attack of Voss C. did not reply. Among his other numerous works was a complete edition of Plotinus (Oxf. 1835), a task for which he was eminently qualified by his knowledge of the Neo-Platonic philosophy. During 1837-47 he published a partial collection of his writings, the last of which contains C.'s autobiography.

Creuzot or **Creusot, Le,** a town of France, in the department of Saône-et-Loire, 20 miles W. of Châlons-sur-Saône. It lies in a district rich in coal and iron, and owes its immense prosperity to the enterprise of Schneider, President of the French Corps Législatif under the Empire. The ironworks founded by him are among the most extensive in the world; there are foundries, engineers' works, and cannon factories. Locomotives, anchors, and all the heaviest iron manufactures are produced. There is also a large glasswork. Pop. 28,635.

Crew, Ship's (Old Eng. *crudh*, 'a crowd'), the company of men belonging to a ship, vessel, or boat. The phrase may include the master and all the officers, but usually it denotes the non-commissioned officers and seamen only. The C. of a man-of-war is divided into subordinate and warrant officers, chief petty officers, first-class working petty officers, second-class working petty officers, and all below the last. Besides this fivefold classification there are smaller groups, each called a C., under the immediate orders of the boatswain, the cockswain, the carpenter, the cooper, &c. In the merchant service, the master sends a list of his C. to the customs authorities before he sails, and also within forty-eight hours after his arrival home.

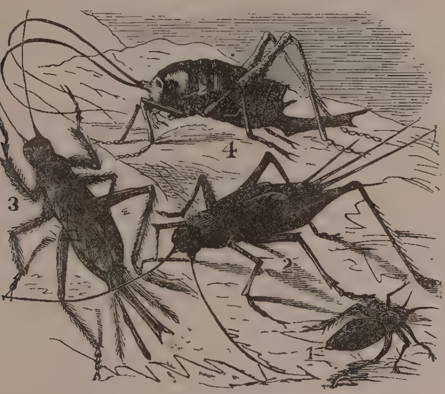
Crewe ('the cross'), a town in Cheshire which owes its existence and prosperity to its being a central station of several important railways. The London and North-Western Railway Company have here their works for the construction of carriages and locomotives, and for the repairing of plant. The Church of St. Michael is a fine Gothic structure, and there is also a Wesleyan chapel, and a good Mechanics' Institute. In 1840 C. consisted of only a few houses, but now the pop. is, mun. bor. 28,761; reg. sub-dist. 43,446; civ. par. 40; and parl. div. of county 64,434. This last consists of the mun. bor. of C. and parts of sessional divisions of Nantwich and Northwich.

Crew'kerne ('the place of the cross'), a town of Somersetshire, 15 miles S.E. of Taunton. It lies in a wooded fertile vale, not far from the river Parret, has a fine church (St. Bartholomew), and a grammar-school founded by John de Coombe in 1449, and some manufactures of sailcloth, sacking, dowlas, and stockings. Pop. reg. sub-dist. 8050; and civ. par. 4946.

Cribb'age, a popular game played with cards, in which generally two complete packs are employed, and the points made are marked with pegs which fit into holes arranged on the top of the box used for holding the C. cards. The game is interesting from the great variety of chances it offers, and at the same time it affords considerable opportunity for calculation and for the exercise of judgment.

Crichton, James, known on account of his learning and accomplishments as 'The Admirable C.,' was born at Elliock, Dumfriesshire, Scotland, 19th August, 1560. He was the son of Robert Crichton of Elliock, who for a time held the office of Lord Advocate, and on the mother's side was descended from King Robert II. C. was educated at the University of St. Andrews, where he was taught by Buchanan, and, according to the popular story, made such progress that, at the age of sixteen, he had mastered ten languages, the whole circle of the sciences, and all the accomplishments of a knight of the period. C. repaired to the Continent (1580), and, if his biographers are to be believed, vanquished in disputations at Paris, Rome, Venice, Padua, and Mantua, all who ventured to contend with him in eloquence and knowledge. He was not less successful in the tilting ring. At Mantua he killed in a duel a celebrated master of fence, who had vanquished all opponents, and in consequence of this the Duke of Mantua appointed him tutor to his son Vincenzo di Gonzago, a dissolute youth. During the Carnival of 1583, C. was assailed by a band of masked assassins at night, and, after a struggle, lost his life (3rd July). It was believed at the time that it was his own pupil's hand that slew him. Some of C.'s Latin poems remain, but possess no merit. See Tytler's *Life of C.* (Edinb. 1819 and 1823).

Crick'et, a genus of saltatorial or leaping Orthopterous insects, belonging to the family *Achetina* (or *Gryllina*). The antennæ are slender, tapering, and very long. The wings are laid flat along the back in repose. The hinder wings are very long, and project beyond the front wings (which form *elytra* or wing-cases when folded). The abdomen in both sexes is provided with two caudal bristles, and the females possess ovipositors. The tarsi are three-jointed. The hind-legs, as in all *Saltatoria*, are greatly elongated for leaping. The *chirp* of the C. is made by means of a serrated plate situated on each wing-cover, the friction of these plates producing the well-known sound. The common C., the field-C., and the Mole-C. (q.v.) (*Gryllotalpa*), are familiar members of this family. The wingless C., either brown or black in colour, is about $\frac{2}{5}$ inch long, and may be seen in meadows and at the sides of the roads.



1, Wingless Cricket; 2, Field Cricket; 3, House Cricket; 4, Spotted Cricket.

Cricket (of doubtful derivation, but perhaps connected with the Old Eng. *cric*, ‘a staff, a crook’) is one of the most thoroughly national and popular of sports. The first mention of it under its present name is towards the close of the 17th c.; but it seems to have been a modification of the more ancient ‘club-ball.’ The southern and south-eastern counties of England have long been noted for their enthusiastic attachment to the game, which was very much confined to these districts at the beginning of this century; but so rapid has been its spread of late years, that there is scarcely a town, village, or school throughout Great Britain which does not boast of its C.-club. In the colonies and United States, too, wherever the English language is spoken, it is steadily gaining ground, and is equally popular among the coloured inhabitants of the W. Indies and the Malays and Chinese in the Straits Settlements.

The requisite implements are stumps, bails, bats, and a ball. The stumps, six in number, are ‘pitched’ in two sets (wickets) of three each, the distance between the sets being 22 yards. Two bails (small pieces of wood) are placed on the top of each set of stumps, and two creases are marked, one as a boundary to the bowler, the other to the batsman. During the progress of a game the centres of interest are the batsmen, who, bat in hand, stand each before one wicket. They are the only members of their side who are at that moment engaged in the game; the members of the other side are disposed in various positions, as bowler, wicket-keeper, and fielders. From one wicket the bowler delivers the ball towards the other, with the object of hitting it; and it is the duty of the batsman to prevent this, as far as lies in his power, by stopping the ball with his bat, or, if possible, by hitting it to some vacant place in the field, thus, perhaps, gaining time to exchange places with the other batsman before the ball is returned, and scoring a ‘run.’ If, however, the ball when delivered by the bowler should strike the wicket, or if, though hit by the bat, it should be held by some fielder before it touch the ground, the batsman is ‘out,’ and must retire and give place to another. If the ball should be returned to either end of the pitch, while the batsmen are running, and should hit a wicket before a batsman has arrived there, the nearer batsman is ‘out.’ In other ways the batsman may be ‘out.’ The wicket-keeper stands behind the wicket towards which the bowler bowls, and his duty is to stop the ball if it should pass both batsman and wicket, and to receive it when returned from the field. An innovation in the method of play was the now almost universal adoption of the *round-hand* style of bowling in preference to the original *under-hand* style. In the former style the ball is delivered with the hand and arm raised above or to the same height as the shoulder; in the latter, the arm is kept close to the side, and always below the shoulder.

The much greater speed of bowling which is possible with the round-hand style, has necessitated the improvement of leg-guards (pads) and gloves for both batsmen and wicket-keeper.

The maximum dimensions of bat, stump, bail, and ball, the length of the pitch, &c., are fixed by the authority of the Marylebone C.-Club; and only by its council can any change be made. The visits of picked teams of amateur and professional players to different parts of Britain and the Colonies, have done much to popularise the game. For a detailed account of the laws, bye-laws, disposal of the field according to the nature of the bowling, the reader must refer to one of the many handbooks on the subject. The oldest existing county club is the Surrey C. Club, founded in 1844. Then come Derbyshire (1845), Sussex (1857), Kent and Notts (1859), Yorkshire (1863), Lancashire (1864), Middlesex (1868), and Gloucestershire (1870). Most of the English counties now have their C. club, and the competition, which formerly existed between only a few of the leading cricketing counties, has been thrown open to the majority of these. In 1894 and 1895 the Surrey C. Club was the most successful in the inter-county matches. The limits of this article preclude any statement as to the scores, ability, and skill of the many cricketers of repute at the present day. Dr. W. G. Grace (Gloucestershire C. Club) has now been before the public for many years as a cricketer, and by his remarkable achievements, both with the bat and with the ball, has earned for himself the title of ‘Champion.’ A very interesting sketch of his career appeared in the *Strand Magazine*, August, 1895.

Crick′lade, an ancient town of Wiltshire, on the right bank of the Thames, 40 miles N. of Salisbury, has a fine church (St. Mary) in the Norman style. It has an important monthly market for fat cattle. It returned two members to Parliament until 1885, when it was disfranchised. Pop. parl. div. of county 59,414; reg. dist. 11,835; and reg. subdist. 5932.

Cricoid Cartilage, one of the cartilages of the larynx. See LARYNX.

Crieff (Gael. *Craobh*, ‘a tree’), a town and parish in Perthshire, beautifully situated at the foot of the Grampians, on the banks of the Earn, 17 miles W. of Perth. On account of its fine climate it is much frequented by invalids. Its chief buildings are Morrison's Academy, Taylor's Institution, the hydropathic establishment, and the Masons' Hall, besides many fine mansions in the neighbourhood, of which Drummond Castle, with its curious gardens, Ochtertyre, and Ferntower, are the most noteworthy. Not far off, in the picturesque Glen Almond, is Trinity College (1847), for students of the Episcopal communion. The chief industries are the tanning of leather and the manufacture of coarse linens and worsteds. Lying as it does on the edge of the Highlands, C. was a suitable place in past times to inflict justice on the marauders from the hills. The ‘kind gallows of C.,’ where the Earls of Strathearn executed their sentences, stood on a knoll to the W. of the town. Among the places in the neighbourhood interesting from their beauty or their associations, are the ‘Sma' Glen,’ St. Fillans, and Loch Earn. Pop. of entire town 4902.

Crill′on, Louis de Berton des Balbes, known as ‘The Brave,’ a singularly chivalrous warrior, was born at Murs, Provence, in 1541. Trained to arms under the Duc de Guise, he obtained at an early age a reputation for bravery, distinguishing himself especially at the siege of Calais and the capture of Guines. He became a great favourite both with Henri II. and Henri III., and was rewarded for his services with a number of Church benefices. In the 16th c. he took the side of the Roman Catholic Church against the Huguenots, fighting against the latter at Dreux, Jarnac, and Montcontour; but he had no share in the massacre of St. Bartholomew, and was opposed to the Catholic League. After some years of devotion and penance, he died at Avignon, 2nd December, 1615. No soldier of his time has been more eulogised for his bravery than C.

Crime is a violation or disregard of public law of a certain gravity. It may be divided into three branches—Treason (q.v.), Felony (q.v.), and Misdemeanour (q.v.). Any act coming under either of these three divisions forms the subject of Indictment (q.v.) and of trial by jury. Minor offences which are not crimes are subject to the summary jurisdiction of the magistracy, without indictment or jury. There is no permanent characteristic of C.—one country and one age holding an act to be innocent, perhaps praiseworthy, which another age or another country holds to be highly criminal. Malice or evil intention is often the essence of C., and is in all cases an aggravation of it; yet C. may be committed without malice by culpable carelessness (see CULPA, DOTE), or even simply from ignorance of the law. (See BONA FIDES, IGNORANCE OF THE LAW.) Thus carelessness on the part of a railway official or the captain of a ship, if it lead to disaster, is criminal. So might it be held criminal to destroy a will, even though under the belief that so to do was of no consequence.

Infants under seven years of age, and insane persons, are legally incapable of C. The degree of insanity necessary for exculpation can never be defined. Compulsion (q.v.) is a sufficient defence, if clearly proved, against a criminal charge. Extreme want is not an exculpation, but it is good ground on which to found a recommendation to mercy.

Intention to commit a C., such intention having consequence, is criminal to the degree of the intention; thus, if A, intending to shoot B, shoots C, A commits a C. equal to killing B. Intention to commit C. is criminal, but to prove intention there must be some act. Such acts are punishable, but not necessarily to the same extent as the meditated C. But this rule of common law as to proof of criminal intention is modified under certain statutes, by which it is declared that certain circumstances, without action, shall be held to prove criminal intention against any one, who shall be punishable accordingly. For example, by 24 and 25 Vict. c. 96, it is declared that anyone having in his possession, without lawful excuse, any crowbar or other implement of housebreaking, shall be guilty of a misdemeanour; the presumption here being that there is proof of intention to commit burglary, burglary being felony.

Crime'a (anc. *Chersonesus Taurica*), a peninsula in the S. of Russia, almost wholly surrounded by the waters of the Black Sea and the Sea of Azov, and connected with the mainland by the narrow isthmus of Perekop, which varies in breadth from 7 to 12 miles. It forms part of the Government of Taurida (q.v.), and has an area of 7650 sq. miles, with a coast-line of about 650 miles. The S.E. coast is bold and precipitous; but the N.E. is low and broken, and washed by the Sea of Azov, a portion of which, almost separated from the greater mass of water by the long narrow tongue of land known as the Peninsula of Arabat, forms the stagnant Sivash (*putrid*) Sea, which gives rise to strong and offensive smells, and sometimes even dries up from the evaporation produced by the intense summer heat. The northern portion of the C. is a low, barren waste, abounding in numerous lakes and marshes of salt, which forms one of the staple exports of the country. The southern district, on the other hand, is rich, beautiful, and hilly, producing grain, olives, grapes, and even oranges, and richly adorned with the summer mansions of the Russian emperor and nobles. The highest peaks are the Kimal Agerek (5000 feet) and Tchatyr Dagh (4983 feet). The present capital is Simferopol (q.v.), in the interior. The other chief towns are Baktshi-Serai, Sevastopol, Karasubazar, Kaffa, Kertch, and Perekop. C. formed a Tartar Khanat under Turkey from 1478 to 1783, when it was subdued by Russia. Two-thirds of the inhabitants are Tartars. The place is especially interesting as the scene of the most important events of the war in 1854-55 between Russia and the allied French, English, Turkish, and Sardinian armies. See Kinglake's *History of the Invasion of the Crimea* (Lond. 1863-75). Pop. about 250,000.

Cri'men Repetundarum, a term of Roman law, indicating the crime of acceptance of a bribe by a judge.

Crim'inal, one who has been convicted of a crime. The accused is sometimes called the culprit or delinquent in England; in Scotland he is called the Panel (q.v.). See ACCESSARY OR ACCESSORY.

Criminal Courts. For England, see ASSIZE; NISI PRIUS; QUARTER SESSIONS, GENERAL; CRIMINAL COURT, CENTRAL. For Scotland, see ASSIZE; JUSTICIARY, COURT OF.

Criminal Court, Central, of the Old Bailey, is for the trial of offences committed in the City of London, county of Middlesex, and certain parts of Essex, Kent, and Surrey, all of which form one county under Statute 4 and 5 Will. IV. c. 36. The sessions are held twelve times a year at least, and oftener if required. Offences on the high seas may be tried at this court. All the judges may be commissioned for this court, but the less serious offences are usually taken before the judge of the City of London Court, the Recorder, or the Common Serjeant sitting in this court. The jurisdiction of the C. C. C. has been greatly augmented by the above statute and subsequent acts.

Criminal Conversation is the legal term in actions of Divorce (q.v.) for the C. intercourse of the person against whom the action is brought.

Criminal Information. See INFORMATION.

Criminal Law. See CRIME, with articles referred to therein; also CRIMINAL STATUTES CONSOLIDATION ACTS.

Criminal Letters.—In Scotland, a criminal may be brought before the Court of Justiciary either by indictment or by C. L., which charged offences that were tried before the inferior courts, and which were issued upon the signet of the Justiciary or from the Sheriff Court. These run in the name of the sovereign, and contain a warrant for citing the witnesses and jury.

Criminal Procedure. See ARRAIGNMENT, BAIL, COMMITMENT FOR TRIAL, INDICTMENT, INFORMATION. The accused having refused to answer, or pleaded *Not Guilty*, a jury is sworn, the indictment opened, the evidence arraigned, examined, and enforced by the counsel for the prosecution; the witnesses being cross-examined by the accused or by his counsel or attorney, if he think fit. When the case for the prosecution is closed, the counsel for the prisoner addresses the jury, and he may examine witnesses for the defence. If he do so, unless the witness be to the character of the prisoner, the prosecuting counsel has the right to reply. The counsel representing the Crown, if the Crown be a party to the case, has always a right to reply. The judge then sums up, and the jury deliberate on their Verdict (q.v.), till which be given they should not be discharged. If they find the prisoner not guilty, he is liberated. If they find him guilty, he is said to be convicted. When the charge is capital (see CAPITAL PUNISHMENT), the prisoner is then asked if he has any reason to give why judgment should not be awarded against him. If he has nothing to say in Arrest of Judgment (q.v.), the judge pronounces sentence. If there be no reversal of judgment by any proceeding in error, the only other way of avoiding execution of sentence is by a REPRIEVE or PARDON. On determined disagreement, the jury may be discharged; when the accused is tried again, before a fresh jury. The above description of C. P. applies to England. While essentially the same in Scotland, the forms in that country are somewhat different. Regarding these differences, see ADVOCATE, LORD; ARRAIGNMENT, CALLING THE DIET, CRIMINAL LETTERS, INDICTMENT, NOT PROVEN, PRECOGNITION, PROSECUTION, PROSECUTOR, PROCURATOR FISCAL, VERDICT.

Criminal Statutes Consolidation Acts.—These may be held to be the first practical result of the series of commissions appointed during the thirty years preceding their date. There are seven Acts, but one is in part a repealing Act. The new statutes are principally a re-enactment of the consolidating Acts of the late Sir Robert Peel, with some improvements by giving a more exact description of offences, with a corresponding gradation in their punishments. They also endeavour more nearly to assimilate the criminal laws of England and Ireland. It may be noticed that the fifth statute is framed in respect of the statute law of the

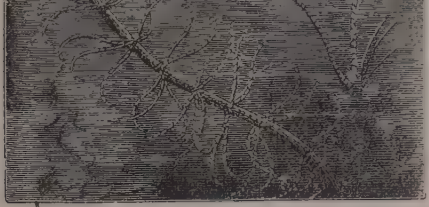
United Kingdom, while the first, second, third, fourth, and sixth, are passed to deal with that of England and Ireland; and the seventh, in its title, speaks only of the criminal law, and that as applied to no part of the United Kingdom in particular. The following is a list of the statutes, together with their titles: 24 and 25 Vict.—c. 94, to consolidate and amend the statute law of England and Ireland relating to accessories to and abettors of indictable offences—c. 96, to consolidate and amend the statute law of England and Ireland relating to larceny and other similar offences—c. 97, to consolidate and amend the statute law of England and Ireland relating to malicious injuries to property—c. 98, to consolidate and amend the statute law of England and Ireland relating to indictable offences by forgery—c. 99, to consolidate and amend the statute law of the United Kingdom against offences relating to coin—c. 100, to consolidate and amend the statute law of England and Ireland relating to offences against the person—and 34 and 35 Vict. c. 32, to amend the criminal law relating to violence, threats, and molestation, which repealed section 41 of the last-named statute, viz. that which provided for the punishment of persons combining and conspiring to raise the rate of wages, &c., and while so engaged unlawfully assaulting any person; and provided differently in respect of the offence.

Crim'son. See RED COLOURS.

Crinan Canal, The, 9 miles long, 24 feet broad, and 12 deep, with 15 locks, cut through the head of the peninsula of Cantire, between Loch Gilp and Loch Crinan, to avoid the long passage from the W. Highland coast to the Firth of Clyde round the Mull of Cantire. It cost £183,000, and can admit vessels of 200 tons. In February, 1859, the reservoirs burst, when part of the banks was washed away and more than a mile of the canal choked with debris. To repair this the Government gave £12,000. The Canal saves a distance of about 115 miles.

Crined (Lat. *crinis*, 'hair'), in heraldry, means that the hair of a man or woman, or the mane of a horse, is tinctured differently from the body.

Crin'gles (Icel. *kringr*, 'a circle'), in nautical language, are loops in the bolt-ropes of sails, formed by intertwisting the strands of which the ropes are made, and commonly confining a metal ring or thimble. A rope passed through them gathers up the bolt-ropes.



Crinoidea.

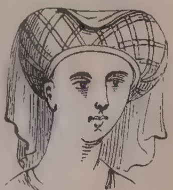
Crinoid', or **Crinoi'dea**, an order of the class *Echinodermata* (q.v.), including the so-called fossil lily-stars, the rosy-feather star, the *Pentacrini* of tropic seas, &c., all of which are distinguished primarily by the fact that they are attached during the whole or a part of their existence to the sea-bed by a jointed flexible stalk. The genus *Rhizocrinus* is a good example of a typical existing C. The body, supported on this stalk, is enclosed in a *calyx*, or cup-shaped arrangement of calcareous plates, and the mouth is central, opening upwards, whilst the vent-passage may be present or absent. The arms, from five to ten in number, are not essential parts of the body, and are provided with *pinnules* or lateral branches. The arms are grooved, and currents of water carrying nutriment run down the grooves to the mouth. The ovaries exist beneath the skin in the grooves of the arms, and the ambulacral tubes are also situated there. The embryo is free-swimming and ciliated. The rosy-feather star is fixed in the early part of its life only, living latterly as a free, starfish-like form.

Crin'oline (from Fr. *crin*, Lat. *crinis*, 'hair'), a hooped petticoat made of horse-hair, or of thin hoops of whalebone or steel held horizontally by vertical bands, revived in France by Empress Eugenie in 1855, and shortly thereafter introduced into England. This garment had its origin in the *vertugade* or *vertugale* worn by ladies in France and Spain in the 16th c., which was introduced into England from Spain, under the corrupted name *farthingale*, in the reign of Queen Mary. In the succeeding reign of Elizabeth the 'wheel' and round farthingales attained enormous dimensions, and gave the wearers the appearance of standing in a drum or in a bell-shaped cage. Capricious fashion retained the farthingale till the time of Charles II., though it became more moderate in size, after which it gradually died out, only to reappear in the hooped petticoat of the 18th c., and the later C. The C., soon after its introduction, swelled considerably in circumference, and continued to be worn as a fashionable article of dress for a number of years, notwithstanding its obvious inelegance, the frequent loss of life occasioned by coming in contact with fire, and the ridicule and satirical treatment it received in certain public prints, till its disuse about 1866. A fabric composed of horse-hair and cotton, used for ladies' bonnets, is also known by the name 'C.'

Cri'num, a genus of very handsome plants, of the natural order *Amaryllidaceæ*, comprising numerous species, natives of Asia, Australia, S. America, and W. and S. Africa, while, owing to the period during which they have been cultivated in our gardens, many fine crosses (hybrids) have been introduced by the skill of the horticulturist. About the only species known to have any marked properties is the Asiatic C., the bulbs of which are believed to be emetic, and as such are in some parts of the East employed in cases of poisoning. The C. of S. Africa is hardy enough to grow in a protected border in warm situations out of doors.

Cri'sis (Gr. 'a judgment,' from *krino*, 'I judge'), a term used by medical writers to denote a sudden change in the condition of the patient, significant of one or other of two things—death or recovery. C. is often accompanied by some marked phenomena, as intense sweating, or a severe shivering. Apart altogether from the doctrine of a *materies morbi*, the law of periodicity in many acute diseases is of great importance, and one too often neglected. In some fevers there are *critical* hours, *e.g.*, in *Ague* (q.v.), when the paroxysm occurs at a fixed hour; in others there are *critical* days, *e.g.*, in small-pox, measles, and scarlet fever. The days on which the eruptions appear are important, and constitute crises. In some Fevers (q.v.), the seventh, fourteenth, and twenty-first days are also considered critical, but there is, perhaps, an admixture of medical superstition in such notions.

Cris'pin, St., according to the legend of the Church, was of Roman extraction and of noble birth. About the middle of the 3rd c. he fled with his brother Crispianus from Rome to Gaul, where he settled in the town now called Soissons. While acting as a Christian missionary he made shoes for the poor, hence in later times, under the name of King C., he became and continues the patron saint of shoemakers. C. and his brother suffered martyrdom in 287, during the persecution of Diocletian. Their festival falls on the 25th of October.



Crispine.

Crispine, a lady's head-dress, in mediæval times, which was fastened over the head by a clasp. It hung down as a thin veil or as a net in which the hair was confined.

Cris'ta, a term used in anatomy to denote a crest or ridge. Thus we have the *C. galli*, or cockscomb of the ethmoid bone, the *C. ilii*, or ridge round the rim of the iliac or hip bones, &c., &c.

Croa'tia, a portion of the Austro-Hungarian monarchy, forming with Slavonia (q.v.) a crown-land proper; area, 16,773 sq. miles; pop. 2,200,977. It lies E. of the Adriatic Sea, and is partly bounded on the S.E. by Bosnia. The chief towns are Agram, Warasdin, Kreutz, and Fiume. The Save with its tributaries, Illova, Kulpa, and Unna, and the Drave are the chief rivers. A great part of the country is traversed by continuations of the Julian and Dinaric Alps, and deep valleys occur in the S., which have no outlet, important streams having to make their way underground. The climate varies much, and in the S. the *bora*, a boisterous wind, prevails from September to May. The soil is in many places fertile, and the vine, olive, fig, and mulberry are successfully cultivated. There are almost no manufactures. The capital is Agram. C. was at one time a separate *Banat* (q.v.). The Croatians, Slavs in blood and language, are for the most part Roman Catholics, with a sprinkling of Greek Catholics, though a considerable number belong to the Greek Church proper. The earliest historical inhabitants of C. were the Pannonians, who were subdued by Augustus. The Croats, or Horvats—*i.e.*, dwellers in the Carpathians, and after whom C. is now named—took possession of the territory in 640. At the end of the 12th c. it was incorporated with Hungary, with which it passed in 1526 into the possession of the Hapsburgs. Together with Slavonia, the *Litorale* and Fiume, it was formed into a crown-land. During the Hungarian revolution, the long-standing jealousy of the Croats towards the Magyars found expression in the hostile action of the Ban Jellachich. The result was its separation from Hungary in 1849. During 1849-60 it was, like the other non-German parts of Austria, subjected to a centralising legislation; but on the 20th of October, 1860, it obtained the right to be governed locally by its own elective assembly and municipal institutions. In the rural communes the magistrates possess executive power; in the towns, the municipal council. There is a university at Agram, at which 413 students are under the instruction of 49 teachers.

Cro'chet-Work (Fr. *crochet*, 'a hook'), the name of a simple kind of fancy needlework in cotton or wool, worked with the aid of a hooked needle. Antimacassars, doyleys, &c., are commonly made with beautiful raised flower or star patterns of C.-W. The delicate Irish crochet-lace is much esteemed.

Crocid'olite (Gr. 'woolly stone'), a silicate of iron, composed of separable flexible fibres like asbestos, found chiefly in S. Africa. It has a pale-blue, green, or yellowish-brown colour, and when cut and polished *en cabochon* it shows a chatoyant lustre.

Crock'ets (Fr. *crochet*, dim. of *croc*, 'a hook,' 'a crook'), in Gothic architecture, ornaments representing curved and bent foliage, and placed upon the angles of spires, canopies, and pinnacles, on gables, and on the weather mouldings of doors and windows. Occasionally C. are found in vertical mouldings, as at Lincoln Cathedral, but never in horizontal situations. About the time of the Renaissance, animals began to be substituted for leaves.

Croc'odile, a genus of the Reptilian order *Crocodilia*, distinguished by the fact that the fourth tooth in the lower jaw is larger than the others, and forms a canine tooth, which is received into a pit excavated in the border of the upper jaw, so that it is visible externally when the mouth is shut. The hind-legs are bordered by a fringe of serrated or toothed conformation, and the toes are completely united by membranes. The snout is long, obtuse, and flattened. The crocodiles, as types of their order, present good examples of the dermal bony plates and scales forming their chain-armour. The teeth are implanted in distinct sockets, new teeth being developed from below, and ultimately displacing the old teeth. The vertebræ are procœlous—that is, hollow in front and convex behind—as in all living *Crocodiliæ*. The heart is four-chambered. No clavicles exist. Two vertebræ compose the sacrum. The Cloaca (q.v.) opens by a longitudinal aperture. The front feet have five, and the hinder ones four toes. The nose opens by a single nostril, and the hinder nostrils open very far back in the mouth, a conformation rendering it easy for these animals to drown their prey, whilst they breathe readily themselves. The tongue is attached to the floor of the mouth. The Egyptian C. is the familiar species, attaining a length of from 20 to 30 feet. Species of true crocodiles also occur in Asia and in the New World, where the Alligators (q.v.) are also found.

Egyptian Crocodile.

Cro'cus, a genus of Iridaceous plants, mostly natives of Southern and Eastern Europe, and of Asia Minor, though a few extend as far N. as Central Europe. They have been long cultivated in most temperate or even northern parts of Europe and America for the sake of their beautiful flowers. Saffron (q.v.) is obtained from *C. sativus*, while *C. vernus*, *C. lagenæflorus* (and its variety *luteus*), *C. pyrenæus*, *C. reticulatus*, &c., are among the favourite garden species. The 'Cape C.' is *Gethyllis*, while the name Indian C. is sometimes applied to the orchideous *Pleiones*.

Crocus of An'timony is a compound of sulphide of sodium and sulphide of antimony, and is obtained during the extraction of antimony from its sulphide.

Crocus of Mars is the sesquioxide of iron.

Crœ'sus, the last King of Lydia, succeeded his father Alyattes, B.C. 560. In the early years of his reign he pursued an unbroken career of conquest, until his dominions extended from the northern and western coasts of Asia Minor to the Halys on the E. and the Taurus on the S. When at the height of his wealth and grandeur, C. (according to a story told by Herodotus) asked Solon who was the happiest man he had ever seen. Solon replied that no man was to be deemed happy till his life had been happily closed. By an accident, and as it seemed to C. in fulfilment of a dream, he lost his accomplished son Atys while hunting. C. grew jealous of the rapidly-rising power of Cyrus, and determined to attack him; but, before doing so, he elicited from the Pythia two replies, memorable instances of the ambiguity of ancient oracles—that if he marched against the Persians he would overthrow a great empire; and that he should flee along the Hermus when a mule became King of the Medes. C. encountered Cyrus in an indecisive battle in Cappadocia, and fell back on Sardis, where he was totally defeated by Cyrus, who, fourteen days thereafter, took the city. C. was condemned to be burned, and when on the pyre, remembering the words of Solon, thrice uttered his name. On receiving an explanation of this occurrence, Cyrus released C., gave him Barene, near Ecbatana, as a residence, and treated him as a friend. C. accompanied Cambyses on his expedition into Egypt. How or when he died is unknown.

Croft, William, Mus. D., one of the greatest English cathedral composers, was born in 1657, and educated under Dr. Blow, whom he afterwards succeeded (1708) in his office at the Chapel Royal, and as organist at Westminster Abbey. He received the degree of Doctor of Music from the University of Oxford in 1715, and in 1724 published *Musica Sacra*, a collection of anthems,—the first music printed from engraved plates. He died in August, 1727, and was buried in Westminster Abbey. His compositions are almost all anthems, very many of which are still sung frequently in English churches. In their own department they have seldom, if ever, been surpassed.

Cro'ia, or **Cro'ja,** the birthplace of the famous Scanderbeg, is a town in the vilayet of Scutari (Skodra), and 45 miles S.S.E. of the town of Scutari. It stands on a height, 500 feet above the plain, and is defended by a castle. Pop. 5080.

Croix, St., or **Santa Cruz,** an island in the W. Indies, E. of Porto Rico, and belonging to Denmark. Area, 74 sq. miles; pop. 19,783. It is very fertile, and almost every inch of ground is cultivated. The chief town is Christianstadt.—C. is also the name of a river which flows into the Bay of Fundy, N. America, after a course of 55 miles, and serves as the boundary between the state of Maine and the province of New Brunswick, in the Dominion of Canada.

Cro'ker, John Wilson, a politician and man of letters, who had a considerable reputation in his time, was born in Galway, Ireland, 20th December, 1780. He studied at Trinity College, Dublin, and at Lincoln's Inn, London, and was called to the Irish bar in 1802. Some clever satires, and a *Treatise on the State of Ireland, Past and Present*, brought him into prominence, and in 1807 he was elected member for Downpatrick. Two years later a defence of the Duke of York obtained for him the appointment of Secretary to the Admiralty, which he held for twenty years. C. is perhaps best known by his articles and reviews in the *Quarterly Review*, of which he was one of the founders, which were remarkable even in that day for their savage partisanship and the extreme bitterness of their personalities, by the clever caricature of him, under the name of 'Rigby,' in Disraeli's *Coningsby*, and by his annotated edition of Boswell's *Life of Johnson*, which was severely criticised by Macaulay in the *Edinburgh Review*. C. rendered, however, some really valuable services both to literature and to art, and he deserves honourable mention for his active part in the establishment of the Athenæum Club. He died at Moulsey, near Hampton Court, 10th August, 1857.

Croker, T. Crofton, a popular collector and author of Irish stories and legends, was born at Cork, 15th January, 1798, and, through the influence of his friend, though not relation, John Wilson C., obtained, at the age of twenty-one, a clerkship in the Admiralty, in which he rose till he had a salary of £800 a year. Among his collections of stories of Ireland, his *Researches in the South of Ireland* and *Fairy Legends and Traditions of the South of Ireland* (1825) are perhaps the most interesting. All his books, especially such essentially original ones as *Barney Mahoney*, are marked by humour and pathos, both genuine and both truly Irish. C., who was an enthusiastic antiquarian, retired from the Admiralty in 1850 on a good pension. He died at London, 8th August, 1854.

Cro'ly, Rev. George, D.D., a most indefatigable writer of romances, magazine articles, and poems, and an eloquent preacher, was born at Dublin in 1785, and died rector of St. Stephen's, Walbrook, London, 24th November, 1860. C. was a man of versatile talents, and, had he written less, his reputation might have been more permanent. The romance *Salathiel* is perhaps the work of his that will live longest.

Crom'arty, a burgh and seaport in Ross and C., at the N.E. extremity of the peninsula which separates the Moray from C. Firth, has an antique appearance from the houses in the older streets being built in the quaint Flemish style. The chief industry—the herring and white fishing—has declined of late, but there are manufactures of sacking, some cooperages, and a brewery. C. unites with Wick, Dingwall, Dornoch, Kirkwall, and Tain in returning a member to Parliament. Hugh Miller was a native of C. Pop. 1338.

Cromarty Firth, an inlet of the N. Sea, in the united counties of Ross and C., opening out from the Moray Firth, 18 miles long and from 3 to 5 miles broad. It is completely landlocked, and has sufficient depth of water to furnish anchorage for the largest navy. The entrance, 1½ miles wide, is between the N. and S. Sutors, two lofty wooded headlands, which have been vividly described by Hugh Miller. The towns of C., Dingwall, and Invergordon are on the shores of C. F.

Cromartyshire, in the N. of Scotland, consists of numerous detached portions scattered widely over Ross-shire. These two shires now form a single county. See ROSS AND CROMARTY.

Crom'dale (Gael. 'winding valley'), a village on the E. bank of the Spey, till 1870 included in Inverness-shire, but since that date also in Elgin, by Act 33 and 34 Vict. c. 16. Here on 1st May, 1690, the troops of William III. defeated a small body of Jacobites. This skirmish forms the subject of the song known as *The Haughs of C.* Pop. civ. par. 3463, included partly in Elgin, and partly in Inverness.

Cro'mer, a parish and fishing village on a bay of the same name, Norfolkshire, 21 miles N. of Norwich. It has a splendid beach for sea-bathing, but the bay is called by the natives the Devil's throat, so dangerous is it to navigation. C. carries on a small coasting trade. Pop. reg. sub-dist. 8419; civ. and ecc. par. 2197.

Crom'lech (Celt. 'an inclined flat stone') is the name given to one of the unsculptured stone monuments of the Celtic races, commonly called *Druidical stones*. The C. has been defined as a large stone placed like a table, but in an inclined position, upon other stones set up on end. A rude chamber is thus formed within; hence the popular names of 'giant's grave,' 'hag's bed,' &c. There is not, however, in such monuments, one unvarying type of construction; the *Logan*, or rocking-stone, and the *monolith*, or unhewn pillar standing alone, are perfectly distinct, but the C. merges into the *circle* and the *altar*, which are also found largely on the N.E. coast of Scotland, and on the diluvial plain between Loch Awe and the Crinan Canal. Stenness, in Orkney, and Callernish, in the Lewis, are the sites of the most conspicuous groups. The *dolmen* of Brittany and other parts of France is the same as C. Two of the largest cromlechs are at Plas Newydd, in Anglesea. Kit's Coty House, in Kent, and Chun Quoit, in Cornwall, may also be mentioned. The fact that cromlechs are sometimes surrounded (as 'The Broadstone,' County Antrim) by a circle of standing stones, long gave currency to the view that they were Druidical remains. Because human remains, with the usual accompaniments, have been found in churches, they have been set down as sepulchres. Hibbert regarded those of Orkney as equivalent to the Scandinavian *tings*, and it is certain that 'stannin' stanes' were frequently used for the purpose of assembling courts of justice. Astronomical meanings and serpent-worship have also been read into these remains by antiquaries. Fergusson says they are the work of partially civilised races who had come into contact with the Romans. No approximate dates are known.

Kit's Coty House.

Cromp'ton, Samuel, an English inventor, was born at

Firwood, near Bolton, Lancashire, 3rd December, 1753. His father was a farmer, but, like many farmers at that time, also a carder and spinner. C. lost his father when only five; but his mother gave him the best education which could be obtained in the district. When old enough he worked at the loom in his uncle's mansion, called the Hall-i'-th'-Wood, and at the age of twenty-one became so dissatisfied with Hargreave's machine that he turned his attention to inventing a better one. For five years he worked at this project, thus employing many of his night hours after his day's weaving was over. At last he succeeded; but his success brought him little pecuniary returns; for, unable from lack of means to patent his invention, he was at length forced to disclose the principle, under promise of a liberal subscription. The subscription amounted to £60! Latterly he received a reward of £5000, with which, however, he could not compete successfully with the wealthier manufacturers, who had largely made use of his machine. C. died 26th June, 1827. His invention was called the spinning-mule, from its partaking of two leading characters of Arkwright's machine and Hargreave's spinning-jenny. See French's *Life of C.*

Crom'well, Oliver, was born of good family at Huntingdon, 25th April, 1599. His father, Robert C., who sat as M.P. for Huntingdon in the Parliament of 1593, was a younger son of Sir Henry C., of Hinchinbrook, while through his mother, Elizabeth Steward, he was connected with the families of Hampden and St. John, and even, it is asserted, with the House of Stuart. He was educated at school at Huntingdon, and afterwards at Sidney-Sussex College, Cambridge. From the latter, however, he was recalled by the death of his father, and settled first on the family estate at Huntingdon, and subsequently on a farm at St. Ives, marrying in 1620 Elizabeth, daughter of Sir James Bourchier, a gentleman of landed property in Essex. C. soon associated himself with the Puritan party, being perhaps prompted to do so by natural melancholy, which showed itself in early years in fancies of approaching death. He was first returned to Parliament in 1628, for the borough of Huntingdon, but did not take an active part in its proceedings for a time, although he actively opposed the tyranny of King Charles, by resisting his schemes for the drainage of the Fens. In 1640 he took his seat for the burgh of Cambridge, and soon was 'much hearkened to' as a member of the Parliamentary party. He threw himself with heart and soul into the war, fought with a troop of his own raising at Edgehill, and spent his substance in equipping two companies, which, in 1642, he asked the permission of Parliament to raise; and it was he who saw the great advantage that would be derived from enlisting religious enthusiasm and stern morality on the side of the Parliament. He began with his own regiment, which became famous as 'the Ironsides,' and the experiment proving successful, his policy was extended to the whole army, henceforth known as the New Model. C., who had rapidly advanced to the position of colonel, distinguished himself greatly at the battles of Marston Moor, 2nd July, 1644, and Newbury, and when the celebrated 'self-denying ordinance' was passed, became lieutenant-general of the Parliament forces under Fairfax, and as such commanded the right wing of the Parliamentary army at the decisive battle of Naseby, 14th June, 1645. From that time to his death C.'s history is the history of his country. After the king fell into the hands of Parliament, he crushed the insurrection of the Scots in favour of the king, at Preston Moor, 17th August, 1648. After the execution of the king he was appointed lieutenant-general, and quickly and surely stamped out a rebellion in Ireland. When the young prince, afterwards Charles II., landed in Scotland, C. superseded Presbyterian and wavering Fairfax, marched into that country, and totally defeated the Scotch under Leslie at Dunbar, 3rd September, 1650. The Royalists having invaded England, C. gained a final victory at Worcester, 3rd September, 1651. C. now found himself at variance with the Rump, which had become a mere clique of crotcheteers and talkers, and dissolved it 20th April, 1653. He summoned a new Parliament, but was compelled to dissolve it also, although not before it had invested him with the title of Lord Protector. From that time to his death, although he repeatedly summoned Parliaments, he was really absolute ruler of England; and the country never was more respected and feared than during the Protectorship of C.; and although he was never popular, and was in constant danger of assassination, even his enemies admitted the wisdom of his domestic measures. After a brilliant but yet melancholy term of solitary power, he died 3rd September, 1658, on the anniversary of some of his greatest victories. In 1661 his remains were dragged by the Royalists from their resting-place in Westminster Abbey, and, along with those of Bradshaw and Ireton, hanged at Tyburn. For some time after his death C. was looked upon as a fanatic, tyrant, and hypocrite; but that shallow and ignoble hypothesis has been banished from historical literature by the industry and genius of Carlyle. He now ranks as perhaps the greatest and (circumstances considered) wisest ruler England has ever had. While his religion was emphatically a matter of heart and soul, he was no bigot, as the manner in which he protected the Jews, and even the Unitarian Biddle, showed. In his brilliant foreign policy there occurred perhaps only one mistake—his considering Spain, and not France, as the Roman Catholic power in Europe most to be feared. During the first session of 1895 a movement was set on foot towards the erection of a statue to C. on the Westminster grass plots adjoining the Houses of Parliament. The Irish Nationalist party in the House of Commons, however, objected to any such recognition of a statesman whose policy with regard to Ireland had been marked with some severity, and as the Constitutional party in the House was also adverse to the proposal, the matter was allowed to drop, to the amused surprise of the public at large. See Carlyle's *O. C.'s Letters and Speeches, with Elucidations*, Guizot's *Histoire de la Révolution d'Angleterre*, and Green's *Short History of the English People* (Lond. 1875).

RICHARD C., eldest son of the preceding, was born at Huntingdon, 4th October, 1626. When his father became Lord Protector, he made his son First Lord of Trade and Navigation and Chancellor of Oxford. Richard proved, however, a feeble, indolent, and self-indulgent man; and when, on his father's death, in 1658, he succeeded him as Lord Protector, he was unable to contend against the factions that opposed him in Parliament and in the army, and resigned his post seven months after accepting it. He went to the Continent, and returned in 1680, when he assumed the name of Clarke, and lived in retirement at Cheshunt. There he died in 1712.

Cromwell, Thomas, the real author of the great ecclesiastical and political revolution accomplished in the reign of Henry VIII., and of whom it has been well said that, 'in the whole line of English statesmen, there is no one of whom we would willingly know so much, no one of whom we really know so little,' was born about 1490 near London, and in humble circumstances, the popular story being that his father was a blacksmith at Putney. For a time he led a roving, adventurous life, was engaged when a mere boy in the service of the Marchioness of Dorset, and took part in the Italian war as a common soldier, or 'ruffian,' as he described himself on one occasion to Cranmer, obtaining, however, a knowledge both of the language and of the politics of Italy. He next appears as a commercial agent to a Venetian merchant, and clerk to a factory at Antwerp, and, probably after another visit to Italy, he returned to England about 1517. At all events, he is found about the beginning of the reign of Henry VIII. as a thriving wool merchant and scrivener in Middleborough. C. now took an active interest in political life, and became a member of the House of Commons. The turning-point in his life, however, was his becoming the confidential servant of Wolsey, who employed him in the unpopular work of suppressing some of the smaller monasteries, and transferring their revenues to Ipswich and Oxford. C. stood by his master to the last, and chivalrously and successfully defended him against the bill of impeachment in the House of Commons. Owing, perhaps, to his suggestion that the King should substitute his own supremacy in the Church for that of the Pope, Henry took him into favour, and made him his secretary and a privy councillor. He rose rapidly from post to post and from honour to honour, and when at length he was made Lord Chamberlain and Earl of Essex, he was the most powerful subject and statesman in England. He had conceived a definite policy, and carried it relentlessly through. It was to render the King the centre of all authority in England, by reducing the Church, in the language of Green (*Short History of the English People*), 'to a mere department of the State, in which all authority should flow from the sovereign alone, and in which his will should be the only law, his decision the only test of truth.' C. did not succeed to the extent he intended, but still he was so far able to accomplish his intentions, that to this day the polity of the Church of England remains substantially the same as it was created by him. It will always be remembered to his credit that, although perhaps for purely political reasons, he took a prominent part in establishing Reformation principles—he had English Bibles placed in the churches, and had the youth of the nation taught the Creed, the Ten Commandments, and the Lord's Prayer. His policy—particularly his maintaining a large army of spies, his sending to the block every one that opposed his measures, and the resolute manner in which he put down monasteries, securing for him the title of *Malleus Monachorum*—raised him up a host of enemies. Many complaints regarding him were presented to the King, who in the end deserted C. for promoting the marriage with Anne of Cleves, to whom Henry had taken a dislike. Ultimately C. was arrested and thrown into prison, and being condemned on the charges of treason and malversation, was executed on Tower Hill, 28th July, 1540.

Cronstadt. See KRONSTADT.

Crook, a lengthening tube used in brass instruments, which enables them to be played with the same fingering in different keys.

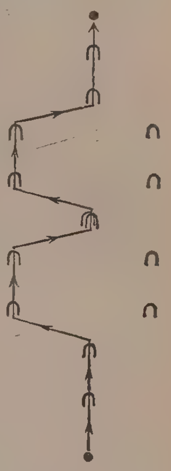
Crook'ed Island, one of the Bahamas, 27 miles E. of the S. point of Long Island, from which it is separated by C. I. Passage. Area about 80 sq. miles; pop. of C. and Long Islands 2634. Like most other islands of the group, it has a considerable export trade in salt.

Crop, or **Outcrop,** is the place where a stratum rises to the surface of the ground. It corresponds to the *strike* on a level area. See DIP AND STRIKE.

Crop. In Scotland, the landlord has a Hypothec (q.v.) over the C. for the rent of the year of which it is the C.; and the right continues in force so long as the C. remains in the tenant's possession. But, if sufficiency be left to pay the landlord, and the time of such payment be passed, then the hypothec no longer exists over any surplus crops as against a creditor's poinding. Also, if the landlord has received notice from his tenant of the latter's intention to sell his C., and if the sale then takes place by bulk in open market, or by public auction, or for a price fair in a bona-fide manner and the C. be removed, the hypothec no longer exists. Again, leases entered into on or after Martinmas, 1881, of land exceeding two acres in extent let for agriculture or pasture, give no right of hypothec to the landlord.

Cropp'ing, a term of the agricultural law of Scotland, indicating stipulated or implied conditions of farming under a lease. What is called the *clause of management* is now generally inserted in leases. It provides, among other things, for a variety or rotation of crops. This rotation varies according to the soil, climate, and other circumstance of the farm. Even in the absence of such a clause there is an implied obligation on the tenant to cultivate according to the rules of good husbandry. By common law a tenant is restrained from such gross mismanagement as will injure or overwork the soil. It is generally provided that white corn crops (*i.e.*, crops which are allowed to ripen) shall never be taken from the same land in immediate succession, and that a certain proportion shall be under turnips, or plain fallow, every year, and be sown to grass with the first corn crop after turnips or fallow. The clause is generally enforced by penalty in case of contravention, as to which the law is, that the tenant is not entitled to pay the penalty and to infringe the clause. Also, an outgoing tenant may take the way-going green crop for consumption off the land and the way-going white crop he has sown, provided there is no stipulation in the lease to the contrary. The straw of the last crop but one, as of earlier crops, must, with the manure of it, be consumed on the land, and the tenant obtains compensation only for such as need not, or, on account of date, could not, be so used.

Cro'quet, perhaps a modification of the old game of Pall-mall, is a favourite lawn amusement of modern origin, played by any number of persons up to eight, either individually or on 'sides.' The necessary implements of the game are wooden mallets, balls also of wood, a pair of pegs, and iron hoops or rings. The rings are arranged in a variety of ways, a common form being shown in the accompanying diagram, and the pegs are placed at the starting and turning points of the game respectively. The object of the game is to drive the balls with the mallets through the rings outward, in the order shown in the diagram, and after 'pegging'—*i.e.*, hitting the peg at the upper end—to return home in a corresponding order, taking the rings on the off-side. On pegging at the home-end, the player has finished, and winning is reckoned according to the order in which this is accomplished.



Croquet.

Cro'sier (Mid. Lat. *crocia*, from *crux*, 'a cross'), the pastoral staff of an archbishop, surmounted by a cross, and so distinguished from that of a bishop, the head of which is a crook. This distinction between the cross and the crook dates back to the 12th c. The C. is about 5 feet long, made of tin, hollow, generally gilt, and often richly ornamented.

Cross (Lat. *crux*, 'a pale or stake,' 'a cross'), two pieces of wood placed transversely, and anciently used in a mode of punishment which probably arose from the custom of fastening culprits or prisoners to trees, and leaving them to die by hunger or by wild beasts. The Persians, Syrians, Phœnicians, Egyptians, and Carthaginians used this mode of capital punishment, which was at Rome, under the government of the kings, inflicted on persons of all conditions in life, but later only on slaves and the vilest malefactors. According to Roman law, the sufferer was first scourged, and then compelled to carry his C. to the place of execution, outside the town in which the sentence had been passed. Here he was stripped naked, and fastened to the C. by tying or nailing. The punishment was abolished in the time of Constantine. Instances are on record of persons being taken down and surviving after remaining some time on the C. During the reign of Louis XV. of France, several women (religious enthusiasts called *convulsionaires*) voluntarily underwent crucifixion as a part of their religious services.

The C. was in form either simple or composite. The simple C. (*crux simplex*) was a mere stake on which the condemned was impaled (*infixus*), or on which he was fastened by the hands crossed above his head (*affixus*). A tree—hence Seneca's phrase, *infelix lignum*, the 'accursed tree'—was convenient for the purpose. There were several forms of the composite C. (*crux compacta*). The most common, the *crux decussata*—resembling the letter X, from *decussis*, the 'number ten'—is also called St. Andrew's C., implying that that saint was crucified on an instrument of this shape. Another form, the Tau-C. (*crux immissa*), was shaped liked the Greek letter *tau* or T. It is called St. Anthony's C., because it was said to have been embroidered on that saint's cope. A variety of this is the *crux ansata* C. with a handle—from *ansa*, 'a handle.' It has a circle at the head of the upright beam, is found on Assyrian and Egyptian sculptures, also among the Copts, Indians, and Persians, and is supposed to have been the symbol of a divinity, or an emblem of life. The most historically famous is the *crux immissa* or *crux* *capitata*—the Latin or High C.—which has the longer upright beam, or *stirpes*, projecting above the cross-piece or *patibulum*. This is held by tradition to be the form of C. on which Jesus Christ was crucified; the *titulus*, or accusation on which he suffered, being placed above his head seems to confirm this supposition; and a further confirmation is, that this C. is repeatedly found on the coins and columns of Constantine the Great. The Greek Church represents the instrument on which Jesus Christ was crucified as having the transverse beam laid across the middle of the upright one, both being equal. This shape is called the Greek C.

The C. became an object of veneration to Christians after the crucifixion of Christ. The early Christians multiplied models of it; and after Constantine's victory in 312 over Maxentius, through the influence, as he professed to believe, of the sign of the C. which he is said to have seen in the sky, it began to be set up in public places and on public buildings. Then also the custom of crossing, or making in the air with the hand the sign of the C., began to prevail. It was not till the 6th c. that the bare emblem of the C. was transformed into the image of the Crucifix (q.v.).

The festival of the 'Invention of the C.' is held on the 3rd of May, and that of the 'Elevation' on the 14th of September. The former commemorates the alleged finding of the true C., in the year 326, by the Empress Helena, mother of Constantine; the latter its re-erection, in the year 628, at Jerusalem by the Emperor Heraclius, after it had been carried away by the Persians.

The C. has been deeply impressed on all the external features of Christian civilisation. It has been extensively used as the ground-plan of churches. The plan of the Cathedral of St. Mark, Venice, is a Greek C.; that of St. Peter's is a Latin C. (q.v.). Churches commonly exhibit the C. on their gable-ends. It was early borne, as it still is, in ecclesiastical processions; an enormous C. made of wood and cardboard is carried in some of these processions at Rome, balanced in a waistband round the body of a man. The C. placed over the altar is called the *Rood* (q.v.), or *holy rood*.

As an ornament of Christian art, the C. has exercised the ingenuity of artists in all ages. The Romanesque period indulged in great luxury in this respect, a wooden C. being overlaid with gold or silver, and ornamented with jewels, gems, pearls, enamelled representations, and filigree work. In the Gothic epoch, the C. had generally the ends of its four arms trefoiled. Reliquaries of the most elaborate description were constantly made in the shape of a C.

The memorial C. has in all the ages of Christianity been a favourite mode of expressing regret for the dead. It is used for this purpose in all its shapes in places of interment. One form of it, the Norman C., is a Gothic turret, either standing on the ground or elevated a few steps. Waltham C., near London, erected by Edward I. in memory of his Queen Eleanor, and not long since restored, with questionable taste, is a good specimen. The Runic C., said to be of Scandinavian origin, and named after the Runes (q.v.), in which its inscriptions are written, seems to have been frequently set up in memory of some hero of the state or of the Church—some king, warrior, or bishop. There were formerly many of these in the Island of Iona, but now only one remains—St. Martin's, in the cathedral grounds. They were common in Ireland—St. Luke's, which still stands in the county of Louth, being of huge dimensions.

The sanctuary or boundary C. marked off Church lands, and showed the people on their way to church where to kneel when they were entering sacred grounds. One of these latter is still to be seen on a field near the parish church of Kilhoman, Islay.

The market-C. has left its name where it stood in many towns of England and Scotland. It is noticeable that in some towns of Ireland the market-place is called the *diamond*—probably owing to its diagonals being a Greek C. Some of the most famous of English market-crosses, as at Salisbury, Chichester, Bristol, and Winchester, are designed with niches, and vaulted, leaving an open chamber. These crosses seem to have been used as *preaching stations*; notably St. Paul's C., London, of which we read as early as the middle of the 13th c. The neighbouring cathedral, St. Paul's, is surmounted by one of the largest constructed crosses in the world, a rival to that on St. Peter's at Rome.

Cross, in heraldry, one of the honourable ordinaries, may be regarded as a combination of a fesse with a pale. It was usual for the Christian warriors in the crusades and for pilgrims to the holy Land to wear it as a badge. The varieties of the C. are very numerous; but when the blazon is a simple St. George's C., it is always understood as meaning the honourable ordinary. There are two classes of the ornamental C.—those in which the extremities reach to the outer edge of the shield, and those which are Couped (q.v.).

Cross, Order of the, an ecclesiastical order of knighthood which arose in Palestine during the crusades, as the Bethlehemite Order, but now has its chief seat in Bohemia, where Church dignitaries and professors of the University of Prague are among its members. In the 13th c. the knights of this order became monks, and in 1328 were confirmed by Pope Gregory IX. as a monastic community. They settled chiefly in Poland, Austria, Moravia, Silesia, and Bohemia. Their badge is a C. of red satin, with a six-pointed star under it; hence they are sometimes called *stelliferi* or star-bearers.

Cross, The Southern, a bright constellation of the southern hemisphere, consisting of four stars, the line joining two of which points to the S. pole, forming with the line joining the other two a very perfect C. The brightest star is nearest the pole, and is between the first and second magnitudes.

Cross, Victoria, a British order, or naval and military decoration, as it is called in the Gazette of 5th February, 1856, instituted for eminent personal valour, in the presence of the enemy, at the close of the Crimean War. A single act of valour may win this decoration, and it is granted to a soldier of any rank, as in the cases of Lieutenant Marsham Havelock, son of the famous general Sir Henry Havelock, at the battle of Cawnpore, and Lieutenants Salkeld and Home, Sergeant Smith, and Bugler Hawthorne, at the blowing-in of the Cashmere Gate in 1857, during the suppression of the Indian Mutiny. The order is said to have been founded in imitation of the French C. of the Legion of Honour; but it resembles the ancient English decoration of the partially-created baron, called a Banneret (q.v.). The badge is a bronze Maltese C., charged with the royal crown and lion crest, below which is inscribed the motto, 'For Valour.' On the clasp, from which the letter 'V' hooks the C., there are two branches of laurel; and the ribbon is red for the army, blue for the navy. The performance of another act or other acts of bravery in the field by a holder of the V. C. entitles him to a *bar* or *bars*, on the ribbon. The pension accompanying this decoration is £10 a year, in the case of every warrant, or petty officer, seaman, marine, non-commissioned officer, or soldier, and for every *bar* £5 additional pension, paid annually. Down to the commencement of the present year 174 heroes had received the distinguishing badge. On 16th July, 1895, Surgeon-Captain H. F. Whitchurch was gazetted as a recipient of the V. C. for his gallant behaviour during a sortie from Chitral fort on 3rd March, 1895.

Cross-Bill in Chancery was a bill filed in the Court of Chancery by a defendant against his co-defendants or the plaintiff, and had for its object either one of two things; discovery of facts for defence in the former bill, or full relief to every one concerned. The same object is now attained by means of a *Counterclaim*. See regarding Scotch law, CONJOINING OF PROCESSES.

Cross'bill, a genus of Conirostral (*Insessorial*) birds, of the sub-family *Loxinæ*, in which the mandibles of the bill are hooked or crossed, and compressed at their tips. The head is large and the bill strong. These birds feed on the seeds of pine-cones, and their bills are well adapted for extracting the seeds and for crushing the cones. The common C., the parrot C., and the white-winged C., occur in Britain.

The first species is common in Europe and in N. America, where the last species is also found. The common species rarely breeds in Britain. The nest is of grass and twigs and placed at the top of pine-trees.

Crossbill.

Cross′bow. See Arbalest.

Cross-Buns, Good-Friday cakes with a cross upon them, long popular in England, where they are hawked about the streets of many towns with the cry, 'Hot cross-buns.' The origin of this practice is not known; it is perhaps a relic of a heathen custom adopted by the early Christian Church.

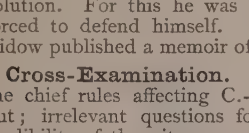
Crosse, Andrew, an eminent electrician, was born at Fyne Court, Broomfield, Somersetshire, 17th June, 1784. After studying at Oxford, he returned to his family seat in 1805, where he devoted himself to electricity. C. made many successful experiments regarding the formation of crystals, and formed numerous artificial minerals through the agency of voltaic currents. He communicated his discoveries of thirty years' labour to the British Association in 1836, and was highly commended by many scientific men. His most wonderful discovery was the apparent generation of certain *acari* between the electrodes immersed in a highly caustic solution. For this he was charged with impiety, and was forced to defend himself. C. died 6th July, 1855. His widow published a memoir of his life and labours (1857).

Cross-Examination. The following are, in England, the chief rules affecting C.-E. Leading questions may be put; irrelevant questions for the purpose of injuring the credibility of the witness are inadmissible; when not put for this purpose, some latitude in questioning is usually allowed. The witness may be asked if he has been guilty of a specified crime, but he is not bound to answer. If a witness under examination be hostile, from interest and any other cause, to the side which calls him, his examination may, by leave of the court, take the form of C.-E. See Evidence.

Crossopo′dia, the name given to certain kinds of *worm-markings* or *tracts* occurring in the Silurian and other rocks, and formerly, but erroneously, described as consisting of the *body* or actual fossil of the worm itself. *C. Scotica,* of the Silurian rocks, is a good example of these appearances, which are similar to those produced on modern coasts by marine-worms burrowing in or trailing across the sand.

Crossopteryg′idæ, a division of Ganoid (q.v.) fishes, so named from the fin-rays of the pectoral and ventral fins being arranged so as to form a *fringe* around a central lobe. The living Barramunda (q.v.), or *Ceratodus* of Australian rivers, shows this arrangement of the fins; whilst the *Polypterus* of the Nile, and the extinct genera *Osteolepis, Megalichthys, Holoptychius,* &c., are good fossil illustrations of the 'fringe-finned' ganoids.

Crotala, wooden castanets which were in use at a very early date. Some of the worshippers performed on C. while celebrating the mysterious rites of Cybele; and dancers on any ordinary occasion beat time with them.



Crotala.

Crotal′idæ, a family of Viperine snakes, represented by the Rattlesnake (q.v.) of N. America, and distinguished by the presence of a deep pit on each side of the nose behind the nostril. The head is broad and flat, scaly on the crown, and scutellated on its sides and on the nose. The teeth are small; no teeth, save the fangs, existing in the upper jaw. The belly is covered with broad shields. The tail may be provided with a rattle or with a spine.

Cro′taphite, the name given by the older anatomists to the temporal muscle on the side of the head, from *krotaphos,* 'the temple.' The term was also applied to the temporal bones and arteries.

Crotch, William, an English musician, born at Norwich in 1775. In 1797 he obtained the degree of Doctor of Music at Oxford, when he became Professor of Music, and in 1822 became Principal of the Royal Academy of Music. His anthems are his best-known compositions, but he wrote also for the organ and piano. He was the author also of some good theoretical works. He died, 29th December, 1847.

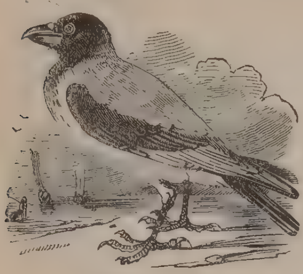
Cro′ton, a genus of Euphorbiaceous plants. The seeds of *C. Tiglium* yield Croton Oil (q.v.). Most of the species are aromatic. Among these may be ranked C. of the island of Eleuthera, one of the Bahamas, which yields cascarilla bark. The *Eau de Mantes,* a spirituous liquor, is made from West Indian C. *C. lacciferum* and *C. Draco* yield a resin used in varnish-making. Other aromatic, fragrant, and balsamic species are found at the Cape of Good Hope, &c. The aromatic tonic Malambo bark, or Matias bark, is the produce of *C. Malambo,* and is used in Colombia as a vermifuge, &c. See also Copalche Bark.

Croton Oil is expressed from the seeds of *Croton Tiglium* (see Croton), is viscid, of a yellowish-brown colour, an acrid taste, and a nauseous odour. It is an exceedingly powerful purgative. Dose, one-third to one drop. Externally it is used as a liniment, one of C. O. to seven of olive oil, or some other oil, and produces pustules on the skin. It is good for counter-irritation, as in internal inflammations.

Crotoph′aga ('tick-eaters'), a genus of Scansorial birds, known as the Anis or sub-family *Crotophaginæ,* the typical genus C. being confined to S. America, and possessing a much-compressed bill, with the edge of the upper mandible sharply keeled. One C., called the Savannah blackbird, is a familiar species, and is found in the W. Indies, feeding on insects such as ticks, which it picks out of the hides of horses or cattle.

Croup is an inflammatory affection of the windpipe, accompanied by the formation of a membranous exudation on the mucous surfaces attacked. The symptoms at first are those of a common cold, but they soon become alarming. The patient, generally in the night-time, awakens with a sense of suffocation—with a peculiar cough, called by physicians '*brassy.*' The breathing is quick, and there is a peculiar *crowing* noise as the air enters the lungs. There are occasional spasms of the muscles of the windpipe. C. is always worse during the night. The sufferer is very restless, and is frequently seen tearing at his mouth or throat as if to clear the windpipe of the obstruction causing impending suffocation. If relief be not obtained in the course of a day or two, death ensues from exhaustion, suffocation, or convulsions. C. is specially a disease of infancy, being most frequent during the second year. It is rare after five years of age, and is more common among boys than girls. It occurs chiefly in cold, damp climates, and is very fatal: one-half of those attacked die, and generally within two or three days. The proper treatment is to give emetics and purgatives at the outset, to apply hot sponges to the throat, to keep the child warm in bed, and to allow it to inhale moist warm air. In extreme cases Tracheotomy (q.v.) sometimes does good.

Crow, a genus of Insessores belonging to the sub-order Conirostres (q.v.). The true crows, forming the sub-family *Corvinæ,* are known by their want of toothed processes at the tip of the upper mandible, the ridge of which is curved, by the long and rounded wings, by the scaly tarsi, and by the two lateral toes being of equal size. Of the British crows, the raven (q.v.), the common carrion C., the rook, and jackdaw are the best known. The Royston or hooded C. is another species found in Britain. Variations in colour between these forms constitute the chief grounds of specific distinction. Other species of crows are the N. American C., the fishing C. of the United States, the jabbering C. of Jamaica, the smaller ebony C. of Ceylon, or Indian C., &c. The Choughs (q.v.) are nearly related to the crows, but are usually included in a separate sub-family (*Pyrrhocoracinæ*). The Alpine C. is one of the latter birds.



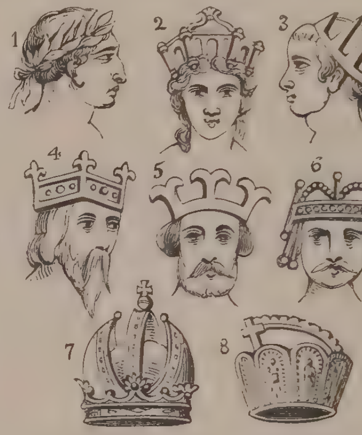
Hooded Crow.

Crow'berry, or **Crake'berry,** a genus of dwarf, creeping, heath-like shrubs, belonging to the natural order *Empetraceæ*, found in high latitudes, and on high, bleak moorlands and mountains in Scotland, the N. of England, and similar parts of Europe and America. The name is, however, generally applied to the black C., the black berries of which are eaten by game-birds and also by crows, which in regions where this berry is common leave the fields and resort to the hill-sides to live on it till harvest-time: hence the name C. Its berries are eaten by the Highlanders, the Russian peasants, and by the Greenlanders mixed with train-oil. Boiled in alum, they yield a purple dye, and are used by the Laplanders for dyeing sable and otter skins black. The red C., of the vicinity of Cape Horn, has edible red berries. The Portuguese Camarinheira is closely allied to the C., and is used in the preparation of an acidulous liquor used as a drink in fevers.

Crow'land, or **Croy'land,** an ancient town in the 'Fens' of Lincolnshire, 48 miles S.S.W. of Lincoln. It consists of four streets separated by watercourses with willows on their margin, and connected by a triangular bridge of three segments of a circle springing from three piers, but meeting in a point, across the Welland, the Nen, and a large drain called the Catwater. It is supposed to be as old as the time of Edward II. C. has also the ruins of an abbey said to have been founded in the 8th c. It was frequently destroyed and as frequently rebuilt, and part of it is still used as the parish church. Ingulphus was one of its abbots. Pop. civ. and ecc. par. 2800.

Crown, an ornament worn on the head as a symbol of regal or imperial station and dignity. In its derivation the modern C. comes from the *corona* which, among the ancient Greeks and Romans, was bestowed as an honorary reward to victors in athletics and public games; but in its real significance it represents the diadem or circlet which was worn by Oriental and early Roman kings. Crowns mentioned in Scripture were wreaths similar in nature and signification to the honorary crowns of the ancient Romans. Originally crowns were of plaited or twisted grass, leaves, twigs, flowers, or other inexpensive materials; but gradually they began, for certain purposes, to be made of precious metals and stones, and some of them were of very great value. Among the Romans, who bestowed crowns with a very lavish hand, the classes and varieties of such decorations were very numerous. Crowns of various descriptions and materials were conferred for distinguished conduct or service in military or naval undertakings; of which type the *corona triumphalis* may be noted as an example. This was bestowed on a victorious general to whom a public triumph was decreed, and consisted, first, of a wreath of laurel or bay leaves; second, a golden C., presented by the army which he had led to glory; and third, another C. of gold contributed by the various provinces. Emblematical crowns were worn by special classes, as, for example, the priests; and on particular occasions, such as funerals, weddings, and social festivities. The radiated C., which was originally reserved for deities and deified mortals, was adopted by several of the Roman emperors, Nero having been the first to use it as an imperial badge.

The crowns of monarchs at the present day are called *closed* crowns, because the diadem or circlet is overarched by a series of bands or arches, and the use of closed crowns is exclusively reserved to certain members of reigning houses. The first monarch who adopted the closed C. was Charlemagne, and his example was gradually followed by European rulers till the fashion became general. In England, the closed or arched C. was not introduced till the accession to the throne of Henry V., who had made for himself a simple C. with two arches. Since that period the royal C. of England has undergone many changes. That of Her Majesty Queen Victoria has two arches, which rise almost perpendicularly from behind the four crosses patées which heighten the circlet. Set alternately with the crosses are four fleurs-de-lys, and surmounting the whole at the intersection of the arches are a mound and a cross patée. The cap is of purple velvet lined with ermine, and the whole C. is richly studded with pearls, diamonds, and other precious stones. The crosses on the C. point to the title, 'Defender of the Faith,' and the fleurs-de-lys are relics of the English claim to the sovereignty of France. The state C. differs from the preceding mainly in superior richness.



1, Roman crown of bay leaves; 2, Mural crown (Cybele); 3, Radiated crown; 4, Square crown of Saxon kings; 5, Crown of King Eadgar (A.D. 966); 6, Crown of William the Conqueror; 7, Imperial crown of Germany; 8, Crown of Charlemagne.

The famous iron C. of Lombardy, now preserved in the Imperial Schatzkammer at Vienna, was originally all gold, but in the 6th c. it was strengthened with a ring of iron made 'of a nail of the Cross,' whence it received its appellation. The signification of the triple C. or tiara of the Pope has been variously explained, but the commonly received interpretation is that it indicated the sovereign pontiff's threefold royalty—spiritual over souls, temporal over the states of the Church, and mixed over all kings. The Vatican treasury contains several tiaras which have been presented to the Pope at various periods, one of the latest being that given to Pius IX. in 1855 by Queen Isabella of Spain, which weighs 3 lbs. and cost £12,000.

The Prince of Wales, as heir-apparent to the British throne, has a coronet closed with only one arch, surmounted with a mound and cross. Other members of the royal family, dukes, marquesses, earls, viscounts, and barons, have open coronets, which are heightened for their various grades according to strict heraldic order. See CORONET.

Crown Agent is the agent or solicitor in Scotland who, under the Lord Advocate, takes charge of criminal proceedings. The appointment lies with the Lord Advocate, and is not held *ad vitam aut culpam*. C. A. also means the agent of our Crown Colonies; the office is in Downing Street, London.

Crown Debts. By English law, debts due to the crown have a preference over all debts due to a subject. They are recoverable by a summary process, called an Extent (q.v.). Statute 28 and 29 Vict. c. 104, provided that debts due to the Crown shall not affect lands until writ of execution has been issued and registered. In Scotland the rule only holds with regard to personal or moveable property: and in a competition affecting heritage the crown has no privilege. The crown privilege is, however, good against the landlord's

Hypothec (q.v.). It is also effectual against mercantile sequestration; consequently a discharge under the Scotch Bankruptcy Act is not effectual against a crown debt.

Crown Lands. Under various statutes all grants or leases, exceeding thirty-one years, of lands belonging to the crown are void. The superintendence of C. L. is now vested in the Commissioners of Woods, Forests, and Land Revenues (q.v.), the demesne lands of the crown, which the sovereign hands over to the country in exchange for the Civil List being settled on him or her for the whole of the reign. The revenue derived from these C. L. is paid to the account of the Consolidated Fund. (Under Statutes 1 & 2 Vict. c. 2, 29 & 30 Vict. c. 62, and 36 & 37 Vict. c. 36.)

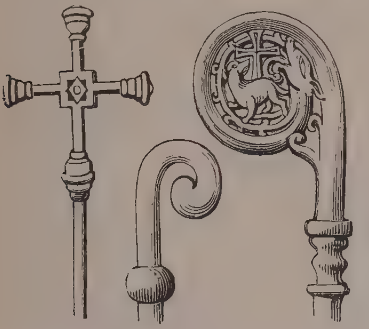
Crown Point, a fort famous in the French, Indian, and Revolutionary wars, stands on the W. side of Lake Champlain, and on the long narrow reach of the upper or southern end of the lake. Along with Ticonderoga, it guarded the pass of the great military route between New York and Montreal which nature has made by the Hudson River and Lake Champlain. It was taken from the English in 1775 by Ethan Allen, and is now a ruin. The village of C. P. is 90 miles N. of Albany. Pop. of township 1907.

Crown Solicitor is a solicitor to the Treasury who, by Statute 47 and 48 Vict. c. 54, is constituted the Director of Public Prosecutions in England. In Ireland a C. S. is attached to each circuit, to attend to every criminal prosecution by the crown. His duties are analogous to those of the Procurator-Fiscal (q.v.) and Crown Agent (q.v.) in Scotland. See PROSECUTOR, PROSECUTION.

Croy'don (Fr. *Croie dune*, 'chalk hill,' from its situation on the edge of the Thames chalk basin), a town of Surrey, 10 miles S.W. of Greenwich. Its main street extends along the London and Brighton road for more than a mile and a quarter, and is flanked on both sides with respectable shops and several handsome buildings. The fine old parish church was entirely destroyed by fire in 1867, with the exception of the tower; but it has since been restored. It has several other good Gothic churches, a large new public hall, and numerous mansions and villas in the neighbourhood. The chief trade is in corn and butter. Two annual fairs are held —the one on 5th July, the other on 2nd October. Pop. county bor., which is co-extensive with parl. bor., 102,659; reg. sub-dist. 128,699; and civ. par. 102,695.

Crozet' Islands, an uninhabited volcanic group in the Indian Ocean, 385 miles S.W. by W. of the Cape of Good Hope. The western extremity of the largest (Possession Island) is in lat. 46° 22′ S. and long. 51° 30′ E. Area about 200 sq. miles.

Crozier, the crooked staff of an abbot or bishop. The early croziers were made of wood or ivory, and shaped like the letter T. In the 13th c. gold or silver croziers were used and were highly ornamented. These were also longer than the early ones. For three hundred years and more they were still more richly adorned. In the 17th c. they ceased to be rectangular in shape, and the present fashion of the crook was adopted.

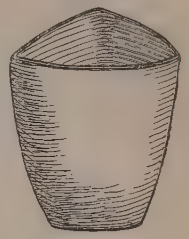


Crozier.

Crozoph'ora, a genus of annual or perennial low-growing plants (natural order *Euphorbiaceæ*), found in tropical and Northern Africa, and extending as far as India. *C. tinctoria*, a native of the Mediterranean countries, is cultivated for the sake of the dye called *Turnsole*, which is obtained from it by grinding the plants (little herbs seldom more than a foot high) to a pulp in a mill, when they yield about half their weight of a dark-green juice, which becomes purple by exposure to the air or under the influence of ammonia. It is chiefly exported to Holland, and is prepared for exportation by soaking coarse linen rags or sacking with it, the rags being previously washed clean. After soaking they are allowed to dry, and are exposed to the influence of ammonia. They are then packed in sacks, and ready for shipping to Holland. Not much is known of the use the Dutch put the dye to, but it is supposed to be chiefly employed as a colouring matter for cheese, and perhaps confectionery, wine, &c. (Black in *Treas. of Botany*). It has been confounded with Litmus (q.v.).

Cru'cian or **German Carp,** a species of *Cyprinidæ* (q.v.) or Carps (q.v.), possessing no tentacles or *barbules* at the mouth. The tail is square. This fish inhabits lakes and rivers of N. Europe and Asia. It has been found in the Thames. Its flesh is palatable.

Cru'cibles are vessels employed in fusing metals, glass, &c. They are made of refractory materials, and are generally of a conical shape. The substances used in their composition are various—platinum, fireclay, a mixture of graphite and fire-clay (Plumbago C.), porcelain, iron, &c.



Crucible.

Crucif'eræ, a natural order of Dicotyledonous herbaceous plants (rarely shrubs), belonging to the subdivision *Thalamifloræ*, so called because the four petals are placed in the form of a cross ('cross-bearing'). With the exception of a few plants of the natural order *Capparidaceæ*, this is the only order having *tetradynamous* stamens (*i.e.*, four long and two short). About 1730 species and over 205 genera, distributed chiefly in temperate climates, are known; a large number inhabit high latitudes, and a few are found in the tropics, chiefly on the side of mountains. The wallflower, Dame's violet, shepherd's purse, &c., are examples. Antiscorbutic and pungent properties, frequently combined with acridity, characterise this order. The seeds generally contain a pungent fixed oil. Many of them contain sulphur, and the watercress contains iodine (Mülder). The order comprises many of our most common culinary vegetables, but not a single poisonous plant. All the plants popularly known as Cress (q.v.), Kale (see BRASSICA), Mustard (q.v.), &c., belong to this order. Woad, which yields the blue dye with which it is said the ancient Britons stained their skins, wallflower, stock, candytuft, honesty, and other favourite garden flowers, are also members of this order. It has various subdivisions, according to the nature of the fruit and the way the embryo is folded.

Cru'cifix (Lat. *crux*, *crucis*, and *figo*, 'I fix'), is a figure of Christ on the cross. It was several centuries till Christian art chose to represent Christ in this way as a suffering Saviour; its aim at first being to inspire faith more than pity, by reminding men of his having died for them, without reference to the agonies of his death. The earliest existing crucifixes are supposed to belong to the 9th c.; the first mention of them is perhaps in the writings of Gregory, Bishop of Tours (544-595). For the same reason, in some of the earliest Christ is represented as erect and robed, with no nails, wounds, or crown of thorns, and without any sign of pain. Besides the figure of Christ, there are also usually many minor figures on the C. The ends of the transverse beam of the cross are occupied with figures of the Virgin and St. John, or of the sun and moon; at the upper end is the hand of the Father blessing Christ or holding a wreath; at the foot is the serpent and a skull; or the four ends are occupied by the attributes of the four Evangelists, &c.

Cru'den, Alexander, to whose labours British divines are much indebted, was born at Aberdeen, 31st May, 1700. He was educated at Marischal College in that city, and but for a tendency to insanity would have entered the Church.

In 1722 he went to London, where he was in succession, a private tutor, a bookseller, and a corrector for the press. In 1737 appeared the work with which his name will always be associated, his *Complete Concordance of the Holy Scriptures of the Old and New Testament*, which stands still the first of its kind. Many editions have been published, that of Chalmers being still the most popular. C. was frequently deranged, and on one occasion he was confined in a private lunatic asylum, where, according to his own statements, he was harshly treated. His delusion that he was divinely commissioned to reform the people resulted in his taking to himself the title of 'Alexander the Corrector.' He was, however, a virtuous and benevolent man. C. died at Islington, 1st November, 1770.

Cruik'shank, George, an eminent caricaturist, was born in London, 27th September, 1792. His artistic powers showed themselves at an early age, and after the death of his father, who was a native of Aberdeenshire, he began to illustrate books for children. He subsequently illustrated two satirical publications, *The Scourge* and *The Meteor*, while his illustrations of the political squibs of William Hone attracted much attention. Turning to worthier and more ambitious work, he illustrated various books of fiction, including some by Dickens, such as *Oliver Twist*, and produced pieces like *The Bottle* (eight large plates), depicting the vice of intemperance, of which he was a vigorous assailant, being personally a total abstainer. He attained the highest success as an illustrator, and a position not unlike that held by Hogarth as a teacher of morality by means of satirical sketches. C. in his later years turned his attention to oil-painting. Among his best paintings are 'Tam o' Shanter,' 'Disturbing a Congregation' (painted for the late Prince Consort), and 'The Worship of Bacchus.' He died 1st February, 1878. C. was a man of great physical vigour, and in his character artistic genius was seen in beautiful alliance with simplicity of heart and genuine benevolence.

Crui'ser (Dut. *kruisen*, 'to move crosswise,' from *kruis*, 'a cross'), a Government ship chiefly employed in watching an enemy or pirates.

Cruithne', Cruithneach (Lat. *Crutheni*), the name given by Irish writers to that branch of the Celtic race which, at the dawn of history, inhabited both the N. of Ireland and the N. of Scotland, and which by the Latin chroniclers is denominated *Picti*. No satisfactory explanation of the meaning of the term has yet been given, and it is needless to refer to the various fables which bring the C. from distant countries—some of them to Ireland, thence to Scotland, while others reverse the process. But it deserves notice that almost all these accounts represent them as soldiers from a distance, who obtained wives from the Irish, and whose children consequently spoke the Irish language; and this probably represents the fact of their being intruders on some older branch of Celts, settling among them and intermarrying with them. It appears that as far back as history goes the C. possessed Ulster and a portion of Meath, while at the same time they held the whole N. of Scotland—then known as Alba, the name Scotia being applied to Ireland, or Erin. The *Pictish Chronicle*, written in the 11th c., says that Cruithne, the son of Cirge, had seven sons—Fib, Fidach, Fodla, Fortren, Cait, Ce, Circin—and that they divided Alba into seven portions. This means that the territory occupied by the C. consisted of seven provinces bearing the above names. Fib represents Fife; Fortren, the western parts of Perthshire; Fodla, Athole, written At-Fodla; Circin, in old writings, Magh-circin, now Mearns; Cait, Caithness. The remaining two have not been hitherto identified; but Dalkeith, in Celtic, *Dail-Cé*, 'the portion or field of Cé,' may represent one of them, while Fidach must meantime be left landless. The Scots, another Celtic branch, encroached on the C. in Ireland, and in the beginning of the 6th c. established themselves in Argyllshire, eventually extending their sway over the whole kingdom, to which they gave their own name of Scotland; but, as the name *Picts* is much better known than that of C., the circumstances of this change of name and dynasty, as far as they can be known, will be given under that heading. The only thing necessary to state here is, that the common idea of the extinction of the Picts, or C., by the Scots, is altogether a fable. The King of the Scots, Kenneth M'Alpine, obtained in the 9th c. the throne of Northern Pictland (*Cruithnetuaith*) by inheritance. Through the aid of its inhabitants he subdued other portions of the kingdom, and united Scotland, as it finally came to be called, under one head. The C. or Picts represent the old Caledonians, who so long and so manfully resisted the Romans. A remnant of their descendants, it cannot be doubted, still occupy the ancestral mountains.

For a full account of the early history of Scotland see Skene's various writings on the subject, particularly his introduction to the *Chronicles of the Picts and Scots* and his *Celtic Scotland* (1st vol. Edinb. 1876), a work which entitles him to be regarded as the greatest authority on the Celtic antiquities of Scotland.

Cruive (perhaps connected with the Old Swed. *krubba*), the Scottish name for a trap, consisting of a sparred chamber or enclosure placed in a dike or dam across a river, for catching salmon. Last century cruives were common in the salmon-fishing rivers of Scotland. Their use in Great Britain is now illegal.

Cru'orine, the colouring matter of the blood. The name usually employed is Hæmoglobin (q.v.).

Cru'ra, a term used in anatomy to designate the roots or peduncles or supports of any structure. Thus we have the *C. cerebri*, or peduncles of the brain, the *C. cerebelli*, or peduncles of the cerebellum, the C. of the diaphragm, &c.

Crusæ'us. The great muscle in front of the thigh, which extends the leg on the knee-joint, called the *quadriceps extensor*, is a large fleshy mass which covers the front and sides of the femur, and is usually divided by anatomists into four parts: (1) occupying the middle of the thigh, the *rectus fermoris*; (2) occupying the outer side of the femur, *vastus externus*; (3) covering the inner aspect of the femur, *vastus internus*; and (4) covering the middle of the femur, between the two last named.

Crusades' (Fr. *croisades*, from *croix*, Lat. *crux*, 'a cross') were the military expeditions of European nations during the 11th, 12th, and 13th centuries to vindicate the right of Christian pilgrimage to Jerusalem, and latterly to seize and hold Jerusalem against the Turks. From the capture of Jerusalem by Omar in A.D. 637 till the reign of Hakem, the third Fatimite Caliph, the Christian inhabitants and pilgrims merely paid a tax to the Mohammedan governor—Harun al Rashid having delivered the city keys to Charlemagne. Hakem, however, persecuted the Christians, and mutilated the rock of the Sepulchre and the Church of the Resurrection. As the Catholic Church commuted penances for pilgrimages, many Europeans of all classes continued to encounter the risks of travel and persecution. This the excitement of the year 1000 favoured. After the capture of Jerusalem by the Turk Togul Beg in 1076, pilgrims were systematically plundered and insulted, but it was not till the Turks seriously threatened the Byzantine Empire that a crusade was formally proposed. Gregory VII. had seen in this only an opportunity for extending the Papal power, but Urban II. was roused by the French hermit, Peter of Picardy, into real enthusiasm, and at the general Council of Clermont (November, 1095) invoked Western Europe to defend the Holy Land. *First Crusade.*—In March, 1096, popular expeditions, without discipline or equipment, began to beg and plunder their way to Jerusalem. The first, led by a Burgundian, Gualtier *Sans-Avoir* (Walter the Penniless), was destroyed in Bulgaria; the second, under Peter the Hermit, was cut to pieces on the plain of Nice by the forces of the Sultan of Rûm; the third, consisting of German peasants, led by a monk, Godeschal, perished before Belgrade through the treachery of the Hungarian king; the fourth, amounting probably to 200,000 persons, after massacring the Jews in Mainz and other episcopal cities, was exterminated by the Hungarian army. The military crusade of 1096 divided itself into four expeditions, organised by the nobles without the help of any monarch. The first division, from the Rhine and N. Germany, was led by Godfrey de Bouillon, Duc de Brabant, and his brothers Eustace and Baldwin; the second, from Central France, Normandy, and Britain, was led by Hugh, Comte de Vermandois, Stephen, Comte de Chartres, Robert, Duc de Normandie, Robert, Comte de Flandres, and Eustace, Comte de Boulogne; the third, from S. Italy, was led by Prince Bohemond of Tarento and his cousin Tancred; the fourth, consisting of Provençals, Spaniards, and Lombards, was led by Raymond, Comte de Toulouse, with whom was Adhemar, the Pope's legate. After collisions between these armies and the Greeks of the Eastern Empire, and much fighting and intriguing at Constantinople, the Emperor Alexius obtained an oath of fealty from a majority of the leaders, and added a small contingent to their forces. On the 20th June, 1097, the crusaders captured Nicæa, and at Dorylæum decisively defeated Solyman, Sultan of Rûm. While the main body crossed the Taurus, Tancred and Baldwin penetrated Cilicia. The unjust claim of the latter to the capture of Tarsus led to his desertion of the general crusade and his Armenian expedition, which resulted in the establishment of the principality of Edessa. The crusaders took Antioch, 3rd June, 1098, but were besieged there by a host of Persian Turks under Kerboga, whom they defeated mainly through the enthusiasm which the clever imposture of the Marseille priest, Peter Barthelemy, had excited. Bohemond became ruler of the new Christian principality of Antioch. Greatly reduced by famine and pestilence which visited them at Antioch, the army, led by Godfrey, Raymond, &c., in 1099 marched S. to Jerusalem, now in the hands of the Fatimite Caliph of Egypt. In spite of the gallant defence of Istahar, the crusaders, after a siege of five weeks, entered the Holy City, and massacred the Mussulman and Jewish inhabitants. On the 23rd July, 1099, the Latin kingdom of Jerusalem was founded, Godfrey de Bouillon becoming king under the title of Advocate or Defender of the Tomb of Christ. By Godfrey's victory at Ascalon (12th August, 1099), by the energy of his successor, Baldwin I., in reducing Acre (1104), &c., and in founding the county of Tripoli (1109), and by reinforcements from Europe, the new kingdom was strengthened and extended. (See BOUILLON, GODFREY DE.)—*The Second Crusade*, provoked by the reconquest of Edessa by the Emir of Mosul in 1144, was preached by St. Bernard (q.v.), under the auspices of Pope Eugenius III., and undertaken by Louis VII. of France and the Emperor Konrad III. After the German army had been almost entirely destroyed by the Sultan of Iconium, Louis, who had been detained at Constantinople by the treacherous Manuel, joined the Emperor, and both reached Antioch with a fragment of their original forces. An abortive attack on Damascus in 1149 was the only fruit of this crusade. The conquests of Noureddin, Sultan of Damascus, the blunders of the weak Almeric (who succeeded Baldwin III. at Jerusalem) in meddling with the affairs of Egypt, and the dissensions which the election of Guy de Lusignan as king excited, prepared the way for the sudden rise of Saladin, who crushed the Christian army at Tiberias in 1187, seized Jerusalem, put Antioch under tribute, but failed to reduce Tyre, which Konrad of Montferrat defended. This led to the *Third Crusade*, marked by the first imposition by European monarchs of the Saladine tithe on rents and moveables. The siege of Acre began in 1189; in 1190 the Emperor Friedrich Barbarossa led his army to Cilicia, where he died; the Duke of Swabia proceeding to Acre, which was regained in 1191, on the arrival of Philippe Auguste and Richard Cœur de Lion. Philippe having returned home, Richard won the victory of Azotus, and captured Jaffa and Cæsarea; but when, in 1192, Jerusalem was reached, the crusade was suddenly abandoned, Saladin agreeing to leave the coast-fortresses in the hands of the Christians, and to give pilgrims free access to the Holy Sepulchre. This truce expiring, and the crusade proclaimed by Pope Celestin III. failing to place Almeric de Lusignan in possession of the Holy City, Pope Innocent III., seconded by the preaching of the French priest Foulques, set in motion the *Fourth Crusade* in 1200. Its leaders, the Marquis Boniface of Montferrat and the Comtes de Flandres and Blois, arranged for the transport of their troops by the Venetian fleet, and joined the Doge Dandolo in storming Zara, a city subject to Hungary. This having placed the crusaders in opposition to the wishes of the Pope, they agreed to espouse the cause of Alexius, son of the deposed Isaac Angelus, who promised that, if successful against his usurping uncle Alexius, he would unite the Eastern and Western Churches and assist the crusade. After the double siege of Constantinople (1203-5), which resulted first in the restoration of Isaac, next in the usurpation of Ducas Murzuphlos and the murder of Alexius, lastly in the coronation of Baldwin, Comte de Flandres, as first Latin Emperor of the East, and the division of the Empire between Venice and the barons, nothing further was heard of this crusade. Montferrat obtained Macedonia and the republic of Venice, Crete and three-eighths of the Asiatic provinces.—*The Fifth Crusade*, to assist Jean de Brienne, titular King of Jerusalem, against the Sultan Saphadin, who had succeeded to Saladin's power, was agreed to at the Lateran Council of 1216, called by Innocent III. The preliminary campaign of Louis of Hungary came to nothing, and although the Germans under the Duke of Austria, assisted by the French following of Comtes Nevers and La Marche, and the English under the Earl of Salisbury, in 1219 took Damietta after a siege of seventeen months, the folly of Cardinal Pelagius and the religious orders in declining the proffered cession of Jerusalem, led in 1229 to the disastrous advance on Cairo. In 1228 the Emperor Friedrich II. (q.v.) obtained a ten years' treaty, guaranteeing the occupation of Bethlehem, Nazareth, &c., and free access to the Holy City, where he was himself crowned despite the protest of the Patriarch. In 1238, the Christians having been driven out of Jerusalem, two distinct expeditions were organised, together known as the *Sixth Crusade;* the first, consisting of French knights led by Thibaud of Champagne and the Comte de Bretagne, was victorious at Ascalon, but routed at Gaza; the second, arranged at the Council of Northampton, was headed by Richard, Earl of Cornwall, brother of Henry III., who in 1240 drew the courts of Damascus and Cairo into a treaty for the cession of Jerusalem and a large territory, and the release of Christian prisoners. The invasion of Palestine by the Kharizmian tribes, expelled from Persia by the Mongols, and assisted by the Sultan of Egypt, crushed the Latin state; and when the Kharizmians were expelled by the Syrians and Egyptians, the Christians did not regain their rights. At the Council of Lyon (1245), accordingly, Pope Innocent IV. proclaimed a *Seventh Crusade*, in which Louis IX. of France, William Longsword of Salisbury, and others from France and England, set out from the rendezvous, Cyprus, in the year 1248. Egypt was the scene of battle. Damietta fell easily, but the Mameluke forces of Nejmeddin, the Sultan, checked the invaders at Mansura, cut off their communication with the sea, and destroyed the crusading army, taking Louis prisoner in 1250. Louis, after being ransomed, spent four years in fortifying the coast-fortresses of Palestine, and then withdrew to France. In 1265-68, Bondocdar, the Mameluke usurper, attacked Palestine, almost defenceless from the feuds of the military orders. The capture of Antioch, after a series of victories, led Clement IV. to proclaim the *Eighth Crusade*. This consisted of the fatal expedition of Louis IX. to Tunis (1270), and the energetic campaign of Prince Edward of England in the neighbourhood of Acre (then the capital) and Nazareth (1271-72), which forced from Bondocdar a ten years' peace. The reign of Hugues de Lusignan was marked by the reduction of Tripoli and Acre, and the final destruction of the kingdom of Jerusalem (1291). The Popes sought in vain to raise another crusade. Enthusiasm for the cross had been killed by the growing sense of failure, and by disgust with the selfish dealing of Rome. Many theories have been framed of the religious, political, and intellectual effects of the C. It would appear that aristocratic power was nowhere directly weakened by them, nor were the geographical outlines of religious and civil power altered. On the other hand, the C. extended the commerce of the maritime republics, who often obtained, for transporting troops, grants of streets and privileges of trade in towns they would not otherwise have reached so soon. To this increased importance of trade, and to the general enlargement of ideas which contact with new nations always begets, may be partly attributed the rise of municipal liberties, which marked the 12th and 13th centuries. The chief histories of the C. are those of Mills, Richaud, and Cox. Of the fourth and seventh C., contemporary accounts have been left by Villehardouin and Joinville. See also Heeren, *Sur l'Influence des Croisades*. A most interesting, original, and valuable contribution to one aspect of the C. seldom reflected on—viz., how were the financial arrangements for them carried through—has been made by Henri Lavoix of the *Bibliothèque Nationale* in his *Monnaies à Légendes Arabes frappées en Syrie par les Croisés* (Par. 1877).

Crusta'cea, a class of *Arthropoda* or *Higher Annulosa*, distinguished primarily by the fact that in its members the head and chest segments are united to form one piece, known as the *cephalothorax*. The breathing is conducted by *branchiæ* or *gills*, but may also be effected by the general surface of the body. Two pairs of antennæ exist. The limbs are more than eight in number, and are borne by the segments of the abdomen, as well as by those of the thorax. The name C. is derived from the general presence of an outer *crust* or skin of calcareous or horny matter, forming an *exoskeleton*, and represented by the 'shell' of the crab or lobster. A *Metamorphosis* (q.v.), or series of changes similar to that seen in insects, &c., occurs in those forms during their development from the young to the adult state. As in the Crabs (q.v.), the young appear first as free-swimming, tailed organisms named *Zoëæ*, and afterwards as *Megalopæ ;* assuming the perfect or tailless form in the next stage. The lower C. may pass, in some cases, through a very complicated metamorphosis, as exemplified in Barnacles (q.v.), &c. In typical C. the body consists of twenty-one joints or segments—seven segments going to the head, chest, and abdomen respectively; and a general plan of structure or homology, as a rule, exists between the various segments of the body of a crustacean—such a homology being especially demonstrable in the Lobster (q.v.). These forms moult or cast their shells periodically; growth taking place in the body only when the body is soft and shell-less, and before the new shell is secreted. Reproduction of lost or injured limbs take place in most C. The mouth is complicated, consisting of a series of jaws, which in higher C. gradually merge into the type of feet. A stomach, liver, and intestine exist. The heart may be wanting, but when present it lies dorsally, and consists of a tubular contractile organ provided with valves. Blood-vessels exist in higher forms. The gills, when present, may be situated on the feet or enclosed within the body. The nervous system consists of a ganglionated chain of nerves lying vertically or on the floor of the body. The C. are divided and classified as follows. They inhabit both fresh and salt water, and some genera (*e.g.* Brine Shrimps, q.v.) inhabit brine solutions :—

CLASS CRUSTACEA.
Sub-Class I.—EPIZOA.
Order 1. *Ichthyophthira*, Achtheres, &c.
,, 2. *Rhizocephala*, Lernæ, &c.
Sub-Class II.—CIRRIPEDIA.
Order 3. *Thoracica*, Balani, Barnacles, &c.
,, 4. *Abdominalia*.
,, 5. *Apoda*.
Sub-Class III.—ENTOMOSTRACA.
Order 6. *Ostracoda*,
,, 7. *Copepoda*, Water-fleas.
,, 8. *Cladocera*,
,, 9. *Phyllopoda*, Brine-shrimps, &c.
,, 10. *Trilobita* (Extinct), Trilobites.
,, 11. *Merostomata*, King-crabs, &c.
Sub-Class IV.—MALACOSTRACA.
Order 12. *Læmodipoda*, Caprella, &c.
,, 13. *Isopoda*, Woodlice.
,, 14. *Amphipoda*, Sandhoppers.
,, 15. *Stomapoda*, Locust-shrimps.
,, 16. *Decapoda*, Crabs, Lobsters, Shrimps, and Prawns.

Crus'ta Petro'sa, a substance found covering the fangs of human teeth, and forming layers in some examples of more complicated teeth, as those of the elephant or horse. It is identical in structure with bone, except that in C. P. we find no Haversian canals. See BONE, TEETH.

Crust of the Earth, the name given by geologists to that portion of our earth's surface accessible to human inquiry, and corresponding to the outer rind of our planet, into which, for several thousand feet, we have been able to penetrate. This 'C.' is made up of *rocks*, variously formed and arranged, and it is the province of geology to determine their relations, formation, and fossil contents.

Cru'ys, Corne'lis, a Dutch naval commander, born 14th June, 1657, whom Peter the Great induced to join the Russian service. He superintended the making of dockyards, canals, and ships of war in Russia, which through his exertions first became a naval power. C. died in 1727.

Cry'ing, Physiol'ogy of. This is a modification of the ordinary movements of respiration excited by a mental emotion. Though excited by a contrary emotion, it is nearly related physiologically to the act of laughing. Frequently an individual may be between a 'laugh' and a 'cry.' In both, the muscles of expiration are convulsed, and the breath is sent out in a series of jerks through the open glottis. (See LARYNX.) C., unlike yawning, coughing, sneezing, never originates in the respiratory system, but is always an expression of an emotional state, though it must be confessed that in states of great general weakness, C. may sometimes occur without any very definite emotional antecedent.

Cry'olite, a native fluoride of sodium and aluminum, occurring in large deposits at Evigtok, Greenland, and also found in the Urals. It is a source of Aluminum (q.v.).

Cryoph'orus (Gr. *kruos*, 'cold;' *phero*, 'I carry'), a glass tube with a bulb at each end. The one bulb contains a little water, the other only water-vapour. When the latter is placed in a freezing liquid, the condensation of the vapour produces evaporation of the water, which, being accompanied by abstraction of heat, transforms the water into ice.

Crypt, a term used in anatomy to denote a pit or tubular depression in a mucous membrane. Thus there are the crypts of Lieberkühn, in the intestinal mucous membrane. See INTESTINE.

Crypt (Gr. *kruphe*, 'a covered place,' 'a vault,' from *kruptō*, 'I hide'), in ecclesiastical architecture, a hollow vault, partly or wholly underground, used as a church by the early Christians for safety during their services, and also as a place of sepulture. The largest C. does not generally extend beyond the limits of the choir or chancel and its aisles, and is often much smaller than these. It is carefully constructed and plainly finished. York Minster and Worcester and Rochester Cathedrals have each a C. older than the present building. That under Canterbury Cathedral is the finest and largest in England: there is also a fine C. under Glasgow Cathedral.

Cryptogam'ia, Cryptogams, or **Cryptogamous Plants** (Gr. *kruptos*, 'hidden,' and *game*, 'marriage'), the name applied to ferns, and their allies the horse-tails, club-mosses, mosses, liver-worts, lichens, fungi, *Characeæ*, and *Algæ*, which do not produce flowers like the phanerogamous or flowering plants, and accordingly have no seeds, and therefore no Cotyledons (q.v.); hence they are sometimes called *Acotyledonous Plants* (q.v.). They reproduce in various ways by *spores* or single cells without embryos. Many of the C. are parasitic, and the lower orders of them are entirely cellular; hence they are sometimes called *Cellulares* (q.v.).

Cryptog'raphy (Gr. *kruptos*, 'secret,' and *graphein*, 'to write') is the art of communicating by signs or letters unintelligible except to the possessor of a key to the cryptograph. Various methods of C. were practised by the ancients. Thus Ovid recommends love-letters to be written in milk, and afterwards to be made legible by applying soot. C. was very generally used by diplomatists in the 17th c., and is still employed, especially in telegraphic dispatches. One method of

C. is to write with metallic solutions, the characters being afterwards disclosed by the action of certain gases, but more commonly a different sign or letter is used for each letter of the alphabet—a system of C. known as *chiffre*, *i.e.*, cipher. A cryptographic machine for transmitting secret correspondence was patented in 1860. In political diplomacy the art is less used than formerly.

Crystall'ine Lens, the principal refractive structure of the eye. See EYE.

Crystalline Rocks are highly metamorphosed rocks, in which the original texture has disappeared, and a new chemical arrangement, completely altering the mineralogical structure, has rendered the texture crystalline, and indistinguishable from that of igneous rocks. The chief of these are granite, syenite, diorite, and diallage rock; and this connecting of the igneous with the true metamorphic, and so with the aqueous, seems to warrant the conclusion that all rocks forming the crust of the earth were at one time aqueous, and have been and are being transformed, through the agency of pressure and heat, into rocks metamorphic and igneous, which, gradually worn away by atmospheric and other causes, form new aqueous rocks, thus completing the cycle of geological operations.

Crystallog'raphy, the science which treats of crystalline forms and their classification. Most minerals assume, in virtue of their molecular constitution, a regular form, which is called a crystal—a form which is symmetrically arranged with respect to three or more definite axes. The most perfect crystals are obtained, not from natural minerals, but from the pure salt formed artificially in the chemical laboratory. The usual method is by cooling or evaporating a saturated solution of the salt, by which means the crystals gradually separate out, the size depending chiefly upon the rate of evaporation. Fusion and slow cooling may be employed in many cases; for instance, in the case of sulphur and some metals; and very often substances such as iodine assume a crystalline form when passing directly from the gaseous to the solid state. Most crystals tend to split in particular directions, parallel to the axis of symmetry; and they very frequently have different co-efficients of elasticity, expansion, and conductivity along these different axes. Their optical properties also point out their structural character.

With regard to their classification, crystals are usually arranged in six classes or systems, which are as follow:—1. *Monometric*, *Regular*, or *Cubic System*, which has three mutually rectangular and equal axes. The most important forms are the *cube*, *regular octohedron*, and *rhombic dodecahedron*, which are met with, under various modifications, among the metals, in common salt, the alums, fluor-spar, diamond, garnet, spinede, &c. 2. *Dimetric*, *Square Prismatic*, or *Pyramidal System*, which has also three rectangular axes, two of which only are equal. These forms occur in zircon, apophylite, yellow potassium, ferrocyanide, &c. 3. *Rhombohedral* or *Hexagonal System*, which has four axes, three of which are equal, co-planar, and inclined to each other at angles of 60°, while the fourth and principal axis is perpendicular to them all. The principal forms are the *regular six-sided prism*, the *rhombohedron*, the *scalenohedron*, and are met with in ice, calcspar, beryl, quartz, arsenic, antimony, &c. 4. *Trimetric* or *Rhombic System*, which has three rectangular but unequal axes. The perspective forms of these crystals are very like those of the dimetric system. They are found in sulphur crystallised at a low temperature, nitrate and sulphate of potassium, sulphate of barium. 5. *Monoclinic* or *Oblique Prismatic System*, which has three equal or unequal axes, two at right angles to each other, while the third is oblique to the one and perpendicular to the other. Such crystals are exemplified by sulphur crystallised by fusion and cooling, by realgar, sulphate, carbonate and phosphate of sodium, borax, &c. 6. *Triclinic* or *Doubly Oblique Prismatic System*, which has three oblique equal or unequal axes, being therefore of great variety of form and exceedingly difficult of study. Such forms are assumed by sulphate of copper and nitrate of bismuth.

Crystals which grow by equal additions all round retain the original form; if the additions take place unequally, but still following some definite law, a new but connected form arises. Thus a cube, which increases except at the solid angles, will become in time an octohedron, the old angles being now the central points of the new planes. These planes are called the *secondary* planes, and the modifications thus produced from the *primary* form are termed *secondary* forms.

Crystall'omancy, a once popular mode of divination by means of crystals, especially of the beryl. The diviner having in a low voice spoken the appropriate formulæ, handed the crystal to a youth or maiden, who read on it, or obtained by inquiry from spirits who appeared in it, what was desired to be known.

Csa'ba, a market-town in the county of Békés, Hungary, and till 1846 the largest village in Europe. It then purchased for 800,000 florins the right to hold markets of its own. It is also the largest Protestant community in Hungary. C. has a trade in cattle, grain, hemp, and wine. It is now joined to Békés, and together with B. (pop. 24,561) has a pop. of 32,244.

Csanad' Palo'ta, the name of a town in Hungary, on the Marös, with a pop. of 5610. It became the seat of a bishop in 1096.

Cso'ma de Körös, Alexander (properly *Körösi Csoma Sandor*), a Hungarian traveller and orientalist, born at Körös (Transylvania) in 1790—according to some in 1798—was carefully educated, and devoted himself to philosophical studies at the college of Nagy-Enyed from 1812 to 1815, after which he studied Oriental languages in Germany. The dream of his youth had been to travel in Central Asia, and discover, if possible, the original seat of the Hungarian race. With this object, he assiduously studied geography, ethnology, philology, and history at Göttingen, and afterwards at Temesvar, Agram, and Bucharest. In 1820 he travelled through Bulgaria and Rumili to the port of Enos, where he shipped for Egypt. Driven out of Alexandria by the plague, he set out on his travels to the East, passed by Aleppo and Mosul to Bagdad, and thence, assisted by the English consul, proceeded by Kermanshah and Hamadan to Teheran, where he arrived in October, 1820. Here he remained four months, studying the Persian language. In March, 1821, C., disguised as an Armenian, set out from Teheran, and after many adventures and hardships arrived on the 18th November at Bokhara, whence, joining a caravan, he travelled by Cabul and the Bamian Pass to Lahore in the Punjab. He subsequently spent some time travelling in Cashmere and Ladakh, making himself acquainted with the Tibetan tongue. The study of this language, hitherto almost unknown in Europe, although its literature deserves attention, engaged C. for several years, first with the Lama of Tsanskar, and afterwards in the Lamaist convent of Kanum on the Upper Sutlej. After mastering the language, C. repaired to Calcutta, where his labours and accomplishments met with a cordial acknowledgment from the Asiatic Society, who appointed him their librarian. While thus engaged he produced his two great works, *A Grammar of the Tibetan Language* and *An Essay towards a Dictionary, Tibetan and English*, both of which were published at Calcutta (1834) at the cost of the British Government. For the *Asiatic Researches* (vol. xx.) he also wrote a synopsis of the holy books of Lamaism. In further prosecution of his researches he resolved to visit Lhassa, the capital of Tibet; but while on the route he was seized with illness, and died at Darjeeling, in Sikkim, 11th April, 1842. If C. failed to discover in Tibetan the origin of his native Magyar, he at least merits the credit of having been the first to bring that language and its literature within the scope of European scholarship. See a most interesting autobiographical sketch, read before the Royal Asiatic Society, Calcutta, 19th April, 1834, and printed in vol. i. of the *Journal* of that Society.

Csongrad', a market-town of Hungary, on a tongue of land opposite the mouth of the Körös, 35 miles N. of Szegedin. It has a trade in cattle, timber, and tobacco. Pop. 20,802.

Ctenoi'dei, or **Ctenoid' Fishes,** the name proposed by Agassiz, not generally used in zoology, to indicate fishes such as the flounders, perches, &c., in which the scales have their hinder margins divided into 'comb-like' structures, or set with spines so as to resemble combs. New spines appear to be developed with the growth of the scales.

Ctenoph'ora, the highest order of the class *Actinozoa*, represented by delicate, free-swimming organisms, such as *Cydippe* (*Beroë*), &c., and distinguished by possessing *ctenophores*, or parallel rows of *Cilia* (vibratile filaments), arranged in comb-like plates. No coral structure is developed in these organisms. There are eight bands of ctenophores, arranged meridionally in *Cydippe*, a familiar member of the group, which may be found in summer floating on the sea in the form of a clear, jelly-like ball of lemon shape. The mouth is at the oral or lower pole of the body, and a stomach and complex system of canals exist, the latter representing a circulatory system. A *ctenocyst* exists at the apical or upper pole of the body, this latter consisting of a small cyst or sac, containing fluid and limy particles, and supplied with nerve filaments from a small nervous mass. This is the first definite appearance of a nervous system in the animal series as we proceed upwards. *Cestum Veneris*, or 'Venus' girdle,' another of the C., is a long band-like organism of 3 or 4 feet long, and at night shines in the sea with a phosphorescent flame.

Ctesib'ius, a Greek mathematician of Alexandria, who flourished in the 3rd c. B.C. He is famous for his mechanical inventions, such as the pump, the water-clock, the bent syphon, and for utilising, along with his pupil Hero Alexandrinus, the elasticity of the air as a motive power.

Ctes'iphon, a city in the southern part of Assyria, on the eastern bank of the Tigris. It rose into importance on the decay of Seleucia, and was the winter residence of the Parthian kings. The site of C. has been identified with the modern *Al Madain*, 'the two cities.'

Cuba, 'the Pearl of the Antilles,' and a colony of importance still belonging to Spain, is the largest and wealthiest island of the W. Indies, and is situated between the Mexican Gulf on the W., the Caribbean Sea on the S., and the Nicolas and Old Bahama Channels on the N. It is about 150 miles distant from the two great peninsulas of Florida and Yucatan. It is 740 miles long, 70 miles in average breadth, extends from E. to W. lat. 19° 43′—23° 12′ N., long. 74° 5′—85° W. Area, 41,655 sq. miles; pop. 1,631,687, of whom 35 per cent. are of African descent. The island is divided into six provinces, and the chief towns are Habana, the capital, Matanzas, Santiago de C., Puerto Principe, Cardenas, Holguin, Sancti Spiritu, and Cienfuegos. The coast, which is encircled by sandbanks, coral reefs, and small islands, is for the most part low, and broken by inlets which form excellent harbours. Habana, the key to the Mexican Gulf, is one of the finest harbours in the world; along the northern coast, at Matanzas, Nuevitas, Nipe, and on the southern coast, at Cienfuegos, Santiago, Guantanamo, and Trinidad, there are also fine natural harbours.

The island is traversed in the direction of its length by a range of hills, comparatively low in the W., but gradually rising towards the E. Above Trinidad, on the S. coast, the rugged mountain masses are not without grandeur, while the rare beauty of the coast and inland scenery is unsurpassed by that of the most renowned of the Mediterranean lands. The western portion of the island, is for the most part level, and contains almost all the great sugar factories and tobacco plantations, which constitute the enormous wealth of the island. In the centre the population is massed in Trinidad, Puerto Principe, and a few small towns; the rural districts are chiefly forests and unpeopled savannahs. The eastern part of C., where the first colonists settled, was previously well cultivated in certain districts. Much of the interior, however, was left in a state of nature, and many tracts are still described as 'waste.' The soil is so fertile that when neglected for a short time it becomes rapidly over-run with vegetation. The principal productions are sugar, tobacco, coffee, rice, and cotton. Many of the most flourishing coffee plantations have been converted into sugar estates. Since the civil war and the abolition of slave-labour in America, that country, which previously grew its own sugar, has become dependent upon C. for that article. Of the whole amount of sugar annually produced in C., 75 per cent. is exported to the United States, and only 15 per cent. to Spain. The amount of sugar exported in 1893 was 718,204 tons. Large quantities of honey, rum, wax, tobacco, and cigars are also exported from Habana. The imports of C. consist principally of rice, olive oil, flour, jerked beef, shooks (boards and staves for hogsheads and sugar-boxes), lard, and coals. Over 1000 miles of railway are in operation, besides the private lines belonging to the plantations.

History.—C. was discovered by Columbus, 28th October, 1492, and was occupied by the Spaniards under Diego Velasquez in 1511. The native Indians were rooted out about 1560. In 1584 Habana was fortified, and in 1777 the government of the island was reconstituted under a Captain-General. From 1773 Habana continued to be the centre of the slave-trade of the whole of Spanish America. The island suffered from insurrections of the slaves in 1844 and 1848. Lopez landed on the island at the head of an American filibustering expedition in 1851, but was captured and executed. In 1868 broke out the insurrection which continued intermittently until April, 1884, when the insurgents were defeated. This movement had its origin in the hostile relations and conflicting interests of the two great classes of the free population—the Peninsulars or Spanish immigrants, and the Creoles or native Cubans. The Peninsulars maintained a volunteer force of 60,000 men throughout the island, and practically overruled the Captain-General and the authorities. The Cubans were anxious for the abolition of slavery; the Peninsulars, embracing all the great sugar-planters, were determined to maintain slavery by force. In 1870 the Moreb law was promulgated, declaring every slave free on reaching the age of sixty, and decreeing the liberty of all children of slaves born after that date. In December, 1879, a bill for the gradual emancipation of the slaves in Cuba and other colonial possessions was passed by the Spanish Senate, and on 6th October, 1886, the last vestige of slavery was abolished by the Queen's decree. It is estimated that during the years from 1868 to 1894 the struggle in Cuba has cost nearly 400,000 lives. The struggle still continues, and in May, 1895, the Cubans were in full revolt. The rebels obtained many advantages over the Government troops and the outlook became so serious that Marshal Campos telegraphed from C. for reinforcements. In August, arrangements were made to send out 41,850 fresh troops, by which the number in the field should be raised to 70,000. Ten years since, in connection with the rebellion in C., a most dastardly act was committed and a gross insult was offered to Great Britain, which to this day remains unpunished. Two of the revolutionist leaders were living in Gibraltar under the protection of the British flag. One day they were seized by officials in the pay of the British Government and were hurried across the lines into Spanish territory, where the Spaniards, according to a pre-arranged plan, at once pounced upon them and refused to give them their liberty. To the lasting disgrace of Great Britain and of the Government in power at the time the matter was hushed up, and the men, who had trusted in the hitherto supposed security of their domicile, found out the mistake they had made.

Cubag'ua, an island between Venezuela and Margarita, in the Caribbean Sea. It is about 9 miles long, and has considerable pearl-fisheries. C. was discovered by Columbus in 1498.

Cube, a solid, all of whose six sides are squares which are necessarily all equal. The volume is found by multiplying the area of the base by the height, *i.e.*, by multiplying the edge twice in succession by itself. Hence we have the expression *to C.* a given number, the C. of a being $a \times a \times a = a^3$. To extract the C.-root of a number is to find that number which when cubed will produce the original number. The C.-root of a^3 is a.

Cu'bebs, or **Cubeb Pepper,** the fruit of *Piper Cubeba*

(*Cubeba officinalis* of other botanists), a climbing shrub of Java and other Indian islands, belonging to the *Piperaceæ*. C. are about the size of black pepper, globular, wrinkled, and supported on a stalk. They have a peculiar odour and a warm taste like that of Camphor (q.v.). C. are distinguished from pepper by their lighter colour and the stalks—hence often called 'stalked pepper.' They contain a volatile oil (oil of C.), constituting about 10 per cent. of C.; also a *resin* and a crystalline principle, *cubebin*, very analogous to *piperin*, found in pepper. African C. is the fruit of *Piper Clusii*.

Cubebs.

Cu′bic Equa′tion, an equation involving the cube of the unknown quantity with either, neither, or both of the lower powers. The most general form can be reduced to the form $x^3 + ax + b = 0$; but the further reduction by Cardan's rule, given in all the more advanced text-books of algebra, evolves a result which is the sum of two impossible quantities, except when two of the roots are impossible or equal. Accordingly, when the three roots are possible and different, ordinary algebraic methods fail, and recourse must be had to trigonometry for the general solution; but in this instance the roots are usually easily obtained by mere inspection. For details the reader is referred to Todhunter's *Theory of Equations*.

Cu′bical Nitre, or **Chili Saltpetre,** is the nitrate of soda, and is imported in large quantities from Chili and Peru, as a manure, and for the manufacture of gunpowder and nitric acid. See SODIUM.

Cu′bit (Lat. *cubitus*), an ancient linear measure, being the length of the arm from the elbow to the tip of the middle finger. The Hebrew C. has been variously estimated from 19 to 22 inches; the Roman C. was about $17\frac{1}{2}$ inches, but it is generally taken as equivalent to a foot and a half.

Cu′boid Bone, one of the bones forming the arch of the foot. It is placed on the outer side of the foot, in front of the *os calcis*, and behind the fourth and fifth metatarsal bones. Its name indicates its shape. See FOOT, TARSUS.

Cuck′oo, a genus of Scansorial birds, of the family *Cuculidæ*, distinguished by the compressed bill, by the ridge of the arched upper mandible, by the membranous nostrils, by the long and pointed wings, and by the short tarsi, which are partly clothed with feathers. The outer toe can be directed backwards or forwards at will. These birds inhabit Europe, Africa, and America, and their name is derived from their song-note. The common C. averages a small pigeon in size. It is of a greyish colour, the breast being marked with brownish-black, and the tail black. It is migratory, arriving in Britain in April, and flying southwards in July. The food consists of insects. It has the habit of laying its eggs in the nests of other birds, so that its young may be, as it were, hatched by foster-parents. The Great Spotted C. inhabits S. Europe and Africa. The yellow-billed C. is a native of the U.S. of America. Its back is of a light greenish brown, as are its wing coverts and central tail-feathers; while the rest of the tail is black or white. The breast is whitish. Length of body is about 1 foot.

Yellow-billed Cuckoo.

Cu′cumber, a tender annual, with rough trailing stems, a native of Asia and Egypt. It was cultivated in England as early as 1327, but it is only since Henry VIII.'s reign that it has become a common table-vegetable. Though accounted by some cold and unwholesome, it is now much used as a salad, or when young (*gherkins*) as pickles; and the village of Sandy in Bedfordshire is said to sometimes furnish in one week 10,000 bushels for the London market for pickling. In the N. a hotbed is required for its growth, but in southern Britain and equally warm localities it is grown in the open air. The Indian C., the American one-seeded star C., the snake C., and the squirting C. are members of other families. The last-named is found in waste places in S. Europe. When the fruit is almost ripe, it comes away from the stalk and spirts out its seed and juice, from which a powerful drug is prepared.

Squirting Cucumber.

Cucurbita′ceæ—the Gourd or Cucumber order—a natural order of Calycifloral Dicotyledonous herbaceous plants, climbers in which tendrils take the place of stipules, chiefly natives of hot countries, and specially of the E. Indies and S. America, though some are found in the N. of Europe, N. America, the Cape of Good Hope, and Australia. The White Bryony Mandrake (q.v.) is the only British species of the order. About 350 species, distributed over seventy genera, are known. The various species of Gourd (q.v.), Melon (q.v.), squirting cucumber (see ELATERIUM), pumpkin, squash, vegetable marrow, &c., belong to this order. In addition to the use of the white bryony mandrake already given, the root is employed as an external application to bruises, and the young shoots are eaten as a substitute for asparagus. The roots of *Momordica dioica* and *Bryonia umbellata* (of the E. Indies) contain starch, and are used as food. The seeds of *Telfairia pedata*, an African plant, and other species, are eaten like almonds, and yield oil by expression. The order is divided into three subdivisions, viz.—(1) *Nhandirobeæ*, (2) *Cucurbiteæ*, and (3) *Sicyeæ*.

Cud'bear, a purple dyeing substance prepared from various lichens, but chiefly from *Lecanora tartarea*, by a process similar to that for making *archil*, from which C. only differs by being prepared in the form of a dry powder. The manufacture was commenced by Mackintosh and Cuthbert Gordon at Leith about 1777, and the name of the dye is a corruption of *Cuthbert*. Formerly the collection of lichens, called *crottals*, for the preparation of C., was an important industry in the Highlands of Scotland, but the supply now comes from Sweden, Norway, &c., and, except for domestic dyeing, no lichens are now collected in the Scotch Highlands. C., as a dye, imparts a brilliant bloom, but of itself is fugitive, and is therefore never so employed.

Cuddalore' (*Kúdalúr*, 'the town at the meeting of the waters'), the chief town of a sub-division of the same name in the district of S. Arcot, Madras, British India, 127 miles by rail S. of Madras city. The harbour has now silted up, and admits only native craft, but large ships can anchor in the roads. Pop. 47,355, of whom 43,389 are Hindus, 2104 are Mohammedans, 1785 are Christians, and 77 are Jains. A considerable amount of weaving is carried on here. Large quantities of grain, indigo, oils, and sugar are sent by rail to Madras. During the latter half of the 18th c. it was a place of great strength and importance, and on the capture of Madras its factories were transferred thither. It was taken by the French in 1758, recovered by the British in 1760, retaken by the French in 1782, and finally ceded to England in 1785. Little remains of the fort, which must have been a very redoubtable place at one time.

Cudd'apah (*Kadapa*, a 'gate' or 'mercy'), a town in a district of C. in the province of Madras, near the right bank of the Upper Pennár, 80 miles W. of Nellore. The military cantonment, with ample accommodation for European and native troops, was the principal feature; but in 1868 the troops were withdrawn and the place has not been used since then as a garrison town. The former palace of the nawabs is now a courthouse and prison. The diamond mines of C., about 7 miles from the town, are celebrated. Pop. 17,379.—The *district* of C., with an area of 8722 sq. miles, contains 1,272,072 inhabitants, of whom 1,142,727 are Hindus, 119,564 are Mohammedans, and 9,725 are Christians. The people are careful and successful farmers, &c., and the soil is rendered most fertile. The chief crops are rice, grains, cotton, indigo, and sugar-cane. The weaving of cloth is an important industry.

Cudd'y (Dut. *kajuit*, Fr. *cahute*, 'a hut, a ship's cabin'), in small vessels, the cabin where the men's rations are cooked.

Cudra'nia, a genus of climbing spiny shrubs of the natural order *Artocarpaceæ*, natives of the Moluccas, Philippines, India, and tropical E. Africa. The heartwood of an E. African species yields a light-yellow dye.

Cud'weed, a popular name for various plants of the genera of *Gnaphalium*, *Filago*, and *Antennaria*, belonging to the natural order *Compositæ*, which, from the heads of the flowers being chiefly composed of involucral scales, preserve an apparently unchanged condition, so that they are generally known as Everlasting Plants (q.v.). *A. dioica* (catsfoot) was at one time employed in chest diseases. The golden C. is *Pterocaulon virgatum*.

Cud'worth, Ralph, D.D., an eminent divine and philosopher, was the son of the rector of Aller, in Somersetshire, where he was born in 1617. He was educated at Cambridge, where he became a tutor, held the livings of N. Cadbury and Ashton, the Regius Professorship of Hebrew, and the masterships of Clare Hall and Christ's College, and was a prebend of Gloucester. He died at Cambridge, 26th June, 1688. C.'s *chef d'œuvre* is *The True Intellectual System of the Universe*, published in 1678 (new ed. by Birch, 1830), in which he defended revealed religion against materialists and atheists, and maintained the doctrine of a rational system of knowledge founded on innate ideas. His philosophy may be considered as a system of Christian Platonism. C.'s work brought him much fame, and, on account of the fulness with which he stated the views of opponents, not a little odium. He left behind him various MSS., which are now in the British Museum. One of these, a *Treatise concerning Eternal and Immutable Morality*, published in 1731, was intended to form the second part of his *Intellectual System*. Principal Tulloch's work on *The Rational Philosophers and Philosophy* (1874) of the 17th c. contains a lucid criticism on C.'s position and mode of thought.

Cuen'ca (Lat. *concha*, 'a shell,' so called from its form), a fine old city of Spain, in the province of the same name, romantically situated amid a girdle of hills at the height of 3400 feet above sea-level, about 90 miles E. by S. of Madrid. It has fifteen churches, twelve convents, and a fine Gothic cathedral, is the see of a bishop, and was once celebrated in arts, literature, and manufactures. The bridge and convent of San Paolo are interesting. C. was thrice sacked by the French in 1808, 1810, and 1811. Pop. 9744.

Cuen'ca, the capital of the province of Azua in the republic of Ecuador, S. America, lies on a plateau 8640 feet above the level of the sea, is a bishop's see, and has extensive sugar-refineries, with a trade in grain and Peruvian bark. Pop. 39,280.—The *province* of Azua has an area of 11,308 sq. miles, and a pop. of 132,400. It produces sugar, cotton, and cochineal, and has gold, silver, copper, and sulphur mines.

Cuirass' (Fr. *cuir*, 'leather,' from Lat. *corium*, 'a hide'), a piece of plate-armour, which covered both breast and back, from the neck to the girdle. It consisted of breastplate and backplate, which were fastened to each other by straps, hooks, or buckles. The earliest C. was made of leather, or quilted linen or cloth, so thick as to be proof against pistol or musket shot. The C. was used by the Greeks and Romans, became common in Europe about the middle of the 14th c., and was discontinued in England after the reign of Charles II.; in France a little later.

Cuirassiers, heavy cavalry wearing the cuirass, which Napoleon I. reintroduced after it had been for about a century disused, and his regiments of C. were prominent in his wars. C. still form a portion of the French cavalry. Germany, Austria, and Russia have also regiments of C. Great Britain has no regiment so named, but the Household Brigade—that is, the Life-Guards and Royal Horse-Guards or 'Blues'—wear a cuirass.

Cuissarts', or **Cuissots'** (Fr. *cuisse*, 'the thigh'), thighpieces in plate-armour, made of small strips of metal riveted over each other.

Cuja'cius, the Latinised surname of **Jacques Cujas,** originally **Cujaus,** a distinguished French jurist, born at Toulouse in 1522. He became Professor of Law successively at Bourges and Valence, and died at Bourges, 4th October, 1590. C. applied himself to the study of Roman law, and completed what Alciat had begun, viz., he restored the body of Roman jurisprudence to its historical sincerity, and is the true founder of the historical school of Roman law, since further developed in Germany. Of the numerous writings of C., the excellent edition of Fabrot (Par. 1658-59; new ed. by Prato, 1859 *et seq.*) merits notice for having a chronological table of the several works.

Cul'dees, or **Kyl'dees.** Among many others, the following derivations of this name have been suggested:—*Céle-dé*, 'servant of God' (*céle* appearing in modern Celtic as *gilly*); *Cultores Dei* ('worshippers of God'), abbreviated; *kill*, 'a cell.' The name is applied to a class of ecclesiastics who appeared in Scotland and Ireland about the middle of the 9th c., but who were merged in the general Church after the close of the 12th c. They did not belong to any of the great regular orders, nor were they secular priests, nor did their often wealthy communities follow any invariable monastic rule. Some indeed were hermits, but most of them conventuals, among whom marriage was not forbidden and poverty not enjoined. Their history shows that at the time the Scottish

C. were neither nationally organised nor habitually subject to Rome; they were not governed by the bishops of the seculars, but they had their grades of office; the *scoloch*, or scholar, who assisted in the services, being the lowest. On baptism, one became a brother or sister; on ordination (which included tonsure of the fore part of the head), one became a presbyter. They had also deacons, who superintended works of charity, and *præpositi*, or teachers of schools. New settlements (*cœnobia*) were founded by a chief presbyter, or *abbas*, and twelve *socii*. The church (*oratorium*) was of plain wood with a stone belfry. Families of catechumens probably gathered round such institutions; land was cultivated, malt-kilns and meal-mills were built, and a spiritual territory was formed, over which the *abbas*, or an *episcopus*, presided. It was at one time thought that the early Church of Columba and the Culdee communities were historically continuous, subordination to Rome being introduced for the first time by the Saint-Queen Margaret and her sons. The lands of the C. were not exempt from the gradual secularisation which overtook the more important pious gifts, the 'abbot' and the 'parson' frequently being laymen. In the Catholic revival (1107-24) many fraternities became canons-regular of the Augustine rule. At St. Andrews, Lochleven, and Dunkeld, the regular canons and the remaining *keledei* (a prior and twelve brethren who performed service, had official residences, and drew the minor dues) lived for some time alongside each other. But gradually, as the parochial and cathedral system was developed, the earlier institutions were absorbed by cathedral-chapter or parish church, and occasional traces of their existence are not found later than the 14th c. In some cases the C. handed over everything, retaining life-interests; in others, the transfer was confined to parochial fees and oblations, the tithes being preserved entire, along with the right to vote in the election of the bishop. Even where the name is lost, the corporation is found subsisting in the form of ten prebendaries governed by a provost. Monymusk (Aberdeenshire), Brechin, Lismore, Dornoch, and Dunblane are also known as the sites of Culdee communities in Scotland. In Ireland the C. also appeared about the 9th c. In Dublin, Armagh, and other places, they seem, as colleges of seculars performing certain functions in the cathedrals, to have maintained a distinct existence much longer than in Scotland. In England and Wales, although the name of *cultores clerici* occurs, and the name of Culdees is once used by Giraldus Cambrensis as equivalent to *cœlebes* ('bachelors'), there is no trace of the Scotch institutions. They have been likened to the minsters, or colleges of missionaries in S.W. England; also to the Austin Canons, and to the followers of St. Chrodogang of Metz. See Walcott's *Ancient Church in Scotland;* Burton's *Hist. of Scotland;* Reeves' *C.; Proceedings of the Royal Irish Academy*, 1860; Grub's *Ecclesiastical History of Scotland* (Aberdeen, 1861).

Cul-de-sac, a term used in anatomy to denote a pouch formed by the unfolding of a membrane. Thus we have the *cul-de-sac* of the pleura, or the pouch formed by the membrane projecting into the root of the neck, so as to cover the apex of the lung in that region.

Culiacan', the capital of the Mexican state Sinaloa, on the river C., which flows into the Gulf of California, a little to the S. of the 25th parallel of N. lat. It was founded in 1532. Pop. 11,950.

Cull'en, a coast town and royal burgh of Banffshire, Scotland, 11 miles W. by N. of Banff, at the mouth of the C. Burn. It has some linen manufactures and distilleries, and important cod, salmon, ling, and herring fisheries. Cullen House, in the vicinity, is the seat of the Earl of Seafield. Pop. 2100.

Cull'en, William, a celebrated Scottish physician, was born at Hamilton, in Lanarkshire, 15th April, 1710. He studied at the grammar school of Hamilton, and was then apprenticed to a surgeon in Glasgow, where he attended some of the classes in the university. In 1729 he was appointed surgeon in a W. India merchantman, and after having made several voyages, he settled in the parish of Shotts, where he was introduced to the Duke of Argyll. Leaving Shotts, he studied medicine for two winters at Edinburgh, and in 1736 commenced to practise at Hamilton. Here he secured the friendship and patronage of the Duke of Hamilton, and became acquainted with William Hunter, the anatomist. In 1740 he graduated as M.D. at Glasgow, where he lived after the death of the Duke of Hamilton, and where in 1746 he delivered a course of lectures on the theory and practice of medicine in the university. Next year he added a course on botany and materia medica, and in the session following a course on chemistry, 'directed chiefly to the improvement of arts and manufactures.' This seems to have been the practical foundation of the medical school of Glasgow. The celebrated Dr. Black (q.v.) was one of his pupils in chemistry, and by directing his attention to the doctrine of heat, and employing him as his assistant in his experiments, C. contributed to his future fame. On the 2nd January, 1751, C. was made Professor of Medicine in the University of Glasgow, by the influence of the Duke of Argyll, at the instance of Henry Home, afterwards Lord Kames, who further influenced the Duke to have C. appointed Professor of Chemistry in Edinburgh University, in room of Dr. Plummer. He began to lecture there, not without opposition from the senatus, in January, 1756, and was formally elected professor in the following July. In 1757 he delivered a course of clinical lectures in the Royal Infirmary; in January, 1761, he began a course on materia medica; on 1st November, 1766, he was appointed Professor of the Institutes of Medicine, his old pupil, Black, succeeding him in the chair of Chemistry; and in 1773 he succeeded Gregory in the chair of the Practice of Physic. For many years before his death, on the 5th February, 1790, he alternated the duties of his chair with those of a practical agriculturist, having in 1778 purchased a small estate near Edinburgh. C. was an original investigator and eloquent expounder of medical science. He delivered his lectures *vivâ voce*, with only a few notes to guide him, and discouraged, amongst his students, the use of text-books, previously in use. He combated the doctrines of Boerhaave, then currently accepted, and encouraged independent investigation. By his originality and enthusiasm he gave an impetus to medical science in the Scottish universities, and his nosological method still forms the groundwork of the classification of disease. His chief works are *First Lines of the Practice of Physic* (Edinb. 1775); *Synopsis Nosologiæ Methodicæ* (1785); a *Treatise of the Materia Medica* (1789). His collected works were published at Edinburgh in 1827 by Thomson. See *Life of C.*, commenced by Thomson in 1832, and finished by Craigie in 1859.

Culle'ra, a town of Spain, in the province of Valencia, about 2 miles from the mouth of the Jucar, on its left bank, and about 23 miles S.S.E. of the city of Valencia. It is fortified, and has an old castle and extensive barracks. The industries of the neighbourhood are farming, fishing, vine-culture, and the production of wine and oil. There is a considerable trade in cattle, and a busy coasting trade, extending to France. Pop. 12,475.

Cullo'den (Gael. *Cuil-eŏdir*, probably *Cul-oitir*, 'the back of the low promontory'), also called **Drummoss'ie Moor,** formerly a desolate moor, near the shores of Beauly Firth, 5 miles N.E. of Inverness. Here the Highlanders under Prince Charles Stuart were defeated by the royal troops under the Duke of Cumberland, and the cause of the Stuarts was crushed, 16th April, 1746. Much of the original moor is now under cultivation.

Culm (Welsh, *cwlm*), a provincial term for an inferior kind of anthracite, used chiefly in the making of lime. The anthracite shales of N. Devon are sometimes called the *C. measures*.

Culm, in botany, is the peculiar, jointed, hollow, cylindrical stem of grasses.

Culmina'tion of a star is the moment at which it passes the meridian, being then at its highest elevation above the horizon.

Cul'na, or **Kalná,** a town of India, in the executive district of Bardwan, province of Bengal, and on the right bank of the Bhagirathi, a tributary of the Ganges, about 50 miles above Calcutta. There is a trade in rice, grain, cotton, and silk, C. being a convenient station for steamers plying between Calcutta and the upper districts. The Maharajah has a palace here, and there are numerous Hindu temples, and a mission-station of the Free Church. The place has suffered much owing to the continued prevalence of a fever epidemic during past years in succession. Pop. 9680.

Cul′pa (Lat. 'fault'), is a term of Scotch law, the doctrine regarding which it has taken from the Roman. There are held to be three degrees of C.—*lata*, *levis*, and *levissima*. The first is gross carelessness or omission, which may be criminal (see Crime), and equivalent to Dole (q.v.). The second is that degree of carelessness which one generally attentive to his affairs may fall into. The last is that slighter degree of neglect which must occasionally be shown even by the most circumspect. *C. levis* and *C. levissima* are often of legal importance in contracts whether constituted by implication or otherwise. They are points in a case which often are left for the jury to decide. See Borrowing, Commodate.

Cul′prit, in English law is a prisoner accused of, and indicted for, a criminal offence, but not convicted. The equivalent term in Scotland is *panel*.

Culross (Gael. *cul*, 'the back,' and *ross*, 'a peninsula,' 'the *back* or *neck* of the peninsula'), an old royal burgh and seaport of Perthshire, on the N. shore of the Firth of Forth, about 22 miles N.N.W. of Edinburgh. It stands on the side of a hill, and possesses the ruins of a chapel, dedicated to St. Kentigern (q.v.), and of a Cistercian abbey, founded in 1217. The chief manufacture now is of linen. There was a considerable trade in coal and iron at C. during the 16th and 17th centuries. C. received its charter from James VI. in 1588, and, along with Stirling, Dunfermline, Inverkeithing, and Queensferry, returns one member to Parliament. Pop. 370.

Cultiros′tres (Lat. 'knife-billed' or 'ploughshare-billed'), a family of Grallatorial or Wading birds, with elongated bills, which are compressed from side to side. The legs are long and slender, the tibiæ being unfeathered for a considerable portion of their extent. The feet have four toes each, and the bases of the toes are webbed. The Crane (q.v.), Stork (q.v.), Heron (q.v.), Ibis (q.v.), &c., are included in this family.

Crowned Crane.

Cultiva′tor, an implement with six or seven tines, or curved, broad-pointed pieces of iron for penetrating the soil. Unlike the plough, the C. does not turn up the land in furrows, but tears it up, leaving it in clods through which air has free access. The tines can be set to any depth required, according to the quality of the ground and the crop it is intended to bear.

Cul′verin (Fr. *couleuvrine*, from *couleuvre*, Lat. *colubra*, 'a snake'), a long cannon of the 16th c., which weighed about two tons and a half, and carried a shot of about 18 lbs. A *demi-C.* carried half the weight of shot, and weighed about a ton and a half.

Cul′vert (Fr. *couvert*, 'covered'), an arched channel built under a canal for purposes of drainage, also the arched drain under a railway.

Cu′mæ, a coast city of Campania, near C. Misenum, was founded jointly by the Chalcidians of Eubœa and the Cymæans of Æolis, and was one of the most ancient and most famous of the Greek colonies in Italy. Its wealth and prosperity rapidly increased, and from 700-500 B.C. it was the foremost city of Southern Italy. C. first appears in history as successfully repelling an invasion of Etruscans. During the reign of the despot Aristodemus (B.C. 505-485), Tarquinius Superbus, when banished from Rome, fled to C., where he died, B.C. 496. C. was completely overthrown by the Sabines, B.C. 420. It was admitted to the Roman franchise in 388 B.C., and in the second Punic War Sempronius Gracchus repulsed Hannibal from its walls. From this time C. appears chiefly as a place of luxurious retirement for wealthy Romans. Under the Empire it was noted for the manufacture of red earthenware and of nets. According to tradition C. was the abode of the Sibyl (q.v.). Her cave was destroyed by Narses in the siege of C., but an artificial excavation on the banks of Lake Avernus is still popularly called *Grotta della Sibilla*.

Remains of a Greek Tomb, Cumæ.

Cuma′na, a town in the state of Bermudez, Venezuela, lies at the mouth of the Manzanares, on the Gulf of Cariaco. It is the oldest European city in America, having been founded in 1521, under the name of New Toledo, and has a capacious port, defended by Fort Antonio. There is a considerable export trade in mules, cattle, smoked meat, and dried fish. C. has on several occasions been almost entirely destroyed by earthquakes. Pop. 12,057.

Cum′berland ('the land of the *Cumbrians*, or perhaps the *land of coombes*,' *i.e.*, valleys), the most north-westerly county of England, bounded N. by Scotland and the Solway Firth, W. by the Irish Sea, S. by Lancashire, E. by Westmoreland, Durham, and Northumberland. Greatest length, 75 miles; average breadth, 22 miles; area, 1516 sq. miles. Much of the surface is rugged and mountainous, with deep narrow valleys or dales, in which are the C. lakes and waterfalls, or 'forces,' celebrated for their picturesque beauty. Several of the mountains are above 3000 feet, as Scawfell, Helvellyn, and Skiddaw. The largest of the lakes, Keswick, Derwentwater (q.v.), Ulleswater (q.v.), and Wastwater (q.v.), attract numerous visitors—the first two by their smiling beauty, the last by its gloomy grandeur. The chief rivers are the Eden, the Esk, and the Derwent. Geologically the Lake District is Silurian, and contains numerous slate quarries;

there is, however, much granite and trap, and new red sandstone crops out boldly at St. Bee's Head. C. is rich in minerals, including coal, iron (especially a very rich hæmatite ore), plumbago, silver, copper, lead, gypsum, and marl, and there are large quarries of limestone, marble, and slate. Corn crops are grown over 89,428 acres (oats 81,199); green crops 46,119 (potatoes 9,150); clover, &c., 115,483. Permanent pasture and unbroken grass account for 329,378; 328 are devoted to small fruit; and 3 to flax. Mountain and heath cover 209,013 acres, and woods, &c., 32,737; while 217 are laid out as nursery grounds. The chief manufactures are iron, pottery, paper, and flax. The principal towns are Carlisle, Whitehaven, Workington, and Cockermouth. Pop. anc. county, adm. county, and reg. county (each) 266,549. C. contains four parl. divisions, each of which returns one member:—Cockermouth 63,590; Mid C. or Penrith 45,643; N. C. or Eskdale 46,364; and W. C. or Egremont 53,604.

Cum'berland, a town in Maryland, capital of Alleghany county, on the N. bank of the Potomac, in the Alleghany Mountains, 179 miles W. of Baltimore. It is contiguous to the C. bituminous coal region, and has a large trade. Pop. 12,729.

Cum'berland, a manufacturing town in Rhode Island, on the Blackstone river, 10 miles N. of Providence. It has trade in iron, cotton, and shoes. Pop. 8090.

Cum'berland, Richard, D.D., a scholar, archæologist, and theologian, was born in London, 13th July, 1632. After holding subordinate livings, he was in 1691 appointed Bishop of Peterborough, the duties of which he discharged with perfect fidelity till his death, 9th October, 1718. C. wrote several works, the chief of which is his treatise, *De Legibus Naturæ*, in answer to Hobbes. His thirst for knowledge and the activity of his mind are shown by his learning Coptic after he had reached the age of eighty-three, and in his celebrated saying, 'It is better to wear out than rust out.'—**Richard C.,** dramatist and miscellaneous writer, great-grandson of the preceding, and grandson, on the mother's side, of Richard Bentley, was born at Cambridge 19th February, 1732. He was educated chiefly at Westminster School and Trinity College, Cambridge, of which he became a fellow. Having been appointed private secretary to the Marquess of Halifax, he filled various offices, and was sent on a special mission to Madrid and Lisbon. Finally, he was made secretary to the Board of Trade, and held the office till the suppression of the Board in 1782, when he retired with a compensation allowance. C. then lived at Tunbridge Wells, where he devoted himself to literature, producing novels, essays, pamphlets, and dramas. He died at London, 7th May, 1811. Many of his plays, especially *The West Indian*, *The Jew*, and *The Wheel of Fortune*, were popular at the time of their production, and considerable talent is undoubtedly displayed in his miscellaneous essays under the title of *The Observer*. C. was a vain man, and Sheridan caricatured him in his farce of *The Critic* under the character of Sir Fretful Plagiary. He wrote *Memoirs of His Own Life*, which were published at London in 1806-7 (new ed. Lond. and Philad. 1856).

Cum'berland, William Augustus, Duke of, second son of George II., was born in 1721. He entered the army, was wounded at Dettingen in 1743, and defeated by Marshal Saxe at Fontenoy in 1745. In 1746 he ended the second rebellion by the victory of Culloden, but treated the conquered Highlanders with great severity. He was beaten by Saxe at Lawfield in 1747, and had to surrender his army at Kloster-Zeven to the Duc de Richelieu in 1757. C. died 31st October, 1765. See *Life of the Duke of C.* (Lond. 1766). He repeatedly figures in Carlyle's *History of Friedrich II.*, and is touched off with good-natured mockery as a military failure. His 'General Orders' of 1745-47 (Henry S. King & Co., Lond. 1876) show that the popular notion of his cruelty after Culloden is at least exaggerated.

Cum'berland Island, a large island between Davis' Strait on the E., the mouth of Hudson's Bay on the W., and Hudson's Strait on the S., and separated by a narrow channel from Cockburn Island on the N.

Cum'berland Presbyte'rians, an American sect which arose about the year 1810, in a time of revival and excitement in Kentucky. The Presbytery of Cumberland, thinking that the times required it, ordained some men who had not gone through the usual course of education, and hence arose a secession from the Presbyterian Church. The C. P. hold the usual evangelical doctrines, with an Arminian interpretation. They are most numerous in the S. W. States, but there are not altogether more than 120,000 members of the sect at the present day in America.

Cum'berland River, in Kentucky, U.S., rises in the Cumberland Mountains, and flows in a generally westerly direction for nearly 600 miles, till it joins the Ohio, about 50 miles above the confluence of the latter with the Mississippi.

Cumb'rae, Great and **Little** ('islands of the Cumbrians or Cymri'), two islands in the Firth of Clyde, between the Ayrshire coast and the island of Bute, and forming part of Buteshire. G. C. is 2½ miles by 1½. Pop. 1784. The village of Millport in G. C. is a favourite sea-bathing resort of the inhabitants of Glasgow. L. C. is about a mile in length by half a mile in breadth. It is in the parish of W. Kilbride, Ayrshire. Pop. 17. The name is a relic of a remote historical period. See CUMBRIA.

Cumbré Pass, an important pass across the Andes, on the high road between Santiago, in Chili, and Mendoza, in the Argentine Republic, a little to the S. of Aconcagua. Its greatest height is 12,178 feet above the sea-level. The railway which is being constructed so as to connect Chili and the Argentine Republic, will take this route. Already over 90 miles of line are completed on the E. side, and 18 on the W.; about 40 miles of road are thus still to be laid.

Cum'bria, or **Strathcluyd',** the kingdom of the Northern Britons, stretched in the 6th c. from the Clyde to the Dee, from Dumbarton to Chester. Strathcluyd was the earlier name of the country; that of C. not having been given till the 10th c. 'It was the last retreat of the Romanised Britons' (Burton). Its history is very obscure; and it is chiefly memorable as the scene of the labours of St. Kentigern. C. was ruled from an early date by kings of Scottish family, but was independent both of the Dalriadic Scots and of the West Saxon kingdom, until, in 924, it submitted to Eadmund the Elder. When the English overran and occupied the district which is now Lancashire and Yorkshire, the Cumbrian kingdom divided into two states; there was 'a gap between the Southern Britons and those of Scotland' (Burton's *History of Scotland*). The northern division was then known as the Strathcluyd kingdom proper, its capital being *Alcluyd* (now Dumbarton), and Whithern the seat of its metropolitan church. It comprised the modern counties of Dumbarton, Renfrew, Ayr, Lanark, together with the whole of Galloway. The southern division of the ancient Strathcluyd, known as English C., was granted by Eadmund, King of England, to Malcolm I., King of Scotland, in 945, to be held on tenure of military service. From that time it remained an appanage of the Scottish crown, but was distinctly regarded as an English territorial fief. Its capital under David I. was Carlisle, and its ecclesiastical centre Glasgow. See Freeman's *Norman Conquest*, i. p. 135 *et seq.*; and in his *Historical Essays*, that 'On the Relations between the Crowns of England and Scotland;' also Palgrave's *English Commonwealth*, i. p. 440 *et seq.*

Cumin, Oil of. This is an oily liquid obtained from the seeds of *Cyminum cymenum*. It has a pleasant aromatic odour, and consists of a mixture of a hydrocarbon called *cymole* and an oxygenated body called *cuminol*.

Cumm'in, or **Cum'in,** a genus of plants belonging to the natural order *Umbelliferæ*, not unlike Fennel (q.v.) in appearance. C.-seeds are the fruits of *C. Cyminum*. They are larger than the Caraway (q.v.), but are not so agreeable or efficacious as these, though used for the same purposes, viz., as a carminative and spice. In Holland, and even in this country, they are sometimes put into cheese, and in

Germany into bread. The volatile oil which they contain is known as *oil of C.* The seeds are chiefly brought to Britain from Sicily and Malta, and are to some extent used in Sweden, Norway, and Denmark to flavour corn-spirit (*aquavit*).

Cumin.—Seeds and Stalk.

The fruits of *Lagöecia cuminoides*, a native of the Levant, and also belonging to the *Umbelliferæ*, have similar qualities. The C. of the Scriptures probably included not only this species but also the *black C.*, a species of *Nigella* (q.v.). The ancients considered that its smoked seeds produced pallor of the countenance.

Cum'nock ('the meeting of the waters,' from the Celt. *cumar*, 'meeting,' and *oich*, 'water'), the name of two places.—**Old C.** is in the S.E. of Ayrshire, on the left bank of the Lugar, near to where it is joined by the Glasnock, 16 miles E. of Ayr, and a station on the Glasgow and South-Western Railway, which crosses the Lugar about a quarter of a mile from the town by a magnificent viaduct 170 feet in height. Pop. ecc. par. 4712. The manufacture of wooden snuff-boxes, for which C. was once noted, has much declined. There are rich coal and iron mines in the district, and manufactures of coarse pottery and agricultural implements.—**New C.** lies 5 miles to the S., and is also a station on the Glasgow and South-Western Railway. Pop. ecc. par. 4419. The district is rich in minerals, including coal, iron, plumbago, and antimony.

Cum'yn, Com'yn, or **Cumm'ing,** a Scoto-Norman family deriving its name from the town of *Comines* in the N.E. of France, and descended from an ancient family in that country.—**Robertus de C.,** who came to England at the Norman conquest, is supposed to be the ancestor of all of that name in Scotland, where his nephew William became chancellor. The grand-nephew of the chancellor married Hexilda, grand-daughter of the King, Donald Bane, and niece of Malcolm Canmore. His great-grandson by this marriage, **John the Black C.,** Lord of Badenoch, was a competitor for the Scottish crown in 1292.—**John the Red C.,** a son of the competitor, was the rival of Bruce. The two rivals met privately, February, 1306, before the altar of the convent of the Minorite Friars, Dumfries. High words arose about treachery and falsehood, and Bruce stabbed C. and fled. The Comyns, who had by alliances acquired immense power in Scotland, were almost swept away in the war of independence. The male line of the family, however, still survives, and is represented by Sir William Gordon Gordon-Cumming of Altyre. See *The Records of the Bruces and the Cummings*, by M. E. Cumming-Bruce.

Cunax'a, the scene of the battle described by Xenophon, in which Cyrus the Younger was defeated and slain by his brother Artaxerxes Mnemon (B.C. 401). The exact spot is not known; but most authorities agree in placing it on the left bank of the Euphrates, nearly 60 miles N. by W. of Babylon.

Cundinamar'ca, one of the departments of the United States of Colombia, obtaining its name from an American goddess, who, among other divinities, was worshipped before the Mexicans conquered the country. Ruins of temples, broken statues, and monuments, are now the sole relics of a forgotten religion. The chief town is Bogotá. There are extensive iron mines at Pradera, to the E. of Bogotá, which produce about 70 tons of pig iron daily, and this is forthwith manufactured into hardware and cutlery. At Zipaguira, which lies in the N. of the department, very considerable salt mines are worked by the government as a monopoly, and from this a large portion of the revenue is acquired, since the mines supply nearly the whole of the confederation with the necessary commodity. Area, 79,810 sq. miles; pop. 571,200.

Cu'neiform (Fr. *tête-à-clou*, Ger. *keil-förmig*), or wedge-shaped, is the name given to the wedge-shaped or arrowhead writing used in the trilingual public inscriptions of the Persian monarchy (the three languages being Persian, Median or Scythic, and Assyrian or Babylonian) and in an immense variety of inscriptions on cylinders, tablets, bricks, both public and private, which have been discovered chiefly on, or near, the sites of Nineveh, Babylon, Asshur, &c., and in Egypt, and from which many interesting fragments of ancient Assyrian and Chaldean history has been constructed. The characteristic example of the later C. is the Behistun inscription, which contains a valuable history of the conquests of Darius. (See BEHISTUN.) The deciphering of C. began properly in the 19th c. Previously various baseless theories were held. It was said to be the work of worms (who must certainly have had geometrical instincts); the remains of a primitive digital alphabet; a system of arbitrary sacred talismans, of which the key had been lost. Niebuhr first suggested that the inscriptions were repeated in three languages, and in 1802 Grotefend of Göttingen deciphered the names of Cyrus, Darius, Xerxes, and Hystaspes, or eight letters out of thirty to which he assigned equivalents. He did so not from any laborious comparison of individual signs, but by a shrewd historical guess as to the probable form and subject of the inscription. Grotefend wrote chiefly in the *Mines de l'Orient* (vols. iv., v., vi.), but his results are given in *Heeren's Researches*, by Talboys, vol. ii. Little was added by St. Martin, whose studies on the subject, from 1823 to 1832, are preserved in the *Aperçu de l'Origine des Diverses Écritures* by the learned Klaproth. The important characters representing *m* and *n* were discovered by Rask (*Ueber das Alter und die Echtheit der Zend-sprache*, Berl. 1826). In 1836 Burnouf published an elaborate *Mémoire sur Deux Inscriptions Cunéiformes trouvés près d'Hamadan*, to which we owe the verification of the characters for *k*, *gh*, *b*, and *z*. In the same year Lassen of Bonn discovered twelve characters (including *i*, *g*, *w*, and several aspirates), which he published in *Die Alt. Persischen Keil-Inschriften von Persepolis*. Rawlinson in 1835, from personal examination of the sculptured tablets at Hamadan, deciphered independently the Achæmenian proper names, as Grotefend had done from the inscriptions at Persepolis, copied by Niebuhr. The collation of the Behistun with the Elwend further supplied the native names of Arsames, Ariaramnes, Teispes, Achæmenes, and Persia. Greatly assisted by the philological suggestions of Burnouf's work on the Zend-Avesta, the language of which is supposed, with the exception of Vedic Sanskrit, most nearly to approach the language of the Persian C., and by the further discoveries in the C. alphabet of Lassen, Jacquet, and Beer, Rawlinson completed an alphabet which was substantially original, and proceeded to his work of translation of the Behistun inscription, which was wholly original. By translation here is meant, not the mere deciphering of particular names, but the rendering of the different members of a sentence according to their etymologies and grammatical relations. With regard to the origin of C., Rawlinson thinks it possible that pictorial representations, and not mere arbitrary arrangement, may have led to the formation of the primitive phonetic character; that the three kinds of C. do not belong to one type of alphabet and language, as has been maintained by Botta and others, but that the Babylonian is the oldest, and has probably been largely derived from the Egyptian written character. The Babylonian C. of the third column in the Persian inscriptions is, however, different from that which appears on cylinders and bricks at Shinar, Birs Nimrúd, &c., and also as a lapidary character on Sir Harford Jones' stone, on the naked rock at Sheikhan, between the ancient capitals of Resin and Calah, &c. The latter form Rawlinson considers to be the primitive C., or Babylonian proper; the former he calls the Achæmenian-Babylonian.

The early Chaldean brick inscriptions at Warka (ancient *Erech*) sometimes pass into a character formed entirely by straight lines of uniform thickness, apparently impressed by a single stamp, which has been called *hieratic*. The hieratic is said to be pictorial, a 'god' being represented by an eight-rayed star, a 'hand' by four shorter and one longer parallels connected by a perpendicular, a 'house' by what resembles the rectangular ground-plan of a house. A singular character, used for the feminine of *one* (Fr. *une*), has been traced to the likeness of the double-toothed comb used by Chaldean women. So also the early ideograph for 'king' has been said to resemble the figure of a bee, an Egyptian emblem of sovereignty. From this C. gradually developed, as clay took the place of stone, a tool with a triangular point in ivory being used. From the variety of dialects the C. signs came to have different phonetic values. The Chaldean characters are of three kinds—letters proper, monograms, and determinatives. The public writings are chiefly on bricks; those on the sealed tablets under clay envelopes chiefly contain private contracts, wills, &c. In the same way the Assyrian branch of the complicated C. writing is divided into (1) the Medo-Assyrian alphabet, which (with the exception of the trilingual inscription of Xerxes) is exclusively found on the rocks at Van and in the neighbourhood, and which occurs at Dash Tappek in the plain of Mujandab, and on the stone pillars at the Pass of Kel-i-shin; (2) the true Assyrian, which is found on the marbles of Khorsabad and in the ruins of Nineveh and Calah. As might be expected from the national history, the Babylonian and Assyrian characters sometimes overlap. The Assyrian C. is much less archaic than the Chaldean. Only a few straight lines are seen, and the wedge often appears very much elongated, or contracted to a triangle, or broadened out, or doubled so as to form an arrowhead, all these forms assuming various directions. The 366 chief characters represent syllables rather than letters, each of the sixteen consonants forming six syllables by means of the three vowels. A second class of syllables is formed by two consonants and a vowel. The determinative stroke before or after merely announces what class of noun is to follow. In 1871 Mr. George Smith, of the British Museum, gave the translation of the principal Assyrian inscription (found on a ten-sided prism) in the British Museum. The lines chiefly refer to the success of Esarhaddon over Egypt and the most important events in the reign of his son. The first ten lines of the cuneiform character are here given and their meaning in English is appended. The Median C., used for translation in all the Achæmenian trilingual inscriptions, even in Egypt, as on the Suez stone, has been called Scythic and Turanian by Norris, who treats it very fully in the *Journal* of the Asiatic Society, vol. xv. 1855. It is not certain whether this syllabarium of 100 characters was invented or adopted by the Turanian people of Zagros. It comes much nearer the idea of an alphabet than the other forms of C. The forms are simpler, five wedges being the maximum. The only diagonal sign is the single wedge which separates words. Lastly, there is the Elymean C., which is found in the vicinity of Mal Amir, the ancient city of the Uxii, and which has been copied by Layard. The Babylonian C. varies from all other Semitic writing in being written from left to right. Each consonant apparently possesses a mute and a sonant sign, so that in expressing a dissyllable in which such a consonant was medial, either or both of the alternative forms might be used. The vowel sounds are inherent in the sonant consonants (perhaps also at the beginning of the mutes), but for greater clearness it was permitted to represent the vowels by definite signs.

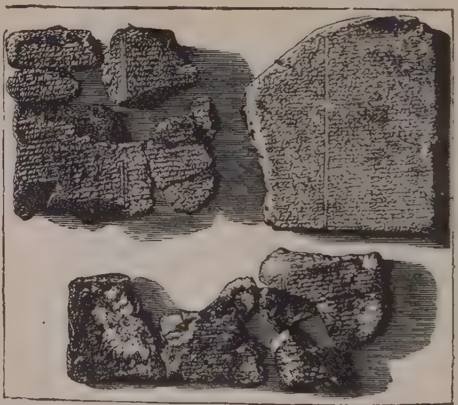
1. I am Asshurbanipal, descendant of Asshur and Beltis,
2. son of the great King of Bitriduti (or Eriduti),*
3. whom Asshur and Sin, the lord of crowns, from distant days,
4. the account of his name prophesied to the kingdom,
5. and in the body (of his mother was made to) rule Assyria,
6. Shamas, Vul (and Ishtar in), their supreme power
7. commanded the establishment of his kingdom.
8. Asshur-ah-iddina (or Esarhaddon), King of Assyria, the father my begetter,
9. the will of Asshur and Beltis, the gods his protectors, fulfilled,
10. who commanded him to form my kingdom.

* Supposed to be the name of the harem of the palace at Nineveh.

Copy and Translation of the first ten lines of Cylinder A, in the British Museum.

Redundant consonants are introduced for euphony. These are among the causes of the great diversity in the orthography of C. Another feature is the constant occurrence of compound vowel articulations in the interior of words, of which, owing to the inherence of the *a* in the preceding consonant, the second element only is expressed. Generally, it varies from Sanskrit in possessing no aspirated sonant; it only has the surd, the aspirated surd, and the sonant.

Besides the great Behistun inscription, there are many of less importance scattered through the Persian Empire, and especially at Persepolis, Hamadan, and Van. Many of these, however, consist simply of a formula of invocation to Ormazd and a repetition of royal titles. Thus, on the ruined pilasters of Murghab or Pasargadæ appears this legend, the oldest of the Persian C.—'Adam Kurush, Khshaya thiya, Hakhamanishiya: I am Cyrus the King, the Achæmenian.' The trilingual legends of Darius at Persepolis are chiefly on the platform, the pillared colonnade, and the palace marked G on Niebuhr's plan. One of them, which has been copied by Porter and Westergaard, is found on a huge slab, 26 feet long and 6 feet high, in the southern wall of the platform. It appeals to Ormazd to save the province of Persia from war, slavery, decrepitude, and lying. The titles often suggest questions of history and geography. Thus Darius puts 'Sparda' among the list of countries who are afraid of him, and bring him tribute. Does this mean Lacedæmon, or merely the Dorian colonies in Asia Minor? Another tablet at the foot of the mountain Alwand, near the town of Hamadan, probably commemorates a royal visit to the Median capital. Ormazd appears in the amiable character of *dadar*, or giver of justice. The Median and Persian inscription of Naksh-i-kustam on the rock-hewn sepulchre of Darius near Persepolis was for long a riddle to travellers. Fryer, quoted in Ouseley's *Travels* (ii. 296), was content 'to stare on them from beneath, they being fit only for atlases or winged folk to look into, there being no passage into them.' A French artist, more ambitious, was drawn up by a rope, but Westergaard's copy was taken by means of a powerful telescope. The writing is probably subsequent to the expedition of Mardonius (B.C. 492), and refers to the Greeks and Scythians beyond the sea. Other members of the Darius series of C. writings were found on a Babylonian cylinder in the British Museum, on the Suez stone near the embouchure of the old canal leading from the Nile to the Red Sea, and on the window-frames of the palace of Darius at Persepolis. There is also a considerable number of Xerxes inscriptions. Those at Hamadan, as they relate no history, contain no admonition, and do not even solicit the protection of *Auramazda*, are probably memorials of the annual journeys made from Babylon to Ecbatana by the old 'road of Semiramis,' across Mount Orontes, by the Ganj Namek, a route coinciding with that of Isidore from Kangawar to Artaman. At Persepolis the Xerxes inscriptions consist of (1) the statements of title in the doorways (both over the king's head and on the folds of his robe), and as a border to the false windows of the palace; (2) more elaborate, but quite formal, statements (including a reference to the building of the palace), which appear on the interior pilasters and on the sculptured staircase leading to the terrace of the Hall of Columns. The twelve small tablets over the colossal animals on the two great portals long remained inaccessible to travellers, although their existence was observed by Gemelli Carreri, who visited Persepolis towards the end of the 17th c., and by Tavernier (1663). The name of *Parsa* for the palace, or metropolitan building, as distinguished from the country, province, or state, occurs here. Another pilaster legend at the S.W. corner of the palace indicates that both Darius and Xerxes took a part in its construction. All these inscriptions are contained in Lassen's *Treatise of C. Inscriptions*, in Rawlinson's *Memoirs on Persian C.*, in *Zeitschrift für die Kunde des Morgenlandes*, vol. vi., and the *Journal* of the Asiatic Society, vol. x. Plates will be found in Morier's *Travels*, Ouseley's *Travels*, Rich's *Babylon and Persepolis*, Porter's *Travels in Georgia*, &c. See also Heeren's *Researches*, by Talboys, vol. ii. There is a trilingual C. writing relating to Xerxes on the vase of the Comte de Caylus, of which there is a duplicate on the vase found at Halicarnassus by Newton. It has a hieroglyphic translation, to which Champollion and Grotefend attached the greatest importance as a source of phonetic values before the C. writing was properly understood. Loftus recovered at Susa some fragments of vases with a Xerxes legend. After the time of Xerxes the C. seems to have fallen into disuse. No record of Artaxerxes Longimanus or of Artaxerxes Mnemon has been discovered, and the attribution of the cylinder and Suez stone to the intervening reign of Darius Nothus depends on mere conjecture. The buildings at Persepolis ascribed to this period of the Achæmenian dynasty, though elaborately sculptured, have no writings. After the lapse of a century Artaxerxes Ochus, fourth in descent from Xerxes, resumed the ancient art of composition. We have of this monarch two inscriptions at Persepolis—one on the northern face of the platform, marked H on Niebuhr's plan, the other on the western staircase added to the palace by Artaxerxes. In these he traces his descent from Hystaspes (whom, however, he does not call 'royal,' thus differing from the Behistun inscription of Darius), explains that he has made this well-sculptured piece of masonry *for his own convenience*, and calls on Ormazd and Mithra (the sun) to protect him. Both inscriptions are marked by bad grammar, which has been the despair of decipherers. The words 'for his own convenience' are supposed to refer to a private entrance from a pavilion to the palace. There is another C. writing relative to Artaxerxes Ochus on an Egyptian vase of grey porphyry in the treasury of St. Mark's at Venice. It has a very singular hieroglyphic equivalent, deciphered by Sir Gardner Wilkinson, and the royal name is degraded into *Ardakhchasche*. In these strictly Persian inscriptions there are thirty-six or thirty-seven forms, expressing twenty-three distinct sounds. The size of the character varies from two inches to one-sixth of an inch. In 1872, Mr. George Smith, of the British Museum, gave the translation of the cuneiform characters on a tablet which had remained in a very fair state of preservation. This tablet narrates in detail the story of the Deluge, and tells how the wickedness of mankind was punished by a great flood, and how Sisit was warned beforehand to build a large ship and betake himself on board with some chosen friends and certain other living creatures. The flood arose and afterwards retired; the ship was left high and dry on a mountain. Sisit sent out birds twice and each time they returned to the ship; again he let one go and this did not return. Sisit and his companions disembarked and builded an altar and there sacrificed. So far these agree with the facts given in the Bible, but further details present the story in quite a different light.



Fragment of the Tablet from which the account of the Deluge was deciphered.

Cun'eiform Bones. These are three bones in the tarsus or arch of the foot, so named on account of their wedge-like shape. With the cuboid bone they form the anterior row of the tarsal bones. They are termed from their position, internal, middle, and external. See Foot, Tarsus.

Cunn'ingham, Allan, a Scottish poet and man of letters, was born 7th December, 1784, at Blackwood, near Dumfries. His parents were humble, and at an early age he was apprenticed to a stonemason. He worked hard at his business in Dumfries, while he gave his leisure to the Muses. He first (1810) became known beyond his native country in connection with Cromek's *Remains of Nithsdale and Galloway Song*, to which he gave what purported to be old ballads, but were really his own composition. After this he was acknowledged to be among Scottish poets next in power to Hogg, and gained the high esteem of Sir Walter Scott, who called him 'Honest Allan.' He removed to London, where, after being for a short time a parliamentary reporter, he became manager in Chantrey's studio. Meanwhile he wrote steadily, his works including novels, poems, a drama, and such books as a *Life of Burns*, a *Life of Sir David Wilkie*, *Lives of British Painters*, &c. Yet he always considered literature as his staff, not his crutch. C. died 29th October, 1842. He will be best remembered for his poems and songs, which, though somewhat florid, are genuine and thoroughly Scottish. The best biography is that containing extracts from his correspondence and works by the Rev. David Hogg of Kirkmahoe (1875).—**Peter C.,** son of the preceding, was born at Pimlico, 7th April, 1816. In 1834 he received a Government situation, and devoted his spare time to literary work, the varied character of which may be judged from the titles of some of his books—*Handbook of London*, *Life of Inigo Jones*, *Life of Drummond of Hawthornden*, editions of Johnson's *Lives of the Poets*, Goldsmith's *Works*, Horace Walpole's *Letters*, &c. C., who contributed largely to magazines, died 8th May, 1869.

Cunningham'ia, a genus of lofty and graceful Coniferous trees, of which only one species, *C. sinensis*, a native of Southern China, is known. It can, however, only be grown in conservatories.

Cunonia'ceæ, a natural order of Dicotyledonous plants closely allied to the saxifrages. About a hundred species and twenty genera, natives chiefly of tropical regions and of the southern hemisphere, and especially of Australia, are known. They have astringent properties, and some have been used for tanning, while others exude a gummy excretion.

Cup, Divination by, a mode of divining still practised by some persons, by examining the arrangement of the sediment in the bottom of a teacup. The practice has been borrowed from the ancient Egyptians, who, after throwing pieces of the precious metals into a C. of water, in which engraved gems had been placed, invoked the infernal gods to furnish the information desired.

Cupa'nia, a genus of trees or shrubs of the natural order *Sapindaceæ*, numbering about fifty species, found in most tropical countries, but most abundantly in S. America. The edible C. is the Akee tree of the W. Indies, where the negro women use the distilled water of the flowers as a cosmetic. The seeds are surrounded by a succulent, slightly acid aril, which is much esteemed as an article of food. A decoction of the seeds is said to be efficacious medicinally. The lofty tulip-tree of eastern tropical Australia is a C. and has a light-coloured wood, interspersed with darker-coloured patches, and is valued by the cabinetmaker from its being susceptible of a high degree of polish. Spruce mentions the curious fact that the embryos of a Peruvian species of C. 'fall out of the seeds, while the outer coating or husk of the seeds, with their aril contained in the burst capsules, still remain on the trees.' The 'Loblolly woods' of Jamaica also belong to this genus.

Cu'par or **Cou'par-An'gus,** a town partly in Perthshire and partly in Forfarshire, on the Isla, about 13 miles N.E. of Perth. It has bleachfields, manufactures of coarse linen fabrics, and a trade in timber. From its occupying the centre of Strathmore ('the great valley'), it is sometimes called the capital of the 'How' of Mearns. The remains of two Roman camps are in the neighbourhood of the town, on the site of one of which Malcolm IV. erected a monastery, now in ruins. Pop. 2106.

Cu'par, the county town of Fifeshire, on the Eden, 27 miles N. by E. of Edinburgh. The principal manufactures are linens and bricks, and there are breweries, tanneries, and flour-mills. C. was erected into a royal burgh by David II. in 1363. Sir David Lyndsay's satiric interlude of *The Three Estatis* was acted in 1555 on a mound at the E. end of the town, on which stood an ancient castle of the Macduffs, Thanes of Fife. C. is one of the parishes constituting the E. division of the county, which returns one member to Parliament. Pop. 4729.

Cu'pid (Lat. *cupido*, from *cupio*, 'I desire'), a modification of the Greek Eros, when his worship was transferred from Greece to Rome. He is generally described as a son of Venus, either by Mercury, Mars, or even by Jupiter. C. was the god of love, who swayed alike gods, men, and all living creatures. His attributes are the bow, arrows, quiver, and golden wings, and from the blindness of his action he is often represented with bandaged eyes. Originally conceived of as a model of perfect youthful beauty, he gradually came to be represented as a chubby boy.

Cu'pola (Ital. from the same root as the Eng. *cup*) is the concave ceiling or vault forming the roof of a building. See Dome.

Cu'pola, a small blast furnace used for the re-melting of raw pig-iron in order that it may be cast into suitable forms in the Foundry (q.v.).

Cupp'ing, a surgical operation now somewhat rare, but at one time so frequent that it was generally performed by specialists called 'cuppers.' It is of two kinds—*dry C.* and *wet C.* The former consists in producing congestion of a part; the latter, in abstracting blood from a part to which dry C. has just been applied. The instruments necessary for the purpose are—(1) a glass resembling a common tumbler; (2) a spirit-lamp (when these are not at hand, a candle and a common tumbler will serve the purpose); and (3) when wet C. is to be performed, an instrument containing lancets (scarificator) to pierce the skin, that blood may be withdrawn. The lancets are concealed within the instrument, and by moving a trigger they project through slits and cut the skin. Their number varies, but they are so arranged as to cut exactly to the required depth. In C. the part is first sponged with hot water, which produces local congestion. The air is exhausted from the glass by means of the spirit-lamp, and the glass is then quickly placed on the part already sponged. This increases much the flow of blood to the part. This part of the operation is dry C. The scarificator is now applied, which cuts the skin, and the glass having the air re-exhausted by the spirit-lamp is again applied, and is now rapidly filled with blood. The number of glasses will depend on the amount of blood to be abstracted; each glass takes about four or six ounces of blood. The lancets must be so arranged as only to cut through the true skin; when they cut deeper, the fat underneath the skin prevents the free escape of the blood.

Cu'pule, the cup in which the fruit (acorn) of the oak and the nut of the Spanish chestnut is contained, and is a sort of involucre composed of a number of adherent bracts. It is also applied to a cuplike body found in some fungi, such as *Peziza*.

Cupulif'eræ, or **Coryla'ceæ,** the Oak or Mastwort order, a natural order of Dicotyledonous plants, consisting of trees and shrubs, abundant in the forests of temperate regions, though a few are found in the highlands of tropical and hot climates. In all about 300 species, distributed over eight or nine genera, are described. The oak, hazel, chestnut, hornbeam, are the best known. C. are mainly important for producing excellent timber, though the seeds of many of them are edible, and others have astringent barks and cupules.

Curaça'o, one of the West India Islands, lies E. of the opening to the Gulf of Maracaibo, about 75 miles off the

Venezuelan coast, S. America. Area, 210 sq. miles; pop. 27,254. The capital, Willemstadt, is situated on the south coast. Like the neighbouring islands of Aruba (pop. 7888) and Buen Ayre (pop. 4053), C. produces tobacco, maize, figs, coconuts, citrons, oranges, &c., and carries on an export trade in maize, beans, cattle, salt, &c., chiefly with the contiguous coast. It gives name to a liqueur (*curaçoa*) or sweetened spirit, which owes its peculiar flavour chiefly to the rind of Curaçoa Oranges (q.v.). In addition to that ingredient, a proportion of cinnamon, mace, and other sweet spices is used in the preparation of curaçoa. Besides this liqueur, some wines are exported from the island which are remarkable for their delicate flavour and freedom from any alcoholic fire. C. was discovered by the Spaniards in 1527, conquered by the Dutch in 1634, taken by the English in 1807, and restored to the Dutch in 1815.

Curaço'a Oranges, the immature fruits of the ordinary Seville or bitter orange, *Citrus vulgaris* of Risso. They are valued for their rind, which has a very pleasant aromatic odour and a bitter taste, and is largely used in medicine as an aromatic tonic, and in the preparation of the favourite liqueur *curaçoa*.

Cu'rarine is an Alkaloid (q.v.) contained in *curara*, *urari*, *woorara* or *woorali*, a resinous substance used by the S. American Indians to poison their arrows. C. is an amorphous body with a bitter taste. It acts as a violent poison when introduced directly into the blood, but is comparatively harmless when swallowed. Its physiological action is peculiar, for it paralyses the nerves of motion without affecting those of sense.

Curass'ow, or **Hocc'o,** a family of Rasorial birds (*Cracidæ*), representing in America the Old World pheasants. The bill is arched, the nostrils are basal, the wings short and rounded, the tail long and very broad, the tarsi stout, the toes slender, and the hind toes as long, and situated in the same plane, as the front toes. The common crested C. is as large as a turkey, and occurs in Brazil and Guiana. Its colour is black, the belly and tail-crests white. The head has a crest of tufted feathers. The red C. has been domesticated in Holland. Another species, the Pauxi or *Ourax pauxi*, has a knob or tubercle at the base of the bill.

Red Curassow.

Cu'rate (lit. 'one who has the *care* (Lat. *cura*) of souls') is the lowest degree in the Church of England. By 1 and 2 Vict. c. 106, where an incumbent does not duly reside, the bishop is empowered to grant a certain fixed salary to the C. out of the proceeds of the benefice. This shall not be less than £80 a year, unless the value of the benefice is under £80 a year; in which event the salary of the C. shall be the full value of the benefice; nor less than £100 or than the value of the benefice (if under £100), where the pop. amounts to 300; nor less than £120, where pop. amounts to 500; nor less than £135, or than value of the benefice (if under £135), where pop. amounts to 750; nor less than £150 or than value of benefice (if under £150) where pop. amounts to 1000 persons. Higher stipends and more curates may be assigned for more populous parishes and more wealthy benefices. In special circumstances the bishop may assign smaller stipends than those mentioned in the statute, but must record the particulars of the case in a book kept in the diocesan registry and open to inspection by leave of the said bishop. Under the Pluralities Amendment Act, 1885 (48 and 49 Vict. c. 54), the bishop is empowered by sections 8—10 to assign extra stipend up to £70 in certain circumstances; may appoint two or more curates, and may assign to each curate a stipend not exceeding £200 or net income of benefice.

Curatell'a, a genus of small Dillineaceous trees from tropical Africa, the rough leaves of one of which, the American C., are used in Guiana for polishing.

Cura'tor, a kind of guardian appointed by the Court of Session in Scotland. The powers and duties of curators vary with the nature of their appointment, and the condition of those over whom their guardianship or curatory extends. They may be classed as *C. to a minor*, *C. to an idiot*, *C. bonis*, and *C. ad litem*.

Curator to a Minor.—A minor in Scotland, until he arrives at puberty (see AGE), which in males is fourteen and in females twelve years, is under the guardianship of a tutor. (See PUPIL, TUTOR.) From puberty to majority he is under a C. The guardianship, in both cases, vests without legal formality in the father, unless the child is forisfamiliated. (See FORISFAMILIATION.) When the father is dead, or legally disqualified, the minor has largely the choice of his curators, but their appointment requires the sanction of the court. All deeds executed or contracts entered into by a minor without consent of his curators are ineffectual against the minor, but they may be held binding on the other party. The term in English law corresponding to C. to a M. is *Guardian* (q.v.).

Curator to an Idiot (or *deaf and dumb person*, or *furious person*, or *lunatic*), is appointed under a brieve of the Chancery. (See BRIEVE.) He is entrusted with the person as well as with the estate of his ward. The court appoints to the office the nearest male relation on the father's side, except when a wife is fatuous; in which case the husband becomes C. Curators to insane persons are subject to the provisions of the Pupils' Protection Act (q.v.).

Curator Bonis.—When an heir is deliberating whether or not he shall enter (see ENTRY OF AN HEIR), when an infant is without a tutor, when a succession opens to one resident abroad, when trustees have declined to accept or cannot legally do so, and in similar cases, the court appoints a C. B. He is subject to the rules contained in the Pupils' Protection Act and its amendments, in the relative Acts of Sederunt, and in the Notes of the Accountant of the Court.

Curator ad Litem is appointed by the court to attend to the interest of a minor in a lawsuit or in other judicial proceedings. When a minor has curators at the beginning of legal procedure, they act as *curators ad litem*. The C. ad L. is not obliged to give caution because he has no intermeddling with the minor's estate—he is simply appointed for a special purpose, and when that ceases his office does so also.

Curb, in veterinary science, means a strain of the extensor ligaments or tendons running down the back of the 'hock' in horses. This lesion occurs chiefly from sudden starts or great exertion, or from the effort made in keeping back a heavy load in descending a hill. The symptoms are swelling and inflammation in the joint, and consequent lameness, which may disappear afterwards, when the animal has been exercised for some time. The treatment consists in rest and fomentations during the active stages of the inflammation, together with cold applications afterwards, and blistering to allay any tendency to swelling that may remain.

Curcu'ligo, a genus of herbaceous plants of the natural order *Hypoxidaceæ*, natives of S. Africa and tropical Australia and India. The fleshy roots of some species (like *C. stans* of the Ladrone Islands) are eaten. Most of the genus is bitter and aromatic.

Curcu'ma, a genus of annual plants of the natural order *Zingiberaceæ*. Turmeric (q.v.) consists of the old tubers of *C. longa* and other species. The young tubers are colourless, and furnish a kind of arrowroot. East India arrowroot, or C. starch, is obtained by bruising and powdering the tubers of *C. angustifolia*, and then throwing the powder into water. Starch is also obtained from *C. rubescens*, *C. leucorhiza*, &c. Zedoary tubers, used in India as an aromatic tonic and as a perfume, are furnished by *C. aromatica* and *C. Zedoaria*.

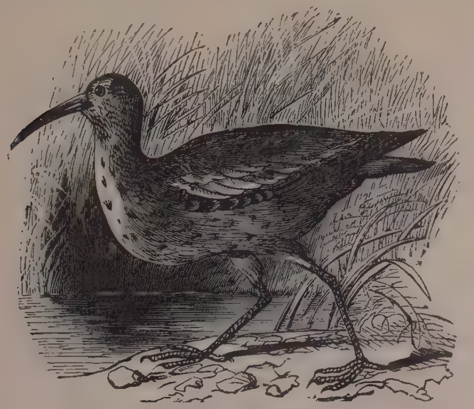
Curd (casein of milk) is a composition similar to the fibrin of wheat, the legumen of bean and pea, and the albumen of egg. It has been suggested by Mulder—and the suggestion is generally accepted—that the cheesy matter in milk is derived directly and without much change from the food upon which the animals live. From a gallon of new milk 1 lb. of C. is produced on the average, but Alderney and Guernsey cattle will give more. According to Dr. Voelcker, the ultimate elements of C. are carbon 53·57, hydrogen 7·14, nitrogen 15·41, oxygen 22·03, sulphur 1·11, and phosphorus 0·74 per cent. Curds-and-cream form a delightful dish, for which Devonshire and Cornwall are specially famous.

Cur'few (Fr. *couvre-feu*, 'cover fire'), the tolling of the church-bell at eight o'clock, or some other hour in the evening, as a signal for the people to put out their fires and retire for the night. The introduction of this practice into England has been ascribed to William the Conqueror, who is said to have used it as a means of preventing the English from assembling in the evening to concoct plans of rebellion. The tradition is sufficiently ludicrous. There can be little doubt that it owed its introduction into England to the same cause that made it common throughout Europe—viz., as a regulation to prevent fires, which were very frequent when houses were built of wood. The evening-bell, still rung in many places in England, is called the C., and though the original signification has long passed away, the word has won an abiding-place in our language, mainly through the line in Gray's *Elegy*—

> 'The curfew tolls the knell of parting day.'

Curl, a destructive disease in potatoes—a variety of chlorosis—in which the tubers 'produce deformed curled shoots of a pallid tint, which are never perfectly developed, and give rise to minute tubers. It is supposed C. arises from the tubers being overripe.' It is a local disease, and quite unknown in many districts (Berkley).

Cur'lew, a genus of Grallatorial or Wading birds, nearly allied to the Snipes, and to the Sandpipers. The bill is long, slender, and curved downwards towards its tip. The face and head are feathered. The tail is short, and the wings, when at rest, reach to the tail. The C. is not migratory. It inhabits the sea-coasts, generally, of the Old World, and also of Australia. Its food is chiefly worms and molluscs, and its cry is of a peculiar shrill kind.



Esquimaux Curlew.

> 'Wild as the scream of the curlew,
> From crag to crag the signal flew.'
> *Lady of the Lake.*

The nest is built among grass or heath. The whimbrel is smaller than the former species, and is also found in Britain, whilst N. American species and the Esquimaux C. are also known.

Cur'ling, a Scottish game on the ice, popular with all ranks. It is usually played on frozen lakes and rivers, though artificial ponds are becoming common. Set matches, called *bonspiels*, are played between rival clubs and parishes, and even between different divisions of the kingdom. A body of rules, generally held as binding, has been issued by the Caledonian Curling Club. C. is played with flattish circular stones, about 9 inches in diameter, from 30 to 45 lbs. in weight, with handles inserted in the upper surface, while the under is carefully polished. A *rink* is formed, from 30 to 40 yards long and 3 broad, at each end of which concentric circles (*broughs*) are drawn, the inner one being named the *tee*, which is the curler's aim—the game much resembling that of bowls. At some distance short of each tee a transverse line is drawn—the *hog-score*—stones failing to cross which are put off the ice. The game is usually 31; the players, four on each side; the last player, or director, being called the *skip*. The game is graphically described in *Guy Mannering*, and Burns' Tam Samson was an adept in it: the following stanza from the humorous *Elegy* contains several of the technical terms of the game:—

> 'He was the king o' a' the core,
> To *guard*, or *draw*, or *wick a bore*;
> Or up the *rink* like Jehu roar
> In time o' need;
> But now he lags on Death's *hog-score*—
> Tam Samson's dead.'

Curr'an, John Philpot, a distinguished Irish barrister, orator, and wit, was born of humble parents at Newmarket, near Cork, 24th July, 1750, studied at Trinity College, Dublin, and the Middle Temple, London, and was called to the Irish bar in 1775. By his power as a ready and sarcastic speaker he speedily reached forensic eminence, and in 1784 entered Parliament, in which he became celebrated as one of the ablest opponents of the policy of the Government towards Ireland. After the Union, to which he was opposed, C. was made, in 1806, Master of the Rolls. He resigned this post in 1813, and retired on a pension to London, where he died, 14th October, 1817. His wit and other attractive social qualities, shown in such books as *Recollections of C.*, will long keep C.'s memory green in the hearts of Englishmen as well as of his own countrymen. See *Life of C.* (Lond. 1819), by his son, J. Philpot Curran, by Phillips, and by O. Regan.

Curr'ant, the common name for various species of plants of the genus *Ribes*, but most generally applied to *R. nigrum* and *R. rubrum*, the black and red C. of our gardens. The red C. is a native of the S. of Europe and of Asia, and perhaps N. America, and is most likely only naturalised in Britain. The white C. is a variety of the red C., the result of cultivation, and in addition there are many other varieties and intermediate forms. The black C. is a native of most woods and the banks of streams in Europe and the N. of Asia. Both it and the red are highly prized for preserving in the form of jams and jellies. It is largely grown in some parts of the Continent for the purpose of making the *Liqueur de Cassis*. There are many other closely-allied species in America, India, &c. The red-flowering C., so common an ornament of our shrubberies in spring, is a native of America to the W. of the Rocky Mountains. It was introduced into Britain in 1826. Its berries, though insipid, are not poisonous. The golden C. is an ornamental shrub from the same regions, producing a fine-flavoured berry. The term C. is applied in Australia to *Leucopogon Richei*, one of the *Epacridaceæ*. Its berries are wholesome. The Indian C. of America is the snow-berry. The native C. of New S. Wales is also *Leucopogon Richei*, while the same name is given in Tasmania to some species of *Coprosma* (natural order *Cinchonaceæ*). The grape-C. is a kind of raisins or dried fruit of the Corinth or C.-vine, a small variety of the ordinary vine, cultivated chiefly in the Ionian

Islands. They are most extensively used in cakes and puddings, but of themselves are highly indigestible.

Currant-Wine, a beverage prepared from the fermented juice of the berries of the red currant, to which a proportion of sugar is added. C.-W. is a favourite domestic preparation, and a wholesome and pleasant drink. A kind of liqueur is similarly prepared with the more strongly flavoured black-currant berries.

Curr'ency, the name applied to the medium of exchange or circulating medium used at any time and place. Its uses, direct and indirect, are obvious: the chief are the establishment of one mode of calculating value, the facilitation of exchange where barter could not take place, and the saving of expense and trouble in the exchange itself. Each of these primitive advantages suggests a great expansion of commerce. They have been realised separately: as (1) in the African conventional unit or *macute*, which had no physical existence at all; (2) in the cattle and fur C. of many nations without foreign trade. Now, however, the precious metals are universally recognised as the best basis for exchange; and by the mercantile school were long considered as the only permanent wealth; a fallacy which led to the early prohibitions of importation and the bounties on exportation. The durability and divisibility of gold and silver, their uniform quality when pure, and the facility with which the quality may be tested, have secured them the first place; copper deriving its C. chiefly from the mint-mark, and from being confined to small transactions. Copper was, however, extensively used at Rome, and iron was exclusively used at Sparta. The C. metals fluctuated little in intrinsic value (although the occasional discoveries of gold-fields, *e.g.*, in Australia and California, produced wide and sometimes violent effects on trade), but it was necessary to prevent fraud that the central Government (wherever such existed) should guarantee the purity of the C., and direct that it should be accepted. Hence state coinage and the prohibition of private coining, a privilege which was frightfully abused in systematic debasement by the later Capetian Kings of France and by the Roman Emperors of the East, &c. In Scotland (where James I. had directed the money to be of the like weight and fineness as that of England), there were mints in Edinburgh, Aberdeen, Perth, Dumbarton, Roxburgh, Stirling, Glasgow, and Linlithgow. Notwithstanding this variety of local coinage, there was a great dearth of C. in Scotland; and the 'sterling' silver penny of the English Plantagenets (which had taken the place of the silver penny of the 'Easterlings' or Baltic trading communities) varied so much from the Scots money, that ultimately £100 Scots was equivalent to £8 6s. 8d. of sterling money. An Act of James II. (1456) tried to retrieve the C., by enacting that several foreign coins in use, such as Henry nobles, dolphins, Rhenish guildings, &c., should 'be cried,' or pass for more than their intrinsic value; and that the coins were to remain in the country. In England, the rude process of minting by shears and hammer had led to extensive clipping and to the institution of the horse-mill. The clipped coin, not being called in, displaced the milled coin; and this produced a state of uncertainty and injustice from which the nation was rescued in 1695 by the Coinage Act, due to the joint efforts of Locke, Somers, and Montague. The new C. was restored to its ancient weight and fineness, and the clipped money was made illegal tender after a certain date. When the milled silver was fully in circulation, the price of the golden guinea fell from 30s. to 21s. 6d. At the Treaty of Union a uniform C. was adopted for England and Scotland, compensation being given for losses through change of denomination. The Scots merks (1½d. more valuable than the English shillings) were called in by 'unpremeditated proclamations;' but the premium was claimed for £40,000 worth of English shillings which had been circulating in Scotland as equivalent to Scots merks. In spite of the facilities for smuggling and melting afforded by the small bulk of the precious metals, the British system has survived a good many commercial crises. The value of the C. depends, in the first place, on the supply (*i.e.*, all money in actual circulation) and the demand (*i.e.*, all goods offered for sale); in the second place, supply and demand remaining constant, it depends on cost of production. The relation between the C. and prices is, however, considerably modified by the use of bills of exchange, accommodation bills, promissory-notes, and cheques. These are the instruments of credit. The experiments made in inconvertible paper C., such as the *assignats* of the French Revolution, show that while the substitution of a paper for a metallic C. held in reserve is a national gain, any further increase of paper is a national robbery. The Austrian irredeemable paper florin varies in value from 11 to 7 *grammes* silver. Accordingly, not merely the Bank of England, but the banks of issue in Scotland, are carefully restricted in their note-issue by reference to their store of bullion. From 1797 to 1819 the cash payments of the Bank of England were, in consequence of the war, suspended, large hoards of bullion being required for military purposes; and there was, at one time, a controversy whether the resumption of cash payments, under Peel's Act of 1819, did not unduly benefit those who had advanced money to the state during the depreciation caused by the suspension. The present system of banking in Great Britain was settled by Peel's Bank Charters Acts, 1844-45 (7 and 8 Vict. c. 32, and 8 and 9 Vict. c. 38). In 1893 the number of pieces struck at the Royal Mint was estimated at 78,380,020, representing value to the amount of £10,789,523 17s. 3d. Of these coins 16 denominations were required for the Home circulation, while 18 more were for use in the Colonies. The profit to the Mint amounted to £206,604 17s. 9d. The value of silver per ounce was 3½d. less than in 1892; and since then it has fallen still lower. As an example of the depreciation of silver, it may be stated that, whereas the silver dollar in use in the Far East was valued at 3s. 11¼d. in 1890, in 1895 it had sunk to 2s. 2½d. The Indian rupee, which used to be exchangeable at 2s., is now worth only 1s. 4d. There the mints have been closed for the coinage of silver.

Curr'ents, Ocean. In treating of these, the most permanent of oceanic movements, we shall first enumerate the more important C., of which careful charts are annually prepared by the British Admiralty, and then consider the physical causes which give rise to the phenomena.

According to Captain Duperrey, there are three great C. flowing N. out of the Antarctic Ocean. The *first* flows in a generally easterly direction, till it strikes the W. coast of S. America. Here it divides, the one branch travelling southward, warming the shores of Patagonia, rounding Cape Horn, and then striking E. by N. towards the S. of Africa, uniting at the same time with the *second* Austral current. This combined current separates at the Cape of Good Hope into two branches, the one flowing eastward to Australia, and ultimately mixing with the westerly equatorial C. of the Indian Ocean, the other striking N. along the W. coast of Africa as far as the Gulf of Guinea, where it is turned out across the Atlantic in a due westerly direction towards Cape St. Roque, in S. America. Here it divides, the one branch coasting down by Brazil till it meets the first Austral current, the second continuing in a north-westerly direction towards the Caribbean Sea and the Gulf of Mexico, which it enters, and is then deflected through the Strait of Florida across the Atlantic towards the N.W. coast of Europe, constituting the Gulf Stream. The Gulf Stream divides at the Azores, one part still directing itself towards the N.W., and washing, through the agency of its numerous ramifications, the shores of Spain, France, Great Britain, Ireland, Denmark, Norway, and Spitzbergen, the other part turning S. then W., thus forming the N. equatorial current, which is separated from the S. equatorial by a narrow reversed current flowing towards the Gulf of Guinea. Returning now to the point at which the *first* Austral current breaks on the W. coast of S. America, we may trace the course of the northern branch. After coasting along by Chili and Peru, it is deflected across the Pacific towards the E. Indies, constituting the great S. equatorial current of the Pacific. It is much broken up by the numerous islands of Australasia; and a portion of it travels S. to the E. coast of Australia, where, making a detour, it mingles its waters with the *third* Austral current, which, after flowing E. along the S. coast of Australia, has now struck N.E. towards New Zealand. In the N. Pacific, a *drift-current* (one due to the action of a prevailing wind), flowing E., then S.E. along the N. American coast, is reversed off the Californian seaboard, and returning towards China, forms the N. equatorial current of the Pacific, which is separated from its companion current by a narrow easterly-directed current, as in the case of the corresponding movements of the Atlantic. A portion of the N. equatorial flows up to Japan; but the greater part turns N. and N.E., uniting with the original drift-current of the higher latitudes, thus forming an endless circulating stream of water. The branch of the *second* Austral current which flows eastward to Australia, uniting with a portion of the *third* Austral stream, turns N., and ultimately, as before mentioned, forming the westerly-directed current of the Indian Ocean, gives rise to the Mozambique current between Africa and Madagascar, which is continued S. to the Cape of Good Hope; but here it is stopped by the opposing current from the W. and turned back towards Australia. Of the C., which have their origin in the N. Polar seas, the most important is the Labrador current, which, travelling S. past Labrador and Newfoundland, has been recognised in the *Challenger* soundings in a cold sub-current far S. off the United States coast. These are the principal constant C. There are others, however, deserving notice, which occur especially in the Indian Ocean, and flow one way in summer and the contrary way in winter. Others again appear and disappear in such a desultory manner that they are as yet little understood. The most interesting and important of these O. C. to Europe is undoubtedly the well-known Gulf Stream, whose temperature, higher as it is than that of the waters through which it passes, must have a considerable effect in modifying and equalising the climate of Western Europe. It would be wrong, however, to give this ocean river the whole credit for the great difference existing between the moist, temperate climate of Scotland and the cold, bleak, and frigid climate of Labrador. The prevailing W. and S.W. winds, laden with vapour due to the evaporation of the waters of the Atlantic, are perhaps as important an element in the phenomenon. The Gulf Stream is not distinguishable from the surrounding water in our latitudes, but in the earlier part of its course it is distinctly marked off, being of a deep-blue tinge, and having at its margin an evident fogbank, produced by the condensation of the water vapour as it passes from a warmer to a colder atmosphere. As it enters the Atlantic, it has a velocity of five miles an hour, and a temperature of 89° Fahr.—some 12° warmer than the adjacent sea.

The great cause of O. C. is the action of prevailing winds. The equatorial trade-winds, for instance, induce upon the ocean a surface flow; and as an outflow must necessarily give rise to an indraught, we have here an explanation, taking into account the effect which the distribution of land must have, of the generation of the great African and S. American coasting C., the occurrence of endless streams of circulating water, and the existence of the Austral C. Other causes, of course, may be at work, yet the great *general* cause is probably the effect of aerial C., which arise from differences of temperature and pressure. The rush of waters out of the estuary of some large river may be felt for hundreds of miles out to sea; differences of salinity and temperature may also give rise to ocean movements; but it seems impossible that such causes could produce streams so constant in direction and rate of flow, so river-like in their comparative narrowness, and so easy of recognition, as these O. C. are. In 1844 Captain Maury, one of the first to show the importance of charting the various C., attempted to prove the existence of a general polar set of equatorial water, accompanied by a creep of polar water along the bottom towards the equator. His reasoning was based upon the lower temperature and less salinity of polar as compared with equatorial water. But if the assumption concerning the salinity be true, it would be physically impossible for polar water to descend below equatorial water, because of the necessarily less specific gravity of the former. Dr. W. B. Carpenter, however, dropping the salinity point, has argued that there must be what he calls a *vertical* circulation of the nature above mentioned, because the sinking of the heavy polar surface-water, due to its low temperature, must be accompanied by a surface influx of a specifically lighter water, which therefore must come originally from the equator. The equilibrium is restored by the flow of the cold polar waters along the ocean-bed towards the equator. Owing to the greater velocity of rotation at the equator than at higher latitudes, this surface-set must gradually shoot ahead of the earth, and therefore have a general motion to the N.E. or S.E., according as the flux is towards the N. or S. pole; and the respective return under-surface flows must be directed towards the S.W. and N.W.

The best current-charts are those of the Admiralty, that in W. and A. K. Johnston's *Physical Geography*, the one in Stieler's *Hand Atlas*, and those in Maury's *Physical Geography of the Seas*.

Curri'e, James, M.D., the biographer and editor of Burns, was born in Dumfries-shire, 31st May, 1756, studied medicine at Edinburgh, and settled as a practitioner in Liverpool in 1781. He died at Sidmouth, 31st August, 1805. His edition of Burns realised £1400 for the benefit of the widow. A professional work, *Medical Reports on the Effects of Water as a Remedy in Febrile Disease* (1797), showed that his views on this subject were in advance of the time.

Curr'ycomb, an iron comb for currying or dressing down horses. It is made up of several notched plates fastened to an iron back parallel to each other.

Curr'y Pow'der, a condiment of East Indian origin, very extensively employed in Oriental food, and at the same time a favourite stimulant relish in European countries. It is a very complex preparation, the leading ingredients being ground capsicum and turmeric powder, to which are added ground corianders and black pepper, with occasionally cardamoms, cummin, fenugrek, &c. There are many sorts of curries, which differ not only in the C. P. used, but also in the preparation of the curry. Broadly speaking, there are four curries—Indian, Malay, Chinese, and European, of which the first two are the most palatable. Chinese and European curries are spoilt by being too liquid; they are usually of a bright yellow, whereas the Indian and Malay are of a brown colour. The Indian curry may be 'dry,' but the Malay is always served with a thick curried sauce.

Rice is taken with all curries. The European cook is satisfied with adding a few pickles to the curried meat, beef, mutton, rabbit, chicken, fish, or pork. The Chinese cook sends up, with the curry, dried fish and sliced vegetables. The Indian and Malay curries mean several curried meats with numerous additions or sambals, as they are called, each served on a little saucer by itself. Thus the curry may consist of a plate of curried fowl, another of curried fish, another of curried prawns, another of curried eggs, and others of several curried fruits, of vegetables interspersed with prawns or shrimps boiled with them, dried fish, fresh ground capsicum, raw prawns or shrimps made into a paste and mixed with cayenne, small boiled cucumbers, shaved coconut kernel, hard-boiled eggs, and pickles. The eater helps himself from the rice bowl, and then from any or all of the dishes of curried meats and sambals.

Cursing, Letters of. Previous to the Reformation letters of excommunication by the Church were termed L. of C.

Curso'res, the order of Running birds represented by the *Struthionidæ* or ostriches, rheas, emus, and cassowaries, and the *Apterygidæ* or New Zealand *Apteryx* (q.v.). This order is distinguished by the flat nature of the breastbone or sternum, by the rudimentary wings, by the length of limbs, and by their muscularity, adapting them for running. The hinder toe is wanting in all but *Apteryx;* the ostriches have two toes only, while the others have three toes. The claws are blunt nails, and the under surfaces of the toes are broadened to form soles in running. The barbs of the feathers are unconnected and loose. The pelvis (as in the ostriches) is unusually strong and firm, and in these latter birds the pubic bones unite to form a *symphysis*—a conformation seen in no other bird. The C. correspond to Huxley's division *Ratitæ*, or those birds with flat shield-like breastbones.

Cur'tilage, a legal term in England for a courtyard or piece of ground lying near and belonging to a dwelling-house, beyond which limit housebreaking cannot be said to have been committed by an intruder.

Cur'tis, George William, author and editor, was born in Providence, Rhode Island, 24th February, 1824. In 1842 he joined the once-famous 'Brook Farm Association,' and went through that curious phase of existence for eighteen months. He then proceeded to Concord, the home of Emerson and of the transcendental philosophy of New England, visited Europe in 1846, and returned to America in 1850. C. was then employed on the staff of the *New York Tribune*, and wrote *Lotus Eating* (1851); became editor of *Putnam's Monthly*; and from 1853 spent much of his time as a popular Lyceum lecturer. He also edited *Harper's Weekly* and *Harper's Monthly*. Among his other works may be mentioned *Potiphar Papers*, *Howadji in Syria*, and *Prue and I*.

Curtis'ia, a genus of *Cornaceæ* (q.v.). *C. faginea* of S. Africa furnishes the wood from which the natives make their spear or *assagay shafts*; hence the tree is usually called Assagay-tree or Hassagay-wood.

Cur'tius, Ernst, a German antiquary and philologer, was born at Lübeck, 2nd September, 1814. He studied philology at Bonn, Göttingen, and Berlin, was appointed professor at Berlin in 1844, and also, in the same year, tutor to Friedrich-Wilhelm, Crown-Prince of Prussia. In 1856 C. accepted the Professorship of Philology and Archæology at Göttingen, a post he held till 1865, when he was removed to a similar chair at Berlin. He became, after 1853, a member of the Academy of Science at Berlin, and after 1870 director-general of the museums of the same city. He wrote much, and among his works may be mentioned *Anecdota Delphica* (Berl. 1843), and *Peloponnesos* (Gotha, 1851-52), a scientific and pictorial delineation of the Greek Peninsula, embracing its history, legends, and monuments of art.—**Georg C.,** brother of the preceding, also a famous philologer, was born at Lübeck, 16th April, 1820. He studied philology at Berlin and Bonn, and gained his degree of doctor at Berlin in 1842, by an essay *De Nominum Græcorum Formatione*. He was subsequently professor at Dresden, Berlin, Prague, and Kiel, till in 1862 he was appointed Professor of Classical Philology and joint-director of the classical seminary at the University of Leipzig. He died 12th August, 1885.

Curtius, Mettus or **Metius,** according to Roman legend, was a noble youth who, when the Forum had opened in 362 B.C., and the soothsayers had declared that the chasm could only be filled by throwing into it the most valuable possession of the state, exclaimed that the greatest wealth of the state was a brave citizen in arms, and mounting his horse in full armour, leapt into the chasm, which immediately closed over him.

Curtius, Rufus Quintus, a Roman historian, author of the very inaccurate work *De Rebus Gestis Alexandri Magni*, is supposed to have lived in the time of Vespasian. The first two books of the ten of which the work originally consisted have been lost, and there are numerous gaps in the remaining eight. The first edition was printed at Venice, probably about 1471, and among the best modern ones are those of J. Mützell (Berl. 1841) and of Zumpt (Bruns. 1849; 2nd ed. 1864). Investigations as to his age have been published by Niebuhr, Büttmann, and G. Pinzger.

Cur'vature of a plane curve is the rate of change of direction per unit of length of a point supposed to be moving uniformly along the curve. It is thus seen that the C. of a circle is the same at every point, and that it varies inversely as the radius—the less the C., the larger the circle. Take any three consecutive points on the curve, and let the length of the arc between the first and third be $\delta\varsigma$, and the angle between the tangents at these two points $\delta\theta$. If the arc be very small, it may be treated as a part of a circle, when $\delta\theta$ may be taken to represent the angle between the radii of C. Hence we have ultimately, as $\delta\varsigma$ is taken smaller and smaller, $r\delta\theta=\delta\varsigma$; and therefore, taking the limit, the C. is $\frac{d\theta}{d\varsigma}=\frac{1}{r}$, where r is the radius of C. The method commonly employed for obtaining an expression for r at any point, is to find the circle which has contact of the first and second order with the curve at that point. A curved line not confined to one plane is called a curve of double C.

Curve, as defined by Euclid, is a line no part of which is straight. In analytical geometry, however, there must be some definite relation between its Co-ordinates (q.v.) which is expressible by an equation. Curves whose equations contain only powers of the co-ordinates are termed *algebraic*; but if other functions, such as sines, tangents, logarithms, enter, they are called *transcendental* curves. Curves are classified according to the *number* representing the highest power of the co-ordinates. The straight line is of the first order; the conic sections are of the second, and are called quadrics; the cissoid and witch are of the third order, or cubics; and the conchoid and cardioid are of the fourth, or quartics. For many curious properties of some of these higher curves, see Salmon's *Higher Plane Curves*.

Curves, Anticlinal and Synclinal, are geological terms applied to the ridges and troughs of undulating strata. The former are indicated by the same series of strata dipping away on both sides from an imaginary line parallel to ridges, and the latter by the same series dipping towards a corresponding line from both sides of it. Thus a valley may be, and very commonly is, really an anticlinal curve; and these C. often occur in continual succession over a plane area, so that the physical configuration of a district can be no indication of the geological structure. The imaginary lines about which the beds may be supposed to be bent are termed respectively the *anticlinal* and *synclinal axes*. Very perfect examples of these C. are found in the Swiss Jura.

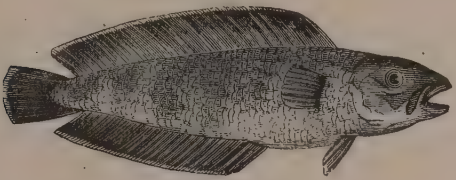
Cur'wen, the Rev. John, founder of the Tonic Sol-fa method of teaching music, was born at Heckmondwike, Yorkshire, in 1816, and educated at Coward College and University College, London. He became an Independent minister in 1838, and a few years afterwards his attention was called to the subject of teaching children music in connection with his Sunday-school. In 1841 he visited Miss Glover's school at Norwich, and afterwards tried her system with some success. His own notation and system (see TONIC SOL-FA SYSTEM) he developed gradually from this time, without any idea at first of the revolution it would effect in the musical education of the country. C. became pastor of the Congregational church at Plaistow, Essex, in 1844, and retained his charge until failing health and the growing cares of his musical work, which he felt it his duty to carry on, compelled him to resign in 1865. In 1876 he was President of the Tonic Sol-fa College, an institution founded by him in 1862 to grant certificates of proficiency in music and promote musical culture. C. devoted most of his time to the duties of this office, to the publication of the *Tonic Sol-fa Reporter*, and to spreading the knowledge and love of music among the people. He died 6th May, 1880.

His works include a *Grammar of Vocal Music*, a number of courses of lessons and exercises in choral singing adapted to different classes, a book on analytical harmony, *How to Observe Harmony*, *Commonplaces of Music*, *Lectures on Psalmody*, &c.

Curzo'la (anc. *Corcyra Nigra*, from its dark pine forests; Slav. *Karkar*), a beautiful island in the Adriatic, off the coast of Dalmatia. It is 25 miles long, with an average breadth of 4 miles; area, 68 sq. miles; pop. 16,148, chiefly engaged in the coast-fisheries. C. is still for the most part covered with wood, the pine attaining a great size and yielding excellent ship-timber. There is a town of the same name in the N.E. corner of the island with a pop. of 6093.

Cuscuta'ceæ, the Dodder order, a natural order of corollafloral Dicotyledons, considered by some as a sub-order of *Convolvulaceæ*, consisting of leafless parasitic climbing plants. There are about fifty species, included under four genera, chiefly natives of temperate climates. They possess acrid properties, and are often destructive to flax, clover, and other crops round which they climb. After the suckers get attached to the stem of the plant on which it is climbing, the dodder separates its connection with the soil. See DODDER.

Cusk, a member of the *Gadidæ* or cod family. It possesses a long body and one dorsal fin, which runs along the whole back, besides ventral fins and a barbel at the chin. The European and American Cusks are said to be distinct species. The colour of the latter is brown or yellow, or white with brown spots. This fish is from 2 to 3 feet in length, weighs from 4 lbs. upwards, and is caught off the Canadian shores. The European C. is met with between the Shetland Isles, Norway, and Iceland. The fishermen salt and dry it. It is very like the American C.



American Cusk.

Cusp (Lat. *cuspis*, 'a point'), in geometry, is a stationary point of a curve, at which there are two branches with a common tangent. When the branches are both on the same side of the tangent, the C. is *ramphoid;* when on opposite sides, *seratoid.*

Cuss'o, or **Kouss'o,** the flowers and tops of *Brayera anthelmintica*, a tree about 20 feet high, a native of Abyssinia. It belongs to the *Rosaceæ*. It was introduced into Europe about the middle of the present century, and since then has been used medicinally.

Cus'tard (Cymr. *cwstard*, from *caws*, 'cheese' or 'curd;' comp. Lat. *caseus*), a kind of pudding prepared from milk and eggs well whipped up together, and allowed to *set* by the application of heat. The dish is flavoured by the addition of aromatic essences, such as lemon-peel, orange-peel, almond, nutmegs, &c. It is highly digestible and nutritious, and as it takes the most delicate flavours, it can be rendered exceedingly pleasant.

Custard-Apple, the name given to the fruits of various species of *Anona*, S. American and W. Indian shrubs and trees, types of the order *Anonaceæ*. Several are cultivated for the sake of their fruits. The sour-sop of the W. Indies, which often weighs 2 lbs., and has an agreeable acidulous flavour, is the fruit of the prickly Anona. The sweet-sop is a native of the Malay Islands, but is now extensively cultivated in the W. Indies. Its luscious pulp is esteemed by some tastes, and the seeds contain an acrid principle fatal to insects, on which account the natives of India use them powdered and mixed with the flour of the gram as a wash for the hair (Royle). The cherimoyer is considered by the Peruvians as the most delicious fruit in the world. The common C.-A., or bullock's heart, is a native of the W. Indies, but is cultivated in the E. Indies and other tropical countries; it is not so much valued as the other fruits of the genus. The C.-A. is also valued for its fragrant leaves and aromatic woods. The wood of the alligator-apple is used in place of cork; the fruit has a pleasant taste, but is dangerous to eat on account of its narcotic properties; this is the marsh A.

Custard Apple.

Cus'tom. In law, the word is applied to general or local usage. In the former case it falls to be determined by a judge, in the latter by a jury. When the right of an individual arises from usage, it is not called C., but Prescription (q.v.). Uniform C. has almost the same legal effect as statute. C. must be one which, in the memory of man, is without its contrary, has been continued, is peaceable, compulsory, reasonable, sure, and consistent with other customs.

Cus'tomary Freehold is, in English law, a kind of tenure of estate practically the same as Copyhold (q.v.). It is also called copyhold in frank tenure or privileged copyhold. It is held by custom and not, as copyholds are, at the will of the lord, which, however, is of no real importance now. A C. F. passes by conveyance, or surrender, and admittance.

Customs Duties are duties levied on commodities exported or imported. They were first authorised by statute (chiefly on wool, sheep-skins, and leather exports) in the 3rd Edward I., and the mode long employed in their collection was to fix a certain rate of value on each kind of merchandise, and to grant on these rates a subsidy, generally of 1s. per £1 of value in the book of rates. Aliens paid duties. In time the customs became tonnage and poundage; the former on wine, the latter on all other goods. These meant in fact a duty of 5 per cent. on everything which when granted to the Crown were known as *subsidy.* William III. obtained a subsidy of 10 per cent. Dues were fixed on certain things in the reigns of Charles II. and George I., while other dues remained or were imposed irrespectively of these. The whole system remained one of great uncertainty and inconvenience until the Customs Consolidation Act of 1787 abolished all duties and fixed a single duty on each commodity, &c. Further amendments and consolidations were effected by subsequent acts. Importation of the following articles is prohibited under penalty of forfeiture or destruction of the commodity:—Copyright books; extracts or essences of coffee, chicory, tea, or tobacco; immoral books, prints, and similar articles.

Persons may be searched, and severe penalties are enacted against any endeavour to contravene or evade the law. Offering to bribe or reward a customhouse officer is prohibited under a penalty of £200.

The British revenue for the year ending 31st March, 1895, was £82,551,191 (net), of which there was derived from customs £20,115,000 (net).

Legislation regarding customs has various and formidable difficulties to contend with. In the first place, while the exigencies of the Public Revenue (q.v.) make it impossible to dispense with customs, the principles of Free Trade (q.v.) must, in imposing them, be as little contravened as is consistent with that exigence. Then the duty must not be raised to a height which will discourage lawful importation, and make smuggling remunerative. To do this is a double evil—it causes loss to the revenue, and demoralises the people.

Cus'tomhouse is the office at a seaport—or abroad at a frontier or seaport—where the Customs Duties (q.v.) are levied. The collection and management of the customs of the United Kingdom are under the control of a department called the Customs Establishment, at the head of which are a chairman, deputy-chairman, commissioner, and secretary. For the year ending 31st March, 1895, the total cost of all the establishments in connection with the Customs was £835,000.

Cus'tos Rotulo'rum, a principal county justice of the place, who appoints the clerk of the peace and keeps the rolls and records of his county.

Cuth'bert, a monk of Jarrow, who wrote the letter containing a graphic and touching account of the death of the Venerable Bede. C. had been a disciple of Bede, and became afterwards Abbot of Jarrow. His letter is printed in Stevenson's edition of the *Historia Ecclesiastica* of Bede (Lond. 1838). The English reader will find it in Bohn's translation, edited by Dr. Giles.

Cuthbert of Canterbury, a Mercian bishop, obtained the see of Hereford in 736, became Archbishop of Canterbury in 740, and died in 758. He is memorable as the author of a letter to St. Boniface (q.v.) dealing with Church corruptions, which is reprinted in Hussey's edition of Bede's *Historia Ecclesiastica* (Oxon. 1846).

Cuthbert, St., of Durham, the Apostle of Northumbria, was born about 635. He was a native of Bernicia, that district lying between Tweed and Tees, and passed his boyhood at the little lowland village of Wrangholm, on the southern edge of the Lammermoors. The early years of C. gave his character a distinctive bent. He was a shepherd—a seer of visions, as shepherds have been in all ages. As he tended his flock by night, the heavens seemed to open above him, and a crowd of bright angels winged upwards, bearing the soul of St. Aidan to glory. This wonder befell him in his fifteenth year; a nature like his, fervid and simple, was impressed profoundly, and he desired eagerly to become a monk. C. accordingly entered the monastery of Melrose, an offshoot from the older house at Lindisfarne. The youth, however, was no dreaming visionary, but an earnest worker. The semi-heathen people that surrounded him woke his missionary ardour, and he ministered for years among the Northumbrians with equal patience and zeal. Leaving Melrose, he shifted his sphere of labour southward. The Council of Whitby, by its decision that Roman ecclesiastical rule should be adopted by the English Church, caused bitter dissensions in the religious houses. Wearied with these strifes, C., who had become Prior of Lindisfarne, withdrew in 676 to a barren islet off the Northumbrian coast. Building with his own hands a rude hut of turf and driftwood, he wished to end his days as a hermit on this lonely rock. His former career had been one of active effort in spreading his faith, and now he felt that his closing span would best be given up to meditation and prayer. But the fame of his sanctity did not allow C.'s recluse life to continue. Ecgfrith, king of the Northumbrian English, was an ambitious monarch, warring against the Pictish Britons of the N. The presence in his dominion of a man so saintly as C. would certainly bring success, therefore he besought him to return. Bishop Trumwine, whom the Picts had driven from his see, added his entreaties. The venerable saint consented reluctantly, and in 684 again became Bishop of Lindisfarne. Next year King Ecgfrith marched against the Picts, and was defeated and slain at Nechtansmere. C. was said to have foreseen and foretold the disaster. He resigned his bishopric in 687, and retired to the island where he had lived as an anchorite. There he died two months after. A monk of Lindisfarne saw from the watch-tower of his monastery a light on the lonely islet of St. C., which was the appointed signal that the old man was no more. His remains were taken to Lindisfarne, and being found incorrupt at the end of eleven years, the belief arose that so they would continue. Danish attacks forced the monks to bear their precious relic inland, and in 945 it was taken to Durham, where it was thought to work many miracles. After the Reformation the coffin was buried under the cathedral pavement, and remained there till 1827, when it was opened, and the bones of the saint were found.

The character of St. C. resembles strongly that of Columba, only that the former was more of an ascetic. Both were evangelists of an eminently practical nature; neither was distinguished for scholarship or erudition. St. C. was a spiritual enthusiast, and yet a man of strong, firm mind. The union of these qualities gave him his great influence over his countrymen. The reverence bestowed on him in lifetime lasted for generations after he was gone. The Church held as a festival the anniversary of his death, and a cloth which he was said to have used in celebrating mass was carried as a standard by English armies. St. Edmund, St. Thomas-à-Becket, and St. C., rank together as the three foremost saints of the mediæval English Church.

None of the early English ecclesiastics have had so much light thrown upon their lives, both by contemporary records and by later investigation, as St. C. Bede has left an account of him both in verse and in prose. There is also a *Historia Translationis Sancti Cuthberti* preserved in the *Acta Sanctorum*, vol iii., and two works, one a *Life* the other an account of his miracles, by Reginald of Durham. More recent biographies are those of Raine (*St. C.*, Durh. 1828) and of Eyre (*History of St. C.*, Lond. 1849). An interesting sketch of St. C. is given in Green's *Short History of the English People*.

Cu'ticle (Lat. *cuticula*, dim. of *cutis*, 'the skin'), the epidermis or uppermost layer of the skin. It is composed of layers of epidermic cells, which become more and more flattened from the surface of the true skin outwards, until on the surface they form hard dry scales. See SKIN.

Cutis Vera, the true skin, covered by the epidermis, and resting on close connective tissue, in the meshes of which there are often numerous fat cells. See SKIN.

Cut'lass (Fr. *coutelas*, Old Fr. *coultelas*, from Lat. *cultellus*, dim. of *culter*, 'a knife'), a broadsword used by sailors in hand-to-hand encounters. It is about three feet long, is very heavy, and has only one cutting edge.

Cut'lery (Fr. *coutellerie*, from *couteau;* Old Fr. *coutel* and *coltel;* Lat. *cultellus*, dim. of *culter*, 'a knife'), a term under which is included cutting instruments such as pocket and table knives, forks, scissors, razors, scythes, sickles, and machine knives generally. The cutting instruments which were used by the primitive inhabitants of the world, before metallurgical operations were understood, consisted of sharp-edged flakes of flint or other hard stone, which they fashioned with wonderful neatness. Remains of such flint-knives are very abundant. Cutting implements of iron or steel were not fabricated till after a kind of bronze had been long used for the making of knives and all other metallic implements. From very remote times the manufacture of C. has been identified with the town of Sheffield, which to the present day stands at the head of all centres of this industry. Its fame was widespread even in the days of Chaucer, who mentions its peculiar manufacture—

> 'A Shefelde thwittle bare he in his hose.'

The processes through which a piece of C., such as, for example, a razor has to pass, are very numerous, when we consider the low price at which such articles are sold. A razor, selling with case complete for one shilling, has to undergo the following series of operations:—A piece of rolled cast-steel sufficient for the blade is cut off a rod. It is heated and hammered into the rough form of the razor, in which state it is called 'the mould.' The 'tang' is next hammered into shape, and a hole pierced in it for riveting the blade into the scales. It is thereafter 'smithed'—*i.e.*, heated and hammered—into proper shape, and the name and mark of the maker is stamped on it. Next the blade is hardened by heating and sudden plunging into cold water; it is ground at the tip, the back is rounded, the tang finished with the file, and a file-surface given to the inside of the tang. It is then ground on a grindstone, and polished on a wheel covered with buff leather, when it is ready for putting into the scales. The scales of cheap razors are made of horn-tips, which are first shaved and scraped, and next moulded into shape by heat and pressure in moulds of the proper form. These are thereafter polished on the buffing-wheel; the blade is riveted in, and the razor is thus complete. Table-knives go through an analogous series of processes, but there are many different ways of forming and fastening the tang into the handles. In the making of steel forks, a 'web' of steel is beaten out of the required breadth and thickness, and by a powerful stamping-press the prongs are stamped in this web. The piece is then annealed and the prongs cut out of the stamped web. After grinding and pointing, the prongs are opened out, filed, and smoothed. They are then set into their proper position, hardened, ground on a dry stone, glazed, and burnished on a buffing-wheel, when they are ready for handling the same as knives. The tang in forks and knives is usually made of iron, which is welded on to the steel at an early stage of the process. Of recent years machinery has been adapted to the moulding of knives, &c., and in such cases steel is used for the tang as well as the blade. The dry grinding of C. is a peculiarly unhealthy occupation, owing to the particles of steel and silica settling on the lungs and originating 'grinder's asthma.' Many means have been tried to obviate this great evil, often much against the will of the grinders, who prefer short life and high pay to good health and fair wages. The most efficient preventive has been found to be a powerful blast created by fans, drawing away the minute particles by a channel having an opening over each grindstone. Even with this amelioration, and with wet grinding itself, the occupation of grinders remains unhealthy, and the average duration of their lives is much under that of men employed in ordinary healthy trades.

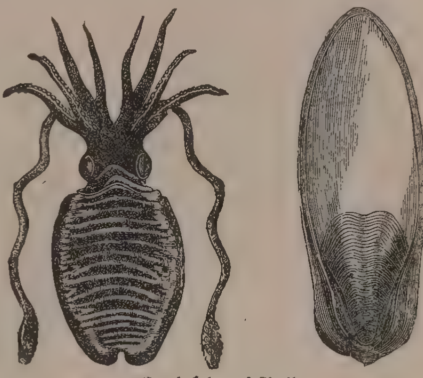
Law as to Cutlery.—By 59 Geo. III. c. 7, articles of C. manufactured with the hammer may be stamped with the *figure of a hammer*, any time after the forging, and previous to the grinding or polishing. Using such device on C. not made with the hammer subjects it to forfeiture, and any one having it for the purpose of sale, or selling it, or exposing it for sale, is liable to a penalty of £5. Furthermore, the penalty is fixed at £5 per dozen for any number of such improperly stamped articles over and above 12 in his possession. Any one stamping on C. the word *London* or *London made*, or words of similar import, unless the article is made in London or within 20 miles of it, or having an article so stamped for the purpose, &c., is liable to a penalty of £10, with forfeiture of the article, and £10 for every dozen of such articles over and above 12 in his possession.

Cuttack' (*Kataka*, 'the fort'), the capital of an executive district of the same name, and capital of the province of Orissa, province of Bengal, India, at the beginning of the Mahanadi delta, 230 miles S.W. of Calcutta. It has little trade, its natural commercial advantages being neutralised by the periodic flooding of the river, to guard against which it is banked round. C. is connected with Calcutta by an irrigation canal. Pop. 47,186. Orissa College is here. C. dated from the beginning of the 11th century, when it was founded by the Long-haired or Lion dynasty, and has continued to be the seat of government ever since. Its position among the canals and hills renders it important, yet its only manufacture is gold and silver filigree work. The *district* is subject to the same vicissitudes as the town, has little trade, but contains iron ore. Area, 3633 sq. miles; population, 1,937,671. The other chief towns are Jajpur (11,992) and Kendrapara (17,647).

Cutt'er (so called from its *cutting* the water in its swift motion) is a small sailing vessel having one mast and is rigged like a Sloop (q.v.). In the navy, a C. is a large Clinker-built (q.v.) boat, of which every man-of-war has at least two.

Cutt'ings are portions of the branches of trees and shrubs inserted into the ground, and which, by sending forth adventitious Roots (q.v.) from the stem, enable the cutting to take root in the ground, and produce a tree or shrub the same as that from which it was taken. It is essential to success that a bud should be left on the cutting, and that the bark should not be stripped off in pushing it into the soil.

Cutt'lefish, the name applied popularly to any member of the Molluscan class *Cephalopoda* (q.v.), in which the body is enclosed in a muscular mantle-sac, the gills being two or four in number, and the effete water of respiration being ejected by an *infundibulum* or 'funnel.' Cuttlefishes are divided into four-gilled, or *Tetrabranchiate*, and *Dibranchiate*, or two-gilled forms. Of the four-gilled forms, the Pearly Nautilus, with its numerous arms, destitute of suckers, its external many-chambered shell, and its want of an ink-sac, is the only living example. The latter group includes all other living cuttlefishes together with the extinct *Belemnites* (q.v.). The *Ammonites* (q.v.) and allied forms are extinct cuttlefishes belonging to the Tetrabranchiate section. Gigantic cuttlefishes have been met with of late off the Irish and N. American coasts. The shell in two-gilled cuttlefishes is internal, and exists as the 'pen' or 'cuttle-bone.' In the Argonaut or paper-nautilus, the shell is external, but it is not a true shell, being secreted by two of the arms, and not by the *Mantle* (q.v.). The two-gilled cuttle-fishes are able to seize prey by means of the numerous *acetabula* or suckers with which their arms are provided.



Cuttlefish and Shell.

Cu'vier, Georges Chrétien Léopold Dagobert, was born at Montbeliard, 23rd August, 1769, where his father had retired after serving with distinction in the French army of the Seven Years' War. His taste for natural history is said to have been first excited by a copy of *Buffon*, the illustrations of which he was copying. By the kindness of the Würtemberg family he obtained a university education at Stuttgart, where he studied natural science in the *Cameralwissenschaft*, or Administrative Science Department of the Academia Carolina. An engagement as tutor in a noble French family living on the coast of Normandy, where he remained from 1788 to 1794, gave C. an opportunity for personal observation of marine animals, which led him to the systematic study of anatomy. A correspondence with Geoffroi St. Hilaire drew C. to Paris, where he made the acquaintance of such men as Lamarck, Jussieu, &c., and was appointed a member of the Commission of Arts and Professor at the Central School of the Panthéon. From this he became Professor of Comparative Anatomy at the Museum, then at the Collége de France, then at the Jardin des Plantes. He also lectured at the Athenæum. C. and St. Hilaire produced together the celebrated *Mémoires sur une Nouvelle Division des Mammifères*, and several others, in which the Linnæan classes of *insecta* and *vermes* were divided into molluscs, insects, vermes, echinoderms, and zoophytes; molluscs being subdivided into cephalopods, gasteropods, and acephala. C.'s celebrated *Leçons d'Anatomie Comparée*, delivered at the Museum, contain the theory of a rational harmony between different organs and their functions, leading to a division into four great types, which was afterwards fully developed in the *Règne Animal distribué d'après son Organisation*, published in 1816. Special lines of inquiry were directed to the systems of digestion and circulation in molluscs, and to fossil remains generally. Especially in the latter inquiry his theory of rational harmonies was of use in filling up the connections between isolated remains, as in his determination of the species of elephants from observation of the teeth and lower jaw and of a drawing of the skulls; also in his classification of the fossil remains of Montmartre. Important services were thus rendered to palæontology and geology, C. and Brogniart making a joint study of the geological conditions of animal life, which the former summed up in his *Recherches sur les Ossemens Fossiles* (1812), to which his *Discours sur les Révolutions du Globe* is an introduction. The *Règne Animal* was intended to furnish not only the outlines of a true classification, but to apply principles so established to all existing groups: the latter design was partly carried out in the *Histoire Naturelle des Poissons*, a work in which C. was assisted by Valenciennes, and in which above 5000 species of fish are described. In the meantime public honours flowed in upon him. He became perpetual secretary to the Institute of the Department of Natural Sciences, an inspector-general for establishing the well-known French *Lycées* or public schools; he drew up the report of 1808 upon Natural Sciences; he was sent on important educational missions to Italy, Holland, and the Hanseatic towns. Before the abdication of Napoleon he was made a councillor of state, and under the Restoration monarchies he held high posts in the bureaux of Education and Public Worship, and as President of the Committee of the Interior for the last thirteen years of his life he effected many useful reforms in the teaching institutions of France. After the Revolution of July he was made a peer. He died 13th May, 1832. In politics C. occupied the position of a moderate Liberal. The closing years of his life were marked by a keen controversy with St. Hilaire, who maintained that real analogies existed even between molluscs and vertebrates, and also that species were variable. See Lee's *Memoirs of Baron C.* (Lond. 1833), and Pasquet's *Éloge de C.* (Par. 1833).

Cuxha′ven, or **Kuxhaven,** a town of N. Germany, in the amt of Ritzebüttel, belonging to Hamburg, is situated at the mouth of the Elbe, on its left bank, 65 miles N.W. of Hamburg by railway. It has a good harbour, a lighthouse, bathing establishments, and is the port from which the Hamburg steamers ply in winter when the Elbe is frozen over. Pop. 8249. In and near C. are five strong forts.

Cuya′ba, the capital of the province of Matto Grosso, Brazil, on a river of the same name, a tributary of the Paraguay, is a naval and military arsenal, has several churches, a hospital, a theological school, &c., and some export trade in gold, diamonds, ipecacuanha, and hides. Pop. 14,096.

Cuyp or **Kuyp, Albert,** one of the most distinguished painters of the Dutch school, the son of Jacob or 'Old' C., a landscape and portrait painter, was born at Dordrecht in 1605. He painted landscapes with cattle, moonlights, winter pieces, canal scenes, &c., and all of them with splendid success. De Waagen says of him—'In elevation of conception, knowledge of aërial perspective, with the greatest glow and warmth of the serene atmosphere, C. stands unrivalled, and may justly be called the Dutch Claude.' It is easy to distinguish in his pictures the time of day intended to be represented. The most ardent collectors of examples of C. have been Englishmen, and the majority of his works—which within the last century have wonderfully increased in value—are in English public and private collections. The precise date of his death, which took place after 1683, is unknown.—**Benjamin C.,** his nephew, painted historical *genre* pictures with much power.

Cuz′co (the 'navel' or 'centre'), the second town of Peru, formerly the seat of the Incas and capital of their empire, situated amid magnificent scenery in the valley of a lofty tableland, at the height of about 12,000 feet above sea-level, and at the distance of over 400 miles E.S.E. of Lima. Its valley is watered by the Gautanai, one of the extreme head-waters of the Amazon. The town, which is regular, is the seat of a bishop, of a so-called university and several schools, a museum founded in 1848, and two hospitals. Among the remains of the Old Peruvian empire are the ruined walls of the temple of the sun and the ruins of the palace of the Incas at the foot of the hill of Sacsahuaman. The citizens produce excellent goldsmith's and lace work, carvings, and cotton and woollen cloth. Sugar-refining, soap-making, &c., are carried on. Agriculture is the chief employment, and the country around is as fertile as it is beautiful. The climate is agreeable and healthy. For an account of the wealth and magnificence of ancient C., see Prescott's *Conquest of Peru*, an authority, however, which certain recent writers have ventured to consider not quite trustworthy. Pop. 28,376.

Cuzco.

Cyan′ic Acid, a liquid substance best obtained by distilling its polymer, Cyanuric Acid (q.v.). C. A. has a very pungent smell, recalling that of acetic acid, and exercises a corrosive action on the skin. When kept for a short time, it suddenly becomes a white crystalline mass of cyamelide. C. A. is a monobasic acid, and forms crystalline salts in which its hydrogen is replaced by metals. When its vapour comes in contact with dry ammonia gas, a white crystalline powder, the cyanate of ammonium, is formed.

Cyan′ogen, a compound of carbon and nitrogen, was discovered in 1813 by Gay-Lussac. It is best obtained by heating its compound with mercury (cyanide of mercury). C. is gaseous at ordinary temperatures, but may be condensed to a liquid by subjecting it to cold or pressure. It has an odour recalling that of bitter almonds, and burns when ignited with a very characteristic peach-coloured flame. It is soluble in water and alcohol. Its solutions, when kept, deposit a brown substance called Para-C., a body having the same percentage composition as C. itself, but probably polymeric with it. (See POLYMERISM.) C. is interesting as affording an excellent instance of a *compound radical* or group of elements behaving like a single element. In its chemical relations it closely resembles chlorine, as will be seen by an inspection of the formulæ in the article on Chemistry.

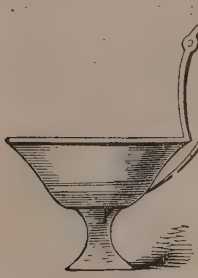
Cyano′sis (Gr. 'blueness' or 'blue disease') is a condition in which there is a blue or purple colour of the skin, due to an admixture of venous and arterial blood, depending in most cases on a malformation of the heart. See HEART, MALFORMATION OF.

Cyan′otype, a photographic process discovered in 1842 by Sir John Herschel, in which sensitive paper is prepared by washing in a solution of citrate of ammonia and iron, and after exposure in the camera, the image is developed by means of a solution of ferrocyanide of potassium, which produces a violet-tinted picture. A solution of carbonate of sodium acts as a neutralising agent and fixes the image.

Cyanu'ric Acid is a white crystalline substance, and a *tribasic* acid, forming crystalline salts in which one, two, or three atoms of its hydrogen are replaced by metals. When strongly heated, C. becomes converted into Cyanic Acid (q.v.).

Cyath'ea, a genus of tree ferns, abundant in S. America, the W. Indies, India, the Malay and Pacific Islands. Some are lofty, and cultivated in our conservatories and gardens. The pulp within the trunk of two fine species of New Zealand and the Pacific Islands is eaten by the natives of these countries.

Cyath'us, a one-handled drinking cup, which the Greeks were in the habit of using also as a ladle whenever they wished to serve the feasters with the wine from their large mixing bowls.



Cyathus.

Cyb'ele, a genus of Trilobites (q.v.) belonging to the family *Cheiruridæ*, in which the body segments number eleven, the caudal shield being composed of few segments. They are found as fossils in the rocks from the Upper Cambrian to the Devonian series, most plentifully in the Silurian system.

Cybele. See Rhea.

Cycada'ceæ, or **Cyca'deæ,** a natural order of Dicotyledonous, small, palm-like, unbranched trees or shrubs, allied to the *Coniferæ* (q.v.), natives chiefly of the temperate and tropical regions of America and Asia, and also of the Cape of Good Hope, Madagascar, and Australia. There are about fifty species and seven genera, of which *Cycas*, *Dion*, *Encephalartos*, and *Zamia* are the best known. The stems and seeds of the plants of most yield mucilage and starch—*e.g.*, inferior sago, prepared from the stems of Cycas of the Moluccas and Cycas of Japan, the latter being known as Japan sago, though none of it is imported into Europe. The seeds are edible, and from those of *Dion edule* the Mexicans prepare arrowroot. *Encephalartos* is Caffre-Bread (q.v.). Arrowroot is obtained from the stems of *Z. integrifolia*, of the Bahamas and other W. Indian islands, though not exported to Europe. Many species of Cycas are found fossil in formations later than those of the Coal measures, such as the Oolite, &c.

Cycadaceæ.—Cone and leaf.

Cy'chla, a genus of Teleostean fishes found in the rivers of S. America, and belonging to the family *Chromidæ*. The typical fishes of Brazil and Guiana belong to this genus. The teeth are minute, but closely set in the mouth, and the colours are very varied and brilliant. The genus *Chromis*, of which the *C. Niloticus* of the Nile is an example, is nearly allied to C. The chromis of the Nile is about two feet long.

Cycla'men, a well-known and distinct genus of perennial herbs belonging to the natural order *Primulaceæ*, with beautiful flowers, heart-shaped leaves, and round, tuber-like root-stocks. Most of them are natives of the S. of Europe, though the genus extends to N. Africa and Western Asia. The fleshy root-stocks, though acrid, are eagerly sought after by swine; hence the plant is known in the popular language of various countries as 'sow-bread.' A stimulant ointment is prepared from the roots of the ivy-leafed C. which, when applied externally by friction, is reputed a powerful vermifuge for children. The active principle of the genus is *cyclamine*, which acts on the animal system like Curarine (q.v.). Many of them are cultivated in our gardens as spring flowers.

Cy'cle (Gr. 'circle'), a name applied, chiefly in astronomy, to a period or interval of time, after the passing of which the same phenomena occur in the same order and circumstances as they did throughout the former period. Cycles are only approximately correct, since the periodic time of no known natural phenomenon is commensurable with our day. The more important articles are mentioned under the special headings Golden Number, Indiction, Metonic Cycle, Period, &c.

Cyclobranchia'ta ('circle-gilled'), a term sometimes used in the classification of Gasteropodous (q.v.) mollusca, and applied to those forms in which the gills are placed in a circular manner round the body, and generally between the 'Foot' and 'Mantle' (q.v.). The cyclobranchiate arrangement is well seen in the Limpets (q.v.), and Chitons (q.v.).

Cy'cloid ('circle-like'), the curve generated by a point taken upon the circumference of a circle rolling along a given straight line. It has many interesting and curious properties, some of which are proved simply and neatly upon kinematical principles in Thomson and Tait's *Elements of Natural Philosophy*, part i. s. 104. Its evolute is an equal and similar C.; its area is three times that of the generating circle; it is the curve of swiftest descent from one point to another not in the same vertical line; and a heavy body sliding without friction down the arc of an inverted C., under the action of a constant force, will take exactly the same time to reach the lowest position, from whatever point of the curve it starts. Huyghens applied this property to obtain a perfectly isochronous pendulum.

Cycloid Fishes, or **Cycloi'dei,** and **Cycloid Scales,** the name applied to the commonest variety of fish-scales, seen in most of our familiar fishes (*e.g.*, salmon, herring, &c.), each scale consisting of a horny plate of more or less rounded form. The outline is smooth, or at most wavy. Agassiz called such fishes *Cycloidei*, but his arrangement has not been followed. Most Teleostean fishes, but not all, are *Cycloidei*.

Cyclope'an Ar'chitecture is the name given to walls of massive unhewn stones, because in ancient Greece such walls were fabled to have been built by the Cyclopes (q.v.). There are remains of these walls on the sites of Tiryns, Mycenæ, and other places in Greece, Asia Minor, Italy, and Sicily. They are built of huge, uncemented blocks, which are generally, as at Tiryns, of irregular polygonal shape, not fitted together, but having the gaps between them filled with small stones. Occasionally, as at Larissa, the stones are smooth and fitted into each other. At Mycenæ the blocks are comparatively regular, and are arranged in horizontal lines. These structures are thought to be Pelasgian, but nothing certain is known of their origin. They are alluded to by Homer, who speaks of the 'walled Tiryns,' and 'the well-built Mycenæ.' The C. A. of the ancient Etrurian towns was probably Pelasgian. Parts of the C. A. of Cortona remain, one fragment being 120 feet high. The name C. A. can be extended to various structures in America and Asia, as to the walls of Cuzco in Peru, and to the ruins of the citadel of Persepolis. The *duns* or hill-forts of Britain are likewise specimens of C. A.

Cyclo'pes (Gr. 'circular-eyed'), in Greek mythology, a gigantic race of shepherds, dwelling on the S.W. coast of Sicily, first mentioned in the *Odyssey* (ix.). They were cannibals. Their chief, Polyphemus, is described as having but one eye in his forehead. Hesiod mentions only three C.—

Brontes ('Thunderer'), Steropes ('Lightning-Flasher'), and Arges ('the Bright' or 'Fiery'), also one-eyed, who were the sons of Uranus and Gæa, and forged thunderbolts for Zeus. For having provided him with that with which he slew Asclepius they were themselves killed by Apollo. Later they are represented as the servants of Hephæstus, with their workshop in Ætna. The C. to whom the walls known as Cyclopean are attributed (see CYCLOPEAN ARCHITECTURE) were considered by Plato as merely types of uncivilised man. Cox (*Manual of Mythology*) compares them to the Trolls or Frost-giants of Northern mythology.

Cyclo'pia, a genus of S. African shrubs of the order *Leguminosæ.* The leaflet of *C. genistoides*, a plant cultivated in our greenhouses, is called the 'bush tea,' from its agreeable tea-like smell. A decoction of it is used as an expectorant in chronic catarrh and consumption.

Cy'clops, one of the best-known 'water-fleas,' or Entomostracous Crustacea (q.v.), included in the order *Copepoda* of that class. The head and chest are protected by a carapace. The feet number five pairs. Each foot has divided extremities and is provided with hairs. The eye is single, and two pairs of antennæ exist. The females carry the eggs in two external *ovisacs.* The young pass through a metamorphosis. These forms occur plentifully in our fresh-water lakes and streams.

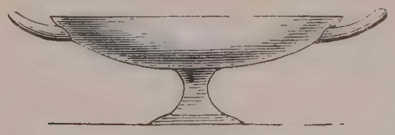
Cyclo'sis ('circulation'), the movement of the latex or milky sap in the lactiferous, or milk-vessels, of various species of plants. The assertion that this movement is merely mechanical, from one part to another when the plant is injured and the juice is allowed to escape, is, in all likelihood, erroneous, for the movement can be well seen if the undersurface of the leaf of Celandine (q.v.), the bracts of the common bindweed, the lower surface of the split stipules of the Indiarubber plant, &c., be put under the microscope, and a strong reflected sunlight be thrown on it. The movement is sometimes very rapid, at other times slower; and the direction of the circulation can be changed at will by the interception of the sunlight. It is not the result of evaporation. (Brown's *Manual*, p. 44.)

Cyg'net, the name given to young swans.

Cygnus, a northern constellation, one of whose stars, Deneb, forms with Vega and Polaris a brilliant right-angled triangle.

Cyl'inder ('a roller'), the general name for a surface generated by a straight line moving parallel to itself. The sections by a series of parallel planes are similar and equal. If the section by a plane perpendicular to the generator be an ellipse, then there will be two different series of parallel planes, whose sections are circles. These are termed the *subcontrary* sections. When the perpendicular section is a circle, we have the *right C.* of Euclid.

Cylix, a wine-bowl at one time in use among the Greeks. The body was both wide and shallow. It possessed a foot and two handles, and its sides were often profusely ornamented.



Cylix.

Cy'ma (Gr. *kuma*, 'anything swollen,' 'a wave'), in architecture, a wavy-lined moulding, consisting of a hollow and a round. The *C. recta* has the hollow above the round; the *C. reversa* has the round above the hollow. They are called *ogees.*

Cym'bal (Gr. *kumbalon*, from *kumbē*, 'the hollow' of any vessel), a musical instrument of percussion, consisting of two metal plates which can be struck against each other. The C. is of very great antiquity.

Cym'ophane (Gr. *kuma*, 'a wave,' and *phainō*, 'I make to appear,' 'I display'), a variety of Chrysoberyl (q.v.), which shows a milky opalescence or 'wave of light,' and is much prized, when cut *en cabochon*, by jewellers, who call it *opalescent chryosolite.*

Cym'ric, or **Kym'ric, Language and Literature.** The Cymric, as well as the Gaelic branch of the Celtic language, shows the peculiar characteristic, the *differentia*, of the Celtic—*i.e.*, changes on the beginning as well as on the ending of its words; but though these changes differ so much in each of the dialects into which Cymric is subdivided as to warrant their being classed separately, the general resemblance of the laws which regulate them is sufficiently strong to prove them all to be of one family. See Rhys's *Lectures on Welsh Philology.*

The Cymric is divided into three branches—Welsh proper, Cornish, and Breton or Armoric. The English public knew almost nothing of any literature contained in these languages until Edward Lhuyd, an accomplished scholar, published in 1707 his *Archæologia Britannica*, showing that in Welsh many ancient treasures were preserved. His work excited very little attention at the time. In 1764 the Rev. Evan Evans, and twenty years later E. Jones, published specimens of the old poems of Wales, accompanied with English translations. Two Scotchmen, Laing and Pinkerton, who had taken a very prominent part in denouncing the Gaelic Ossian as a forgery, denounced the Welsh bards in the same style, and were listened to, although they were profoundly ignorant both of Gaelic and of Welsh. Sharon Turner answered them with considerable ability in his *Vindication of the Genuineness of Ancient British Poems* (1803). In 1801 Owen Jones, a native of Myvyr, in Wales, who devoted much time and money to the illustrating of his country's literature, published a collection of great extent and value under the title of *The Myvyrian Archæology of Wales.* Two accomplished writers, Stephens (*Literature of the Kymry*, 1840), and Nash (*Taliesin, the Bards and Druids of Britain*, 1858), laboured hard to prove that the great majority of poems published by him are spurious, while they admitted a few to be genuine and ancient. The question, however, has been conclusively disposed of by W. F. Skene, who in 1868 published the *Four Ancient Books of Wales*, with a translation and a learned and exhaustive dissertation. He assigns the poems ascribed to the four great bards, Taliesin, Aneurin, Llywarch Hen, and Myrddin, to the 7th c., and considers that they were written down at various periods from the 12th to the 15th centuries. There are no traces of poetic composition from the 7th to the 12th centuries preserved, but during the next two centuries great literary activity manifested itself both in N. and S. Wales, and the writings of no fewer than seventy-six authors are handed down in circumstances which forbid any question of their genuineness.

It is worthy of remark that, in the old poems, Arthur (q.v.) is spoken of without romance or extravagance as the Guledig, or war-leader, who fought many successful battles against the enemies of his country, while in the later ones the popular romances concerning him are found full-blown. Much of the Welsh literature is of great historical value, and the Welsh deserve praise beyond any of their Celtic cousins elsewhere for still publishing newspapers and periodicals in their native tongue.

Little need be said of the Cornish dialect of the Cymric. It was spoken in Cornwall until after the middle of last century. The English has, however, entirely displaced it, and it is chiefly through the *Archæologica Cornu-Britannica* of Dr. Pryce, published in 1790, that a knowledge of it must now be sought.

The Armoric or Breton is still spoken by a numerous people in the N. of France, and is much better known. See *Breton Literature* under BRETAGNE.

Cynan'che (Gr. *kuōn*, 'a dog,' and *agcho*, 'I strangle'), an inflammatory disease of the throat. See THROAT, DISEASES OF.

Cynan'chum, a genus of S. American, Malayan, and

Mediterranean herbs belonging to the natural order *Asclepiadaceæ*. Montpellier, or French scammony, a violent purgative, is in the juice of *C. Monspeliacum* mixed with other purgative substances; and the sap of *C. ovalifolium*, a native of Penang, supplies good caoutchouc. The leaves of *C. Argel* are used to adulterate Alexandrian senna.

Cyn'ics, a philosophic sect founded in the 4th c. B.C. by Antisthenes (q.v.), an Athenian and disciple of Socrates. The C. were so called either from the Cynosarges, a gymnasium where their founder taught, or from the Gr. *kunikos* ('doggish'), because of their snarling captiousness, or of the bestiality into which they sank. Their tenets were Socratic in so far as they advocated ethical in opposition to physical inquiries. They made virtue synonymous with self-denial and contempt of fortune. Their bracing but narrowing teaching appeared in nobler form in the Stoical school. Among the most famous C. were Diogenes (q.v.), Crates, and Menippus.

The effigy over the marble pillars raised by the Athenians to the memory of Diogenes was a dog, with the following inscription beneath it:—

> '"Say, dog, what guard you in the tomb?"
> "A dog." "His name?" "Diogenes." "From far?"
> "Sinope." "He who made a tub his home?"
> "The same—now dead, among the stars a star."'

Cynocephali (Gr. *kuōn*, 'dog,' and *kephalē*, 'head'), a species of baboon, in ancient times regarded by the Egyptians as possessing more than ordinary intelligence. As a mark of their intellectual sagacity, Thoth is often represented with the head of this baboon, and, according to some persons, the same honour is done to the C. by the god Anubis, whose head may be taken for either a baboon's or a jackal's.

Thoth as the God of Letters.

Cyn'odon, a genus of grasses, only one (*C. Dactylon*) of the fourteen species of which is a native of Britain. It inhabits the southern coast of England. Its roots, in common with those of another species (*C. lineare*), are reputed to possess some of the properties of sarsaparilla. In India it is known as *Dhob*, *Doorba*, and is one of the chief fodder grasses.

Cynomo'rium, a genus of plants belonging to the natural order *Balanophoraceæ*. *C. coccineum* is found in the island of Malta, and more particularly on a single rock in the islet of Gozo; is fungus-looking in appearance, and was long celebrated as the *Fungus Melitensis*. It is found in the Levant, Northern Africa, and the Canary Islands, where it is esteemed as an article of food. It was formerly highly esteemed as a styptic and astringent, and at one period was so much valued as a remedy for dysentery, &c., that the rock on which it grew was carefully watched, and its produce deposited in a Government office, whence it was sent as a precious gift to friendly sovereigns by the Grand-master of the Knights of Malta. Even under the British Government, until recently, the office of keeper of the rock was kept up.

Cyn'osure (Gr. *Kunosoura*, 'the tail of the dog'), a name given to Ursa Minor, a northern constellation, whose tail terminates in the Pole Star. It was the object by which travellers and mariners directed their course, and hence has arisen its metaphorical application to anything to which attention is strongly directed:—

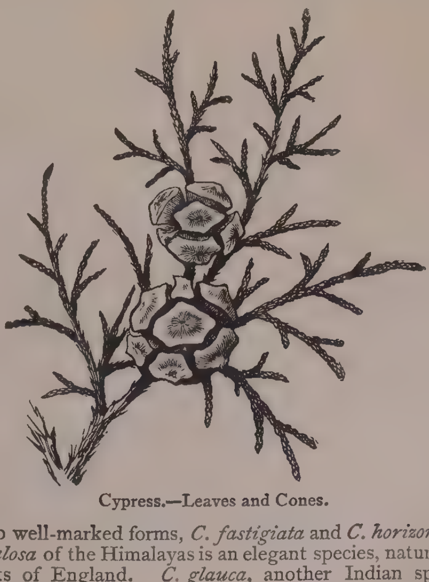
> 'Where perhaps some beauty lies,
> The *cynosure* of neighbouring eyes.'—Milton, *L'Allegro.*

Cypera'ceæ, or **Caricin'eæ,** a natural order of glume-bearing Monocotyledonous plants, of which about 120 genera and 2000 species are known. They are found all over the world, though chiefly in moist, cold, and temperate regions. Some are demulcent, others bitter and astringent. The long underground stems of *Carex arenaria* bind together drifting sands, and are for that purpose planted on parts of the coast. The herbage of one of them has very nutritive properties, but the order possesses no marked economic or medicinal species. The creeping underground stems of *Carex arenaria* have been used as a substitute for sarsaparilla, under the name of *German sarsaparilla*; and the species known as 'carnation grasses' are erroneously believed to cause 'rot' in sheep. *Eriophorum*, or Cotton-Grass (q.v.), and the *Papyrus* of the Nile (q.v.), also belong to this order.

Cype'rus, a genus of plants of the natural order *Cyperaceæ*, most of the species of which are tropical. The tubers or corms of many are mucilaginous and nutritious, while those of others are bitter and medicinal. Among the latter may be classed *C. longus*, the rhizomes of which are astringent, tonic, and stomachic, and were at one time employed in medicine, but now, from their odour of violets, are more valued in perfumery, as are some of the Indian species. The tubers of *C. esculentus* (the *Souchet comestible* or *Amande de terre* of the French) are used for food in the S. of Europe, and when roasted can be substituted for cocoa and coffee. They are also employed in making *Orgeat* (q.v.). Unlike most of its order, its roots contain a fixed oil. The tubers of *C. bulbosus* and *geminatus*, though small can be used as an article of food. From *C. textilis* of India, and other species, mats, &c., are woven. The roots of other species bind drifting sands together.

Cy-Près, a term of English legal doctrine. In certain cases, where the will of a testator cannot be precisely carried out, the court will, by the doctrine of C.-P., administer as closely according to the will as the law permits. A secondary or particular object must give way before the primary and general object of a will.

Cy'press, a very large genus of evergreen trees and shrubs, type of the *Cupressineæ* family of conifers. *C. sempervirens* of Persia and the Levant is planted in burial-grounds. It has two well-marked forms, *C. fastigiata* and *C. horizontalis*. *C. torulosa* of the Himalayas is an elegant species, naturalised in parts of England. *C. glauca*, another Indian species,



Cypress.—Leaves and Cones.

though hardy in Portugal, can seldom stand our winters without protection. *C. funebris* of China is a valuable ornamental hardy evergreen. *C. macrocarpa, Goveniana, Lawsoniana,* and other species from N.W. America, are well known as hardy ornamental trees. The wood of *C. sempervirens,* believed to be the *cedar wood* and *gopher wood* of the Bible, is perhaps the most durable of all woods. All of them are highly scented, and at one time this balsamic odour from the wood was believed to be salutary in chest diseases. There are besides the following, which are not true Cypresses, viz.: the *bald C.* of America, broom C. and summer C., deciduous C., ground C., embossed C.

Cyp'rian, Thascius C., one of the fathers of the Church, was born at Carthage about 200. He was highly educated, became a teacher of rhetoric, and was converted to Christianity in 245. As the brilliancy and popularity of his lectures had won him a great reputation, the pagan party was intensely chagrined at his change of faith, and sought to cover him with ridicule. C. was indifferent to its censure and reproaches, devoting himself to the study of the Bible and his favourite author Tertullian. On account of his zeal and earnestness in religion he was made a presbyter a few months after his baptism, and Bishop of Carthage in 248. C.'s episcopal career was spent amidst the storms of persecution and theological strife, and his writings are marked by an intense and high-wrought feeling. During the Decian persecution (250) he retired into concealment for about two years, but his enforced seclusion was not spent in idleness. Letter after letter was shot forth from his retreat, full of warning, direction, exhortation, and he was never more vigilant in his episcopal supervision than when he dared not show his face in Carthage. On his return he was engaged in a controversy regarding the reception of the lapsed—that is, those who during the persecution had publicly renounced Christianity—as well as in the Novatian controversy. In 257, in the persecution under Valerian, C. was banished to Curubis. Here as usual his pen was active. Recalled next year by the governor, in consequence of the rigorous edict that all bishops, priests, and deacons were to be put to death, C. was executed at Carthage in presence of an immense crowd. His genuine writings consist of eighty-two epistles and thirteen treatises. On account of his high ideas of episcopal power he has always been a great authority in the Roman Catholic and other Episcopal Churches. The best editions of C.'s works are those of Bishop Fell (1682), and of Maran (Par. 1726). There is an English translation (1868-69) in Clark's *Ante-Nicene Fathers.*

Cyprin'idæ, a family of Teleostean fishes represented by the Carps (q.v.), Minnow, Bleak (q.v.), Roach, Barbel (q.v.), Bream, Tench, &c. In this family the mouth is small and the jaws toothless, the upper jaw being formed by the intermaxillary bones. Teeth exist in the inferior pharyngeal bones, and these bite against the base of the skull, which is covered with horny plates. The head is small, and dorsal fin single. No pyloric cæca exist, and the air bladder is generally divided. Most C. inhabit fresh water.

Cyprindidæ is also the name given to a family of Lamellibranchiate mollusca, including shells belonging to the genera *Cyprina, Crassatella* (q.v.), *Isocardia* or heart-cockles, *Cardita,* &c. The shells are equivalve and closed, the ligament external, and the mantle lobes united posteriorly, and pierced by two siphonal apertures. The foot is thick and tongue-shaped.

Cyprinodon'tidæ, a family of Teleostean fishes, distinguished by having small jaw-teeth, but numerous teeth in the throat. The branchiostegal rays are five or six. The head is scaly, and no soft dorsal fin exists. To this family belong the *Anableps* (q.v.), and the genus *Orestias* of S. America.

Cy'pris, a genus of Entomostracous Crustacea (q.v.) belonging to the order *Ostracoda.* They are familiar freshwater fleas. They have a bivalve shell or carapace, from which the feet, numbering two or three pairs, are protruded at will. The carapace is closed by an adductor muscle. A pair of tail-appendages subserve locomotion. *C. vidua* and *C. tris-striata* are well-known species.

Cyprus (Gr. *Kupros,* mod. Gr. *Kebris*), the third largest island in the Mediterranean Sea, is distant 41 miles from Syria and 60 from Asia Minor. Area 3584 sq. miles; pop. 209,286, of whom only 48,044 are Mohammedans. The island is divided into six provinces:—Nicosia, Larnaca, Limassol, Famagusta, Paphos, and Kyrenia, of which Nicosia is the most populous with 61,695, and Famagusta comes next with 41,423. The blind number 2074; the deaf and dumb 214; and the lepers 108. The mountains are grouped in two chains, one running parallel to the N., the other to the S. coast. The latter is the higher, reaching in Mount Troodos (anc. *Olympus*) an elevation of 6655 feet. Between the two ranges lies the great plain of the Messorie (or Messaria), rich in cereals, wines, cotton, madder roots, locust-beans (10,000 tons yearly), sumac, all of which are exported, besides raisins, silk cocoons, hides, cheese, cattle, and sheep. The sponge fishery is very remunerative (over £20,000). Salt is inexhaustible in certain lakes (the two largest are near Larnaca and Limassol), tobacco is now grown in small quantity (years ago it was an important product), and wool forms a staple article of commerce, though the climate is so dry that frequently there is but little pasturage. In 1869 the crops were a complete failure, and the poorer inhabitants were reduced to great extremities. The axes of the mountain-chain are of igneous origin, being flanked by limestones, sandstones, and slates. Coal, sulphur, and various minerals might be worked to advantage. Anciently it was famous for its copper-mines, the name 'copper' being derived from the island. A telegraphic cable, laid in 1871, connects Nicosia with Latakieh on the Syrian coast, and 240 miles of wire are in use throughout the island. The annual exports have risen from £314,628 in 1889 to £316,872 in 1893, while the imports show an increase of £72,548 during the same period. There are over 200 Christian, and over 100 Mohammedan schools in the island; to these the Government give a grant when recommended by their Inspector. The capital is Nicosia, or Lefkosia (q.v.); the chief ports, Larnaca (q.v.), and Limassol. The ancient capital of C., Paphos (q.v.), was held to be a favourite abode of Venus. C. was ruled by petty kings till it was subdued by Cyrus of Persia. It was subsequently conquered by the Greeks in 477 B.C.; was annexed to Egypt about 323 B.C., and became a Roman province in 58 B.C. After the division of the Roman, it formed part of the Byzantine Empire. In A.D. 648 it was taken by the Saracens, from whom it was soon retaken by the Greeks. In 803 it was captured by Harûn-al-Rashid, but was won back by Nicephorus II. Richard I. of England reduced it in 1191, and ceded it the succeeding year to Guy de Lusignan, whose descendants reigned over it till 1489, when Caterina de Cornaro (q.v.) sold it to the Venetians. It was finally taken by the Turks in August, 1571, in whose hands it remained till 1878, when by a convention between Great Britain and Turkey, dated 4th June of that year, the government of the island was transferred to the former power. C. is now virtually a British possession, and its first British governor, Sir Garnet Wolseley (q.v.), in the month of August, 1878, proclaimed the authority of Queen Victoria amidst the enthusiasm both of Greeks and Turks. Since then the commerce, &c., of the place have vastly improved. The British Governor, or as he is called, High Commissioner, has all the power of a colonial governor, with an executive council of four to assist him. There is also a legislative council of eighteen, six of whom are members *ex officio,* and the remainder are elected every five years, three by the Mohammedans and nine by the other inhabitants. An elector must be a five years' resident, at least; of 21 years of age, and a male, payer of certain taxes. In August, 1895, the British garrison was reduced by three-fourths, and owing to the scare caused thereby, that the island was about to be handed over to the Turks, the prosperity of C. rapidly declined. See Ungar and Kotschys' *Die Insel Cypern* (1865) for natural history, climate, products, &c.; also De Mas Latrie, *Histoire l'île de C. sous de Règne des Princes de la Maison de Lusignan* (Par. 1861-62); and for antiquities, Cesnola's *C., its Ancient Cities, Tombs, and Temples* (Lond. 1877). See also an interesting and valuable volume on the history and industrial condition of C., by R. Hamilton Lang, for many years H.M. Consul for the island (Macmillan & Co., Lond. 1878).

Cyr, Saint, a pleasantly situated village in the department of Seine-et-Oise, France, in the great park of Versailles, 12 miles S.W. of Paris, is notable in connection with an institution (*Maison de St. C.*) founded here by Louis XIV. in 1686, for the upbringing of 250 daughters of the nobility. This building was erected at the desire of Madame de Maintenon, who retired to it on the death of the King to spend the remainder of her life. In 1793 it was converted into a military hospital, and in 1806 Napoleon transferred hither the military school of Fontainbleau, where it has since remained as the *École Spéciale Militaire de St. C.*, educating some 300 officers, infantry and cavalry, of the general staff, and of the Marines. Pop. of village and school, 3641.

Cyrena'ica, anciently a district of N. Africa, named after its capital, Cyrene (q.v.). In its widest sense it included the region stretching on the N. from Carthage on the W. to Egypt on the E., and from the Mediterranean to the oasis of Phazania (Fezzan) on the S. The Greek colony, however, established here in the 7th c. B.C., occupied only the tableland of Barca (q.v.) and the terraces between it and the coast. Fanned by cool sea-breezes, and sheltered by the broad plateau from the hot winds of the Sahara, these terraces, well watered, and enjoying a diversity of climates, were among the most delightful and fertile regions of the globe, and furnished a succession of harvests for eight months of the year. Corn, wine, oil, honey, and fruits of all kinds abounded, and the district was famous for its breed of horses. From the time of the Ptolemies C. was sometimes called Pentapolis, from its five chief cities, Cyrene, Barca, Teucheira, Hesperides, and Apollonia. C., after being a Roman province, was subdued by Chosroes (A.D. 616), and finally overrun and wasted by the Arabs (A.D. 647). The whole region is rich in valuable remains of antiquity.

Cyre'né (Gr. *Kurēne ;* Doric form, *Kurāna*, corrupted by the modern Arabs into *Grenneh*), the capital of Cyrenaica, founded in 631 B.C. by a colony of Dorians under Battus, whose dynasty terminated about 450 B.C., when a republic was established. It subsequently became a Roman colony with the title of *Flavia*. C. was long the chief Greek colony in Africa, and several of its sons were distinguished in the annals of Hellenic intellect; as the poet Callimachus, a scion of the royal house of Battus, the philosophers Aristippus and Carneades, the polyhistor Eratosthenes, and the rhetorician Synesius. Extensive ruins still mark the site of the city.

Rock-cut Temple, Cyrene.

Cyril, St., of Jerusalem, one of the fathers of the Church, was born about 315. Of his earlier years nothing is known, but his writings evince a superior education. He was elected Bishop of Jerusalem in 351. In the Arian controversy then raging he formed one of the middle party, called Semi-Arians, but was nevertheless persecuted by the stricter Arians, through whose influence he was banished from Jerusalem three times. His persistent and unscrupulous opponent was Acacius, Metropolitan Bishop of Cæsarea. In 381, at the Council of Constantinople, he joined the Nicene party, and took an active part in the debates. He died in 386. C. is chiefly distinguished for his catechetical works (edited by Touttée, Par. 1720; and by Reischl and Rupp, Munich 1848-60), in which he set forth the doctrines of the Church in a popular style.—**St. C. of Alexandria,** born at Alexandria about the end of the 4th c., was educated among the monks in the Nitrian desert, and then succeeded his uncle as Bishop of Alexandria (412). He immediately attacked the Novatians, and had their churches shut up, got the Jews banished from the city and their synagogue pulled down, and occasioned other insurrections in Alexandria. He must be held responsible in some measure for one of the most odious crimes in history—the murder of Hypatia (q.v.)—in so far as he inflamed the passions of a fanatical and ignorant community. C.'s chief controversy was with Nestorius, Bishop of Constantinople, who disapproved of the name 'Mother of God,' as applied to the Virgin Mary. At a council held at Alexandria (430), C. accused Nestorius of blasphemy against Christ, and Nestorius, in turn, accused C. of Apollinarianism. (See APOLLINARIS). A council was convened at Ephesus to settle the dispute, in which C. presided, and before all the bishops had arrived Nestorius was condemned and banished. When the other Eastern prelates, for whom C. would not wait, arrived, he himself was deposed by them, and a controversy was thus begun between the E. and W. Churches, which was not settled at the death of C., 444. In the religious strifes of the time C. plays a foremost part. The popes gave him the most extensive powers and the most unbounded praise, and the Coptic and Abyssinian Christians, among whom he is known as *Kerlos*, call him 'the world's doctor.' C.'s works include *De Adoratione et Cultu in Spiritu et Veritate ;* '*Polished Discourses on the Pentateuch*,' &c.

Cyr'il and **Metho'dius,** called the 'Apostles of the Slavs,' were two brothers of distinguished family, born in Thessalonica in the 9th c. M. first embraced a military career, and rose to the rank of general, while C. (whose proper name was Constantine) devoted himself to the study of languages, for which he displayed peculiar aptitude. The Slavic tongue, in various dialects, had long been in use in the valley of the Danube ; it had even penetrated as far S. as the Peloponnesus, and in a commercial centre like Thessalonica the brothers had no difficulty in acquiring a familiar acquaintance with it. At Constantinople, whither C. went to complete his studies, he was soon known as 'the Philosopher.' Chosen by the Emperor Michael III. to preach the gospel to the Khasars, who had requested the services of a Christian missionary, he appears to have met with some success among the Turanian tribes of the Ural ; but the real commencement of the evangelical career of the brothers was their mission to the Bulgarians, whom they converted to Christianity, and provided with an alphabet adapted from the Greek, by means of which this Slavic people soon acquired through translation some knowledge of the Græco-Christian literature. In 863 C., accompanied by M., who had now become a monk, were sent by the Emperor to the Moravian king. The Slavs of Moravia and Pannonia had been Christians for about a century, but were dissatisfied with their ecclesiastical dependence on the German see of Salzburg. They received with joy men who could enable them to celebrate divine worship in their own language. The brothers spent four years in organising a Slavic service. In 867 they were invited to Rome by the Pope, and were consecrated bishops. It was at this time that Constantine took the name of C., and shortly after died, 13th February, 868. M. returned alone to his great work, and became Archbishop of Moravia and Pannonia. The Latin Liturgy was generally displaced by the new Slavic one, and the supremacy of the Archbishop of Salzburg was more and more threatened. The latter appealed to the Pope, and charged M. with numerous heresies. In the end, however, M. got a verdict in his favour, but after a long struggle with the Latin priests of Pannonia, he withdrew to Rome in 881, where he died. The exact date of his death is not known. The brothers have a great place in Christian history. They gave a national character to the religion of the Slavic peoples. The alphabet invented by C., and called the 'Cyrillic alphabet' (Slav. *Kyrillitza*), was adopted by the larger portion of the eastern Slavs, *e.g.*, Bulgarians, Serbs, Bosniaks, Russians, &c.; it was afterwards modified and enlarged in the different countries, according to their respective needs, and the modern Russian and Servian alphabets are directly derived from it.

Cy'rus the Great (called by Greek historians *Palaios* and *Proteros*), said to be the son of Cambyses (the Persian) and Mandane, whose father Astyages, the son of Cyaxares and King of Media, had endeavoured to destroy him as destined by prophecy to usurp the throne, probably succeeded his grandfather in the year B.C. 559, when he changed his name (*Agradatus*) for the Persian *Kobresch*, or sun. The first volume of the *Histories* of Herodotus contains a number of picturesque stories about his birth and childhood. After subduing the principal towns of Media, C., in 546, conducted a great expedition against Crœsus of Lydia, whom he defeated at Thymbra, and took prisoner at Sardis, and afterwards made a satrap of his new empire. The Greek colonies of Asia Minor, with the exception of Miletus, formed against C. the Pannonian League, which received moral support from Sparta; but C. was recalled to the S. by a revolt at home. In the year 538 he was engaged in the conquest of Babylonia, where the luxurious Belshazzar offered only a feeble resistance. His later campaigns seem to have been directed against Bactriana, Margiana, and Sogdiana, the territories forming the upper basin of the Oxus. C. probably penetrated as far as the Massagetæ and Sacæ, and Ctesias has left an account of an expedition against the Derbiccæ. In one of these C. was killed, B.C. 529. His name is thus associated with the predominance of the Persians over the Medes, and of the Zend nations over the Semitic. The *Cyropædia* of Xenophon is not a history, but a kind of ethical romance.—**Cyrus the Younger** was the son of Darius Nothus or Ochus, King of Persia, and Parysatis. While governor of Asia Minor he had assisted the Spartan general Lysander against the Athenians at Ægos-Potamos (B.C. 405). Accordingly, when Artaxerxes Mnemon, the eldest son of Darius, succeeded to the throne, and C.'s first conspiracy had failed, it was chiefly from Sparta that he obtained the army of 13,000 Greeks which, under the command of Clearchus, accompanied him on his famous expedition from Sardis in 401 B.C. At Cunaxa, between Pylæ and Babylon, on the Euphrates, he encountered his brother, whom the satrap Tissaphernes had warned of his approach. C. was killed and his Asiatic troops dispersed, but the Greeks held their ground, and began from the battlefield their wonderful 'Retreat of the Ten Thousand' (*Katabasis*) up the Tigris valley, through the highlands of Armenia to Trapezus on the Black Sea. From the accounts left by Xenophon (who was a leader in the retreat), C. appears to have been intelligent and of a good disposition. The *Cyropædia* of Xenophon relates to the elder C. It is interesting to compare the route of C. eastward through Laodicea, Iconium, Tarsus, and Beræa, with the routes of Alexander and the Crusaders.

Cyst (from *kustis*, 'a bladder'), a bag or tunic in animal bodies, which includes morbid matter as a secretion or an endogenous growth, entirely or for the most part its own product. Cysts are formed (1) by a morbid growth, having a distinct elementary groundwork derived from cells or their nuclei; (2) by obstruction, dilatation, and growth of natural ducts or sacculi; and (3) by enlargement and fusion of the areolar spaces in connective tissue—the walls becoming condensed, and the inner surface secreting fluid like a serous sac. *Simple* or *barren* cysts contain fluid matter; *compound* or *proliferous* cysts contain variously organised bodies; *sebaceous* or *epidermal* cysts are formed from enlarged hair follicles; *mammary* cysts from enlarged lactiferous tubes; *sanguineous* cysts from dilated blood vessels, and from hæmorrhage into the cavity of serous cysts; *synovial* cysts in connection with the synovial membrane of the sheaths of tendons; *mucous* cysts in connection with mucous membrane and the ducts of mucous glands. *Serous* cysts or *hygromata* have thin or honey-like contents of a yellow or brownish colour, and *colloid* cysts have glue-like contents. *Proliferous* cysts are compound. The *cystic duct* is the membranous canal that conveys the bile from the hepatic duct into the gall-bladder. The *cystic artery* is a branch of the hepatic.

Cyst'olithes ('bladder-stones'), clusters of crystals found in the superficial cells of nettles and some other species of the order *Urticaceæ*, and various genera of *Acanthaceæ*, &c. They are globular or club-shaped and of various other forms, 'usually hanging by a short stalk in an enlarged cell; their principal mass is found to be cellulose, but their surface is studded with crystalline points of carbonate of lime.' The crystalline contents of the cells are enclosed by the general cell-wall, and by a very delicate organic covering closely applied to every part.

Cyt'isus, a genus of plants of the natural order *Leguminosæ* (sub-order *Papalionaceæ*). Laburnum (q.v.) and other species are much esteemed as ornaments in shrubberies and greenhouses. See also Broom.

Cyt'oblasts, a name given to new active cells in animal and vegetable structures. Sometimes the term has been restricted to the nucleus of the cell. See Cell.

Cyt'oplasm is a semi-fluid molecular material in which cells may originate or grow. See Cell.

Cyz'icus, a peninsula of Anatolia, projecting into the Sea of Marmora, and connected with the mainland by a sandy isthmus. It stretches from E. to W. 1 miles, and from N. to S. 9 miles. C. was once an island, its connection with the mainland being attributed to Alexander the Great. Cherry-orchards and vineyards now surround the ruins of the ancient city of C., which in size and beauty was one of the foremost cities of Asia.

Czacki, Tadeusz, a Polish author and administrator, was born 28th August, 1765, at Poryck, Volhynia. He held the post of director of the crown archives at Warsaw, and, as member of the commission of inquiry into the Polish revenue, did his best to give new life to the trade and industries of Poland. But his chief efforts were devoted to the improvement of the education of his countrymen in the Polish provinces of Russia under the Emperor Alexander. In 1807 he was appointed deputy of Prince Czartoryski, who had the care of public instruction in the Polish government of W. Russia. By energy, personal liberality, and strong appeal to the patriotic feelings of his countrymen, he was enabled to establish eighty-five primary schools in Volhynia, twenty-six in Podolia, and fifteen in the Polish Ukraine, besides a great lyceum at Krzemienietz. C. died 8th February, 1813, at Dubna, Volhynia. Of his works, which are numerous and varied, one of the most valuable is that upon Lithuanian law. In 1832, by order of the Czar Nicholas I., the scientific establishments founded by C. were abolished, and the artistic and literary treasures collected at Krzemienietz were carried away, partly to St. Petersburg and partly to the new Russian University at Kieff. See *History of the Life and Works of C.*, by Osinski (Krzemienietz, 1816).

Czar, or **Tsar** (Russ. *tsarj*, 'king,' probably a corruption of the Byzantine *Kaisar*, Lat. *Cæsar*, though some etymologists seek for its origin in the *sar* that ends the names of Assyrian kings), a title of the Emperor of Russia.

It was in partial use as early as the 12th c.; but it was not till the 16th c., when Ivan II., surnamed the Cruel, caused himself to be crowned C. of Moscow (1547), that the Muscovite princes formally adopted the title. After the conquest of Little Russia and Smolensk in 1654, they called themselves Czars of all the Russias—*i.e.*, of Great, White, and Little Russia. The word is now practically equivalent to emperor. The consort of the C. is named Czarina, his eldest son Cesarevitch, and his eldest daughter Cesarevna.

Czartorys'ki, a celebrated Polish family of Lithuanian origin, which can be traced back to the 14th c. In the same century also appears a Russian branch connected with the line of Rurik, and possessing the village of Czartorysk in Volhynia, from which the later name of the family is derived. The latter first become Polish in the person of Fedorovicz C., who in 1570 subscribed the union of Lithuania with Poland. With Georg Ivanovicz C. (died 1622) the family passed over from the Greek to the Roman Catholic Church. In 1623 the heads of the family were made princes of the German empire; in 1785 they received the Austrian 'Indigenat,' and in 1788 the Hungarian Diet conferred on them the rank of 'magnates.' For a considerable period the family flourished in two main lines, an elder at Novgorod, and a younger at Klevan. The former became extinct in the time of Sigmund the Elder; the latter was subdivided into two branches, that of Zukov and that of Korzec, of which the latter became extinct in the male line in the person of Prince Joseph Clemens C. (died 1810). To the Zukov line belonged **Prince Michael Friedrich C.,** born 26th April, 1696, died Grand-Chancellor of Lithuania, 13th August, 1775. His nephew, **Prince Adam Kasimir C.,** born 1st December, 1734, noted for his wealth, intelligence, and learning, was a candidate for the throne of Poland after the death of August III., but was defeated through the influence of the Empress Catharine of Russia, who favoured Stanislas Poniatowski. After the first partition of Poland, C., who had extensive estates in Galicia, entered the Austrian service, rose to the rank of field-marshal, but was never untrue to Poland. At the Congress of Vienna he headed a deputation to the Russian Emperor, and submitted to him a 'Constitution' for his native country. C. died at Sieniawa in Galicia, 19th March, 1823.—**Prince Adam Georg C.,** son of the preceding, was born at Warsaw, 14th January, 1770. After an education at Edinburgh and London, he took part in the second Polish partition war. Being afterwards taken to St. Petersburg as a hostage, he gained such favour with the Emperors Paul and Alexander, that he filled in succession the posts of Ambassador to Sardinia, assistant to the Minister of Foreign Affairs, and curator of the University of Wilna; but when the Revolution of 1830 broke out, he gave both his heart and his property to his countrymen, and in 1831 became head of the National Government. When the insurrection was crushed, C. was especially excluded from the amnesty, and went to live in France. The most notable event in his later life was the liberation of his serfs in Galicia in 1848. C. died at Montfermeuil, near Paris, 26th July, 1861.—**Adam Louis, Prince C.,** is now the head of the family. He is the son of Prince Ladislas C. (born 3rd July, 1828, and died 23rd June, 1894), and his second wife Marguerite of the Bourbon-Orleans family. Prince Adam Louis C. was born in Paris on 5th November, 1872.

Czas'lau (Boh. *Caslau*), a town of Bohemia, 46 miles E.S.E. of Prague. Its deanery-church steeple is the highest in Bohemia. C. has manufactures of brass, coffee substitutes, beetroot sugar, and alcohol. During the Thirty Years' War the place suffered much. Near it, on the 17th May, 1742, the Austrians were defeated by Friedrich II. of Prussia. Pop. town 8388; district 63,638.

Czechs, the name given to the branch of the great Slavic family which has spread farthest west. Driven forward by the Avari (q.v.), they came, in the latter half of the 6th c., into the country now called Bohemia (q.v.). The C. are first mentioned by the earliest Russian chronicler, Nestor, who wrote during the latter half of the 11th c.

Language and Literature.—The Czech language, a branch of the widely-spread Slavic, is spoken in Bohemia, Moravia, and, with some modifications, by the Slovacks in the N. of Hungary. In the 15th c. it began to be written in Roman characters. It has forty-two open vowels and distinctly marked sounds, is rich, precise, and euphonious, and, like the classical languages, is ruled by quantity rather than accent. In its complicated grammar there is a dual number, while there is no separate form for the passive voice. The best grammars are those of Burian (3rd ed. Vienna 1850), Koneczny (3rd ed. Vienna 1855), Tomiczek (4th ed. Prague 1865). The best lexicons are those of Franta-Schumansky (Prague 1859), Koneczny (3rd ed. Vienna 1855), Rank (1871). The Czech literature began to clearly develop itself in the 13th c.; there are even traces of it as far back as the 10th c. The rhyming Chronicle of Dalimit (1314), the *Manual for Children* by Schtitny (1376), and the poem, *The Council of the Beasts,* by Smil von Pardubitz (1384), are famous books of the times before Huss. The era introduced by that reformer (1469-1526) gave a powerful impetus to prose. Doctrinal, polemical, devotional, and political writings became numerous. The *Travels* of Postupik (1464) and Lobkowitz (1493) may be mentioned, and also the political writings of Ctibor of Cimburg (1494) and Cornelius of Wschehrd (1520). The Augustan age of Czech literature was from 1526—1620. During this period the Bohemians were free and prosperous. Literature was fostered by the two universities at Prague, and the language became matured. The names of Streyc and Lomniki of Budezc are famous in poetry; Bartosch (died 1544), Sixtus of Ottersdorf (died 1583), Blahoslav (died 1571), Brzezan (died 1610), and Dacicky (died 1629), are eminent as historians, and Beneschowsky and Abraham of Ginterrod as students of language. The Bible was translated and published 1579-93. But the Thirty Years' War (1618-48) was an irreparable disaster, not only to the literature but to the nationality of the C. During that war the Jesuits burnt most of the books which had been produced between 1414 and 1635. An imperial decree, issued in 1774 and also in 1784, prohibiting the use of the Czech language in the higher schools, was another disaster to Czech literature; but the writings of the historians Count Kinsky (1774), Parizek (died 1823), Prochazka (died 1804), the popular author Kramerius (1783), and the poet Jungmann (1805), kept it alive. Since 1818, however, Czech literature has had fair scope. The language has been permitted by imperial edict in the higher schools; valuable remains of old

Bohemian Peasants.

literature have been discovered, and fresh literature has been largely produced. Poetry, belles-lettres, history, archæology, and science are assiduously cultivated. Among the newer poets are Kollar (died 1852), Czelakovsky (died 1852), Agnell Schneider, Vinariczky, Tomicek; the fabulist Zahradnik; the lyrical poets Marek, Turinski, Hanka, Kamaryt, Chmelinski, Stule; the idyllic Langer; the dramatists Stzepanek, Machaczek, Klicpera, and Ulczkovsky; the didactic Jablonski; the epic poets Huievskovski, Negedly, Holy, and Wocel. Among the national historians are Palacky and Tomek; Schafarik and Wocel are distinguished in Czechic antiquities; Jungmann, Schafarik, Hanka, and Presl in Czechic philology. See the works of Dobrowsky (2nd ed. 1818), Jungmann (1825), Count Thun (1842), Wocel (1845), Wenzig (1855), Hanus (1868), and A. H. Wratislaw, *Native Literature of Bohemia in the 14th c.* (Lond. 1878).

Czeg'led, a town of Hungary, 43 miles S.E. of Pesth by railway. The chief industries are brewing and agriculture. Pop. 22,050.

Czens'tochau, or **Czenstochōva,** a monastery of the order of St. Paul the Hermit, on the summit of Mount Klarenberg (Pol. *Jasnogora*), in the government of Warsaw. In the church of the monastery is the famous dark-brown Madonna which the legend asserts to have been painted by St. Luke, and which has made C. the favourite resort of Roman Catholic pilgrims in Russian Poland. In 1655, by the help, it was believed, of the Virgin, the monastery, manned by 70 monks and 150 soldiers, withstood for thirty-eight days 10,000 Swedes and a part of the Polish army. The Emperor Alexander allowed the works to be demolished after C. came into the possession of Russia in 1813. At the foot of the mount on which the monastery stands lie the two towns of 'Old' and 'New' C., which carry on a lively trade in amulets and images.

Czern'owitz (Slav. 'Black Town'), the capital of the crownland of Bukowina, in Austria-Hungary, on the Pruth, 138 miles S.E. of Lemberg by railway. It has a Greek cathedral, hardware manufactures, and a considerable trade between the Moldau and Bessarabia in timber, wool, skins, cattle, and brandy. Over the river, here 760 feet wide, stretches a bridge of six arches. Pop. 54,040, with 2174 troops.

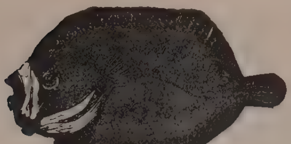
Czer'ny, Georg, popularly *Karadgorge* ('Black George'), a Servian leader, was born at Vishevac, near Belgrade, 21st December, 1770, and was originally a swineherd and drover. He was led to take an active part against the Turks by the plunder of his cottage in 1801 by janissaries. Gathering round him a band of discontented Servians, and secretly supported by Russia, he raised an insurrection against the Turks, and ultimately captured Belgrade. He was even recognised in 1808 by the Porte as Prince of Servia, but a new struggle with Turkey taking place, he had to flee to Russia, and then to Austria in 1812. C. returned to Servia in 1817, but was murdered in the July of that year at the instigation of Prince Milos, the new ruler of Servia and founder of the present dynasty. When the latter was deposed in 1842, C.'s second son, Alexander, known as *Karadgordjevitch* ('son of Black George'), was elected his successor, but was obliged to resign in 1858. Prince Michail succeeded and was assassinated in 1868. Milan, his nephew, was elected Prince, proclaimed King in 1882, and abdicated in 1889, when his son Alexander, the fifth member of the dynasty, was raised to the throne of Servia, which has been independent of Turkey since the Berlin Treaty of 1878.

Belgrade.

D.

D formed the fourth letter in the Phœnician alphabet, and it holds the same place in all the alphabets derived from that source. Its Semitic name was *daleth*, which means 'a door,' and is familiar to us through its Greek equivalent, *delta*. This name is thought to be derived from the original form of the letter (Δ), like a tent-door, which is the same both in Phœnician and Greek, and is scarcely altered in the Roman capital. The pronunciation of the letter D has also retained a similar uniformity. The sound which it expresses in English, it expresses everywhere, except in the Spanish and modern Greek languages, in both of which it is pronounced like *th*. D belongs to the class of consonants called Dentals, and is readily interchangeable with the other members of the same class, especially with *th* and *t*. Examples of this change are *theos* in Greek and *deus* in Latin, *dell* or *dale* in English and *thal* in German. A good example of a double change is *tod* in German, which in English becomes 'death.' D is also interchanged, though less regularly, with *l* and *r*. *Odusseus* and *dakru* in Greek correspond to Ulysses and *lacrima* in Latin; and in Latin itself, *ar-cesso* is only a surviving archaic form of *ad-cesso*. As *b* has an affinity for *m*, so D exhibits a tendency to affix itself after *n*, originally as a mere euphonic change in pronunciation, but finally as a recognised alteration in spelling. Thus, the Latin *tener* becomes the English 'tender'; and 'kind' is only another form of 'kin.' When followed by *i*, D sometimes becomes *j*, as 'journal' from *diurnus;* and when conjoined with *s* it forms the origin of *z*. As a numeral, D stands for 500, being manifestly a condensation of IↃ. As an abbreviation, it is best known as standing for doctor in D.D. and M.D.; and d.d. is to be understood as meaning *dono dedit*.

D, in music, the note next above the tonic in the scale of C major. The vibration fraction D: C is $\frac{9}{8}$.



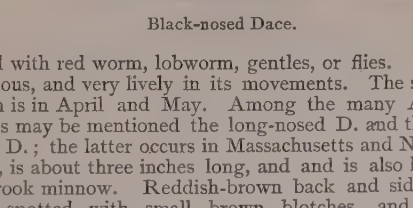
Dab.

Dab, a genus of Teleostean fishes belonging to the family *Pleuronectidæ*, or Flat-fishes. The D. is recognised by the rough or somewhat spiny nature of its back, hence the specific name *limanda* or 'file-backed.' It is of lighter colour than the allied Flounder (q.v.), and the lateral line is more curved than in the latter fish. The average length is 12 inches. The smooth or lemon D. is a second species, with a smaller head and still lighter colour than the common D.

Da Capo (Ital. 'from the beginning') a term used in music to indicate a repetition from the commencement, of a part or of a movement. D.C., as the words are usually abbreviated, was first introduced by Scarlatti in *Theodora*.

Dacc'a (Sansk. *Dhaka*, from *Dhakeswari*, 'the hidden goddess,' from a statue of Durga found there), the capital of a district of the same name, in the province of Bengal, British India, on the Buriganga ('Old Ganges'), 40 miles E. of Goalband, an important station on the Eastern Bengal Railway, and 190 miles N.E. of Calcutta, across the Gangetic delta. It has numerous mosques, and Brahmanical temples, a Government college, schools, a hospital, and several ruined palaces, also bridges, ghâts, bazaars and public fountains. But it is no longer celebrated for its manufacture of striped and figured muslins and delicate Kasheeda or embroidered cotton cloth, having, indeed, few industries now beyond the production of lac, dye, soap, cheese, and the gold and silver ornaments which find a market in Calcutta on account of their ingenious and original designs. The rainfall at D. is about 82 inches, and the mean temperature 72° Fahr. Pop. 82,321, including a small number of Portuguese, Greek, and Armenian merchants. In 1325 the district of D. was annexed to the Afghan kingdom of Gaur, and the town of D. remained for long the frontier fortress of the Mohammedans. After that the country was overrun by various savage tribes. In 1608 D. was made the seat of government of the Nawabs of Bengal. It reached the height of its prosperity under Aurungzebe, and later was visited by the Portuguese, Dutch, and French, who here erected factories. The British gained possession of the city and state in 1765, but descendants of the native ruler were granted allowances till as late as 1845. —The *district*, which is intersected by numerous rivers, yields great quantities of rice, tea, indigo, &c., and has manufactures of coarse cloth, coco-nut oil, country paper, and iron and brass implements. The production of cotton has declined in quantity though not in quality. Dacca merchants are most enterprising, and visit distant countries on trading expeditions. At least eight newspapers are in regular publication. Education is steadily advancing, not only in the elementary schools, but also among the high grade establishments. Area, 2797 sq. miles; pop. 2,420,656; of whom 935,565 are Hindus, 258 are Brahmos, 1,473,799 are Mohammedans, 76 are Buddhists, and 13 are Jains. The prevailing language is Bengali.

Dace, Dart, or **Dare,** a genus of freshwater Teleostean fishes, included in the family *Cyprinidæ* (q.v.) of that order. It is allied to the Chub (q.v.), Roach (q.v.), Barbel (q.v.), and Bleak (q.v.), and is generally found in slowly-running streams in England and on the Continent. It is a dullish-blue on the upper, and white on the under parts; the gill-covers and cheeks being silvery white. The average weight is about three-quarters of a pound, but a half-pound fish is considered a good take. In shape it is somewhat elongated. The scales are smaller than those of the roach. The flesh is not of particularly fine quality. The D. is fished for with line and float baited with red worm, lobworm, gentles, or flies. It is very voracious, and very lively in its movements. The spawning season is in April and May. Among the many American species may be mentioned the long-nosed D. and the black-nosed D.; the latter occurs in Massachusetts and New York states, is about three inches long, and and is also known as the brook minnow. Reddish-brown back and sides, white belly spotted with small brown blotches, and a dark streak drawn from the tail to the head, are its principal distinguishing marks. It is excellent eating.



Black-nosed Dace.

Da'cia, the country of the Daci, originally called *Getæ*, a people of Thracian origin, comprehended, in its widest acceptation, the countries now known as Hungary (E. of the Theiss), Transylvania, the Bukowina, the S. of Galicia, Moldavia (W. of the Pruth), Wallachia, and the Banat of Temesvar. Of the history of the Daci before the time of Philip of Macedon almost nothing is known, but even then (B.C. 335) they were a powerful race, and had established themselves on both sides of the Danube. In 292 B.C. they compelled the Thracian king, Lysimachus, who had invaded their territory, to surrender with his whole army. Curio, the first Roman general who penetrated as far N. as the Danube, did not dare to attack them. Augustus, in 10 B.C., sent Lentulus against them, but without success. From this time the wars between the Romans and the Dacians were frequent; and eventually the latter, under their king, Decebalus, obtained such a decided advantage over Domitian as to compel him to accept their terms and pay a yearly tribute. Thus matters continued till Trajan, in A.D. 101, set out through Pannonia, crossed the Theiss, marched along the valley of the Maros into Transylvania, and defeated them in a great battle near Thorda, on a field called to this day *Prat de Trajan* (Trajan's field). Decebalus, however, soon broke the conditions of peace imposed by the Emperor, and in A.D. 104 Trajan again set out against them. The Daci, unable to defend their capital, fired it and fled; while their leader, to avoid captivity, stabbed himself. D. now became a Roman province; colonists were sent thither; a bridge was built across the Danube, and the country was intersected by three great roads. In the time of Aurelian (A.D. 270-275) the Romans abandoned D. to the Goths. After submitting to the Gepidæ, Lombards, and others, it fell under the dominion of the Magyars in the 9th c. See Wilkinson's *Wallachia and Moldavia*, and Paget's *Hungary and Transylvania*.

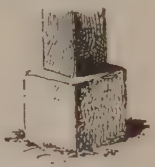
Da'cier, André, a French scholar and critic, was born of Protestant parents, near Castres, in Languedoc, 6th April, 1651. After studying at Saumur under Lefèvre, whose daughter Anne he afterwards married, he went to Paris in 1672. There he was employed to prepare for the Dauphin's use an edition of various classics, known as the *Delphin Edition*. D. and his wife renounced Protestantism in 1685. He became librarian of the Louvre, member of the Académie des Inscriptions, and Secretary of the Académie Française. He died 18th September, 1722. D.'s once brilliant reputation as a critic has greatly faded; his editions and translations are very indifferent. See Nicéron, *Mémoires*.—His wife, **Anne D.,** born at Saumur in 1651, rivalled her husband in erudition, and shared in his editorial labours. Her chief work, a translation of the Iliad (1711), involved her in a controversy with Lamotte. She attacked him, said Voltaire, like the head of a college, and he answered like a polite and witty woman. In the great controversy as to the respective merits of ancient and modern literature, along with La Fontaine and Boileau she advocated the ancient against Perrault, Lamotte, and others. Madame D. executed translations of Terence, Plautus, Anacreon, and Aristophanes. She died 17th August, 1720. See Sainte-Beuve's article *Sur Madame D.* in his *Causeries du Lundi*.

Dacoits' (Beng. 'robbers'), a term used in India for a class of robbers. They lived apart in a semi-savage state, and sometimes went in gangs of forty or fifty.

Dacryd'ium, in botany, a genus of trees of the natural order *Taxaceæ*, indigenous to New Zealand, Tasmania, and the E. Indies. The principal New Zealand species is *D. taxifolium*, which in a few cases reaches a height of 200 feet, and yields a valuable timber. *D. Franklinii*, the Huon pine of Tasmania, is a noble tree, yielding very valuable timber as well as splendid spars for ships.

Dac'tyl (Gr. *daktulos*, 'a finger,' because each finger consists of one long joint and two short ones) is the name of a trisyllabic foot in Latin and Greek versification, of which the first syllable is long, and the other two short, as *cārmĭnă*. In dactylic verse the D. is the prevailing foot, and the only other foot admissible in it is the spondee. The most important of the dactylic verses is the Hexameter (q.v.). In English verse a D. consists of one accented and two unaccented syllables, as *lúnacy*.

Dactylorhiz'a, a disease of carrots, turnips, and other agricultural plants, in which the root divides and becomes hard and worthless. It is commonly called 'fingers and toes.' Berkeley thinks that it is not properly a disease, but only a tendency in the plant to revert to the wild state, and can only be remedied by a careful selection of seed. It must be distinguished from 'anbury,' which is caused by the attacks of insects.



Dado.

Da'do (Ital. 'a die,' 'a cube'), in classical architecture, denotes the solid block or cube which forms the body of a pedestal between the base mouldings and the cornice. The name is also applied to wainscoting about the height of a chair-back, which resembles a continuous pedestal round a room.

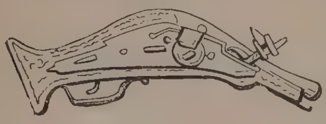
Dadur', or **Dadar,** a town in the Kachi province, Baluchistan, 5 miles E. of the Bolan Pass. The principal products of the neighbourhood are cotton, sugar, madder, several kinds of grain, cucumbers, and melons. Pop. 1980. The British here defeated a Kelat force in November, 1840. The heat at D. is so intense that it has reddened the unburnt bricks of the ancient sepulchres.

Dædalus ('the cunning worker'), a famous artist and mechanician of the heroic age of Greece, is represented as an Athenian of the royal race of the Erechtheidæ, being, according to some, the son, according to others, the grandson, of Eupalamus, the son of Erechtheus. To D. is ascribed the invention of carpentry and most of its tools—the saw, the axe, the plumb-line, and the auger—and glue. Among his greatest achievements in sculpture and architecture were the Cow of Pasiphae, the Cretan Labyrinth, the Colymbethra near Megara in Sicily, the impregnable rock-fortress and city near Agrigentum, in which were the palace and treasury of Cocalus; the temples of Apollo at Cumæ and Capua, that of Artemus Britomartis, in Crete; the Propylæon to the temple of Hephæstus at Memphis; an altar on the Libyan coast sculptured with lions and dolphins, and many wooden statues of gods and heroes. In naval architecture the invention of the mast and yards is attributed to him, and that of sails to his son Icarus—the fabled wings by which they essayed to cross the Ægean.

Dæn'dels, Hermann Willem, a Dutch commander, was born at Hatten, in Gelderland, in 1762, quitted Holland in 1787 in consequence of a revolution, and in 1793 aided Dumouriez with the volunteer corps called *Francs étrangers*. He held important commands in the Republican army until 1803, when he fell under suspicion and left the service. Three years later, however, he was restored by the French King of Holland. He defeated the Prussians, conquered E. Friesland, and was made general of the Dutch cavalry. In 1807 he was appointed governor-general of all the Dutch possessions in the E. Indies. D. ruled Java from 1808 to 1811, and compiled a valuable work, *Staat der Nederlandschen Oost-Indischen Bezittingen*. On the fall of Napoleon, the new King of Holland retained his services, and D. was engaged in colonial government till his death, 2nd May, 1818.

Daff'odil, or **Daffy-down-dilly** (a corruption of the Gr. *asphodelos*, the King's spear or asphodel lily). It is doubtful if the yellow D., now naturalised in Scotland, is a native of that country. It is, however, indigenous to England and most parts of Europe. There are several other species, all natives of southern countries, more particularly of those bordering the Mediterranean. *Narcissus poeticus* is one of the most common white cultivated forms. There are, besides, the rush-D., the Peruvian D., *Isme Amancaes;* the sea-D., *Ismene calathina*. The bulbs are purgative and emetic. For a description of the species see Baker's *Synopsis* of the genus.

Dag, a pistol in use in the 16th and 17th centuries. The D. was remarkable for its butt, which was fashioned like that of a musket.



Dag.

Dagg′er (Celt. *dag*, 'a point'), a short, pointed, two-edged sword or rapier, used by all peoples from prehistoric times to the present epoch. The broad-bladed short sword of the ancient Greeks may be taken as the type of this weapon of offence, of which almost every country has its own peculiar form. The poniard, dirk, French *misericorde*, or 'D. of mercy,' Italian stiletto and *anelace* (French *langue de bœuf*), Malay creese or kris, and Persian *kanjan*, are all varieties of the D. The mark of reference † is called a D. or obelisk.

Dagger Scene, an incident which took place in the House of Commons on 28th December, 1792, during the discussion of the 'Aliens Bill,' on which Burke and Fox were widely opposed. During his speech the former produced a dagger from his waistcoat pocket, and, flinging it down on the floor before him, thus continued, 'This is what you are to gain by an alliance with France; wherever their principles are introduced their practice must follow. You must equally proscribe their tenets and their persons from our shores,' and he ended an impassioned address by begging the House to strengthen the hands, not of the ministry, not of the opposition, but of the country, by passing the 'Aliens Bill.' It is said that Sheridan threw great ridicule on this theatrical exhibition by saying, 'The gentleman has brought his knife with him, but *where's the fork?*'

Daghestan′ (Tartar, *Tagh stan*, 'mountainous country'), a province in the Trans-Caucasian government, Russia in Asia, on the W. side of the Caspian. Area, 11,332 sq. miles; pop. 609,380. It is traversed by spurs of the Caucasus. In the valleys good crops of grain are produced, also of silk, saffron, madder, flax, and tobacco. The population is composed of Lesghians, Turks, Tartars, D. Arabs, and Armenians. Derbend is the chief town.

Dag′obert I., surnamed the Great, one of the Merwing kings of France. He was born about 600; succeeded his father, Hhlotar II., in 628; warred successfully against Gascons, Bretons, Saxons, and Slavonians; first opposed and then favoured the clergy; reformed the Frankish laws; died at Epinay, and was buried at St. Denis, in 638. He was an able but a cruel and licentious king. He is said, after conquering the Saxons, to have caused all those whose stature was greater than the length of his sword to be slain.

Dagöe, or **Dagen**, a Russian island in the Baltic, N. of Osel, and included in the Government of Esthonia, has an area of 367 sq. miles. It is separated from Vorms Island on the E. by Mago Sound, and forms, from its rocky character, the chief danger to ships entering the Gulf of Finland. Its capital is Keinis. On the W., the promontory of Dagerort has a lighthouse.

Da′gon (Heb. *dag*, 'fish'), the national deity of the Philistines, resembling in form the body of a fish, with the head and hands of a man (1 Sam. v.). Like the Indian Vishnu and Babylonian Odakon, it was a symbol of water and of the generative and vivifying principles of nature, which produce their effects through the influence of water; for which the fish, with its immense fecundity, was specially adapted. The corresponding female element was the Syrian goddess Atargates (2 Macc. xii. 26) or Derceto. See Layard's *Nineveh*, &c., Stark's *Gaza*, and Selden's *De Diis Syriis*.

Daguerre′otype, a positive photographic process named after Daguerre, who, in 1839, made known to the Academy at Paris that photographs of great beauty, in nicety of detail and gradation of light and shade, could be produced by developing by means of mercury the latent image obtained on a sensitive surface of salts of silver. The details of the process are as follow:—a copper plate, coated on one side with a film of silver, is highly polished, and rendered sensitive to light by being exposed in darkness to the vapour of iodine, thus forming an iodide of silver of a reddish-yellow colour. On exposure of the iodised plate in the camera for a short time, a latent image is formed which is developed by the vapour of mercury, which adheres to the parts affected by light, or, in other words, the lights of the picture, while the shadows are represented by the blackened polished metal. The picture is afterwards fixed by immersion in a solution of hyposulphite of sodium. It was afterwards found that the image acquired greater strength and an improved appearance by being coated with a boiling solution of hyposulphite of gold. The most important improvement that has been effected upon the original process is that the silvered plate is rendered extremely sensitive by employing the vapours of iodine and bromine successively. The D. process is now seldom practised in Great Britain.

Dahl, Johann Christian Clausen, a Norwegian painter, born at Bergen, 24th February, 1788. After residing at Copenhagen, and visiting the Tyrol and Rome, he was chosen Professor of Painting at Dresden, where he died, 14th October, 1857. His works consist of powerful landscape and marine paintings. Among others may be mentioned 'Winter in Zealand,' 'View of Bergen,' 'Scene in the Neighbourhood of Christiania,' and 'Winter Scene on the Banks of the Elbe.'

Dahl′gren, John A., a distinguished officer of the United States navy, was born in Pennsylvania in 1809, rose to eminence during the civil war, and, after the death of Admiral Foote, was appointed to the supreme command of the national fleet. He was admiral of the squadron that blockaded Charleston, and performed most efficient service. D. died at Washington, 12th July, 1870. He is perhaps most widely known in Europe through the invention of a cannon called by his name, which has been introduced into the United States navy. This gun is constructed with a very heavy mass of metal at the breech end; in front of the trunnion it is light. He wrote a *Report on Thirty-two-pounders* (1850), *Shell and Shell-Guns* (1856), &c.

Da′hlia, a well-known genus of Herbaceous plants belonging to the natural order *Compositæ*, cultivated in gardens for the beauty of its flowers. It is a native of Mexico, and was named in honour of Dahl, a pupil of Linnæus (q.v.), though, owing to the name having been preoccupied by another plant, it is also known, especially on the Continent, by the name of *Georgina*. More than 2000 cultivated varieties of this plant are described, but all are descended from two wild species—viz., *D. superflua* and *D. frustanea*; or, according to some, these two are only varieties of each other,

Dahlia.

and may be referred to one type, *D. variabilis*. In Mexico the D. grows on sandy meadows 5000 feet above the sea, and though introduced into England in 1789, it was not thoroughly established as a garden plant until 1814. Owing to careful cultivation, its garden varieties have now arrived at great perfection, chiefly by 'artificial selection' and Hybridising (q.v.), and the production of double-flowered forms. In Mexico the bulbs are used as food, and, owing to the quantity of *Inuline* (q.v.) which they contain, are nutritious. In 1800 they were introduced into France for that purpose, but on account of their acridity and 'medicinal flavour' were disliked by men and cattle, and the attempt to grow them on a large scale has now been discontinued. Though grown in the open air, the D. is not altogether hardy in this country, being frequently cut down by early frosts, and the tubers have to be taken up and stored away in winter out of the reach of frosts.

Dahl'mann, Friedrich Christoph, a German historian of Swedish descent, was born at Wismar, 17th May, 1785. After studying at the Universities of Copenhagen and Halle, he devoted himself to history, the fruits of which were shown particularly in his *Forschungen auf dem Gebiete der Deutschen Geschichte* (Alt. 1822-23), and his edition of the *Chronik von Dithmarsen* (1827). D., who had been appointed secretary to the States of Slesvig-Holstein, allowed himself to be drawn into the arena of politics, and expressing too independent opinions, was refused the promotion he would otherwise have obtained. So he accepted, in 1829, the Professorship of Political Science at Göttingen, which post, however, he resigned when King Ernst suppressed the Hanoverian constitution. D. then lived for a time in Leipzig and Jena. In 1842 he accepted the chair of History in the University of Bonn. The Revolution of 1848 brought back D. to public life. He became the head of the constitutional parliamentary Liberals in the German Diet, and was at one time asked to form a ministry. Foiled, however, by the Reactionary party, he retired finally from political life, and devoted himself entirely to teaching and writing. He died at Bonn, 5th December, 1860, leaving unfinished a history of Friedrich II. of Prussia, to which he had set himself during the last years of his life. D. has left behind him many valuable historical works.

Dahomey', a native state of W. Africa, on the coast of Upper Guinea, extends from To-Go land on the W. to Yoruba on the E., and has an estimated area of 3960 sq. miles, and a pop. of some 250,000. The country rises in a gently sloping plane for about 200 miles inland to the base of the Kong Mountains, has a rich soil of reddish clay, is watered by many minor streams, and yields cotton, sugar, tobacco, indigo, palm-oil, ivory, india-rubber, yams, melons, oranges, limes, pine-apples, and other fruits, and beans, peas, maize, millet, and Guinea-corn in abundance. A very plentiful supply of cattle is to be found over all the country. Wild animals are numerous, including the lion, tiger, elephant, hyæna, the boa, and other reptiles. The inhabitants are a tall, well-made, and warlike, but savage race, of pure Negro blood, belonging to a branch of the Ewe family, partly employed in agriculture, and practising a rude form of fetish-worship made up of ridiculous ceremonials and extensive human sacrifices. All the females in the state belong nominally to the king, and at a grand yearly festival there is a general distribution of wives. The only considerable town is Abomey or Agbome, the capital, situated 95 miles inland from its small port of Whydah. It is surrounded by mud-built walls and by a ditch four miles in circumference, but only contains some 20,000 inhabitants. In 1876, for an outrage on a European, by name Turnbull, at Whydah, the King of D. was ordered to pay a fine, and on his refusing, a blockade of the coast was made, which was removed on his making concessions, in 1877. In Oct. 1885, at the request of the king, Dahomey was placed under the protectorate of Portugal. In 1890 King Benhawzin and the French fell out about Porto Novo and Kotonu, which the latter claimed. A short war resulted in the submission of the king, who agreed to waive all claim to the territory in question on the receipt of an annual payment of £800. Peace lasted only two years, when the French were forced to march against the king, who fled, leaving his capital in the hands of his enemies. In 1894 he surrendered, and was sent to Senegal with the chiefs who had sided with him. The French had already annexed the districts of Whydah, Savi, Godomey, Abomey-Kalavy, and Avrekete, and proclaimed the rest of the country a French protectorate. Later on, in 1894, Guthili was elected king, and in January, 1895, obtained French recognition. It is most probable that France will annex the whole country close up to the German frontier of To-Go land.

Dah'ra, a maritime district of Algeria, between Oran and Algiers, chiefly notable in connection with the horrible massacre by the French of the *Ouled-Riahs*, a Kabyle tribe that fought stubbornly in the revolts of Abd-el-Kader. In June, 1845, this tribe, which had sought refuge in some extensive caves, refused to surrender to Colonel Pélissier, who thereupon choked the entrances to their retreat with fascines, and engulfed the whole band, numbering some 800, in a terrible death by suffocation and burning.

Daillé (Lat. *Dallæus*), **Jean,** a French Protestant theologian, born 6th January, 1594. After finishing his studies at Saumur, he was entrusted in 1612 with the education of the grandsons of Duplessis-Mornay. In 1625 he was appointed pastor and professor at Saumur; the following year he was translated to Paris, where he was a pastor for forty-three years. D. died 15th April, 1670. Among his warmest friends were Conrart and Balzac. His masterpiece is his *Traité de l'Emploi des Saints Pères pour le Jugement des différends qui sont Aujourd'hui en la Religion* (Gen. 1632; Eng. trans. 1651), in which he did much to shatter the authority of the fathers. Among his other writings may be mentioned his *Apologie pour les Églises Réformées* (1633; Engl. trans. 1653), and *La Foy fondée sur les Saintes Écritures* (Char. 1634), and 20 vols. of sermons. Even his adversaries admit his important services to the history of the Church by his learned researches into Church antiquities.

Daily Council was the court which, in Scotland, immediately preceded the institution of the College of Justice (q.v.), and from which the present court derives its title of 'Council and Session.' The D. C., in fact, was the court or council nominated by the king, in 1503, to take the place of the Court or Session erected in 1425, consisting of members of the Parliament named by the king, which had become so inattentive to its business as to create a public scandal. See COURT OF SESSION.

Daimiel (*Daimael*), a manufacturing town of Spain, province of Ciudad-Real, on the Azuar, 20 miles E.N.E. of Ciudad-Real by railway. It has a good Gothic church, a hospital, fine public gardens and promenades; its industries chiefly consist in the production of woollens, linens, blond lace, leather, and pottery. Pop. 11,508.

Dair-el-Kam'ar, or **Deir-el-Kamr,** a town in Syria, on a slope of Lebanon, 12 miles S.S.E. of Beirut, is the capital of the Druses (q.v.). The inhabitants, who are extremely industrious in cultivating the mulberry, the olive, and the vine, number 7060. Near D. are the ruins of the palace of the Emîr Beshîr, ruler of the Lebanon from 1788 to 1840.

Dai'ry, the department of a farm connected with the production of milk, the manufacture of butter and cheese, and the various industries arising out of the keeping of milch-cows. The word is derived from the old English *dey*, a servant-maid in charge of cows and milk. The D. on a mixed farm is generally a subsidiary concern, cows being kept on such primarily to supply the wants of the family and servants, and for breeding stock for fattening. In certain districts, however, where the herbage and climatic conditions are favourable, D. farming is practised, and the chief aim of the farmer in these cases is the production of milk, butter, and cheese. D. farming is largely practised in Buckinghamshire, Gloucestershire, Devonshire, Dorsetshire, and Cheshire in England, in Ayrshire and the S.W. of Scotland generally, the S. of Ireland, West of France, Holland, Denmark, and

Switzerland, and in New York, Ohio, Illinois, and others of the United States. When a D. farm is so situated that its produce can be readily disposed of in large towns as milk, this is generally done, and in such a case the D. operations are much simplified. Some dairies are devoted principally to the production of cheese, and on these the only residual product is whey, which is used for feeding pigs. In the case where butter is the staple, skimmed milk, *i.e.*, milk deprived of its cream, and churned or butter milk—healthy and nutritive beverages—remain. Cheese is made from skimmed milk, but cheese is valuable in proportion to the amount of fat or butter it contains.

Certain breeds of cattle are regarded as especially suitable for D. stock, while others are valued for fattening for the market. In Great Britain the Ayrshire and Alderney cattle are in greatest repute for D. purposes; the former on account of the large quantity of milk they yield on comparatively poor feeding, and the latter for the great richness of their milk, which, however, is small in quantity. The shorthorn breed is highly esteemed at once as good milkers and as kindly fattening stock. On this account shorthorns are preferred by town dairymen, who are obliged to renew their stock frequently, which they do most conveniently by feeding off for the butcher the cows to be withdrawn. Small breeds of cattle are, as a rule, better milkers in proportion to their weight than the larger kinds. See AYRSHIRE CATTLE.

The Byre (q.v.) or cowhouse of a D. farm should be lofty, spacious, well ventilated, and conveniently situated for feeding the animals, removing offal, &c. In the summer and autumn months cows are turned out to the grass parks to feed, and if the 'bite' is good, little more is required; but proper stall-feeding in winter, or when growing grass is not available, is a matter of serious importance. The nature of the food given has a most powerful influence on the richness and flavour of the milk secreted. Cows fed on brewer's grains, or 'draff,' give a large yield of thin, watery, insipid milk; turnip-feeding is at once detected by the strong 'nip' it communicates to milk and butter made therefrom. The winter feeding on a first-class Ayrshire D. farm 'consists in giving each cow in the morning 6 lbs. of hay; at nine o'clock they have steamed food, consisting of cut hay, turnips, bean-meal, and occasionally ground oilcake, or linseed-meal seasoned with salt. At noon each gets 4 lbs. of hay, and at 4 P.M. steamed food as in the morning. In the course of the day each gets 30 lbs. of raw turnips. A stable pailful of steamed food is the measure each gets at a time. During the day they have water between the intervals of meals.' Condimental foods are in favour in some dairies.

The largest yield of milk is secured by frequent milking, and if quantity is aimed at, cows are milked three times a day. When rich milk for butter or cheese is desired, milking twice a day is the rule. The average yield of milk varies within a wide limit, according to breed, feeding, state of health, interval since last calving, &c.; but the yearly average has been stated to range between 4900 and 2400 quarts. It is on record that a cross-bred cow, between a shorthorn and Galloway, gave as much as forty-five quarts a day. A cow not in calf will continue to give milk for several years, but the quantity gradually falls off, and when in calf they become dry several weeks before calving. The milk of a newly-calved cow is always richest in fat, and what is first drawn off is very highly-coloured, and known as colostrum or beistyn.

The D. proper, or milk-room, should be a cool apartment, so situated as to be as far as possible kept at a uniform temperature. An essential condition of the very first importance in a D. is the most scrupulous cleanliness of every corner, implement, and operation. There should be nothing to which foreign matter or any noxious odour adheres; marble shelving, glazed dishes and glazed tile-flooring should, if possible, be used, and all wooden implements should be washed and scalded and thoroughly dried before use. Nothing that will communicate any odour should be allowed to come near the milk, as cream quickly absorbs all smells, and reproduces them in the butter made from it. Milk sours and thickens quickly in the summer time, and after thickening, the cream particles become so entangled that they cannot rise to the surface; but with a well-situated D. and suitable milk-vessels, the cream can be secured before this occurs. Cream rises quickest in high temperatures, and when milk is exposed in shallow dishes. When, therefore, cream is to be secured for butter-making, shallow milk dishes are used; but when the manufacture of cheese is the object, the separation of milk in cream is avoided, the milk is poured into deep vessels, and in the best dairies it is generally agitated by working a kind of rake through it. As soon as the milk is brought from the byres it should be passed through a fine mesh sieve to free it from short hairs and any impurities. When the milk is to be creamed, it is poured into the shallow milk dishes, and under ordinary circumstances the whole of the cream will have risen, and be ready to skim off, in from eighteen to twenty-four hours; but in hot weather it is desirable to cream earlier. After the cream has been skimmed off, its butter-making qualities are not injured by its souring, and the frequency of churning is a matter of convenience.

In America a system of co-operative D. working has been in practice for several years, with great advantage as regards economy of labour, certainty of working, and quality of produce. The associated dairies, as they are called in America, are chiefly concerned with cheese-making, and each D. farmer pledges himself to supply milk in certain quantities and of pure quality. A certificate is given to each contributor of milk when his milk has been measured out and emptied into the tanks. By this system large quantities of milk of uniform quality are kept under the best conditions, and operated on by the most approved methods and apparatus. Such associated dairies have been introduced in Cheshire and Derbyshire, and in Sweden, Switzerland, and other Continental localities. A new D. industry, the preparation of condensed milk, has arisen. The milk is evaporated to a certain point by low steady heat, and a proportion of ground sugar added to it. In this form, when put in soldered tins, it will remain sweet and wholesome for a considerable period; and when sufficient water is added, it has the appearance, taste, and qualities of new milk, with only a little additional sweetness. So perfect indeed remains the substance of the milk, that on allowing the condensed milk to stand after dilution, cream forms on its surface.

The manufacture of butter and cheese will be treated of under these heads respectively. (See also CHURN.) The question of the comparative profit and advantage of selling D. produce as milk, or in the form of butter or cheese, is one which entirely depends on situation and local circumstances. Cheese-making is evidently an industry which can only be profitably cultivated on a large scale. See Morton's *Dairy Farming*, Horsfall's *Dairy Management*, and Stephens' *Book of the Farm*.

The most perfect and most expensively-erected D. in the world is, probably, that at the Queen's model farm situated within a short distance of Windsor Castle. It is 30 feet square; the roof is supported by six octagonal columns of white marble with richly-carved capitals. White porcelain tiles compose the floors, while the windows are filled with stained-glass, bordered with may blossoms, daisies, buttercups, and primroses. The floors are lined with tiles of a delicate blue tint, and rich medallions are inserted of the Queen, the late Prince Consort, and each of the royal family. Shields, monograms, and bass-reliefs are also used as ornamentation. All round the wall rests a marble table, and through the centre two long tables are supported by marble posts, and rest on basins through which flows perpetually a stream of fresh water. In this way is a cold temperature maintained throughout the D. The Aylesbury D. Co.'s farm at Stammerham covers over 1000 acres.

Da'is (Old Fr. *dais* or *deis*, 'a table,' Low Lat. *discus*), denoted in the Middle Ages (1) the high table on a raised platform at the upper end of a hall or refectory, (2) the seat on which guests sat at the high table, and (3) the canopy over the whole. The last became the most common use of the term, and thus we read of the D. of a throne, altar, shrine, stall, font, statue, or any object which has a cloth of estate, canopy, or heaven over it.

Dai'sy (Old Eng. *daeges eage*, 'eye of day,') the name of a genus of plants, plentiful in grassy meadows in Europe, and represented in America by one species, confined to Tennessee, Arkansas, and the neighbouring regions. In Continental Europe are found some species not native to Britain, but none of such interest as the common D., which, under the English name of D., the Scotch *gowan*, the French *marguerite*, &c., has been celebrated by poets in many languages as the emblem of modesty, purity, and fidelity, and as such was worn at tournaments by knights and ladies during the age of chivalry. Among the English poets of the D. are all who have touched upon pastoral subjects, from Chaucer to Burns. The allied genus, comprising five species closely allied to the D., is found in the S. of Europe. There are, besides, many other so-called Daisies, belonging to entirely different genera; among them may be mentioned the African D., Australian D., blue D., Swan River D., ewe D., French D. or Paris D., horse-D. and moon-D., Mexican D., and native D. of New Zealand. The ox-eye D. is also a name given to the horse-D. and moon-D. It is a common plant in England and in America. The stem is about two feet high, and the disk of the flower is yellow. It shows a marvellous tenacity when once established in a meadow, and farmers experience much difficulty in getting rid of it. The name D.-tree is applied to *Olearia* and *Eurybia*.

Ox-Eye Daisy.
